K. A Tiger crew was the creme de la creme of the Panzer force. Therefore, as an inherent crew its morale is 9 (signified by "ML:9" on the counter), and the Tiger's printed APCR Depletion number (if one is present on the counter) is one higher than normal.

L. Vehicle has Low Ground Pressure (D1.41)—signified by its identity letter being inside a square. Moreover, when this vehicle is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending $\geq$ four MF in the vehicle's hex Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract 2 (1 per crew/HS) from its immediately subsequent unbogging DR.

M. Optional AAMG RF is 1.3.

N. This vehicle was used in North Africa at some time from 3/41 to 5/43 (within the limits of its own given Date). If the superscript "F" appears, the vehicle was used in small numbers only (RF = 1.5; if normal RF is $\geq$ 1.5, North Africa RF = 1.6). If the superscript "T" appears, the vehicle's use in NA was limited to Tunisia, 11/42-5/43 (within the limits of its own given Date).

O. The AAMG is remotely controlled; it cannot be used by a Rider, and may never fire at an aerial target.

P. The AAMG may not fire outside of the VCA—as signified by "MG: VCA only" being printed on the counter.

Q. The CMG may not fire outside of the VCA—as signified by "MG: VCA only" being printed on the counter. Otherwise, it is treated as a normal CMG, but is available only after 9/44 (RF 1.3).

R. RF is 1.5 in 1943.

S. This AFV can have Schuerzen (D11.2).

GERMAN ORDNANCE NOTES

1. *5cm leGrW 36*: The standard German light mortar was issued on the scale of three per rifle company; these were often distributed individually to the company's platoons. It was rather complex for such a small weapon and, being little more than a glorified grenade launcher (like all such small caliber mortars) with insufficient range and punch, it was mostly relegated to second-line and reserve units after 1942. Its nickname was the Buletten-schmeister (meatball thrower).

2. *8cm GrW 34*: A conventional medium mortar whose actual caliber was 81.4mm. It was the standard battalion support weapon, with six being issued to the machinegun company of each; these in turn were often distributed two per company within the battalion. In a foot-infantry unit the mortar was hand-carried when in action, but for long moves was carried in a horsecart. One interesting type of ammunition fired by the GrW 34 was the "bouncing bomb", which rebounded into the air when it struck the ground; then at a height of 15-50 feet it exploded with an enhanced fragmentation effect. This round usually worked well if it struck hard ground but functioned poorly (if at all) when the ground was soft, so in 1942-43 it was withdrawn. Later in the war the GrW 34 was supplemented by a lightened, shorter-range version called the kz GrW 42. This variant had been intended for use in airborne units but eventually saw more general issue, often being used in infantry companies.

† RF is 1.1 prior to 1943; .9 in 1943 and thereafter.

3. *10cm NbW 35*: This mortar was designed to equip the Nebeltruppen, whose primary task was to lay smoke screens. When the Nebeltruppen were re-equipped with Nebelwerfer rocket launchers the NbW 35 were relegated to use as conventional mortars. Relatively few were built.

4. *12cm GrW 42*: In 1941 the Germans captured large numbers of the excellent Soviet 120mm mortar and were so impressed by them that they produced an almost exact copy for their own use.

A platoon of four GrW 42 was often found in the 4th (machinegun/Heavy Weapons) company of the infantry/Panzergrrenadier battalion.

† RF is 1.4 in 1943; 1.3 thereafter.

5. *2.8cm sPzB 41*: A light AT gun (or heavy ATR, as the Germans designated it) using a barrel whose bore was tapered toward the muzzle. The round had a 2.8cm caliber in the breech but, due to malleable skirts around the projectile (which were squeezed back by the tapered bore), the emerging projectile had only a 2cm caliber. The advantage of this design was that as the base area of the projectile decreased, the propellant exerted a proportionally increased pressure on it, thereby greatly increasing its muzzle velocity. The drawbacks were rapid bore wear and the need for large amounts of scarce tungsten. The projectile required a tungsten carbide core since, with a muzzle velocity of some 4600 ft/sec, a normal steel AP round would simply shatter upon impact. In 1942 however, the general shortage of tungsten necessitated a ban on its use in AT rounds, and as the ammunition supply dwindled the taper-bore guns fell into disuse. The sPzB 41 was built in only limited numbers, and was most commonly encountered in North Africa. There was also an airborne version that was issued later in 1941.

† RF in North Africa is 1.2.

6. *3.7cm PaK 35/36*: The standard German AT gun at the beginning of the war. By 1941 over 15,000 had been produced. It first saw combat during the Spanish Civil War in 1936, where it acquired a good reputation. In the 1940 invasion of France however, the PaK 35/36 was unable to penetrate the armor of certain French and British tanks, and the same proved true in Russia in 1941 when confronted by the T-34 or KV. Such increasingly inadequate performance caused the PaK 35/36 to become derisively referred to as the "Army's door-knocker", and by 1942 most AT battalions were re-equipped with the new PaK 38. In the meantime a special HEAT projectile (the Stielgranate 41) was developed for the PaK 35/36, thus prolonging its usefulness even after it was relegated to second-line and reserve units. Prior to 1943, three platoons of four AT guns each made up the AT company of each infantry regiment, with another three companies in the divisional AT battalion.

ORDNANCE LISTINGS KEY

† If † appears beside an entry, the corresponding Note for the ordnance should be consulted.

The number of counters of this type supplied in one game.

Type The type of ordnance. MTR=mortar. AT=anti-tank. INF=infantry. RCL=recoilless. ART=artillery. AA=anti-aircraft.

CSize Caliber Size (C2.21).

ROF Multiple Rate of Fire (C2.24). () = IFE (C2.29).

B# Breakdown Number (C2.28).

Range Range Limit (C2.25). If two numbers appear, the first is the minimum range; the latter the maximum.

M# Manhandling Number (C10.3). If in bold type (circled in black or red on the counter), an increased (un)hooking MP cost applies to the towing vehicle (C10.11-12).

TSize Target Size To Hit DRM (C2.27).

Dates Dates in use after acceptance by that nation's army.

Special PP=portage points. T=360° mount (C2.3); NT=non-turreted. QSU=quick setup (C10.23). s#=Smoke Depletion Number (C8.9); WP=white phosphorus (C8.6). H#=HEAT Depletion Number. H5/6[9]=special HEAT ammo; see pertinent German Ordnance Note. AP#=AP Depletion Number (C8.8). A=APCR (C8.1). D=APDS (C8.2). IR=Illuminating Round (C8.7). C=Canister (C8.4). h-d=horse-drawn (i.e., cannot be towed by a motorized vehicle). LF=may use Limbered Fire (C10.24); [...] =changed specs when LF Gun is limbered. RFNM: see Index. NM: see Index.

Note: the superscript following the Depletion Number indicates the year it applies (EX: A6⁴/7⁵ means the Gun has A6 in 1944 and A7 in 1945).

BPV Basic Point Value. The DYO purchase cost of one piece of this type.

RF Rarity Factor. Indicates the relative rarity of one gun to another at any given time. .9=extremely common; 1.6=extremely rare. The Rarity Factor is based on production figures, and is included for DYO purposes only.

7. 4.2cm lePaK 41: The second German AT gun to incorporate the Gerlich (taper-bore) principle used the same carriage as the PaK 35/36. Its nominal caliber was 4.03cm but its emergent caliber was 2.94cm. The lePaK 41 was issued in late 1941 to infantry and parachute troops, seeing action in Tunisia, Sicily, Italy, and Russia before its ammunition production was halted.

8. 5cm PaK 38: Fortunately for the Germans, the eventual need for an AT gun more potent than the PaK 35/36 had been foreseen, and resulted in the PaK 38. Unfortunately for them however, the armor on many of the tanks this new gun would have to face was thicker

than had been anticipated. Thus the PaK 38 could deal satisfactorily with the Matilda, T-34, or KV only when using scarce APCR rounds. In every other way, though, it was an excellent gun, being relatively small, easy to manhandle, and incorporating several innovative design features. It was initially issued primarily to anti-tank battalions, but as the heavier 7.5-7.62cm AT guns became available they displaced the PaK 38—which in turn were allotted to the regimental AT companies (superseding the obsolete PaK 35/36). When the production of APCR was halted in 1942, a temporary exemption was granted for the PaK 38 in order to prolong its usefulness. In 1943 the number of towed AT guns per platoon was lowered from four to three.

† RF is 1.3 prior to 7/41; 1.2, 7-12/41; 1.1, 1-6/42; 1.0, 7/42 on.

9. 7.5cm PaK 97/38: A stop-gap conversion necessitated by the need for more AT guns that could effectively engage the T-34 and KV. It consisted of the barrel from the famous French 75 Model 1897, modified and mounted on a PaK 38 carriage. The gun was too powerful for this light carriage however, which caused problems in action. Some 700 were built and rushed to the Eastern front, but as soon as better guns became available the PaK 97/38 was relegated to second-line use. Some were encountered in Normandy, being used as light artillery. Captured French and Polish ammunition was mostly used with the PaK 97/38, but a HEAT round was also specially designed and issued for it.

10. 7.5cm PaK 40: The next planned generation of AT guns after the PaK 38. In fact, the PaK 40 was really a scaled-up version of the PaK 38 and looked very similar to it (except for being larger, of course). Design work on the PaK 40 began in 1939, but Operation Barbarossa and the discovery of the T-34 and KV found it still in the pre-production stage. Once its manufacture began however, it did not cease until 1945. In action the PaK 40 was an excellent AT gun—its only drawback being its weight, which made it difficult to manhandle. The PaK 40 eventually became the standard equipment of AT battalions; it was mounted on many TD and was also the basis of the long-barreled 7.5cm gun used in the PzKpfw IV and StuG III. Some were even issued as field guns, although in this mode they were hindered by their limited elevation.

† Decrease RF by .1 for each four-month period after 3/42, until 1.1 is reached in 4/43.

11. 7.62cm PaK 36r: In the 1941–42 period large numbers of the Soviet 76.2mm P obr. 36 field gun were captured by the Germans and quickly put to use by them. A substantial number were adapted to use German-designed ammunition and firing techniques, and in this guise became an excellent (and low cost) addition to the German anti-tank armory. The modified versions were not available until 1942, but the piece Date reflects their earlier use. 124 were received by the Afrika Korps; availability in North Africa begins as of 1942.

† Decrease RF by .1 for each three-month period after 9/41, until 1.2 is reached in 4/42.

12. 8.8cm PaK 43: Designed by Krupp, this was the best AT gun to see service in WW2, and overall probably the finest AT gun ever designed. It was easy to conceal, very hard-hitting, able to fire while limbered, traversable through 360°, and accurate at extremely long range. Variants of this excellent gun were mounted in the Tiger II, Nashorn, Jagdpanther, and Ferdinand. The game piece can also be used to represent the FlaK 41 AA/AT gun, which first saw service in Tunisia in 1943 (RF 1.5); however, when used as the FlaK 41 the piece should have B10 in both limbered and unlimbered modes.

13. 8.8cm PaK 43/41: Demand for the excellent PaK 43 soon outstripped production, leading to an expedient version that consisted of a modified PaK 43 barrel mounted on a carriage assembled from parts of several existing howitzers. The result was big and awkward (it was nicknamed Scheuntor [barndoor]), but in action was just as powerful as the PaK 43. It was encountered by the Allies on all fronts.

14. 12.8cm K 81/1: Several different prototypes of a 12.8cm gun configured like the PaK 43 were built, but none ever reached production. In order to utilize the existing barrels, a small number (about 50) were mounted on captured French 155mm and Soviet 152mm carriages and issued as AT/field guns.

15. 7.5cm leIG 18: The standard regimental light support piece of the German infantry. Its design was initiated in 1927 and, once production started, it remained in use throughout the war. A special lightened version was also provided for mountain troops. Six were allocated to the 13th (infantry gun) company of each infantry regiment. One interesting feature of this howitzer was its breech action, which was similar to that of a shotgun; i.e., the barrel was pivoted, and reloading was accomplished by elevating the rear of the barrel to clear the non-moving breech block. The short-barreled 7.5cm guns mounted in German AFV

were not derived from the leIG 18, incidentally. Several other light infantry guns were built and issued during the war (e.g., the IG 37 and IG 42) but do not differ in game terms.

16. 15cm sIG 33: The companion piece to the leIG 18, two being included in the regimental infantry gun company. It was also the heaviest and largest-caliber infantry gun used during the war. In action its 84 lb. HE shell provided powerful support, but its weight greatly limited its tactical mobility and led to a number of SP variants on full-tracked chassis.

17. 7.5cm LG 40: Recoilless guns were popular with designers, because the absence of the various mechanisms used to absorb a normal gun's recoil meant they were much lighter and were also cheaper to produce. They were not as popular with the users however, who disliked the dangers and tactical limitations inherent in their tremendous backblast. The LG 40 was the first recoilless gun to see combat in the ground role, being initially used during the airborne assault on Crete. Some 450 were built, and were issued to parachute and mountain regiments, and probably also to Jaeger (light infantry). Two RCL were often present in the MG company of each such regiment. **Errata:** The counter should have a thin white circle representing a T Gun type.

18. 10.5cm LG 42: After production of the 7.5cm LG 40 commenced it was decided that future guns would be of larger caliber. This resulted in the 10.5cm LG 42 (and the similar 10.5cm LG 40), which was used in the same manner as the earlier 7.5cm gun. Recoilless guns could be either dropped by parachute or landed with their SdKfz 2 Kettenkrad towing vehicles in a glider. Production of German recoilless guns ceased in early 1944 since they consumed three to five times the amount of propellant used in conventional artillery—and by this time in the war propellant was in short supply. 10.5cm LG 42 were sometimes used as artillery in divisions of the types mentioned in the preceding Note.

† Sources vary on when this gun became available. Some say late 1941 while others state 1943. The earlier date may represent combat trials; therefore, RF is 1.5 prior to 1943. **Errata:** The counter should have a thin white circle representing a T Gun type.

19. 7.5cm leFK 16nA: A modernization of the WW1 7.7cm leFK 16. Some were used as first-line artillery pieces in the early campaigns, but in 1941 most were passed to reserve and occupation units. The game piece also represents the later FK 18, as well as many other similar types captured during the early Blitzkrieg years. Volksgrenadier divisions often contained at least one battalion of 7.5cm artillery.

20. 10.5cm leFH 18: The standard German light howitzer throughout WW2. It was a good reliable piece, but was generally heavier and shorter-ranged than its Allied equivalents. Subsequent versions attempted to redress these problems but were never entirely successful. Some leFH 18 were also used by Hungary. German towed artillery batteries usually consisted of four guns each, although in 1944–45 some only had three guns while batteries in Panzer and Panzergrenadier divisions might have six. A version of the leFH 18 was mounted in the Wespe SPA.

21. s 10cm K 18: The "long arm" of the divisional artillery. One battery of four guns were often found per artillery regiment; however, as the war progressed they fell from favor, being judged as too big and heavy for their caliber. They were also used as corps artillery.

22. 15cm sFH 18: The standard German heavy howitzer throughout WW2. Like most of the German artillery park, it was somewhat large, heavy, and short-ranged for its caliber. Its actual maximum range in hexes was 333—but is given in the Listing as 243, which was its normally allowed maximum range. Increasing the range further (by adding extra propellant charges) required permission from a higher formation, due to the strain such use imposed on the gun; therefore its true maximum range could be utilized only under exceptional circumstances. A later version (the sFH 18M) reduced the wear/stress problem,

and another variant (the sFH 18/40) increased the range to 377, but this latter model was much less accurate and only 46 were built. The sFH 18 was used in batteries of four or six guns, and was also mounted on the Hummel SPA. The sFH 18 was also used by Finland and Italy.

23. **15cm K 18:** A powerful but very heavy gun that took much time to emplace or limber. It was probably used at corps or army level. In reality it could have 360° traverse, but not at the speed necessary for it to qualify as a T gun in the game.

24. **17cm K 18:** An excellent gun which incorporated many advanced ideas. One such was dual recoil: the barrel recoiled normally, but the platform also recoiled along rails mounted on the carriage. It had 360° capability, but not at the speed necessary for it to qualify as a T gun in the game.

25. **2cm FlaK 30:** A conventional light AA gun whose design can be traced back to WW1. It had a rather low rate of fire and a tendency for the feed mechanism to jam; nevertheless, it remained in use throughout the war. It was also used as the main armament in the early PzKpfw II and armored cars.

26. **2cm FlaK 38:** The FlaK 30 was redesigned by Mauser to correct its deficiencies, and as the FlaK 38 it became the standard German light AA gun for the duration of the war (although it never entirely replaced the earlier model). It was also used in a variety of reconnaissance vehicles. Use of the single-barreled 2cm FlaK gun in the AA role began to diminish in early 1944 due to its decreasing ability to deal with the faster and more heavily armored Allied ground attack aircraft. In March 1944 there were 19,692 FlaK 30 and 38 guns in service with the Luftwaffe, while an undetermined number were being used by the Army.

27. **2cm FlaKvierling 38:** This weapon consisted of four FlaK 38 guns on a common mount, and was originally produced for the German Navy. Its prodigious firepower was feared by Allied pilots, and could be quite deadly against ground targets. In January 1945 there were 3,806 in service with the Luftwaffe, and in the last few months of the war a FlaKvierling with on-carriage radar was used in radar-controlled AA-fire experiments. 2cm FlaK platoons could consist of either three or four guns each.

† Make four To Kill DR when using the 20L column of the AP To Kill Table; only one DR (firer's choice) is used.

28. **3.7cm FlaK 36 o. 37:** Another standard light AA gun. In its towed version it does not seem to have often been included in the Army's divisional establishments. Apparently most were used in FlaK divisions and independent FlaK regiments and battalions. A 3.7cm FlaK platoon consisted of three guns, with three platoons forming a battery. The main difference between the FlaK 36 and 37 was in the type of sights used.

29. **3.7cm FlaK 43:** This AA gun was primarily a new design rather than an improved version of existing 3.7cm weapons. It featured a substantially increased rate of fire, but was also much bulkier than the older guns. Relatively few were made; there were 1032 in service with the Luftwaffe in February 1945.

30. **8.8cm FlaK 18 o. 36:** The "88", probably the most famous gun of WW2, was designed by a team of Krupp engineers working clandestinely in Sweden. It was an excellent design and quickly became the mainstay of the Luftwaffe heavy AA defenses. The differences between the FlaK 18 and 36 were minor; many of their parts were interchangeable. During the Spanish Civil War its usefulness against ground targets was noted, and appropriate ammunition was developed for this role. The 88's lasting fame (or notoriety) came with its use in North Africa, where it easily destroyed the previously invulnerable Matildas at over 2000m. It came to be so feared in the desert that British crewmen were said to sometimes abandon their tank even if an 88's first shot missed

them—for they knew it rarely missed with a second. Nor did its reputation ever diminish. One reason for this was that at the end of the war an 88 could still frontally penetrate any U.S. or British tank, save perhaps the Sherman Jumbo. Another reason was that so many 88s were built; for instance, in August 1944 the Luftwaffe alone had 10,704 in service—and this number does not include those used in Army FlaK battalions. These facts alone make it easy to understand why they made such a powerful impression on those who had to face them. An 88 platoon consisted of four guns, usually towed by SdKfz 7.

GERMAN MULTI-APPLICABLE ORDNANCE NOTES

A. Due to the design of its armor piercing projectile, this gun uses the APCR To Kill Table and Range modifiers for its To Kill DR vs. AFV, unless using HE. In addition, it always uses the Basic TH# Modification (C4.3) for its To Hit DR—even if it fires HE—and is not subject to APCR Depletion Numbers.

B. This special HEAT round was known as the Stielgranate 41. It consisted of an egg-shaped hollow-charge warhead, to the rear of which was attached a rod inside a finned and perforated sleeve. The round was muzzle-loaded; i.e., the loader inserted the rod into the muzzle end of the gun-barrel (with the finned sleeve sliding down over the outside of the barrel), and a special blank cartridge was loaded into the breech to fire it. The fin-stabilized projectile had a muzzle velocity of 110 m/sec (361 ft/sec) and a maximum range of about 364m (400 yds).

† H#(9) has a Basic To Hit number of 11. Each hex of range decreases this number by one. Its maximum range is 9 hexes. All Firer/Target-based To Hit DRM apply normally. It may only be fired at a vehicle, or at those target types allowed to HEAT (C8.31). The gun's ROF is lowered by one if it successfully fires the Stielgr 41 (i.e., it can continue to fire in that phase if its To Hit colored DR for that shot was a 1 or 2 rather than 1-3).

C. When using Limbered Fire the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

N. This Gun was used in North Africa at some time from 3/41 to 5/43 (within the limits of its own given Date). If the superscript "7" appears, its use in North Africa was limited to Tunisia, 11/42-5/43 (again, within the limits of its own given Date).

RUSSIAN VEHICLE NOTES

By 1941 the Soviet Union had a vast armored force of almost 30,000 AFV—more than the rest of the world combined. An obsession with annual production figures, however, upstaged the more mundane concern for the manufacture of spare parts. Consequently, when the Germans invaded, only about 7,000 of the 24,000 existing Soviet tanks could be considered completely battle-worthy. This in turn caused a large part of Soviet tank losses in the first months of Operation Barbarossa to be caused by mechanical breakdown. Several other important factors contributing to the poor showing of early Soviet armor were a general scarcity of radios, the inexperience of crews and commanders, and obsolete two-man turrets—all of which made Soviet tanks difficult to control as formations, and individually unwieldy in action. They were relatively "blind" and "dumb" in combat—often blundering about oblivious to beneficial terrain and enemy positions; a situation which the Germans (and Finns) were quick to exploit. The result of all this was that by December 1941 the Soviets had lost all but about 4,500 tanks (of which some 2,100 were keeping watch on the Japanese) and their armored force was at its nadir. In 1942, with better tanks beginning to predominate and with better training and tactics resulting from the experiences of 1941, the situation slowly improved and the gulf in tactical expertise between the Soviets and the Germans began to gradually diminish. Moreover, the Soviet philosophy of quantity before quality allowed them to outproduce the Germans, whose AFV were technically superior but also more expensive and time-consuming to build. Indeed, even with the loss of much of their natural resources and the forced relocation of many production facilities in 1941, the Soviets during the course of WW2 built some 102,000 AFV (of which about 71,000 were the superior T-34/KV/IS tanks) and could use sheer weight of numbers (as could the Western Allies) to help overpower the outnumbered invaders.

H

1. **T-37:** A slightly altered version of the British Vickers A4E11. Used in recon units of infantry, cavalry, and mechanized formations. The game piece also represents the slightly different T-38 model. About 2,500 of all types were built.

2. **T-40:** Successor to the T-37/T-38 as a recon vehicle, and also pressed into service as an infantry support AFV when heavier tanks became scarce toward the end of 1941. Only about 220 were built before production was halted in favor of the superior T-60.

3. **T-50:** This Maly Klim was an infantry support tank somewhat resembling a midget T-34, and was intended as a replacement for the T-26 series. Only 63 were built, as they were found to be very cost-ineffective compared to the T-34. All were used in a single brigade on the Finnish front.

4. **T-60 M40 & M42:** The T-60 was designed as a recon tank, but was nonetheless often pressed

into service in support of infantry attacks since, due to attrition, by late 1941 recon tanks comprised roughly 50% of a tank brigade's strength. About 6,300 T-60 types were built. Beginning in 1943 many had their turrets removed and were used as gun tractors or SP rocket launchers. By the end of 1941, Soviet light tank platoons consisted of three vehicles each; prior to this each contained five tanks. M stands for model year in cases where significant variations existed.

5. **T-70:** Another attempt to create the right combination of firepower, mobility, and protection in a light tank. However, by this time it was seen that the T-34 could do anything the T-70 could, and a lot more that the T-70 couldn't. So with ever increasing numbers of T-34 tanks obviating the need for light tanks, the T-70 was withdrawn from tank brigades in early 1944 (although it remained in use with other formations and Soviet allied forces). More than 8,200 T-70 were built.

6. **T-26 M33 & M37/39:** The T-26 tanks were originally developed from the British Vickers 6-ton models, and for the most part equipped the tank battalions (22 T-26 and 16 recon tanks) of rifle divisions. Prior to the German invasion of Russia they were used in the Spanish Civil War (9/36-38), Manchuria (1939), and the Russo-Finnish War (1939-40). 88 were also sold to China around 1937. In 1941, T-26 and BT tanks formed 75 % of the Soviet tank force. Over 12,000 T-26 were built, of which about 5,500 were Model 1933. The Models 1937 and 1939 had a more sloping turret and thicker armor. Optional CMG RF is 1.1.

7. **OT-133:** These were used in special battalions which contained 45 FT tanks each, plus a few T-26 and armored cars. The game piece also represents the earlier OT-130 model.

8. **BT-5:** The BT (Bistrokhodny Tank: Fast Tank) were the basic AFV of independent tank brigades, and of mechanized and cavalry divisions. They were intended for use in the long-range exploitation role. Developed from the M1931 design of the American J.W. Christie, BT could be driven on their wheels, sans tracks—although this theoretical advantage was rarely used. BT were well-liked by their crews, but their thin armor made them vulnerable to even ATR. Prior to the German invasion of Russia, BT were used in the Spanish Civil War (about 50 were sent, 1937-1938), Manchuria (1938-39), and the Russo-Finnish War (1939-40). Almost 5,000 BT were built, up to and including the BT-5 series.

9. **BT-7:** This series was an evolutionary modernization of the BT-5 with redesigned front armor, and with a new turret, more machineguns, and a new engine/drive train (without the wheels-only

capability) being introduced in stages from 1935; the version equipped with both optional MGs is actually the BT-7M (aka BT-8). Unfortunately, such improvements did little to enhance the survivability of an obsolete design. Over 2,000 BT-7 types were built. The great significance of the BT design is that, via several experimental models, it was the direct predecessor of the T-34.

10. **BT-7A:** This artillery tank was intended to provide close support for the BT platoon. It was usually radio-equipped.

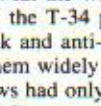

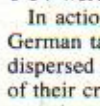

11. **T-28:** This was the first Russian medium tank. It was loosely based on the British A6E1 and had two MG-armed turrets flanking the driver. T-28 were used in Manchuria against the Japanese and in the Russo-Finnish War of 1939-40, as well as against the Germans. After 1938, most T-28 were consolidated into three heavy tank brigades, with each ideally containing 136 T-28, 47 BT, and 25 armored cars. About 600 T-28 types were built.

12. **T-28E:** The original T-28 were found to be easily penetrated by Finnish AT guns and so were strengthened by adding additional plates. These uparmored versions successfully assisted in breaking through the Finnish Mannerheim Line in early 1940 but did not fare well against the Germans in 1941. T-28 production was ended in 1940 in view of the much superior T-34 design.

13. **T-34 M40:** At the time of its introduction, the T-34 was the most revolutionary AFV in the world. Its combination of medium velocity 76mm gun, well-sloped armor, high top speed, and excellent mobility across soft ground, placed it a generation ahead of all other existing tanks. This is not to say, however, that it had no faults. It was extremely cramped and tiring to operate, its two-man turret reduced its rate of fire and overall fighting efficiency, and the early models were prone to breakdowns. Despite these problems, the T-34 was an excellent design overall and its appearance came as a rude shock to the Germans, who had until then been smug in the belief of their own technical superiority. 967 T-34 were with the western Military Districts on June 22, 1941.

In action, the T-34 proved to be almost invulnerable to the standard German tank and anti-tank guns. Initially though, the Soviet command dispersed them widely amongst the armored units and the vast majority of their crews had only a few hours of training, which often enabled the experienced German panzer crews to fully utilize their superior tactics to negate the T-34's superiority. On the other hand, the German infantry with their relatively immobile 37mm AT guns came to greatly fear the T-34, often being able to stop it only by attaching a grenade bundle or mine to its rear deck—not exactly a task they relished. The Model 1940 was the original production type; about 1,000 were built.

14. **T-34 M41:** This model was initially reserved for use by platoon and company commanders, but clamors from the front for its more effective gun led to its superseding the Model 1940 in production. The game piece also represents the Model 1942, which incorporated minor improvements. Soviet medium tank platoons generally consisted of three tanks apiece, with a company containing ten tanks.

15. **OT-34 & KV-8:** Flamethrower tanks were generally organized into independent battalions attached to tank corps, with each battalion consisting of 10 KV-8 and 11 OT-34. Later these battalions had 20 OT-34 and 10 T-34.

16. **T-34 M43:** The addition of a roomier hexagonal-shaped turret and significant improvements in automotive reliability characterized the T-34 Model 1943, which was the most numerous version of the T-34/76 series. When production ceased in 1944, more than 35,000 T-34/76 had been built.

†Decrease RF by .1 for each two-month period after 12/42 until .9 is reached in 9/43.

†X#— applies only to FT.

†Increase 1941 RF by .1 for each month after 7/41.

H

Vehicle 27

17. **T-43:** This was actually the prototype of an uparmored T-34 which never reached production, but for ease of identification its name is used here to identify those versions of the standard T-34 which were locally uparmored by welding additional plates to the hull front and turret. Most of these variants were produced in Leningrad and were therefore more commonly used in the areas around the Baltic Sea.

18. **T-34/85:** By mid 1943 the Soviet Union, somewhat like the U.S., found its tanks to be under-gunned when confronting the new generation of German Panthers and Tigers. The resolution of this problem was the T-34/85, with a more powerful gun mounted in a new three-man turret. It first saw combat with the 1st Guards Tank Army. About 29,500 were built during WWII.

†Decrease RF by .1 for each month after 4/44 until 1.1 is reached in 8/44.

19. **M4/76(a):** The Russians used more Shermans than any other Lend-Lease tank during the last two years of the war. Shipments of the M4A2(76)w (which was the only 76mm version given to the Soviets) began in May 1944, and ultimately 2,095 were sent. Some tank and mechanized corps were entirely equipped with Shermans; the 1st Guards Mechanized Corps in 1945 was one such. The M4/76 may have a functioning gyrostabilizer (D11.1), and is also equipped with a 2in. smoke mortar (sM8; D13). The "(a)" in the piece name stands for American, for ESB purposes. Note that the M4/76 uses black to hit numbers.

†RF is 1.5 in 1944.

20. **T-44:** This was designed to replace the T-34/85, but the initial models failed to live up to expectations. About 200 were built by VE Day. Some saw limited action in 1945. The T-44 was the direct predecessor of the long-lived T-54/T-55 series.

21. **T-35:** This was a "land-battleship" based on the design of the British Independent tank. While quite a dreadnought on paper, operationally its multitude of weapons could not be effectively directed by the overburdened tank commander; moreover, it was mechanically very unreliable. A total of about 60 were built. Some were used in Finland (1939), and most of those still running in 1940 were amalgamated into the elite 34th Tank Div., only to be subsequently lost in the frontier battles of 6/41—most to mechanical failures. A few participated in the defense of Moscow during late 1941. The high CS# is due more to the size of its crew (10 men) than to any intrinsic strength of the vehicle.

†The T-35 has four sub-turrets: two with a 45L gun (one each in the port aft sub-turret and the starboard fore sub-turret); and two with a 2 FP MG (one each in the port fore sub-turret and the starboard aft sub-turret). Each port sub-turret may fire at targets within the T-35's port side Target Facing, and each starboard sub-turret may do likewise within the T-35's starboard side Target Facing. Each fore sub-turret may fire at targets within the T-35's front Target Facing, and each aft sub-turret may do likewise within the T-35's rear Target Facing. Thus each sub-turret has a "CA" of either "front and one side" or "rear and one side" T-35 Target Facing, as per the diagram below. All ST penalties apply to the 76* gun.

Each 45L gun is always subject to the +1 BU DRM but does not suffer any TCA change DRM (although it must pay NT CA DRM if the T-35 changes its VCA); moreover, it may not use a multiple ROF nor may it use Intensive Fire.

22. **KV-1 M39:** The KV (Klementi Voroshilo) caused great consternation amongst the Germans when they first encountered it. Barring a lucky track hit, it was almost totally invulnerable to all German guns save the 88s and large caliber artillery pieces. Its chief drawbacks were a poor turret layout and the fact that it was both extremely tiring to drive and unwieldy in action (the KV's turret had a three-man crew, but in game terms it suffers RST penalties because its turret configuration precluded the commander's being CE while the MA was being used). 508 KV were in service on June 22. Slightly more than 3,000 KV-1 types were built. Most Soviet independent tank battalions and brigades in the 1941-42 period contained a mixture of KV, T-34, and recon tanks. Soviet heavy tank platoons consisted of only two tanks each, with five tanks per company.

†The KV's first major combat came with the German invasion, although a few KV-1 Model 1939 prototypes saw action near Summa, Finland, as early as 12/39 (RF 1.6 for pre-1941 use).

23. **KV-1E, KV-1 M41, & KV-1 M42:** Uparmoring of the KV (Klim) was started even before Operation Barbarossa, based on faulty intelligence reports that the Germans were massively upgunning their tanks. Moreover, as new German weapons and ammunition were encountered, the Soviets introduced further modifications and retrofitted many of the surviving older KV with various types of applique armor. Each successive addition to their weight engendered a further loss of mobility however—and although the front lines were calling for faster tanks with thicker armor, the critical shortage of heavy tanks meant that the current models had to remain in production and could only be improved through expediencies.

Due to their hampering of operations when used with the faster T-34, from 7/42 KV were placed in separate independent heavy tank regiments of 21 KV each.

24. **KV-2:** The Dreadnought was designed as a "bunker-buster", the need for which was discovered during the war against Finland in 1939. While it was an effective weapon vs. static emplacements, its lumbering bulk was the complete opposite of what was needed during the mobile defensive battles of 1941, and it was quickly phased out of production. 334 were built.

†One prototype saw action in Finland in February 1940, around Summa.

†The KV-2's massive turret was difficult to traverse—especially if the tank was not on level ground. For this reason it is treated as a NT AFV [EXC: it may change its TCA but pays NT traverse DRM when doing so].

25. **KV-1S:** By mid 1942 the number of Soviet tanks was again on the increase, and this luxury allowed the KV-1S to be introduced in order to increase the mobility of the heavy tank. In some ways it was a retrograde step, since its armor had to be drastically thinned; however, its new three-man turret freed the commander of his distracting need to also be the loader. 1,232 KV-1S were built.

†RF is 1.4 in 1944 and 1.6 in 1945.

26. **KV-85:** This mounted the turret of the prototype IS-1 heavy tank on the hull of the KV-1S as a stopgap counter to the German Tiger and Panther. Only 130 were built and these were quickly consumed in the winter battles of 1943-44.

27. **IS-2:** The IS (Iosef Stalin) heavy tank incorporated a re-designed KV hull and chassis combined with a new three-man turret. The first prototypes were built with an 85mm gun and then with a new 100mm gun, but the production versions had a 122 mm gun chosen for its better HE capability and ease of production. This model is generally known as the JS-1 in the West. IS tanks were initially used in independent heavy tank regiments, each of which contained 21 (5 per company; 2 per platoon).

★ Vehicle 28

13  **122L**  **CS 6**
28. IS-2m: The main distinguishing characteristic of the IS-2m was its uniformly sloped upper hull front. Besides its above-mentioned use, by 1945 the IS also equipped the new independent heavy tank brigades (each containing 65 IS types). More than 3,800 IS-2 types were built between late 1943 and mid 1945. The IS-2m is generally known as the JS-2 in the West. The main tactical drawbacks of the IS series were their slow rate of fire and their stowage of only 28 rounds. **Errata:** The counter with identity letter "F" should have a white dot behind its BMG FP.

13  **122L**  **CS 6**
29. IS-3: The prototype IS-3 (Shchuka) was built in November 1944. Its low, round, and extremely sloped turret was a revolutionary design, and its pointed hull front gave rise to its being nicknamed the "Pike". The IS-3 was first issued at the time of the battle of Berlin. It is not definitely known if any saw combat; the Soviets claim they did. When first publicly displayed in September 1945, they caused great concern to Western observers and significantly influenced post-war Western designs.

16  **76L**  **CS 4**
30. SU-76M: The Suka was designed as a combination assault gun-tank destroyer on a much modified T-70 hull and chassis. The increasing effectiveness of German armor and guns soon relegated it to the infantry support role, however, where it saw widespread use. It was initially used in conjunction with the SU-122 on the Volkhov Front in the attempt to relieve Leningrad. To ease logistics, in mid 1943 the SU-76 were placed in their own light SPA regiments of 21 vehicles each (with each battery comprised of four vehicles). 12,671 SU-76 and ZSU-37 AA vehicles were built between 1942 and mid 1945. The SU-76 was not well-liked by its crew, as evidenced by its nickname, "Bitch".
 †RF is 1.5 prior to 9/43.

13  **76L**  **CS 5**
31. SU-76i(g): This used the hull and chassis of a captured PzKpfw III or StuG III, on which was fabricated a sloping box superstructure mounting a 76mm gun. 190 were built in 1943. They were generally used like the SU-76M. The sole surviving example (converted from a PzKpfw III J) was found in the Ukraine in 1972, lying at the bottom of the Sluch River where it had fallen through thin ice in January 1944 during the 143rd Rifle Division's attack on Sarny. The "(g)" in the piece name stands for "German", for ESB purposes.

16  **122**  **CS 5**
32. SU-122: An assault gun consisting of an M-30S field howitzer mounted on the hull and chassis of the T-34. First used in conjunction with SU-76; in mid 1943 the SU-122 were placed in their own medium SPA regiments of 16 (later 21) such vehicles each (with each battery comprised of four vehicles). 1,148 were built between 1942-44.

13  **152**  **CS 6**
33. SU-152: Designed to combat the German Tiger at long range, the SU-152 was an adaptation of the hull and chassis of the KV-1S. It first entered combat in the Kursk battles, and dealt so successfully with Tigers, Panthers, and Elephants that it was dubbed "Zvierboy"—variously translated as Animal Hunter or Conquering Beast. Its greatest tactical drawback was in carrying only twenty rounds of ammunition. 704 SU-152 were built and used in heavy SPA regiments of 21 vehicles each. A battery of heavy SU/ISU AFV consisted of three vehicles each.

†RF is 1.6 for 7-9/43, and is 1.4 thereafter.

13  **122L**  **CS 6** **13**  **152**  **CS 6**
34. ISU-122 & ISU-152: These were continuations of the SU-152 concept, but using the IS chassis. In action, the greater armor piercing capability and longer range of the 122mm gun were complemented by the 152mm's better HE performance. They were used almost exclusively for direct fire, in the second wave of tank attacks. Their greatest liability was their ammunition capacity, which was only 30 and 20 rounds respectively. The ISU-122 and 152 were used in heavy SPA regiments (as per the SU-152), and after 1944 also in Guards heavy SPA brigades (as per the SU-100). From latter 1943 to mid 1945 a total of 4,075 of both types were built.

H

16  **85L**  **CS 5**
35. SU-85: Designed as a countermeasure to the latest German AFVs, the SU-85 was essentially an SU-122 upgunned by mounting a derivative of the 85mm AA gun. Used in tank destroyer battalions of 16 vehicles each (21 from 1944), it first saw combat during the forcing of the Dnepr River. With the advent of the T-34/85, the gun of the SU-85 became redundant and it was eventually superseded in production by the SU-100. 2,050 SU-85 were built.

15  **100L**  **CS 5**
36. SU-100: This was essentially an upgunned SU-85, using an adapted 100mm naval gun. It was used in Tank Destroyer Battalions of 21 vehicles each, and in Guards Heavy SPA Brigades with 65 SU-100s and 3 SU-76s. 1,675 SU-100 were built from late 1944 to mid 1945. An SU-85 or SU-100 platoon consisted of two such vehicles, with five vehicles per battery.

19  **57L**  **CS 4**
37. SU-57(a): The U.S. T48 GMC halftrack. 650 were Lend-Leased to the Soviet Union, where they were re-armed with the more powerful Soviet 57mm AT gun and used in special brigades of 60 SU-57 each. The "(a)" in the piece name stands for "American", for ESB purposes.

21  **CS 3**
38. BA-20: This was a modernization of the older BA-27 and BA-27M armored cars. It consisted of an armored body topped by a MG turret, all on a modified 4x2 Ford Model A chassis with an updated Model A engine. It was used for security and reconnaissance missions. BA = Bronieavtomobil (armored automobile). Approximately 4,800 armored cars (of all types) were in Soviet service in June 1941.

19  **45L**  **CS 4**
39. BA-6: The BA-6 (aka BA-10 in the West) utilized the 6x4 chassis of the GAZ-AAA truck, which was itself a modification of the 1930 Ford Model AA truck. It mounted the turret of the T-26 Model 1933 tank. About 100 Soviet 6x4 armored cars fought in Spain (1936-38); these types also saw combat as standard recon vehicles in all subsequent Soviet military actions through 1943. The game piece also represents the later (1938) BA-10 (aka BA-32), which carried the turret of an experimental light tank but is equivalent in game terms.

30  **CS 2**
40. BA-64B: This was a light armored car based on the GAZ 4x4 automobile. It was used as a recon vehicle by commanders and staff officers and as a liaison vehicle in recon units. One source states that about 3,500 were built during the war.

†All 1MT restrictions apply normally [EXC: the crew must be CE to fire the CMG].

16  **37L**  **CS 4**
41. ZSU-37: A curious attempt at AA defense based on the SU-76M. Several hundred were built, but they were withdrawn from service at the war's end, due to their excessively slow turret traverse.

†The ZSU-37 is treated as a NT AFV [EXC: it may change its TCA but pays NT traverse DRM when doing so].

23  **76**  **CS 4**
42. SU-12: The first standardized Soviet SP gun. Used in cavalry and mechanized units, with one battery of six vehicles supporting each cavalry/motorized infantry regiment.

25  **AA**  **CS 4**
43. GAZ-4M-AA: Standard Soviet AA vehicle of the 1930s. AAMG consists of four MMG with 8 hex range, and can be neither Removed nor Scrounged.

†Make four To Kill DR on the MG column when using the AP To Kill Table; only one DR (firer's choice) is used.

21  **25L**  **CS 4**
44. ZIS-42-AA: Just prior to the outbreak of the war, a limited number of 25mm M1940 AA guns were mounted on modified ZIS-5 trucks. They were probably used by motorized/mechanized units.

15  **76L**  **CS 4**
45. IAG-10-AA: A standard AA gun mounted on a IAG heavy truck. Probably used by motorized/mechanized units, with one battery of eight vehicles in the division's AA battalion.

★ Vehicle Note D

H

46. **GAZ-67B:** This was a 4x4 car closely patterned after the U.S. Jeep but using GAZ automobile components (including a modified Model A Ford engine).

47. Counters are provided for three common Soviet trucks, although they were by no means

commonly used in other than motorized/mechanized units. The GAZ-MM was commonly known as the Russki-Ford; the ZIS-5 as the Stalin Truck. During WW2 the Soviet Union produced about 344,000 cars and trucks, while it received some 433,000 from the U.S. alone.

48. **Stuart III:** Although called the Stuart III for game purposes, most of the M3A1 light tanks sent to the Soviet Union were the (Mark) IV type with diesel engines. The Soviets disliked the Stuart's high silhouette and its fixed BMG (which they, like the British, often removed).

49. **Lee:** The U.S. shipped Lees (M3 Medium) to the Soviet Union from late 1941 through August 1942. Their high silhouette and bow-mounted gun rendered them unpopular with Soviet tankers, however. One known use of Lees in Russia was during the unsuccessful amphibious operation at Ozereyka Bay in Feb. 1943, where afterwards the Germans counted 31 knocked-out Lees and Stuarts.

50. **Sherman III:** The first shipment of some 200 75mm Sherman III (M4A2) medium tanks was made in Sept. 1942; further shipments were not made until July 1943, but then continued on through 1944. The Soviets not surprisingly regarded the Sherman as inferior to the T-34, but could not have failed to be impressed by its durability—since a Sherman could generally be expected to run at least three times as long as a T-34 before suffering a mechanical breakdown.

†RF is 1.5 in 1943.

†The number listed as shipped includes the late models [signified by "(L)" in piece name].

51. **Matilda II:** The Matilda was the second most common Lend-Lease British tank used by the Soviets. They did not like it however, and criticized both its slow speed and its poor performance in winter. It was used mainly for infantry support. In deep snow scenarios, assume the Matilda's MP allotment to be printed in red.

52. **Valentine II, V, & VIII:** The Soviets received more Valentines than any other British tank. They also preferred it over the others because of its higher speed and greater reliability—but they still (justifiably) considered it manifestly inferior to their own T-34. Almost all Marks were sent; the Marks II, V, and VIII given in the Listing are representative of the various types (note that when the British AFV are re-issued in ASL form, the Valentines II and VIII will have an ST gun while the Mark V will have a T gun).

†The number listed as shipped is for all Marks—and includes 1,388 Marks VI-VII built in Canada.

53. **Churchill III:** Due to their weight, Churchills were considered heavy tanks by the Russians, who regarded them as inferior to their own KV heavy tanks. The only heavy tanks available to the 5th Guards Tank Army at Kursk were 35 Churchills in an independent heavy tank regiment.

54. **M3A1:** Lend-Lease M3A1 scout cars were used by the Soviets primarily for liaison, scouting, and as prime movers for guns.

55. **M5 & M9A1:** Lend-Lease halftracks were used by the Soviets almost exclusively in the HQ units of armored formations. They were rarely, if ever, used as tactical infantry transport. The number of M9A1 halftracks listed as shipped includes 342 of the M2 version.

56. **M17:** The M17 MGMC was the Lend-Lease equivalent of the U.S. M16 MGMC, and was the most common AA vehicle used by the Soviets (note that when the British AFV are re-issued in ASL form, the M17 MGMC will be included). They were allotted to Tank and Mechanized Corps.

57. **Carriers:** Carriers from Great Britain, Canada, and even 96 U.S.-built types were Lend-Leased to the Soviet Union. They were used for scouting, liaison, and troop transport.

58. **Trucks:** Most Lend-Lease trucks were modern purpose-built military vehicles of 4x4, 6x4, or 6x6 configuration. This gave them better off-road mobility than the obsolete Soviet designs, which were basically copies of 1930 U.S. vehicles. On the other hand, the Lend-Lease types probably

had problems in the severe Russian winters (as western vehicles do in the Soviet Union to this day). U.S. trucks contributed vitally to the motorization of the Red Army, and became so common in certain areas that the locals sometimes thought the "USA" stenciled on them stood for "Ubiyat Sukinsyna Adolfa" ("kill that sonofabitch Adolf").

LEND-LEASE VEHICLES

The United States supplied the Soviet Union with some \$9 billion worth of goods and materials during World War II. Included in this were some 7,200 tanks (of which 6,300 arrived), over 432,500 trucks, and just over 14,000 aircraft. Great Britain and Canada supplied the U.S.S.R. with about 5,200 tanks (of which some 4,600 arrived), 4,000 planes, over 2,500 Carriers, and several types of trucks. The Soviets generally belittled the AFV of the Western Allies and relegated many to secondary fronts, thus releasing their own AFV for use in more important areas at a time when Soviet AFV production was still recovering from the setbacks of 1941. On the other hand, the great influx of trucks and other transport vehicles gave Soviet units a degree of mobility that could not have been attained had they been solely dependent on their own domestic truck production, which out of necessity had to be greatly curtailed to allow increased AFV production. In sum, while the Soviets have minimized the effects of Lend-Lease on their ability to defeat Germany, it is fair to say that in this regard it was not decisive but was certainly significant.

For DYO purposes use British counters to represent the following vehicles in Soviet service. All pertinent Vehicle Notes apply normally. As a rule of thumb, keep in mind that generally only one type of Lend-Lease tank was used in a Soviet tank brigade or regiment—although often in conjunction with Soviet light or medium tanks. Note also that since the Soviets have been largely reticent concerning their use of Lend-Lease vehicles, the Dates given below are in many cases estimates based on shipping and/or delivery dates.

Name	Type	Dates	RF	#Shipped	Notes
Stuart III	LT	42-43	1.5	1,676	48

RUSSIAN MULTI-APPLICABLE VEHICLE NOTES

A. MA and CMG (if so equipped) have AA capability—signified by "MA:AA" being printed on the counter.

B. Due to being in a fixed mount and fired remotely, this BMG receives a +1 DRM to all fire at a moving/Motion target. This penalty is signified on the counter by a white dot over the BMG factor.

C. This AFV has no radio in scenarios set prior to 1943 (see D14). As of 1943 it is radio-equipped.

D. Optional AAMG RF is 1.3. If available, optional RMG RF is 1.3.

★ Vehicle Note E

E. BMG factor (2x2) is actually two 2 FP BMG: one in a starboard fore sub-turret and one in a port fore sub-turret. The starboard MG sub-turret may fire through the T-28's front Target Facing and starboard side Target Facing, and the port MG sub-turret may fire through the front Target Facing and port side Target Facing. No CA-change DRM apply to such fire through a side Target Facing unless the AFV changes its VCA. See the diagram below.

F. MA may not fire at a same or lower level target through the VCA—as signified by "MA: NA VCA" being printed on the counter. If "No Bnd(F)F" appears on the counter, the vehicle may not use Bounding (First) Fire.

G. Optional AAMG is 12.7mm, with RF of 1.2.

H. The Target Size To Hit DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream hex.

I. Increase 1941 RF by .1 for each month after 7/41.

J. This AFV may possibly carry smoke dischargers (sD). Use rule D13 [EXC: they are usable only once per scenario].

K. Uses red To Hit numbers despite its non-Russian manufacture.

L. Vehicle has Low Ground Pressure (D1.41)—signified by its identity letter being inside a square. Moreover, when this vehicle is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending $\geq$ four MF in the vehicle's Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract 2 (1 per crew/HS) from its immediately subsequent unbogging DR.

M. Russian tracked AFV of the early war years had notoriously poor transmissions. Not only were they plagued by breakdowns, but were also extremely difficult to shift; in fact, many models carried as standard equipment a large hammer which the driver used on the shift lever to "persuade" it to move. Therefore, each time a Mechanical Reliability DR (D2.51) is made for a Russian-built AFV, an 11 result indicates that the AFV has stalled or suffered transmission difficulties that have prevented it from starting normally. Its owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to stop, but excluding the MP expended to start) that the AFV has used in the unsuccessful attempt to move. It can again attempt to move, but must expend another MP to start—and must undergo another Mechanical Reliability DR as it does so. An AFV that stalls is subject to Defensive First Fire (since it has expended a MP to start), but not as a moving target unless it had already entered a new hex during the same MPh. Should a Stall result in more Delay MP being expended than the AFV has available, the AFV is considered to have expended its entire MP allotment in Delay.

RUSSIAN ORDNANCE NOTES

1. **50mm RM obr. 40:** Superseded the overly-complex models 38 and 39 as the standard Soviet company mortar. Its design was extremely simple, and it could be fired at only two different elevation settings: 45° or 75° (some sources state that it also had an 82° setting). An adjustable sleeve vent at the base of the barrel allowed a variable portion of the propellant gas to bleed off, thus shortening the projectile's range at a given elevation setting. A large number of the RM 40 (and its successor, the 50mm RM obr. 41) were built but, as in the German Army, the light mortar gradually lost favor due to its lack of punch and diminished in use as the war progressed.

2. **82mm BM obr. 37:** A slightly redesigned copy of the French Brandt medium mortar. It was used primarily for support at the battalion level. The later versions (BM 41 and 43) had wheels, thus obviating the need to disassemble the mortar for long hauls; therefore, after 1941 this mortar can be fired once in the same phase either prior to becoming dm or after reverting to non-dm status.

† RF is 1.1 prior to 1942; 1.3 in 1942; and .9 after 1942.

3. **107mm GVPM obr. 38:** An enlarged version of the BM 37 designed specifically for mountain troops. It weighed about 350 lb. in action and fired an 11.6 lb. bomb.

4. **120mm PM obr. 38:** The best heavy mortar of WW2. In fact, the German GrW 42 was an almost direct copy of it. It was widely used by the Soviets, both as a regimental support weapon (after 1941 one battery of 6 tubes per rifle regiment; 9 tubes if Guards) and in 120mm mortar brigades.

5. **160mm PM obr. 43:** Due to the weight of its bomb (90 lbs), this mortar incorporated breech-loading, which necessitated elevating the breech clear of the baseplate before reloading could take place. It was used as divisional artillery by some Soviet units.

6. **37mm PTP obr. 30:** A license-built version of the German 3.7cm AT gun, with the only difference being the use of wire-spoked wheels on the Soviet model. It was probably used by second-line units, as the superior 45mm AT gun was in widespread service by 1941.

7. **45mm PTP obr. 32:** Basically the 37mm PTP 30 with a 45mm barrel substituted. At the time of its introduction it was the most powerful purpose-built AT gun in the world and, along with its successor the Model 37, formed the mainstay of the Red Army's AT defenses through the first half of WW2. A light AT gun platoon consisted of two guns; a battery could contain either two or three platoons; and a battalion contained six platoons.

8. **45mm PTP obr. 42:** An updated and more potent version of the PTP 32 and 37, incorporating several minor design changes—most important of which was an increase in barrel length (and thus armor penetration).

9. **57mm PTP obr. 43:** This gun was originally introduced in the spring of 1941 as the Model 41, but in very small numbers. In 1943 it was re-issued in a slightly modified form, and remained in Soviet service for many years after the war. It was also referred to as the ZIS-2.

† RF is 1.6 prior to 1943.

10. **100mm PTP obr. 44:** An extremely potent gun with the usual Soviet dual purpose field/AT gun capability. It is also commonly known as the D-10. Slightly modified versions were used in the SU-100 tank destroyer (D-10S) and the post-war T-54 tank (D-10T). The D-10 (and a later version, the M1955) remain in service to this day in some Soviet-equipped armies.

11. **37mm PP obr. 15R:** This diminutive support piece entered service with Imperial Russian Army in 1915 and in 1941 was still in limited use, probably with second-line units.

12. 76.2mm PP obr. 27: A sturdy and reliable gun also known as the 75-27. A battery of six provided support for each rifle regiment. The Germans appreciated the 75-27's simplicity and its longer range compared to their own 7.5cm IeG 18. Consequently, those they captured were retained and eventually saw service on all fronts; many of them using German sights and ammunition specially produced in Germany.

13. 76.2mm P obr. 00/02P: This gun had originally been designed at the turn of the century and had seen action with the Imperial Russian Army during WWI. Subsequently, it became the mainstay of the new Red Army's artillery arsenal, but by 1941 was only in limited use, probably with second-line units. Other armies also using this gun in 1941 were Rumania and Finland.

14. 76.2mm P obr. 02/30: An updated model of the original P 00/02P gun. The modification actually resulted in two "new" guns with different barrel lengths; the game piece represents the shorter-barrelled version. It was in widespread use in 1941 and the Germans captured many, which they subsequently used throughout Europe.

15. 76.2mm P obr. 39: Also called the 76-39, this Soviet field gun also had a designed anti-tank capability. It was intended as a replacement for the 76-36 since it was lighter and thus easier to handle. The game piece also represents the later P obr. 42 (76-42), which had a new carriage and a muzzle brake. These two models became the standard Soviet light artillery/medium AT guns for the duration of the war, with four constituting a battery. They also remained in use for many years after the war, and indeed are still in service with some armies. The high velocity 76mm gun was called the "crash-boom" by the Germans, due to its supersonic shell exploding on the target before the defenders could hear the sound of the gun firing. Any gun whose shell traveled faster than the speed of sound could actually be called a crash-boom, but this nick-

name was applied primarily to the 76mm types since they were so commonly encountered.

† RF is .9 after 1942.

16. 76.2mm P obr. 36: Also known as the 76-36, this was a standard Soviet field gun with very potent anti-tank capabilities. Introduced in 1939, it first saw action in the Winter War against Finland, and some captured by the Finns were subsequently used against their former owners. It seems the Germans captured practically all the remaining guns of this type, and were so impressed by them that they rebuilt and issued many as the 7.62cm PaK 36r.

† RF is 1.4 in 1942.

17. 85mm P obr. 44: Also referred to as the D-44, this was yet another field gun with purpose-built anti-tank capabilities. In fact, it was mostly used as an AT gun. A similar gun (the D5T) was mounted in the SU-85 tank destroyer, as well as in the KV-85 and very early models of the T-34/85. A modernized version of the D-44 is currently used by Soviet airborne forces; it has a two-cylinder engine and a third (steerable) wheel attached, and is thus capable of limited SP mobility at up to 4.5 mph.

18. 107mm P obr. 10/30: A pre-WWI gun of French design, updated in 1930 by replacing the original barrel. It was commonly known as the 107-10/30, and many were in use as corps artillery in 1941. A longer-barrelled version (the 107-40 M60) was just entering service when the Germans invaded; its use was short-lived however, for the Germans overran many of its production facilities. A tank-gun version of the 107-40 was also being designed at this time as the main armament of the prototype KV-3 heavy tank, which would have superseded the KV-1 had the Germans not invaded when they did.

19. 122mm G obr. 10/30: This gun was originally the French Schneider 10S, imported in large numbers by Imperial Russia prior to the First World War. In 1930 they were modernized and

★ Ordnance 19

H

were then known as the 122-10/30. Many were captured and used by the Germans, and the Finns also acquired some.

20. 122mm G obr. 38: This howitzer was the medium artillery piece of first-line rifle divisions, rifle corps, independent artillery brigades, and artillery divisions. Four pieces formed a battery, and three batteries a battalion. Also known as the M-30, it was produced in great numbers and remains in use in many countries today. The M30S version was used in the SU-122 assault gun.

21. 122mm P obr. 31: The 122-31 (as it was also known) was an original Soviet design that utilized the carriage of an interim 152mm gun-howitzer (the 152-10/34). Along with a later version (the 122-37 or A-19) it was used in artillery divisions and independent artillery brigades, with two guns per battery and six per battalion. Several modified versions of the A19 were carried by the ISU-122 assault gun and IS tank series.

22. 152mm G obr. 38: A very good heavy howitzer with a designed anti-tank capability. It was also referred to as the M-10, and was used by rifle corps, artillery divisions, and independent artillery brigades, with four constituting a battery and twelve a battalion. The M-10T version was mounted in the KV-2 heavy tank.

23. 152mm GP obr. 37: An excellent heavy gun-howitzer that actually was a combination of the earlier 152-10/34 barrel and the 122-37 carriage. It was intended primarily for counter-battery fire in artillery divisions and independent artillery brigades, but also had a designed anti-tank capability. Other designations for this gun are 152-37 and ML-20; when used in the ISU-152 assault gun it was known as the ML-20S. The ML-20 was so successful that today it is still in service in many countries.

24. 25mm ZP obr. 40: Apparently this light AA gun was produced in small numbers only, and few facts regarding it have come to light. It's possible that it was not a very successful design since three different versions were built in rapid succession; the Models 39, 40, and 41. On the other hand, it may be that the Model 41 was intended to become standard issue but its manufacturing facilities were overrun in 1941, thus bringing its production to a premature halt. Of course, it is also possible that the Soviets simply decided to concentrate their efforts on AA guns of larger caliber.

25. 37mm ZP obr. 39: A rugged, no frills gun derived from the Swedish Bofors. Large numbers of captured pieces were used by the Germans to equip their own FlaK units. The fact that it is still currently in service with a number of countries vouches for its successful design. Soviet light AA batteries were usually comprised of four or six guns each. It is interesting to note that rifle divisions lost their organic light AA battery in mid 1942. This process of centralization combined light and heavy AA batteries into AA divisions which were allotted to Armies and Fronts, and then assigned as needed to lower formations. Four batteries of four guns each also equipped each tank and mechanized corps.

† RF becomes 1.3 in 1943.

26. 76.2mm ZP obr. 38: The standard Soviet heavy AA gun of the 1930s. The date given for this piece includes the earlier Model 31, which is equivalent in game terms. The Germans captured a large number of these AA guns and, starting in 1943, modified many to use 8.8cm ammunition. In Soviet service, the 76.2mm AA guns apparently either lost favor or had their production facilities overrun; their use seems to have declined rapidly after the rifle division's heavy AA battery was officially deleted at the end of July 1941.

† RF is 1.4 in 1942.

27. 85mm ZP obr. 39: This gun was designed to replace the earlier 76.2mm AA guns. Also known as the KS-12, it was used in AA divisions. A later version, the Model 44 (or KS-18), was basically a more heavy-duty model, and continues in widespread service today.

U.S. VEHICLE NOTES

The National Defense Act of 1920 made tanks a responsibility of the Infantry, under whose benign neglect U.S. tank development languished for almost a decade. In 1931 MacArthur, as the new Chief of Staff, instituted a vigorous policy of motorization and mechanization for the Army. One element of his vision was an exploitation role for mechanized cavalry using tanks, and soon afterward the Cavalry took the initiative in AFV development and tactics away from the Infantry. (Ironically, until 1940 the Cavalry was forced to call its tanks "combat cars" because legally only the Infantry could possess "tanks".) Tank development accelerated during the 1930s; the Infantry began developing a medium tank, and several types of combat cars and light tanks entered production. However, the tight budgets of that era, coupled with America's isolationist outlook, kept production figures extremely low in view of the ominous clouds on the political horizon. Consequently, in May 1940 as the German Army was overrunning France and the Low Countries, the U.S. had only about 300 tanks in service—and of these only eighteen woefully inadequate M2A1 Mediums and ten M2A4 Lights were gun-armed (with a 37mm piece); all the rest were armed only with MG. The stunning German victory over France, and the ensuing Battle of Britain, shocked America out of its lassitude and spurred government and industry to gear up for the production of armaments in what would become fantastic quantities.

U.S. vehicles, with a few exceptions, were highly regarded for their reliability and ease of operation. For example, the Soviets felt that it was excellent for one of their tanks to run for fourteen hours without a mechanical failure, whereas a U.S. tank was expected to run for at least forty hours without a breakdown. Moreover, German and Japanese tank tracks had an average life of about six hundred miles, while U.S. tank tracks averaged about three thousand miles. Overall, American AFV designs were not ingenious, but usually were competent and adequate when brought into service. Unfortunately there was far too much resistance to the introduction of improved models (due to both a desire to keep production at full capacity and an unwillingness to change tactical doctrines), with the result that U.S. AFV found themselves outgunned and under-armed from 1944 on. Combined with tactics that were often less than inspired, this frequently allowed an outnumbered German force (which was sometimes more experienced but usually technically superior) to exact a heavy toll of attacking American AFV.

Thanks in part to factories that were safe from enemy bombs and invading armies, during WW2 the U.S. produced some 207,000 AFV (including 88,410 tanks and 53,813 halftracks) and 3,200,436 soft-skin military transport vehicles. Indeed, more U.S. tanks were Lend-Leased to the British Empire than either she or Germany produced individually. America truly was the Arsenal of Democracy.

The Army used an alphanumeric system of nomenclature for its vast array of materiel. This system showed not only the basic model of an item but also any modifications to it. "T" stood for an equipment type still in the developmental stage, while "M" signified a standardized type. "E" represented an experimental modification to the basic type, and "A" a standardized modification. "B" indicated a major change in production (e.g., a vehicle with another chassis substituted for the standard one). The number following each letter generally—but not always—gave its numerical sequence; e.g., "M1E3" would designate the first model of a particular type of equipment M1, which also incorporated the third in a series of experimental modifications. This M1 equipment type could be a helmet, a tank, a slide rule, etc.

[Note: ETO stands for European Theater of Operations, which in game terms comprises Europe and Sicily. PTO stands for Pacific Theater of Operations, which in game terms equals "vs Japanese".]

  1. **M2A4 Light Tank:** The Army's most modern light tank in 1940. 375 were built. It was a very reliable and well-armed light tank for its time, but was rapidly superseded by the improved M3 version. The M2A4 saw combat only on Guadalcanal with Company A of the 1st Marine Tank Battalion.

  2. **M3 Light Tank:** A large number of improvements were made to the M2A4 in early 1941, resulting in the M3 Light Tank. 5,811 were built. A small number were with the 1st Armored Division during the Torch landings and the subsequent fighting in Tunisia. In the PTO the 192nd and 194th Tank Battalions with a total of 108 M3

Lights (and no HE ammo) formed the core of the 1st Provisional Tank Group, which was employed in the defense of the Philippines (12/41-4/42); more than thirty of them were captured by the Japanese, whose 7th Tank Regiment used them against the returning Americans in 1944-45. M3 Light Tanks were also used on Guadalcanal (8-12/42) by Company B of the 1st Marine Tank Battalion. The M3 garnered the distinction of becoming the first U.S.-built AFV to see combat in WW2 when the British used it in Operation Crusader (11/41).

†Dates for use in other than the PTO are 11/42-5/43. PTO Dates are 41-42.

  3. **M3A1 Light Tank:** This was an improved version of the M3 Light Tank, incorporating a remodelled turret, deletion of the two fixed BMG, and standardization of the gyrostabilizer. 4,621 were built. The M3A1 first saw action on Guadalcanal (9-12/42) with Company C of the 1st Marine Tank Battalion, and remained in widespread use with the Marines until early 1944 when the M5A1 Light Tank began to replace it. In North Africa, both Light Tank Battalions (1st of the 1st Armored Regiment and 1st of the 13th Armored Regiment) in the U.S. 1st Armored Division were equipped primarily with the M3A1.

†Dates and RF for use in other than the PTO are 11/42-5/43 and 1.2. PTO Dates are 9/42-44. RF in the PTO is 1.2 from 9/42 through 6/44; thereafter increase RF in this theater by .1 for each two-month period after 6/44, until 1.5 is reached in 11/44.

  4. **M3A1 Satan:** The need to eliminate Japanese bunkers created a requirement for flamethrower tanks. The Marines met this by replacing the MA on some of their M3A1 Light Tanks with a Canadian-built Ronson FT. They were first used on Saipan by Company D of the 4th Marine Tank Battalion. Each such battalion was to have 24 Satans; however, while some sources state that each possessed an average of about 18, other sources claim that only 20 Satans were ever built. The Army also used a very small number of similar vehicles (based on the M5A1) on Luzon, 4-5/45.

  5. **M5A1 Light Tank:** The M5 did not replace the M3A1 but rather was produced concurrently with it, and actually entered production several months before the latter. (Since the M5 and M5A1 are equivalent in game terms there is no M5 counter.) Its front hull plates were sloped to enhance protection and its turret-front armor was increased. This new armor configuration was then also applied to the M3A1, resulting in the M3A3 which was used only for Lend-Lease purposes. While the designers were thusly creating the M3A3 they decided to also improve its gun mount and move the radio from the hull to the rear of the turret. This new turret was judged superior to that of the M5 and was consequently introduced on M5 production lines, thus creating the M5A1. Both M5 and M5A1 were used to replace combat losses in the light tank battalions of the 1st Armored Division in Tunisia. By the time of the invasion of Sicily in July 1943, all M3 and M3A1 Lights had been withdrawn from active service in the ETO, making the M5A1 the Army's standard light tank. In the PTO the U.S. did not use the M5A1 in action until Feb. 1944, with the 4th Marine Tank Battalion on Roi-Namur. 2,074 M5 and 6,810 M5A1 were built—and altogether 19,316 M3-M5A1 Light Tanks were produced. Five constituted a platoon in both Army and Marine use. The British referred to tanks of the M3-M5A1 series as "Stuarts".

†RF in North Africa (11/42-5/43) is 1.3; thereafter in ETO scenarios its RF is 1.1. PTO Dates are 2/44-45, while RF in this theater is 1.3 for 2-5/44, 1.2 for 6-7/44, and 1.1 thereafter.

  6. **M24 Light Tank:** The replacement for the M5A1 was the M24, also known as the "Chaffee" (for Gen. Adna Chaffee, the "Father of the U.S. Armored Force"). It used a modified M18 GMC chassis, while having a completely new turret that mounted a lightweight 75mm aircraft gun adapted from the B-25H Mitchell bomber. At least two (used by the 740th Tank Battalion) saw action during the Battle of the Bulge. By VE Day all Light Tank companies in the 7th Armored Division, and all Light Tank troops in mechanized cavalry squadrons in NW Europe, had been completely re-equipped with the M24. M24 production totalled 4,195 in the period 4/44-6/45. Chaffees also saw combat with U.S. forces in the postwar era, being the first tanks to reach South Korea. They went into action on July 10, 1950 near Chonui but it quickly became apparent

H

that the M24, while an excellent recon tank, was out of its league when confronting the T-34/85.

†Decrease RF by .1 for every month after 12/44, until 1.3 is reached in 3/45.

7. M3 Medium Tank: By mid 1940 the Army had come to the conclusion that its newest medium tank (the M2A1, which carried a 37mm gun and a multitude of MG, and which had not yet even entered mass production) was outclassed by the PzKpfw IV with its 75mm gun. What the Army now desired was a tank armed with a weapon at least equivalent to the German piece. The problem was that no turret capable of carrying such a powerful weapon had ever been built in the U.S., and the development of one would necessarily take time. Meanwhile, the British were in desperate need of new tanks to replace those lost in France. The Army therefore decided to modify the M2A1 and install both a turret-mounted version of the Army's 37mm AT gun, and a limited-traverse 75mm gun (which was an adaptation of an unsuccessful AA gun) on the starboard side of its front hull. The resulting M3 Medium was viewed only as a stopgap solution until a proper 75mm tank could become available—but with the added benefit that the automotive bugs corrected on the M3 would expedite the Sherman's development since both would use essentially the same chassis. Other versions of the basic M3 were also produced, but in much smaller quantities; since they vary little in game terms they are not included in counter form.

In all, 6,258 were built, but only about 1,400 were retained by the U.S.; the rest were Lend-Leased to various allies. In U.S. service the M3 first saw combat in mid-June 1942 during the latter stages of the Gazala battle when three with U.S. crews (who had been sent to help familiarize the British with their new tanks) attached themselves to the British 1st Royal Tank Regiment and for a few days fought the Germans between Knightsbridge and Acroma, southwest of Tobruk; during this time they claimed the destruction of nine enemy AFV. However, its first official U.S. use came with the Torch landings and later in Tunisia with the 2nd and 3rd Battalions of the 1st Armored Division's 13th Armored Regiment. These battalions were equipped solely with M3 types until Shermans from the 2nd Armored Division began arriving to replace combat losses. At the conclusion of the Tunisian campaign all M3 Mediums were relegated to training roles. In the PTO, their only U.S. use occurred in Nov. 1943 when the 193rd Tank Battalion aided in the seizure of Makin Atoll.

†B11 applies individually to both the 37LL MA and 75 SA. The 37LL MA is a T Gun, while the 75 SA is a NT Gun. Either the MA or SA can claim the possibility of multiple ROF, but only the one that fires first in a phase (treating Defensive First and Final Fire as one phase) can actually use it. Either the MA and SA both have Gyrostabilizer benefits or neither does; i.e., when using H1.42 one dr applies to both Guns.

†The AAMG was mounted in a turreted cupola. For game purposes it can be used as a normal AAMG or, while the crew is BU, like a remotely-controlled AAMG (i.e., while BU, it cannot be used vs an Aerial target but can be used in CC).

†Dates for North African use are 11/42-5/43. PTO Date is 11/43 only.

8. M4 Medium Tank: Popularly referred to as the Sherman, the M4 Medium series was designed to be used in the role of exploitation; i.e., to assist the infantry in breaking through the enemy's defenses and then to rapidly penetrate far behind his lines to disrupt his supplies and communications. It was well-suited to this role by being highly reliable and relatively maintenance-free, and by having a gun with excellent HE characteristics. However, since current Army doctrine held that enemy tanks were to be engaged by tank destroyers rather than tanks, it was deemed unnecessary to give the Sherman any special AT capability. The Sherman used the chassis of the M3 Medium with a new superstructure and turret for its MA, and by 1944 it had become the main battle tank of all the Western Allies. The chief deficiencies of the early Shermans were: the aforementioned mediocre AT capability; a high, bulky silhouette; the use, except in the M4A1, of a number of plates welded together (as opposed to a single rolled or cast piece) to form the sloping hull front (aka the glacis), which significantly compromised the glacis' ballistic protection; and a high susceptibility to fires due mainly to exposed ammo rounds which often ruptured when a projectile penetrated the tank. A total of 49,234 Shermans were built, of which 30,600 were equipped with the 75mm gun. Of these, 6,748 were the M4 type, (which was the original design model but actually entered production in July 1942, several months after the M4A1 and M4A2 versions). No M4 Mediums were built with the 76mm gun.

†PTO Dates are 1944-45.

9. M4A1 Medium Tank: This was the first Sherman model to enter production. It was also the only original model to have a cast upper hull; otherwise it was identical to the M4 except for carrying six fewer rounds of ammunition. 6,281 were built. The M4A1 was the only Sherman used by U.S. forces in North Africa. The game piece also represents 1,676 M4 Mediums built at the Detroit Tank Arsenal; these are often referred to as "composite hull" Shermans because their front hull was cast (like the M4A1) while their side and rear hulls were welded. In Army service throughout the war, a medium tank platoon consisted of five tanks.

†Dates for North Africa and the ETO are 12/42-5/45, with RF of 1.4 in 12/42, 1.3 in 1/43, 1.2 for 2-5/43, and .9 thereafter. PTO Dates are 12/43-45, with RF of .9.

10. M4A2 Medium Tank: This Sherman model used two GMC diesel engines. 8,052 [including the M4A2 (L) model] were ultimately built, making this type the most numerous of the 75mm Shermans—but as the Army preferred gasoline powered vehicles most were assigned to Lend-Lease and only 640 were retained in U.S. service. The only U.S. combat use of the M4A2 was with the USMC, since many of the Navy's small craft were also diesel-powered and both could use the same fuel. The M4A2's operational debut was with Company C of the 1st Marine Amphibious Corps Tank Battalion in the assault on Betio (Tarawa Atoll). A Marine medium tank platoon comprised four Shermans prior to April 1944, three from then until April 1945 (with two bow-mounted FT also authorized), and five Shermans thereafter (with three FT Shermans per company).

11. M4A2 (L) Medium Tank: The final-production M4A2s in 1944 incorporated the new front hull design that was coming into use on all the Shermans (other than the M4 and M4A1). This new design replaced the multi-piece welded glacis with a thicker one-piece unit. Shermans with this glacis are generally described as having the 47° front hull, which refers to the glacis plate's inclination from the vertical. About 1,600 of the M4A2 (L) were constructed. "(L)" in the piece name indicates "late model".

12. M4A3 Medium Tank: The M4A3 differed from other early Shermans by having a Ford V8 engine. Due to this engine's high output, compact design, and ease of maintenance, the M4A3 became the preferred model for Army service; however, the original model's production was insufficient to supply the Army's entire needs and it remained a minority type. 1,690 were built.

†PTO Dates are 1944-45.

13. M4A3(75)W Medium Tank: Beginning in Feb. 1944 all newly-built models of the 75mm-armed M4A3 incorporated both the 47° glacis and a new arrangement for ammunition stowage wherein all MA rounds were now stowed on or beneath the turret floor in racks that contained jackets filled with antifreeze and water. Thus if a shellcase were ruptured by a projectile or fragment the liquid would douse any exposed propellant, extinguishing or at least hampering any resultant fire. This was known as "Wet Stowage", and cured the Sherman of its tendency to rapidly "brew up" when penetrated. The M4A3(75)W remained in production until March 1945, long after all other 75mm versions had been discontinued. 3,071 were built.

†PTO Dates are 10/44-45.

14. M4A3E2 & M4A3E2 (L) Medium Tanks: To provide a heavily armored assault tank, 254 M4A3(75)W were produced between May and July 1944 with an extra 1½ inches of armor plate on the hull front and upper hull sides, a new lower front hull casting 5½ inches thick, and a new turret with 6-inch cast armor and a 7-inch thick gunshield. All originally carried the 75mm gun but in early 1945 permission was granted to field-mount the 76mm weapon instead. As this conversion could be easily accomplished, the Dates for the 76mm version have been extended back into 1944 to allow for possible "unauthorized" conversions. The M4A3E2 was nicknamed the "Jumbo" and was a very successful variant, often being used as the lead

☆ Vehicle 14

vehicle in a column when moving through unfriendly territory. Not surprisingly, it played a prominent role in the drive to relieve Bastogne. Apparently neither version was used in Italy.

†RF for the M4A3E2 (L) is 1.6 from 10/44 through 3/45, and 1.5 thereafter.

13. M4A1(76)W Medium Tank: Attempts had been made to upgun the Sherman with a high velocity 76mm gun as early as mid 1942 but the Army Ground Forces, which formulated Army tactical doctrines, would not allow its production. The AGF steadfastly believed that the current Sherman was an ideal balance of firepower, armor protection, and mobility, and did not want to disrupt production for a change it considered non-essential. Moreover, it held that tanks should be used for infantry support and exploitation, and that enemy tanks should be left to tank destroyers—which sounded fine in theory but which often proved impossible to comply with in battle. Eventually the 76mm-armed Sherman did go into production but the delayed decision, along with the reluctance of field commanders (including Patton) to introduce the new weapon on the very eve of the Normandy landings, resulted in none being included in the invasion forces. However, the first clashes with Panthers and Tigers revealed the relative impotence of the 75mm gun against these well-armored tanks. 76mm Shermans were therefore rushed across the Channel as quickly as possible with the initial intent of arming one-third of each Sherman unit with them, but by VE Day well over half the Shermans in U.S. units carried the more potent 76. Unfortunately even this gun proved to be only marginally effective against the frontal armor of a Panther or Tiger.

The M4A1(76)W was the initial production version of the 76mm Sherman. It consisted of a slightly-modified M4A1 hull and chassis with Wet Stowage and the turret of the T23 Medium Tank (a forerunner of the M26 Pershing). 3,426 were built.

†RF is 1.2 in 1944 and 1.1 in 1945.

15. M4A1(76)W Medium Tank: This used the hull and chassis of the M4A3(75)W as well as the new 76mm-armed turret. It was built in greater numbers than any other 76mm Sherman, with 4,542 being produced. Of these, more than half used the new HVSS (Horizontal Volute Spring Suspension) system to give the tank a better ride and lower ground pressure (though not low enough to qualify for low ground pressure in game terms). With HVSS this tank was designated the M4A3E8, from which arose its nickname "Easy Eight".

†RF is 1.1 through 10/44, 1.0 from 11/44 to 2/45, and .9 thereafter.

17. M4(105) & M4A3(105) Medium Tanks: The original design of the Sherman's 75mm gun turret allowed for the alternate installation of a 105mm howitzer. Production of the M4(105) amounted to 1641, with about half having the new HVSS system. M4A3(105) production totalled 3039, with all but about 500 having HVSS. The howitzer-armed Shermans had neither power traverse, gyrostabilizer, nor Wet Stowage (their ammo being kept in armored bins instead). Three of these tanks formed the basis of the assault gun platoon in the HQ company of an Army medium tank battalion, and one (two in 1945) was also present in the HQ platoon of each of that battalion's medium tank companies.

†ETO RF for the M4(105) is 1.4 in 1944 and 1.3 in 1945; that for the M4A3(105) is 1.3 in 1944 and 1.2 in 1945. PTO Dates and RF for both AFV are 10/44-45 and 1.3 respectively.

18. M4 Tankdozer: Aside from engineer field-built tankdozers, a special kit consisting of a dozer blade and associated components was developed for the Sherman. This kit was designated the M1, and 1,957 were produced by the end of the war. Tankdozers were usually operated by combat engineers and could also be found in Medium Tank Battalions (Special). Sixteen tankdozers using the M1 kit were assigned to the assault on Omaha Beach but only five landed still fit to be used as bulldozers. As of April 1944 each Marine medium tank company was authorized one M1 dozer kit. For tankdozer usage see "Bulldozers" in Index.

†Due to the extra protection afforded by the dozer blade, a special +2 To Hit DRM applies to the calculation of a front-hull hit vs a Tankdozer unless the firer is at least one full level higher than the target. This is signified by "+2 for HH" on the counter.

EX: If a Gun needs a Final DR of 10 to hit the front Target Facing of a Tankdozer, it will strike the hull only if the Final DR is ≤ 8 (and the colored die is $\geq$ the white die).

H

19. TIE3: This ungainly combination of Sherman and 27-ton roller mine exploder, nicknamed the "Aunt Jemima", was the Army's most widely used mine clearance vehicle. About 200 were built but it is doubtful that even half of them saw action. The "Mine Exploder, TIE3" consisted of a normal 75mm-gun Sherman with special drive sprockets that not only propelled the tank but also drove, via a system of roller chains and shafts, two groups of five pancake-shaped rollers that stood on edge ahead of the tank tracks. Each roller was eight feet in diameter, 2 3/4-in. thick, and weighed more than two tons, and their collective ground pressure would detonate any mines directly ahead of the tracks. Unfortunately, the mine rollers sank rapidly into soft ground and the vehicle had great difficulty in negotiating hills. To aid its movement the TIE3 had a curved plate attached to its hull rear, thus enabling it to be pushed by another tank when necessary. Two TIE3 were used to lead road columns of the 6th Armored Division in its attack south of Lessay on July 29, 1944; others were later used near Brest and in the Nancy-Metz area. Apparently none were used in Italy.

†**MOVEMENT:** The TIE3 may change its VCA only *one* hexside in a particular hex, and only immediately after entering that hex; i.e., when it expends MP to enter a new hex it may then expend another MP to change its VCA *one* hexside, but thereafter as long as it remains in that hex it cannot again change its VCA—nor can it change its VCA in a hex where-in it has just expended a Start MP. The TIE3 may not enter a building or woods, or rubble [EXC: via a TB], and may not ford a stream or river, conduct an OVR, or use VBM. Moreover, it may not move to a different elevation unless on a road. A TIE3 may cross a wall/hedge hexside; see "BOG:" below. A TIE3 may not cross a Bocage hexside, even via a Breach; nor may it create a Breach itself.

†**BOG:** A TIE3 crossing a wall/hedge hexside (not bocage) in either forward or reverse mode must make a Bog DR; if it bogs it remains in the hex it was attempting to *leave*. It must also make a Bog DR when it enters a Trench hex. A bogged TIE3 can attempt to free itself as per D8.3 only if another fully-tracked AFV of ≥ 25 tons is in the TIE3's Location to help push it. Both AFV must have coinciding VCA, and the pushing AFV is subject to all the rules given in D8.3 for an assisting AFV (i.e., one that grants a -1 DRM to the colored die of the Bog Removal DR); however this -1 DRM does *not* apply to the TIE3's unbogging attempt. Conversely, a TIE3 may not be used to grant such a -1 DRM to another vehicle's unbogging attempt.

†**CLEARANCE:** A TIE3 clears mines like a flail tank (B28.7-72), with the following exceptions. Each time a TIE3 enters a new hex, the player owning mines in that hex must announce their presence (but not type or strength). The TIE3's owner then makes his Mine Clearance DR, but there is a +2 DRM to that DR unless when entering that hex the TIE3 paid *twice* the normal MP cost and did not use the CE road movement cost. A Final Mine Clearance DR of 11 or ≥ 12 is treated as per B28.72 or B28.71 respectively. A TIE3 need not be, or remain, in Motion in order to attempt Mine Clearance, even in the last hex it enters during the MPh. If the TIE3 reveals the presence of mines while CE it must immediately become BU (even if not normally allowed to do so).

†**TO HIT:** Due to the obstruction caused by the mine rollers, all attacks [EXC: mines, CC, Indirect Fire, those to/from at least a full-level higher elevation, and those whose LOS to/from the TIE3 coincides with the center hexside of its VCA] vs/by a TIE3 within its VCA receive a +4 TH (or Effects for non-ordnance) DRM—as signified by "VCA: +4 DRM" on the counter.

20. Sherman Crab: The U.S. and Britain experimented with a wide variety of roller, plow, and explosive-device mine clearance AFV, but none were as successful as the British-designed Sherman Crab, which used chains attached to a revolving drum to beat the ground ahead of the tank. This flailing action detonated any mines and, as the tank inched forward at 1 1/4 mph, cleared a path whose width equalled the vehicle's. A small number were used by U.S. forces in Europe. See B28.7-72 for usage rules. The game piece also represents the experimental T3 Mine Exploder, twelve of which were used by the 6617th Mine Clearing Company during the breakout from Anzio (5/44) and the drive to Rome. The use of flail tanks in the PTO was restricted to a few field-improvised types.

†A flail tank can attempt to clear wire in a non-woods/non-building (only) Location by making a Mine Clearance DR. If that DR results in successful mine clearance (regardless of the presence of mines), that wire counter

H

is removed (along with any mines). All other possible results of that DR are still applicable. A flail tank that successfully clears wire by this method is not subject to a Bog DR due to that wire (B26.43); however, if the tank is unsuccessful and must undergo the Bog DR, B26.53 applies unchanged.

†If used in the PTO or pre-7/44 in Italy, a +1 DRM applies to the Mine Clearance DR, and the DR given in B28.7-72 for each possible result is assumed to be a *Final* DR.

†Dates for ETO use are 5-6/44 (for the T3 version in Italy) and 7/44-5/45 (for the Crab). PTO Dates are also 7/44-45.

21. POA-CWS-H1 Flame Tank: The demand in the PTO for a more heavily armored tank with a main armament flamethrower resulted in the Ronson FT being mounted in a Sherman. The breech end of the tank's gun was replaced by the FT apparatus so the FT could fire through the 75mm gun barrel, thus making the FT version virtually indistinguishable from the original tank. (This camouflage was desired because flame tanks always became prime targets when identified by the enemy.) Eight POA using the M4A3(75)W chassis were used on Iwo Jima: four each with the 4th and 5th Marine Tank Battalions, first going into action on Feb. 21, 1945. Fifty-four "composite-hull" M4 Mediums were also converted to POA flame tanks and were designated the 713th Tank Battalion (Armored Flamethrower). They were sent to Okinawa where they were parceled out amongst the other attacking divisions, going into action on April 19, 1945. 41 were knocked out (with 26 subsequently repaired and returned to duty) with no crew fatalities—an exceptional record for a flame tank.

†The TCA may not traverse into or through the tank's "rear" VCA (as defined in U.S. Vehicle Note J). This is signified on the counter by "TCA:NA BVCA".

†Use an M4A1 or M4A2 (L) Medium Tank counter to represent the POA-CWS-H1 until the FT fires, or the M4A1's smoke mortar fires with a DR of 6-8, or the tank is destroyed (for CS purposes).

†Used only on Iwo Jima and Okinawa. RF is 1.4 from 4/45 on.

22. M26 Heavy Tank: The Pershing originated with the T20 Medium Tank, which was to be the eventual replacement for the Sherman with approximately the same firepower and armor protection as the Tiger I. Ultimately a prototype designated the T26E3 Medium Tank appeared in the spring of 1944 equipped with a 90mm gun derived from the AA piece. As a minor exercise in psychology it was then redesignated a Heavy Tank. The first shipment of twenty arrived in Europe as part of the Zebra Mission (which was to oversee the combat trials of a variety of new weapon types). The 3rd and 9th Armored Divisions each received ten T26E3, and these new tanks went into combat on Feb. 25 and Feb. 28 respectively. In March 1945 the T26E3 was standardized as the M26 Heavy Tank. Other units to use the M26 (from 4/45 on) were the 2nd, 5th, and 11th Armored Divisions. The most famous action involving Pershings was the capture on March 7, 1945, of the Ludendorff railway bridge across the Rhine at Remagen, in which four Pershings of Company A, 14th Tank Battalion, 9th Armored Division, played a leading role. Ironically, the Pershings never crossed the badly-damaged bridge as they were considered too heavy for it; instead they were ferried across the Rhine five days later. By VE Day over 700 Pershings had been built, of which 310 were in Europe (none were sent to Italy). The M26 Heavy Tank was also used in Korea (by which time it had once again been designated a Medium Tank), but the lighter and more agile M4A3(76)W was preferred in that rugged countryside.

†RF is 1.5 after 3/45.

23. M10 GMC: Designed to give the Army's Tank Destroyer Command a turreted and fully-tracked AFV to replace the M3 GMC Halftrack, the M10 Gun Motor Carriage used the basic chassis and drive train of the M4A2 Medium Tank; the hull, however, was completely redesigned using thinner but well-sloped armor to decrease weight and thus enhance mobility, and its pentagonal turret was open-topped to increase visibility. Its main armament was a modified 3-in. AA gun which was massive and heavy; consequently two 1800-lb. counterweights had to be attached to the rear of the M10's turret to balance it. Other features unusual for a U.S. "tank" were its lack of power traverse and the use of twin diesel engines. 4,993 were built. The M10 GMC equipped the 899th and 776th TD Battalions (Heavy SP) in Tunisia, with four per platoon; after that campaign it became the standard AFV of all Tank Destroyer

Battalions (SP) in the ETO until the latter half of 1944 when the M18 and M36 GMC began to replace it. In the PTO only three M10-equipped TD Battalions (or elements thereof) saw action: the 632nd, 640th, and 819th. A few were also used on Kwajalein by the 767th Tank Battalion. From late 1943 through 1945 a U.S. TD platoon (SP) consisted of four TD, two M20 (or M3A1) Scout Cars, and one Jeep.

†ETO RF is as follows: 1.5 for 3-8/43; 1.3 for 9/43-5/44; 1.1 for 6-8/44; 1.2 for 9-12/44; and 1.3 in 1945. PTO RF is 1.3, with Dates of 10/43-45.

24. M18 GMC: The M18 (nicknamed the "Hellcat") was a completely new TD design, and was intended to be as light and fast as possible. Thus it had only half-inch armor front, sides, and rear (with a 1-in. thick gunshield), and instead of using the heavy gun of the M10 it used the lighter 76mm weapon of the Sherman. The M18's low weight gave it a high degree of mobility which, it was believed, would compensate for its thin armor. Indeed, it proved to be the fastest tracked vehicle of WW2, and was well-liked by its crews since its mobility allowed rapid changes of position during an engagement. Overall the M18 came closest to the Tank Destroyer Board's original concept of the true TD. 2,507 were built. The M18 was the intended replacement for the M10 GMC and could have been in combat by the end of 1943, but its deployment was withheld because commanders in the ETO preferred to wait for the more-heavily-armed M36 GMC which was itself nearing the production phase in late 1943. No M18-equipped TD battalions served in Italy, but some M18 were used there in 1945 by the 752nd Tank Battalion. In the PTO only one M18 TD battalion saw combat; this was the 637th, which fought on Luzon.

†Decrease ETO RF by .1 for each two-month period after 8/44, until 1.2 is reached in 3/45 [EXC: Dates and RF for use in Italy are 1945 and 1.5 respectively]. PTO Dates and RF are 1-6/45 and 1.4.

25. M36 GMC: The M36 Gun Motor Carriage was basically an M10A1 GMC (an M4A3 Medium with an M10 GMC turret; none saw combat) with a new turret and a 90mm gun derived from the M1 towed AA weapon. 1,413 were built. Because of its potent gun the M36 was the most successful of the three main U.S. TD. Like the others however, it was all too often expected to double as a tank—a task for which it was not well suited due to its thinner armor, weak MG FP, and open top. The realization that TD were not as adaptable as tanks to the various demands of the battlefield resulted in the demise of the TD Command in 1946. The M36 GMC was sometimes referred to as the "Jackson" or the "Slugger". Apparently none were used in Italy.

†RF is 1.6 in 8/44, 1.5 in 9/44, 1.3 for 10-11/44, and 1.1 thereafter.

26. M36B1 GMC: The continuing demand for 90mm Gun Motor Carriages resulted in a composite vehicle which consisted of an M36 GMC turret on an M4A3(75)W Medium Tank. This TD was taller and heavier than the M36 but retained the BMG and thicker hull armor of the Sherman. A total of 187 were built in late 1944. Apparently none were used in Italy.

27. M2 Halftrack: The M2 Halftrack was intended to be used as a recon vehicle (it replaced the M3A1 Scout Car in certain mechanized cavalry roles during 1943), mortar or MG carrier, and artillery prime mover. It could seat ten including the driver, and its armament officially consisted of two MG: one .50-cal and one air-cooled .30-cal, with both mounted on a skate rail that ringed the passenger compartment to allow them a form of 360° traverse. (Other MG combinations existed as field modifications but have been excluded for simplicity.) M2 production totalled 11,415 vehicles. 1,643 M2A1 halftracks were also built during 1943-44; these replaced the skate rail with a pulpit mount (as in the M3A1 halftrack) but are not included in the game. Since the M3 halftrack was larger and proved to be more versatile, the M2 types became less common towards the war's end.

†Dates for non-PTO use are 11/42-5/45, with RF of 1.1 for 11/42-43 and 1.2 thereafter. PTO RF is 1.3 for 41-45.

28. M3 Halftrack: The primary function of this halftrack was to carry the infantry of the armored divisions. It was slightly longer than the M2 and could seat thirteen including the driver. Its single .30-cal air-cooled MG was pedestal-mounted in the center-forward section

☆ Vehicle 28

of the passenger compartment. 12,499 were built. Compared to their German counterparts, U.S. halftracks had superior overall mobility by virtue of their higher top speed, driven front axles, and front bumper-mounted roller (to help prevent digging into the side of a ditch or steep incline) or winch. On the other hand, U.S. halftracks had no floor armor (thus making their occupants vulnerable to mines), higher ground pressure, and tracks that tended to wear out quickly. In game terms a 1942-43 armored infantry platoon consisted of three M3, one M2, and one M3(MMG) halftrack; three M3 with one passenger squad each (and one 60mm MTR in one of the halftracks), one M2 towing a 37mm AT Gun and carrying its crew, and one M3(MMG) for MG support.

†MA is a MMG for To Kill and Removal purposes—as signified by “MA: MMG” on the counter.

†Dates and RF for non-PTO use are 11/42-5/45 and 1.0. PTO RF is 1.3 for 41-45.

29. M3A1 Halftrack: This differed from the M3 Halftrack by having a .50-cal MG on a ring mount (also commonly known as a “pulpit”) to the right of the driver, and an air-cooled .30-cal MG on one of three pintle mounts that were located on the side and rear walls of the passenger compartment. 2,862 M3A1 were built. Many M3 halftracks were also converted to M3A1 by the addition of a pulpit kit. Versions with additional MG were quite common but are not included in the game. In game terms a 1944-45 armored infantry platoon consisted of one M3A1 halftrack carrying the platoon leader and a squad, two M3 halftracks with a passenger squad apiece, one M3 with a passenger HS and a 60mm MTR, and one M3(MMG) halftrack. Such a platoon possessed tremendous fire-power for an “infantry” unit (even with just its official weapons allotment), but it should be noted that the squads usually dismounted before attacking because their halftracks were vulnerable to the lightest of AT weapons and even close-range MG fire. In fact, halftracks were sometimes referred to as “Purple Heart Boxes”.

†Non-PTO RF is 1.2. PTO RF is 1.4.

30. M3(MMG) & M3(HMG) Halftracks: The M3(MMG) Halftrack represents the vehicle used to provide MG support for the armored infantry platoon, with one M3(MMG) per such platoon. The squad carried in this vehicle was historically referred to as a LMG squad since the Army called its air-cooled .30-cal a LMG, but in order to avoid confusion this weapon is termed a MMG in the game.

The M3(HMG) represents the vehicle used in the armored infantry battalion's MG platoon, which consisted of three such vehicles. While the armament of these vehicles could vary considerably, for game purposes the M3(MMG) is assumed to carry one .50-cal MG along with two air-cooled .30-cal MG while the M3(HMG) is assumed to carry one .50-cal MG and two water-cooled .30-cal MG. Neither of these halftracks were used in these roles in the PTO, since no armored infantry was employed there.

†This halftrack starts each scenario with an Inherent crew, and also with a 6-6-6 (or as otherwise specified by SSR) squad, or that squad's two HS (owner's option of squad or HS), as a Passenger that applies to the vehicle's PP capacity (D6.1).

†The AAMG FP actually consists of three MG: one .50-cal HMG (MA; 4 FP), and two secondary .30-cal MG [each a 4 FP MMG in the M3(MMG), or each a 6 FP HMG in the M3(HMG)]. This is signified on the counter by “4MA&[red]4&[red]4” for the M3(MMG), and by “4MA&[red]6&[red]6” for the M3(HMG). The MA .50-cal AAMG may fire normally in any direction. However, neither of the two secondary .30-cal AAMG may fire at a target that lies within the halftrack's VCA. One secondary AAMG may fire at a target that lies either to one “side” of the halftrack or within its “rear” VCA, while the other secondary AAMG may fire in like manner to either the halftrack's “other side” or within its “rear” VCA. See the accompanying diagram and U.S. Vehicle Note E.

31. M4 MC Halftrack: The M4 Mortar Carrier was based on the M2 Halftrack and arose from the desire to increase the mobility of the medium mortar and its crew in mechanized units. Unfortunately, since it was assumed that the mortar would always be dismounted before being fired, the mounting faced to the rear and had an extremely limited traverse. 572 were built. A platoon of three was included in the HQ company of an Army tank battalion and armored infantry battalion. It was apparently not used in the PTO.

†The mortar suffers an extra +1 TH DRM to all fire at a moving/ Motion target. This is signified by a white dot on the counter beside the MA designation. See U.S. Vehicle Notes J and M.

32. M4A1 MC Halftrack: This was a redesign of the M4 Mortar Carrier. In it the mortar still faced to the rear, but was provided with increased traverse and a reinforced mount to absorb the shock of recoil when firing. For this reason the M4A1 MC is treated as a normal NT AFV [EXC: see U.S. Vehicle Note J]. Some 600 were built.

†RF is 1.5 prior to 1944. PTO Dates are 44-45.

33. M21 MC Halftrack: While the “rear-fire only” characteristic of the halftrack mortar carriers enabled them to make a rapid withdrawal from an untenable position, it also meant that they took longer to get into firing position—which made them unpopular with their crews when going into action under fire. Consequently the M21 Mortar Carrier, based on the M3 Halftrack, was designed with a forward-facing mortar. 110 were built, of which 54 were ultimately used by the Free French. In addition, some units (e.g., the 2nd Armored Division) modified their old M4 and M4A1 MC so that they fired forward. Apparently none were used in the PTO.

34. M3 GMC Halftrack: This vehicle resulted from an urgent requirement to have some form of tank destroyer available until the M10 GMC could enter service. The M3 Gun Motor Carriage Halftrack used an M3 Halftrack modified to carry an M1897A4 field gun. Production began in late 1941, and in December of that year 50 arrived in the Philippines where they were used as SP artillery until the fall of Bataan. Altogether 2,202 were built, but 1,360 were later converted to M3A1 Halftracks. In the PTO the M3 GMC was used successfully by the USMC (who often referred to it as the “SPM” [Self-Propelled Mount]) until the war's end, with each infantry regiment in a Marine division having a platoon of two (four after April 1944) in its weapons company, and until that same date the divisional Special Weapons battalion also had three such platoons. The M3 GMC was the only type of halftrack employed in Marine divisions. In Tunisia the M3 GMC was used in the 601st, 701st, 805th, 813th, and 894th TD Battalions (Heavy SP), with four per platoon. They met with mixed success in that campaign; their thin armor caused many to be knocked out, but when properly used in ambushes from HD

☆ Vehicle 42

H

positions they were effective vs Axis armor. M3 GMC were also used in Sicily by the 601st TD Battalion.

†Optional AAMG is available only for USMC use, is a .50-cal HMG, and has a 1.0 RF.

†Dates for non-PTO use are 11/42-8/43, with RF of 1.2 through 5/43 and 1.4 thereafter. Dates and RF for Army PTO use are 12/41-4/42 and 1.4; for Marine PTO use they are 8/42-6/45 and 1.3.

35. T30 HMC Halftrack: The T30 Howitzer Motor Carriage was an expediency, designed to provide a self-propelled close-support AFV. It was usually referred to as an assault gun, and consisted of an M3 Halftrack carrying a 75mm pack howitzer. 500 were built. A platoon of three was allotted to the HQ company of each Army tank battalion and armored infantry battalion, and a platoon was also included in the armored regiment's recon company. In addition, the infantry regiments initially used in the Mediterranean area included two such platoons in their cannon company. The T30 HMC fought only in North Africa, Sicily, and Italy.

†RF is 1.1 through 8/43; thereafter increase it by .1 for each month until 1.5 is reached in 12/43.

36. T19 HMC Halftrack: This was simply a 105mm howitzer mounted on an M3 Halftrack. 324 were hastily built in early 1942. Only eight rounds of ammo were carried aboard the vehicle; hence it towed an ammo trailer. The T19 equipped the armored field artillery battalions of the 1st and 2nd Armored Divisions (with six per battery), and two were included in the cannon company of infantry regiments initially used in the Mediterranean area. Those in armored field artillery battalions were gradually replaced by the new and far-superior M7 HMC during the Tunisian campaign, while those in regimental cannon companies were eventually superseded by the M3 105mm howitzer.

†This halftrack is assumed to be towing an armored (0/0 AF) ammo trailer which, by its owner's announcement, can be unhooked at the start of its MPH if it is not in Motion and its crew is CE. Unhooking is accomplished by simply flipping the counter over to the side showing no trailer. Its MP allotment is thus increased to 19 (although the act of unhooking the trailer costs the vehicle one-fourth of this new MP allotment), while its WGT becomes 9 and its B# becomes ⑨. The trailer is always assumed to be hooked up at the start of a scenario, and an unhooked trailer cannot be hooked up again. A hooked-up trailer is otherwise treated as per C10.4-.41. If the halftrack is destroyed, replace it with the wreck counter of another halftrack that has the same MG armament.

†RF is 1.2 through 6/43; thereafter increase it by .1 for each two-month period until 1.5 is reached in 11/43.

37. M15A1 MGMC Halftrack: This vehicle consisted of an M3 Halftrack altered to carry a 37mm AA gun and two coaxial .50-cal MG, with armor plates around the front and sides of the gun to provide crew protection. The first 80 were designated T28E1 and sent to Tunisia where they were highly successful in the AA role. Their crews found that they could lure an enemy aircraft to its destruction by opening fire at long range with just the .50-cals; the enemy pilot would note the trajectory of the tracers and assume he could fly closer at no risk—but if he did the 37mm gun would then open fire with an increased chance of a hit. The T28E1 was standardized in 1943 as the M15 Multiple Gun Motor Carriage, and at this time the armor plates around the gun mount were added. The main production model was the M15A1, which differed from the M15 only in how the MA and CMG were mounted. Production of all versions amounted to 2,332 vehicles. Those used in Tunisia were assigned to TD battalions (Heavy SP), with six vehicles per battery. Later in 1943 they were removed from TD battalions and placed in various types of AAA [Anti-Aircraft Artillery] Automatic Weapons battalions, which were usually either attached to divisions or directly controlled at Army level. At the same time the size of an AA halftrack battery was reduced to four such vehicles.

†The turret's rear Target Facing is unarmored. However, in North African scenarios the vehicle's entire side and rear Target Facings (both hull and turret) are treated as unarmored.

†Normal range of the CMG is 16 hexes—as signified on the counter by "Nml Rng: 16".

†PTO Dates and RF are 1945 and 1.5.

38. M16 MGMC Halftrack: This was an M3 Halftrack carrying four .50-cal MG mounted coaxially on an electrically-powered Maxson turret. With a maximum rate of fire of 2,200 rounds per minute and a traverse rate of 60° per second it proved to be very deadly against low-flying aircraft, and was also a devastating weapon when used for ground support; hence its nickname of "meat chopper". The M16 MGMC was used in AAA Automatic Weapons battalions in the same manner as the M15A1 MGMC, with the AA halftracks in these battalions ideally having a 50/50 mix of the two types.

†Due to the height of the gun mount, the crew's CE DRM is only +1 when being fired on through the turret's side/rear Target Facing—as signified by "CE: +1SRT" on the counter.

†Make four To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used.

†Maximum range for To Hit purposes (A9.61) is 16 hexes—as signified by "[16]TH" on the counter.

†ETO Dates and RF are 44-5/45 and 1.3 [EXC: 1.4 RF in Italy]. PTO Dates and RF are 1945 and 1.5.

39. M3A1 Scout Car: This vehicle was used primarily for scouting, screening, and security. Most were found in the mechanized cavalry recon troops of infantry, and armored divisions—usually in platoons of three or four vehicles each. Others were used in TD battalions and the scout company of Marine light tank battalions—in both cases, in sections of two vehicles each. Almost 21,000 M3A1 Scout Cars were built, and were one of the first U.S. vehicles to be Lend-Leased (in which role they were still being used in 1945). Some were still being used by the U.S. 1st Army in Europe as late as 10/44—probably as commanders' vehicles.

†Each M3A1 Scout Car starts the scenario with an inherent crew, and also with either a 3-3-6 (or as otherwise specified by SSR) HS or a 2-2-7 crew (owner's choice of HS or crew) as a Passenger that applies to the vehicle's PP capacity (D6.1). This vehicle can retain any unpossessed SW aboard it (D6.4), and its crew may Remove its MG armament (D6.631).

†RF is 1.2 through 8/43; 1.3 for 9-12/43; and 1.5 thereafter.

40. M20 Scout Car: Known officially as the Armored Utility Car M20, this vehicle was derived from the M8 Armored Car by replacing the turret with a ring-mounted .50-cal MG and rearranging the interior to create a cargo/passenger compartment. The requirement for such a vehicle came from the Tank Destroyer Force who wished to replace their obsolete M3A1 Scout Cars; thus most M20 were used in TD battalions for command, scouting, and cargo-carrying purposes. 3,791 were built. In 1944-45 each TD platoon (SP), in addition to four Gun Motor Carriages and a Jeep, also contained two M20 Scout Cars that conducted local reconnaissance for the platoon and afforded it extra protection against close assaults by enemy infantry.

†PTO Dates are 5/44-45.

41. T8 Reconnaissance Vehicle: As the M24 Light Tank entered service with combat units, a number of redundant M5A1 Light Tanks had their turrets removed and replaced by a .50-cal MG on a ring-mount. The modified vehicles were then used as fully-tracked "scout cars" in various recon units operating in NW Europe.

†The Scout Car designation is given only in deference to the T8's historical use. For all game purposes it is treated as fully-tracked.

42. M8 Armored Car: Although originally designed as a light TD, the M8 Light Armored Car replaced both the M3A1 Scout Car and M2 Half-track as the primary AFV in mechanized cavalry units. The M8's light weight and 6x6 drive gave it excellent speed and cross-country mobility, making it well-liked by its crews despite being rather thin-skinned and undergunned when confronting serious opposition. 8,523 were built. From late 1943, each mechanized cavalry recon platoon was authorized one section of three M8, while each TD battalion was authorized 2-6 M8; see U.S. Vehicle Note 54 for more details.

†Decrease ETO RF by .1 for each two-month period after 10/43, until 1.2 is reached in 3/44. PTO Dates and RF are 5/44-45 and 1.4.

☆ Vehicle 43

43. M8 HMC: This AFV (sometimes called the "Scott") was often referred to as an assault gun and was used for both direct and indirect close support. It consisted of a modified M5 Light Tank with a new turret that mounted a modified pack howitzer. 1,778 were built. Each divisional mechanized cavalry recon squadron had a troop of eight M8 HMC in four platoons of two each (three platoons if a nondivisional squadron), and the HQ company of armored infantry battalions and Army light and medium tank battalions had an assault gun platoon of three, replacing their old T30 HMC Halftracks. Those M8 in medium tank battalions were replaced by 105mm Shermans as the latter became available.

†PTO Dates and RF are 1944-45 and 1.4.

44. M7 HMC: The requirement for a self-propelled howitzer with mobility equal to that of the tanks it would support was met by modifying the M3 Medium Tank to carry a 105mm howitzer in an open-top non-turreted fighting compartment. It was standardized as the M7 Howitzer Motor Carriage, and 3,490 were built. Another 826 were built based on the M4A3 Medium Tank and designated the M7B1 HMC; for simplicity this version is not included in the game. The M7 HMC first saw combat with U.S. forces in Tunisia, where as the opportunity arose it replaced the T19 HMC Halftrack in the armored field artillery battalions of the 1st Armored Division. Thereafter it became the standard equipment of all armored field artillery battalions, with six per battery. Some sources state that the HQ company of an armored infantry battalion contained an assault gun platoon of three M7 HMC (instead of M8 HMC), but this is not reflected in the 9/43 Table of Organization for that battalion. In the PTO, six M7 HMC formed the cannon company of at least some Army infantry regiments that fought in the Philippines and on Okinawa, while the regimental weapons company of a Marine division was authorized a platoon of four M7 in May 1945. The British called the M7 the "Priest" because of the pulpit-like appearance of its .50-cal AAMG mount.

†RF for use in other than the PTO is 1.5 for 11/42-5/43, and 1.3 thereafter. PTO Dates and RF are 10/44-45 and 1.2.

45. M12 GMC: This was an M1917 or M1918-type 155mm gun on a much-modified M3 Medium Tank chassis, with a retractable spade at the rear to help absorb the gun's recoil. 100 were built and remained in the U.S. until 1944 when 74 were sent to Normandy between June and August with the nondivisional 174th, 258th, 557th, 558th, 987th, and 991st Field Artillery Battalions (SP). They proved particularly valuable after the Normandy breakout by often being the only heavy artillery that could keep pace with the rapid advance across France while still being able to provide support at short notice. The M12 GMC was sometimes referred to as the "King Kong", and was used in batteries of four.

†Due to the M12's configuration most of the crew actually stood outside of and behind it while serving the gun. Therefore, one side of the counter shows the AFV "limbered" while the other side shows it "unlimbered". To change modes the counter is flipped over during any friendly PFPh/DFPh, provided its inherent crew is not stunned, shocked, pinned, or broken, and neither the crew nor the MA has fired; both the crew and AFV then become TI. The MA may not fire while "limbered". While the M12 is "unlimbered" it may not expend MP, it is treated as an RFNM Gun (C10.25) for To Hit purposes, and its crew is always CE as per D6.84 (but with only a +1 CE DRM [0 DRM if attacked through its unarmored Target Facing; D5.311])—as signified by "CE: +1" on the counter.

46. LVT(A)1: After the near-disaster at Tarawa, it was decided that in future assault landings the initial wave would need an armored type of LVT, plus amphibious tanks for close support. This resulted in the LVT(A)2 (see U.S. Vehicle Note 50), and also the LVT(A)1 which consisted of an LVT(A)2 with its cargo compartment roofed-over to carry a turret derived from that on the M5A1 Light Tank. In addition, on both sides of the turret and aft of it was a scarf-mounted .30-cal MG operated by a gunner who stood through a hole in the roof. 509 were built, and their first combat use was in the Kwajalein Atoll landings with the Army's 708th Amphibian Tank Battalion and the Marines' 1st Armored Amphibian Battalion. An LVT(A)1 or (A)4 platoon consisted of five vehicles (of one or both types), although in action there were usually six since one of the three company HQ LVT(A)1/(A)4s accompanied the platoon. "LVT" stands for "Landing Vehicle, Tracked", while "(A)" indicates that it was constructed using armor plate (rather than soft steel).

H

†The AAMG FP actually consists of two 4 FP MMG, neither of which may fire within the LVT's VCA [EXC: during CC]. These are signified by "4&4;NA VCA" on the counter. One AAMG may fire at a target that lies either to one "side" of the LVT or within its "rear" VCA, while the other AAMG may fire in like manner to either its "other side" or within its "rear" VCA. See the accompanying diagram and U.S. Vehicle Note H.

47. LVT(A)4: The inability of the LVT(A)1 to deal with heavily fortified positions led to the development of another amphibious tank based on the LVT(A)2 but having greater HE firepower. The LVT(A)4 differed from the (A)1 by carrying the turret of the M8 HMC and not having scarf-mounted MG positions. Unfortunately, its OT turret and weaker MG FP made it more vulnerable to Japanese close assault tactics, so extra MG began to appear on it almost immediately after its introduction. 1,890 LVT(A)4 were built, and their first combat use was at Saipan. Despite its "Tank" designation, the LVT(A)4 was intended to be used as an assault gun and SP artillery piece, and had been armed with a howitzer specifically for such a dual direct/indirect fire role.

†RF is 1.4 prior to 1945.

48. M4 DD Medium Tank: The basic principles of the DD system are given in footnote D13. To go into more detail, the waterproof canvas screen was attached to steel decking that had been welded on around the tank's hull at the fender line, and was erected by using compressed air to inflate rubber air tubes attached to the decking and the frame of the screen. After the screen had been raised, hinged struts were locked into place to keep it rigid. Erecting and securing the screen took about fifteen minutes, and care had to be taken when moving the tank so as to not tear the screen by hitting a tree limb, etc. Steering was effected by the tank commander who stood on a platform attached to the rear of the turret and controlled a tiller that angled the propellers. Once ashore, the screen was dropped by the driver's actuating hydraulic plungers which unlocked the struts and opened the air valves. One slight drawback to the DD system was that the screen's frame blocked the line of fire from the BMG until the screen was removed. While afloat the DD tank itself was not visible from the ground due to the screen, and drew relatively little fire from the enemy who thought it just a small boat.

During the Normandy landings DD Shermans were used by three U.S. tank battalions: the 70th (30 launched, of which one sank) on Utah Beach, and the 741st (29 launched, of which 27 sank; 3 ship-landed on the beach) and 743rd (32 ship-landed) on Omaha Beach. The intention was to have them land several minutes before the infantry so as to provide covering fire but, due to rough seas and the general confusion of the day, those

☆ Vehicle 51

H

that made it ashore arrived late. DD Shermans were also used in the Anvil landings in southern France (8/44) and in several river-crossing operations in NW Europe (including the assault across the Rhine in March 1945).

49. LVT2: The LVT (Landing Vehicle, Tracked) derived from an amphibious rescue vehicle called the Alligator, whose tracks were specially configured to propel it in water as well as on land.

Designated the LVT1, it was unarmored since it was to be primarily used for the ship-to-shore movement of supplies. (For this reason it is not included in the game.) The great advantage of the LVT was that, in the PTO where many islands are surrounded by coral reefs that block the passage of boats, it could simply drive across the reef and continue shoreward. It also excelled in crossing soft or muddy ground. On the other hand, the LVT—and especially its delicate tracks—proved to be somewhat unreliable; in fact it was generally accepted that each hour of operation necessitated two hours of maintenance. The LVT1 and LVT2 also had another drawback in that only light cargo items could be carried since they had to be lifted over the vehicle's side to be unloaded. However, in spite of these deficiencies the LVT was one of the most important tactical innovations of WW2 and proved indispensable in PTO amphibious landings. Total production of the unarmored LVT2 was 2,963 vehicles, and it first saw combat during the Betio landings in the Tarawa Atoll. Beginning in July 1942, each Marine division was authorized an amphibian tractor battalion—within which a platoon comprised nine LVT (increased to ten in April 1943).

†RF in the PTO is 1.1 through 3/44, 1.2 for 4-5/44, 1.3 for 6-9/44, 1.4 for 10-12/44, and 1.5 for 1-6/45. ETO Dates and RF are 1-5/45 and 1.5.

50. LVT(A)2: The armored version of the LVT was requested by the Army and was designated LVT(A)2. 450 were built; in addition, many unarmored LVT2 were modified into LVT(A)2 by the use of bolt-on armor kits. Unfortunately, the extra weight ensuing from the use of armor decreased the LVT(A)2's payload capacity. The LVT(A)2 first entered combat in the Kwajalein Atoll landings with the Army's Provisional Amphibian Tractor Battalion.

†RF in the PTO is 1.1 for 2-3/44, 1.0 for 4-12/44, 1.2 for 1-3/45, and 1.3 for 4-6/45. Dates and RF for use in the ETO are 1-5/45 and 1.5.

51. LVT4: To increase the carrying capacity of the LVT2, two new models were designed in 1943. The first to be used in combat was the LVT4, which had the engine moved forward from the stern to behind the driver's cab so that a manually operated ramp could be incorporated at the stern. This ramp allowed quick on- and off-loading, and even enabled the LVT4 to carry a small vehicle. (The LVT3, also known as the Bushmaster, was not used operationally until the landings on Okinawa in April 1945 and is equivalent to the LVT4 in most game terms, so has not been included in the game.) As originally built, the LVT4 was armored only on the cab and ramp but most were modified by the use of bolt-on armor kits and so are treated as AFV in the game. 8,348 LVT4 were built, making them the most numerous LVT type during WW2. They first saw action during the Saipan landings. The LVT2 and (A)2 were nicknamed "Water Buffalo", while all LVT were referred to generically as "amtracs" (amphibious tractors) or "alligators". More than 18,600 LVT of all types were produced during WW2.

†The AAMG FP actually consists of three AAMG: one .50-cal HMG (MA; 6 FP), and two secondary .30-cal MMG (4 FP each). This is signified by "MA:12.7" and "6MA&4&4" on the counter. The MA AAMG may fire only at a target that lies within the VCA, but the secondary AA-MMG may not fire thusly within the VCA [EXC to both: during CC]. One secondary AA-MMG may fire at a target that lies between one border of the VCA and the hexspine-defined centerline of the "rear" VCA, while the other secondary AA-MMG may fire in like fashion but only on the "other side" of the LVT. See the accompanying diagram and U.S. Vehicle Note H.

†PTO RF is 1.4 for 6-9/44, 1.2 for 10-12/44, and 1.0 for 1-6/45. ETO Dates and RF are 1-5/45 and 1.5.

†PASSENGERS: The ramp on the LVT4 enabled it to carry a vehicle/Gun as well as Personnel, making special rules necessary for their transport. Such a Passenger-Gun/vehicle (including the latter's PRC) may not attack in any way. An LVT4 must be CE to (un)load any type of Passenger(s). In addition, if an LVT4 has (un)loaded any Passenger(s) during the current MP, its rear Target Facing is treated as *unarmored* vs all Defensive First Fire attacks that can affect it through that Target Facing.

PP CAPACITY: The LVT4 may transport any combination of the following items, with the total indicated PP applying to the LVT's PP Capacity (D6.1).

Item	PP Cost
• Vehicle of ≤ 2 tons	15
• Vehicle of > 2 but ≤ 4 tons	30
• Non-MTR Gun with M# of ≥ 10	10
• Gun with M# of 6-9	20
• MTR of 76-107mm	0
• Ammunition	4 or 8 ^{1,3}
• Inherent vehicle crew	0
• All other Personnel/SW	normal ^{2,3}

¹: As per C10.13 (i.e., 4 PP for a Gun of ≤ 99mm, or 8 PP for one ≥ 100mm). This applicable PP cost is also used for a dm 76-82mm MTR, as well as for a 107mm mortar.

²: As per their normal Passenger/Rider PP cost.

³: EXC: the PP cost of units/SW/ammunition are reduced to zero if they are *Passengers* of a vehicle that is itself a *Passenger*.

VEHICLE: Unloading a Passenger vehicle consists of driving it off the LVT4 into the LVT's Location at a cost of one MP for starting, plus one-fourth of the Passenger vehicle's MP allotment, plus COT. There is no MP cost for entering the LVT's Location (D2.14), but Overstacking will apply. Loading is the reverse of this procedure; i.e., the vehicle first enters the LVT's Location if necessary (paying one extra MP; D2.14), and then expends one-fourth of its MP allotment plus one MP for COT to load onto it, plus one MP to stop. Otherwise, the normal principles of D6.4-.5 for (un)loading Passengers apply, including the "simultaneous expenditure" of each 25%-segment of movement allotment by both the Passenger vehicle and the LVT4 during the turn of (un)loading. An allowed vehicle can (un)load while towing a Gun (unless using Reverse movement; C10.1) by paying the extra MP for towing. A Passenger vehicle or Gun may not change its CA relative to that of its LVT. Since the LVT4's ramp is at its rear, a vehicle's VCA must coincide with the LVT's VCA (or "rear" VCA) so that the vehicle is properly aligned for forward or reverse entry/exit onto/from the LVT. Overstacking does not occur due to a vehicle's being a Passenger on an LVT4. A vehicle that is also a Passenger cannot claim or retain Motion status independently of the LVT4.

GUN: (Un)loading an *unhooked* Gun from/onto an LVT4 follows the same procedure as (un)hooking it from/to a towing vehicle (C10.11 & .2). A Gun may be (un)hooked from/to an allowable vehicle while both are Passengers on the LVT (any resulting TI status does not apply to the LVT).

SURVIVAL: If an LVT4 is destroyed (but does not burn) *while on land*, all unarmored vehicles and Guns aboard it are also destroyed; *all* vehicular PRC roll for survival using the LVT's CS#. If an AFV is aboard such a destroyed LVT4, repeat the original attack, using its Original DR but now vs the AFV and adding an extra +2 TH (or IFT for non-ordnance) DRM as well as all other DRM applicable to the AFV. If the AFV survives it is bogged but may freely unload in a subsequent friendly MP if it first passes a Bog Removal DR. The AFV's PRC automatically survive the LVT's destruction, but if the AFV does not survive they must roll for survival using the AFV's CS#; if they survive they are placed on foot in the hex in the normal manner.

☆ Vehicle 52

52. DUKW: In 1942 a requirement originated for a wheeled amphibious cargo carrier that could land supplies directly on a beach and then proceed inland with them if necessary. The vehicle ultimately developed for this purpose was a 2½-ton 6×6 truck that was transformed into a boat (complete with anchor) while retaining its wheeled drive. It was designated the DUKW (D=1942; U=utility; K=all-wheel drive; W=twin rear axles) and was commonly referred to as the "Duck". Water propulsion was via propeller, and steering was effected by the combined use of the front wheels and a rudder which were both controlled by the steering wheel. Over 21,000 were built. One vehicle in four was equipped with a ring-mounted .50-cal AAMG. The DUKW was first used in March 1943 during the landings at Noumea, New Guinea; against the Germans its initial use came in July 1943 when 300 were used during the invasion of Sicily.

†ETO Dates are 7/43-5/45. PTO Dates are 3/43-45.

53. Jeep GPA: The amphibious Jeep was based on the standard Jeep chassis and engine, but with a boat-like waterproof hull. Propulsion in water was via an engine-driven propeller, and the steering wheel doubled as a helm controlling the rudder. Production of the GPA began in Sept. 1942, but the type never saw widespread service as only about 6,000 were built. Various nicknames were applied to the amphibious Jeep; among them were "Seep", "Waterbug", and "Duckling". "GPA" stands for "General Purpose, Amphibious".

†The Target Size TH DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream.

54. Jeep: By the end of the war 361,349 Willys MB had been built, as well as 277,896 Ford GPW, for a total of 639,245 standardized Jeeps. The name "Jeep" is said to have derived from the "GP" (General Purpose) designation used by Ford; however, the vehicle's official name was "Truck, ¼-Ton, 4×4, Utility". During the early war years it was often also referred to as the "Peep" (while "Jeep" was used for the ½-ton Dodge truck). Aside from its many command, liaison, etc., roles the Jeep was also standard equipment in the mechanized cavalry recon platoon from mid 1943 on. Each such platoon consisted of an armored car section, and a scout section that contained six Jeeps (three with a mounted MG and three with a 60mm mortar apiece). In addition, a 1944-45 TD battalion included one (if towed) or three (if SP) recon platoons, each of which contained five Jeeps (four with MG) as well as two M8 Armored Cars.

†RF is 1.5 prior to 8/42, 1.3 for 8-10/42, 1.1 from 11/42 through 6/43, and .9 thereafter.

55. ¼-Ton Truck: This vehicle, known as the Weapons Carrier and nicknamed the "Beep" (for Big Jeep), was used primarily in maintenance and support units for the transport of weapons, equipment, and personnel. The game piece also represents the older ½-ton truck which was used in the same roles but was phased out when the ¼-ton versions became available in the latter half of 1942. About 82,000 ½-ton and 267,000 ¼-ton trucks were built—all by Dodge.

†If "T7" is used as its Towing number, the game piece can also represent the International 1-ton truck which was widely used by the USMC.

†RF is 1.3, except for use with Marines in which case it is 1.1.

56. 1½-Ton Truck: In late 1939 the U.S. Army standardized five classes of trucks: ½-ton, 1½-ton, 2½-ton, 4-ton, and 7½-ton. Although 428,196 of the 1½-tonner had been built by 1945, it was largely superseded in the cargo-carrying role in U.S. units by the more versatile 2½-tonner; consequently many were built with specialized bodies and fittings for use by the Signal Corps, engineers, etc. The 1½-tonner was not used by the Marines.

†RF is 1.0 prior to 7/42, 1.2 for 7/42-6/43, and 1.3 thereafter.

57. 2½-Ton Truck: The 2½-ton "light-heavy" truck was the most widely used transport vehicle of U.S. forces during WW2, and was also numerically the most important army truck of the period.

There were two basic types: 6×6 and 6×4, with the latter being used almost entirely for road-bound cargo haulage. 812,262 of the 6×6 version were built. The 2½-tonner had various nicknames such as "Deuce and

a half", "Jimmy", "Eager Beaver", and "Workhorse of the Army".

†RF is 1.0 through 6/43 and .9 thereafter [EXC: for use with the Marines the RF is always 1.2].

58. 7½-Ton Truck: In Army service any truck with a load capacity ≥ 4 tons was in the "heavy-heavy" class. Three of the more common vehicles in this category were the Diamond-T 4-Ton 6×6 (used for, among other things, towing the 155mm howitzer and 4.5-in. gun), the 6-Ton 6×6 (used for towing heavy AA guns), and the Mack NO 7½-Ton 6×6. However, for simplicity only the latter is used in the game to represent its class. The Mack 7½-tonner was used as a prime mover for the 155mm gun and the 8-in. howitzer. A low production priority for heavy-heavy trucks during the early war years resulted in their being rather rare, especially in the 1943-44 period. 154,686 heavy-heavy trucks were built during WW2.

†RF is 1.4 through 6/43; 1.5 for 7/43-44; and 1.4 in 1945.

U.S. MULTI-APPLICABLE VEHICLE NOTES

A. APCR is not available in Italy or in the PTO (as signified by "E" in the Depletion number if the vehicle is available in the PTO). "A" stands for "August 1944", the date when this ammo becomes available.

B. Due to two of the MG that constitute the BMG FP being in fixed mounts and fired remotely, this BMG receives a +1 DRM to all fire at a moving/Motion target. This penalty is signified on the counter by a white dot over the BMG factor.

C. 37mm canister has 12 FP, and is available in all theaters but only after 7/42—as signified by the superscript "A2+" ("August 1942 on") on certain counters. 75mm canister has 20 FP, and is available in 1944-45 but not in Italy. 105mm canister has 24 FP, and is available in 1944-45 but only in the PTO. Printed canister Depletion numbers are increased by three for use in the PTO unless the superscript "P" is present to indicate that canister is available only in the PTO; e.g., "C7" becomes "C10" when used in the PTO, but "C7P" is used as "C7" and only in the PTO. For the M3 Medium Tank, canister is available only to the 37LL MA—as signified by "C537" on the counter.

D. The vehicle's high hull made exit and entry difficult for Personnel who had to climb over the sides. Therefore, the costs to (un)load (D6.4-.5) are doubled to ½ of the vehicle's MP allotment and two MF for the Personnel—as signified by "(un)load×2" on the counter [EXC: normal costs apply to the LVT4]. In addition, all attacks made by the Passengers of this vehicle are halved (or receive a +2 TH DRM) as Mounted Fire (D6.1). This vehicle can retain any unpossessed SW aboard it (D6.4), and its crew may Remove its MG armament (D6.631).

E. The inherent crew may fire only the .50-cal MA unless it is malfunctioned or disabled, in which case the crew may fire a secondary AAMG instead. Otherwise, only a Good Order Passenger may use a secondary AAMG (as signified on the counter by printing such FP in red). If such a Passenger is a lone SMC, it can fire one secondary AAMG; if ≥ two SMC or a MMC, all secondary AAMG can be fired. Assuming they are properly manned, the MA AAMG and any/all secondary AAMG may be fired together as a FG or at separate targets (as per D3.5 and within any applicable field of fire restrictions). Each red-FP AAMG fired by a Passenger counts as use of a SW for the purpose of also using that Passenger's inherent FP. See U.S. Vehicle Note H.

F. This AFV may be equipped with a bow-mounted SA FT instead of a BMG—but only by SSR. For DYO purposes (H1.41) use the rules below to determine if this tank is so equipped; note that the DR mentioned below are actually Availability DR.

LT: If the AFV is a Light Tank (as per Vehicle Listing), it has a FT if its owner makes a DR of 2 (for a 7/44-45 scenario in the ETO) or ≤ 4 (for a 1944-45 scenario in the PTO). This FT has 24 FP, Normal Range of 1, and X10.

MT: If the AFV is a Medium Tank it has a FT if the scenario date is 7/44-45 and the owner makes a DR of 2 (for an ETO scenario), or ≤ 4 (for a 7-12/44 scenario in the PTO), or ≤ 5 (for a 1945 scenario in the PTO). This FT has 30 FP, Normal Range of 1, and X10.

G. May be equipped with a Gyrostabilizer as per D11.

H

H. Each AAMG malfunctions and is repaired or disabled independently of the others. If a vehicle's MA AAMG malfunctions, mark it with a "MA Malfunction" counter to show that its non-MA AAMG FP is still usable. Whenever *all* of a vehicle's *non-MA* AAMG malfunction, indicate this by using an "AAMG Malfunction" counter. If a vehicle has more than one non-MA AAMG and one of them malfunctions, mark the vehicle with a "One AAMG Malfunction" counter; thereafter, in each friendly fire phase in which that AAMG is not repaired, the remaining still-usable non-MA AAMG may fire in its own allowed direction or in the malfunctioned AAMG's direction at no extra penalty. [EX: An LVT4's "port-side" AAMG malfunctions. As long as that AAMG is not repaired, the "starboard-side" AAMG can be used in *either* AAMG's side-rear field of fire; i.e., its field of fire is then in any direction except through the VCA. See the diagram for U.S. Vehicle Note 51.] Since the ROF applies only to the MA (A9.2), the owner must announce before he fires that he is using the MA if he wishes to possibly retain a multiple ROF. An Armor/Passenger leader may direct the fire of more than one vehicular-mounted/Passenger-fired MG only if those MG are firing together as a FG.

I. The AAMG FP actually consists of two MG: one .50-cal HMG (MA; 4 FP) and one secondary .30-cal MMG (2 FP)—as signified by "4MA&[red]2" on the counter. See U.S. Vehicle Note E.

J. While inherent armament of the halftrack, the mortar can fire only at a target that lies within the halftrack's "rear" VCA (i.e., the VCA emanating from its rear Target Facing)—as signified by "MA:RVCA only" on the counter.

K. The AAMG may not fire at a target that lies within the VCA [EXC: during CC]—as signified by "MG:NA VCA" on the counter.

L. This vehicle has Low Ground Pressure (D1.51). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending $\geq$ four MF in the vehicle's Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract two (one per crew/HS) from its immediately-subsequent unbogging DR.

M. The mortar's range is 3-75 and can be Removed dm (D6.631). While Removed, its ROF, B#, and all other specifications conform to that of the U.S. M1 81mm MTR counter, and the halftrack retains an Inherent Driver.

N. This vehicle was used in North Africa (Morocco/Algeria/Tunisia) at some time from 11/42 to 5/43 (within the limits of its own given Dates).

O. The AAMG is a .50-cal HMG if 4 or 6 FP, or a MMG if 2 FP—and may be Removed (D6.631) as such. If the MG is optional, its RF is 1.3 if 4 FP or 1.1 if 2 FP.

P. This vehicle was used by U.S. forces *only* in the PTO [EXC: if "P" appears, it was *not* used in the PTO by U.S. forces].

Q. The AAMG FP actually consists of three MG; one .50-cal HMG (MA; 6 FP) and two secondary .30-cal MMG (4 FP each)—as signified by "MA:12.7" and "6MA&4&4" on the counter. These MG may fire together as a FG or at separate targets (as per D3.5). In all other respects they are treated as normal AAMG. See U.S. Vehicle Note H.

R. This AFV had a very fast and accurate turret traverse, and also a better-than-normal ROF for a MA of its caliber. Therefore, this AFV is allowed the possibility of Multiple Hits (C3.8) even though its MA is > 40 mm. Moreover, in a Gun Duel (C2.2401) its total Firer-based TH DRM are halved (FRD) prior to adding any Acquisition DRM. (The final total of all DRM may not be < 0 , and applies for Gun Duel calculations *only*.) These abilities are signified on the counter by the ROF # being printed on a white background.

S. Equipped with smoke pots (as signified by "sP#" on the counter) instead of a smoke mortar. See D13 for usage. A crew must be CE in order to attempt sP usage.

T. The Bog DRM for ground specified as "soft, mud, or snow-covered" (D8.21) does not apply to an LVT.

U. Gunshield yields a +3 DRM against incoming fire through the AFV's front Target Facing instead of the normal +2 DRM for CE status. This is signified by "CE:+3F" on the counter.

V. Even though the CMG (or IFE, for the M16 MGMC) FP actually comprises more than one MG, it is treated as a single weapon for malfunction/repair purposes. Neither the MA nor CMG may be Scrounged or Removed—as signified by "CMG [or MA] Rmvl NA" on the counter.

☆ Ordnance 2

Neither the MA nor CMG may fire at a target that lies within the VCA and is also at the same or a lower level than the firer [EXC: during CC]. This is indicated on the counter by "VCA $\leq$ level NA".

W. Reverse movement costs this vehicle four times its normal hex entry cost—as signified by "REV $\times 4$ " on the counter.

X. Any optional MG are available 7/44-45, with 1.1 RF. The BMG *can* fire while the vehicle is HD—as signified by "BMG HD FP ok" on the counter.

Y. If the scenario date is after 7/25/44, and if SSR so specifies, this AFV is equipped with the Culin hedgerow device. For a DYO scenario set after this date the player may, if he wishes to use the Culin device, make a dr to determine its availability: ≤ 2 means all *eligible* LT, MT, TD, and SPA are so equipped; 3-4 means only *eligible* LT and MT are so equipped; ≥ 5 means no AFV are so equipped. One dr determines availability for all *eligible* AFV purchased for the player's OB. The BPV cost of the optional Culin device is five points per AFV having it.

Z. This vehicle starts each scenario carrying one BAZ of the latest model (signified by "BAZ" on the counter), which does apply to the vehicle's PP capacity (D6.1) when it takes counter form. (Thus it must remain inherent if the vehicle currently has no unused PP capacity.) In a single Player Turn the inherent crew may fire either the vehicle's normal armament *or* the BAZ (as per C13.8-81). Otherwise, the BAZ may only be Removed (D6.631) by the crew or a Passenger (who can claim possession of it automatically), or Scrounged (D10.5). These principles also apply to the inherent SW in the German SPW 251/10.

AA. MA and CMG (if so equipped) have AA capability—signified by "MA:AA" on the counter.

BB: WP7 and s5 become available in June 1944—as signified by the superscript "M-" on the counter.

CC. The vehicle if armed, has an Inherent crew and thus has a CS# instead of a cs# (D5.6).

U.S. ORDNANCE NOTES

1. M2 60mm Mortar: This light mortar was a license-built version of the French Brandt 60mm mortar, and was adopted by the U.S. Army in 1940. About 75,000 were made. An Army rifle company had three in the mortar section of its weapons platoon. A mechanized cavalry recon troop had nine (three per platoon; see U.S. Vehicle Note 54). Each armored infantry platoon had one (see U.S. Vehicle Notes 28 and 29). Each parachute infantry platoon had one, as did each glider infantry platoon until 8/44. The glider infantry company also had 2-4 more (depending on the date) in its weapons platoon. A Marine rifle company had two (officially increased to three in April 1943—although many companies apparently did not receive the third one until much later). In May 1944 four were also authorized in each Marine infantry battalion HQ company. A Marine Raider company had three 60mm mortars.

†The M2 had a longer range than most light mortars because its primary role was not as a "direct support" weapon for the platoon/company, but rather as the company's on-call "OBA". Therefore, for every three M2 mortars the U.S. player receives in his OB, he may exchange those three for a radio (or field phone) and a 4 FP OBA battery that can fire only HE (and WP in 1945) Concentrations/IR. This battery receives the -2 Radio Contact Maintenance DRM of C1.22, and uses the standard U.S. Battery Access draw pile [EXC: if the U.S. force is suffering from Ammo Shortage, this battery has Scarce ammo]. When used as OBA, the M2 is treated as having a maximum range of 40 hexes, which is counted from the center road hex of the U.S. player's Friendly Board Edge (i.e., as per B11.42). An AR/SR/FFE counter of this OBA cannot be placed/Corrected beyond this range of 40 hexes, and any direction/extent of error dr that would place such a counter beyond this range is void and must be rerolled. If the U.S. force has no Friendly Board Edge, this OBA option cannot be used.

2. M19 60mm Mortar: Also known as the T18E6, this was a lighter, simplified version of the M2. Only a small number were made, and were issued to a few airborne and special purpose units. The M19 used the same tube as the M2, but had a much smaller baseplate and no bipod. It also differed from the M2 by being trigger-fired.

U.S. ORDNANCE LISTING

3. M1 81mm Mortar: This weapon, a copy of the classic French Brandt 81mm mortar, was the standard battalion mortar in U.S. service. It fired both light (7-lb.) and heavy (10½-lb.) HE bombs, as well as WP. About 30,000 were made during the war. Its primary use was in the heavy weapons company of the infantry battalion, whose mortar platoon contained three sections of two mortars each. (Parachute mortar platoons had only two sections—and airborne 81mm mortar platoons were located in the infantry battalion's HQ company.) A mechanized cavalry recon squadron had three 81mm mortars, as did a TD battalion (SP). The weapons company of a Marine battalion contained a platoon of four 81mm mortars until April 1944 (after which date the platoon was moved to the battalion's HQ company), while the HQ company of a Marine Raider regiment had eight.

4. M2 4.2-in. Mortar: This weapon was designed by the Chemical Warfare Service, and some 8,500 were built. The 4.2-in. (or "Goon Gun", as it was sometimes called) had been intended to fire only gas and SMOKE rounds; however, an HE round was also designed in time for the mortar's combat debut in Sicily. In action it was found that the higher ROF used when firing HE increased the incidence of malfunctions. The normal Smoke rounds appear to have been used rarely, if at all, in combat. Unlike the vast majority of mortars whose barrels are smooth-bore, the 4.2-in. was unusual in having a rifled barrel. This feature increased its accuracy, but at the cost of making it (and its projectiles) more expensive and time-consuming to manufacture. The 4.2-in. was used only in chemical mortar battalions, which were attached at army/corps level. A platoon comprised four weapons.

†This MTR fired an exceptionally potent round for its caliber; therefore its Area Target FP is "12" (rather than "8"). This is signified by "12 Area FP" on the counter.

†RF in the ETO is as follows: 1.4 for 7/43-5/44; 1.3 for 6/44-2/45; and 1.2 for 3-5/45. PTO Dates and RF are 8/43-45 and 1.4.

5. T25 155mm Mortar: This weapon was designed to give heavy and immediate fire support to amphibious landings and jungle troops in locales not suited to conventional artillery. To be moved, it had to be disassembled; the tube and recoil mechanism were loaded aboard a special handcart, while a second cart carried the bipod and baseplate. Other carts transported the ammo, with six rounds on each. Combat trials were conducted in the SW Pacific in 1944, whereupon it was decided that the extra weight of the T25 and its ammunition negated the value of its larger round, so it was withdrawn from service. Only 244 were built.

†This mortar is carried on a vehicle that has a T# ≤ its M# (like a 76-107mm MTR; C10.1), rather than towed by it—as signified by "Tow NA" on the counter.

6. M3A1 37mm AT Gun: Development of the first purpose-built U.S. anti-tank gun started in 1937, and was based on the German PaK 35/36. Unlike most AT guns, the M3A1 had a manual breech block which lowered its rate of fire. It was used in combat in North Africa but was then gradually replaced in the ETO by the 57mm gun. In the PTO, however, it remained in use throughout the war, being quite adequate to deal with the lightly-armored Japanese AFV, and having a canister round that proved invaluable for stopping massed infantry attacks. 18,702 were built. It was usually towed by a Jeep or ¾-ton truck. In the 1941-43 period it was found in the Army infantry battalion's HQ company, the infantry regiment's AT company, the armored infantry company (with one gun per armored infantry platoon and one in the company HQ, towed by an M2 Halftrack), the HQ company of an armored infantry regiment, the armored division's HQ company and armored recon battalion, and the glider infantry regiment. A platoon comprised four guns. In addition, the 10th Mountain Division in Italy was authorized three 37mm AT guns per infantry battalion. A Marine division had three four-gun 37mm AT platoons in each infantry regiment's weapons company, and also had (from April 1943 through 1944) three six-gun platoons in its Special Weapons battalion.

H

A Marine Raider regiment had four 37mm AT guns. The Philippine Army also used the 37mm AT gun in 1941-42.

†Dates for use in North Africa and the ETO are 11/42-5/45; RF for such use is .9 for 11/42-6/43, 1.2 for 7-12/43, and 1.4 thereafter. PTO RF is 1.0.

7. M1 57mm AT Gun: By 1941 the Army had realized that its 37mm AT gun was rapidly becoming obsolete. Since it might take several years to design and develop a new gun, the British 6-pounder was copied, with minor alterations made for American preferences and production methods. Some 16,000 of the M1 were built, and from mid 1943 it gradually replaced the 37mm M3A1 in the ETO. In mid 1943 the Army also reorganized its infantry divisions; subsequently the 57mm could be found in the division's HQ company, as well as in the infantry battalion HQ company's AT platoon and the infantry regiment's AT company (first appearing in the latter company, and only later in the battalion AT platoon). Each armored infantry company had one platoon (towed by M2 halftracks), as did the armored division's HQ company. In an airborne division AT guns were found in the glider infantry regiment, the glider infantry battalions (in 1945), the Airborne AA battalion, and the artillery battalions. A platoon comprised three guns (four in certain airborne applications) which were often towed by Jeeps. Unlike most British, Soviet, and German divisions, a U.S. Army division had no organic AT battalion—divisional AT assets being in the form of one or more attached TD battalions. Exceptions to this were the 10th Mountain Division in Italy with its AT battalion of 18 57mm guns, and the airborne divisions which each had a combined AA/AT battalion.

Contrary to what has been previously published, the M1 did fire other types of ammunition besides AP. Limited supplies of British HE and APDS became available in the summer of 1944, and the U.S. T18 HE round was being issued by early 1945. A canister round was also developed—but if used in combat it was issued only in small amounts in late 1944.

†HE with a Depletion number of "7", and APDS with a Depletion number of "4", are available in the ETO as of June 1944. HE7 becomes available in the PTO in 1945. These restrictions are signified on the counter by the superscripts "J" (for June) and "E" (for ETO).

†Dates for use in the ETO and PTO are 7/43-5/45 and 44-45 respectively. Decrease ETO RF by .1 for each two-month period after 8/43, until 1.0 is reached in 1/44. PTO RF is 1.2.

8. M5 3-in. AT Gun: While the M1 57mm AT gun was being developed in 1941, the Army also decided to start work on a more powerful weapon. To bring it into production as quickly as possible, the designers used the barrel of the 3-in. (76mm) AA gun and the carriage, breech, and recoil mechanisms of the 105mm howitzer. The result was rather large and heavy for an AT gun (its weight in action was almost twice that of the German 7.5cm PaK 40), but it worked better than might have been expected from such an improvisation. However, while the M3 3-in. AA gun and the M7 3-in. gun of the M10 GMC had semiautomatic breech blocks, the M5 had a manual breech block which lowered its rate of fire. 2,500 were built before production ended in 1944. The M5 was not used as a divisional AT gun but rather in tank destroyer battalions (towed), with four guns (each towed by an M3 halftrack) per platoon. In early 1945 most towed battalions were converted to SP, making the towed gun relatively rare in the last few months of the war. Since the M5 3-in. was used solely in towed TD battalions it was sometimes referred to as a tank destroyer instead of an AT gun. Apparently it was not used in the PTO.

†APCR is not available in Italy.

†RF for use in the ETO (other than Italy) is 1.3 for 6-8/44, 1.2 for 9/44-2/45, and 1.4 for 3-5/45. Dates and RF for use in Italy are 11/44-5/45 and 1.4.

9. T32 37mm Manpack Gun: The canister-firing 37mm AT gun was highly valued in the jungle fighting that was common in the PTO, but was difficult to manhandle forward in such terrain. Therefore in late 1943 work began on a light gun that could be completely dismantled and backpacked by its crew or by mule. When assembled, the barrel and recoil mechanism were mounted on a modified .50-cal MG tripod, and the gun's weight in action was 264-lbs. It fired the same HE ammo as the 37mm AT gun as well as a specially developed canister round. 155 were sent to the PTO in 1944 (possibly at the same time as the T25 155mm MTR), and about 100 others were used in Italy in 1945.

†Due to the T32's rarity and unusual design it is treated as a crewed weapon; see U.S. Ordnance Note D. In addition, the T32 may be moved (or advanced) into/through, and fired from, all terrain types allowed to a HMG (e.g., an upper building level). As a SW, the T32 incurs no CA-change DRM penalty (C9.2), but is subject to the woods/building CA restrictions of A9.21. The T32 has no Gunshield, and its portage cost while dm is 3 PP.

†Dates for use in Italy are 3-5/45.

10. M18 57mm Recoilless Rifle: Although the first patent for a recoilless gun was granted to an American in 1898, serious work on turning the principle into a viable weapon did not begin in the U.S. until June 1943. The Infantry Section of the Army's R&D Service designed a 57mm piece based on principles gleaned from British RCL experiments, while the Artillery Section produced a weapon based on the German 105mm RCL. The 57mm was test-fired in October 1943 and the Army decided to give it priority over the 105 since its light weight would enable it to be easily carried through jungle or broken terrain. Under the designation T15, 100 were ordered in the spring of 1944 for combat trials. Fifty were sent to the ETO in early 1945 and were first used by the 17th Airborne Division near Essen. Some were also used on Okinawa. The T15 weighed 44-lbs. and could be fired from either the shoulder, its attached bipod, or a modified .30-cal MG tripod. It was standardized as the M18 in June 1945. Development of a canister round was initiated, but was unsatisfactory and apparently was cancelled without undergoing combat trials.

ERRATA: 57mm HEAT ammo has a Basic TK# of "11".

11. M20 75mm Recoilless Rifle: This was basically an enlarged version of the 57mm gun. Its weight of 115-lbs. relegated it to almost always being fired from its modified .30-cal MG tripod. The first production order for the T21E4 was placed in October 1944, and combat trials took place alongside the 57mm RCL. It was standardized as the M20 in June 1945. Both U.S. RCL were known as "Kromuskits", which is an amalgamation of the original designers' names.

12. M1A1 75mm Pack Howitzer: This weapon was originally developed in the 1920s as a mountain gun able to be disassembled and carried by pack mules. Later a new carriage with pneumatic tires was introduced, thus making the gun able to be towed at higher speeds by a motorized vehicle (usually a Jeep) as well as enabling it to be dropped by parachute. In the latter role it was broken down into nine loads, which in 1944-45 were held together by a harness during their descent. (Prior to 1944 no harness was used, causing a wide dispersion of the gun's components and resulting in an average assembly time of half an hour in daylight or one hour at night.) The 75mm pack howitzer was used in action by field artillery battalions of Marine divisions (officially deleted in May 1945), airborne divisions, and the 10th Mountain Division in Italy. It was also used by several nondivisional artillery battalions in Europe, the Pacific islands, and Burma/China. Some also equipped regimental cannon companies in the PTO. Allied troops who used it included British airborne and Chinese artillery units, and Yugoslav partisans. In U.S. service a pack howitzer battery comprised four such weapons.

†For 1944-45 DYO scenarios the gun is represented by a 1/2" parachute when being air-dropped, and is considered re-assembled only if its manning Infantry have spent one complete Game Turn TI in the same Location with it.

†Dates and RF for use in other than the PTO are 7/43-5/45 and 1.3. PTO RF is 1.5 through 7/42, and 1.1 thereafter.

13. M1897A2 75mm Gun: The M1897A2 was the famed "French 75"—the world's first modern field piece—as altered and built in the U.S.A. after WW1. Although being phased out of active service in 1941, it did see combat in the Philippines with elements of the 23rd, 24th, and 88th Field Artillery Regiments (and probably also with the Philippine Army), and on Java with the 2nd Battalion of the 131st Field Artillery Regiment. The remaining guns were used for training, for arming various allies, and as the armament of the M3 GMC. 4,236 of the M1897A2 were built.

☆ Ordnance 14

14. M2A1 105mm Howitzer: As the standard divisional light artillery piece, the M2A1 was used in the field artillery battalions of Marine, cavalry, and infantry divisions, and also in nondivisional field artillery battalions. A battery consisted of four howitzers, each towed by a 2½-ton truck. 8,536 were built by the end of the war. 13 different types of ammunition were developed for it. The M2A1 was an excellent howitzer and in various modified forms is still in service with over forty countries, including the U.S. where it is designated the M101A1.

†ETO Dates and RF are 11/42-5/45 and 1.0. PTO Dates are 8/42-45, with ROF of 1.2 for 8-10/42 and 1.0 thereafter.

15. M3 105mm Howitzer: In 1941 a requirement was issued for an air-transportable 105mm howitzer. The weapon designed to meet this requirement used the M2A1 howitzer's barrel (shortened by 27 inches), the carriage from the cavalry version of the 75mm pack howitzer, and a modified version of the pack howitzer's recoil mechanism. The result worked surprisingly well (although its maximum range was much less than M2A1's). Its primary employment was with the infantry regiment, which as of July 1943 was authorized a cannon company of six M3 howitzers (each towed by a ¾-ton truck). Several glider field artillery battalions (e.g., the 319th, 320th, and 907th) also used the M3 in 1944-45; one glider would bring in the howitzer and its ammo, while another would land its crew with the Jeep used to tow it. (A few sources state that all glider field artillery battalions used the M3, but others say that some retained the pack 75.) While the M3 could be classified as an INF Gun, it was used in the indirect fire role more than its German 75 and 150mm counterparts, and had no gunshield, so has been classed as an ART Type.

†Decrease ETO RF by .1 for each month after 9/43, until 1.0 is reached in 1/44. PTO Dates and RF are 1944-45 and 1.2.

16. M1 4.5-in. Gun: In 1939 the Army decided to design a new 4.7-in. (120mm) gun. It was then suggested that the caliber be changed to 4.5-in. (114mm) so as to allow interchangeability of ammunition with the British gun of the same caliber. The M1 was the result. Its British-designed ammunition had a low HE content for its caliber, which made it less effective than desired; for this reason, and its excellent range notwithstanding, the 4.5-in. was declared obsolete the day after VE Day. 426 were built, but only about 200 saw combat in sixteen medium field artillery battalions—all in the ETO. A battery of 4.5-in. guns comprised four such weapons.

†Dates and RF for use in Italy are 10/43-9/44 and 1.6. Dates for use elsewhere in the ETO are 6/44-5/45, with RF of 1.6 through 9/44, and 1.5 thereafter.

17. M1918 155mm Howitzer: In June 1940, 2,791 M1917 (the French C17S) and M1918 (its U.S.-built version) howitzers were in service, of which 599 had pneumatic tires for vehicular towing. The M1918 saw action in the PTO (initially with the 86th Field Artillery Regiment in the Philippines and possibly with the 26th Field Artillery Brigade on Java), North Africa, Sicily, and Italy. It was also used at one time or another during the war by the Chinese, British, Free French, and South Africans.

†Dates for use in North Africa, Sicily, and Italy are 11/42-5/45; RF for this use is 1.2 through 10/43 and 1.4 thereafter. PTO Dates are 41-45, with 1.3 RF through 1943 and 1.4 thereafter.

18. M1 155mm Howitzer: Production of the M1 was slow in getting underway; by the end of 1942 only 33 had been completed. 4,035 were eventually built during the war, during which time it gained a reputation for both reliability and accuracy. Slightly modified after the war, it is still used in almost 30 countries, including the U.S. where it is designated the M114A1. The 155mm howitzer was most commonly used as a companion piece to the 105mm howitzer in divisional artillery, with one 155mm medium field artillery battalion (three batteries of four howitzers each) per infantry division. "One-five-fives" also equipped nondivisional medium artillery battalions. Marine divisions were authorized a battalion of 155mm howitzers in May 1945.

†Dates for use in other than the PTO are 7/43-5/45; RF for such use is 1.5 through 8/43, 1.4 for 9-10/43, and 1.2 thereafter. PTO Dates and

RF are 44-45 and 1.3 [EXC: for use with the Marines they are 2-6/45 and 1.5].

19. M1918M1 155mm Gun: The M1918M1 was a U.S.-built version of the French "Canon de 155 GPF". 641 of the M1918M1 were produced, while 48 of the M1917 model had been purchased.

Some saw combat in the Philippines and several other Pacific actions, mostly with coast artillery battalions providing long range artillery support. They were also used in Tunisia, Sicily, and Italy before being replaced by the newer M1A1 model. Some M1918M1 were used as the MA of the M12 GMC, others were Lend-Leased, and the remainder were used for training.

†Dates and RF for use in North Africa, Sicily, and Italy are 1943 and 1.5, while for use in the PTO they are 41-44 and 1.6.

20. M1A1 155mm Gun: Work on what came to be called the "Long Tom" started immediately after WW1, but the design was not standardized until 1938. By the end of 1941 only 65 had been built. Prior to 1944 the M1A1 was produced, which incorporated an improved breech ring. Both types (and the M1918M1 models) were used in nondivisional heavy field artillery battalions which comprised three four-gun batteries, and also in eight-gun coast artillery battalions that were used as heavy artillery throughout the island campaigns in the Pacific. The M1 and M1A1 guns became standard U.S. heavy artillery weapons during WW2, and an improved M2 version remained in both U.S. and British service until the 1950s. The normal time required to completely unlimber the M1A1 was 20-30 minutes.

†Dates and RF for use in the ETO are 8/43-5/45, with 1.5 for 8/43-6/44, 1.4 for 7/44-1/45, and 1.3 for 2-5/45. PTO Dates and RF are 5/43-45 and 1.5.

21. M1 8-in. Howitzer: This howitzer first saw combat in late 1943 with the 932nd and 935th Field Artillery Battalions in Italy, while its debut in the PTO was in New Guinea with the 465th Field Artillery Battalion. It was not used by the Marines. By 1945 1,006 M1 8-in. howitzers had been built, and had acquired the reputation of being the war's most accurate long range artillery pieces. An 8-in. howitzer battery consisted of four such weapons. In its towed version the 8-in. was redesignated the M115 after the war and still serves in the armies of several nations. The normal time to completely unlimber the M1 was 30-60 minutes.

†Dates and RF for use in Italy are 11/43-7/44 (RF 1.5), 8-10/44 (RF 1.6), and 3-5/45 (RF 1.5). Dates and RF for use elsewhere in the ETO are 7/44-1/45 (RF 1.5) and 2-5/45 (RF 1.4). PTO Dates and RF are 9/44-45 and 1.6.

22. M51 Multiple .50-cal MG Carriage: This weapon was the same as that on the M16 MGMC halftrack (see U.S. Vehicle Note 38), but here was mounted on a four-wheel trailer. In both cases the weapons system was usually referred to as the Maxson, after its manufacturer. A lighter air-transportable version was also developed; designated the M55, it could be towed by a Jeep.

†Make four To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. Maximum range for To Hit purposes (A9.61) is 16 hexes.

23. M1A2 37mm AA Gun: The design of this weapon was started in 1920 by John Browning (of MG fame) but the final version did not enter production until 1939. It compared unfavorably with the 40mm AA gun in several respects but, since production of the latter could not meet demands, the M1A2 continued to be built. 7,278 were manufactured and the gun saw service in all theaters throughout the war. It was also employed as the MA of the M15 and M15A1 MGMC halftracks. The Army used the M1A2 in four-gun batteries in both Mobile and Semimobile AAA [Anti-Aircraft Artillery] Automatic Weapons battalions, and in Coast Artillery (AA) regiments. The Marines used four-gun M1A2 platoons in AAA battalions, Defense battalions, and divisional Special Weapons battalions.

†Dates for use in North Africa and the ETO are 11/42-5/45, with RF of 1.3 through 3/44, 1.4 for 4-12/44, and 1.5 in 1945. RF for use in the PTO is 1.3 through 5/44, and 1.4 thereafter.

H

☆ OBA Availability Chart

24. M1 40mm AA Gun: This is the famous Bofors, which was the most widely used AA gun of the Second World War. 34,116 were built in the U.S. during WW2, and they served in all theaters in most of the same types of units as the M1A2. A light-weight, air-transportable version known as the M5, which when disassembled could be carried in a C-47, was also built; although originally intended as an Airborne weapon it was mainly used in the PTO—presumably by the 101st, 102nd, and 843rd AAA Automatic Weapons Battalions (Air-Transportable). Eighteen U.S. Bofors were field-mounted on M3 halftracks by the 209th AAA Automatic Weapons Battalion (SP), and in 1945 were used by that unit in the ground support role on Luzon.

†Dates for use in the ETO (other than Italy) are 6/44-5/45, with RF of 1.3 for 6-9/44 and 1.2 thereafter. Dates for use in Italy are 9/43-1/45, with RF of 1.4 for 9/43-3/44, 1.3 for 4-10/44, 1.4 for 11-12/44, and 1.5 for 1/45. Dates for use in the PTO are 11/43-45, with RF of 1.5 through 5/44 and 1.3 thereafter.

25. M3 3-in. AA Gun: There were two distinct types of 3-in. AA guns: a mobile version (which the game piece represents), and a static gun that was used in permanent defenses. About 800 were built. By 1941 most had been relegated to training roles, but some equipped Coast Artillery (AA) regiments and Marine Defense battalions in the PTO where they saw combat during the initial Japanese attacks (e.g., on Guam, Wake Island, and in the Philippines). AP ammunition was not issued to the static guns. One interesting fact concerning all Army AA units is that prior to March 1942 they were part of the Coast Artillery; hence they had Coast Artillery designations until inactivated or renamed later in the war. A 3-in. AA battery comprised four guns.

26. M1A1 90mm AA Gun: In 1940 the M1 90mm AA gun, which after slight modification became the M1A1, entered production. By the end of 1942 more than 2,000 90mm AA guns had been built, and they saw service in all theaters. Two deficiencies of the 3-in. AA gun which were not corrected in the 90mm piece were the amount of time required for unlimbering and the inability to depress the gun barrel to fire on targets at lower elevations. This was due to their having been designed solely for AA fire, with little consideration given to use against ground targets.

†ETO RF is 1.5 until 1944 when it becomes 1.4. PTO RF is 1.6 until 1944 when it becomes 1.5.

27. M2 90mm AA Gun: Even as the M1A1 gun was entering production it was decided that AA guns should be able to fire at all types of ground targets as well as aircraft. The M1A1 was redesigned to incorporate this principle, resulting in the M2 in 1943. In the M2 the gun itself was little changed, but the mount was entirely new and provided for both rapid unlimbering and limbered fire. Because of the M2's ability to fire at land, sea, and air targets it came to be known as the "triple threat" gun. By the end of the war 7,831 M1, M1A1, and M2 90mm AA guns had been built. They were used in four-gun batteries in both Mobile and Semimobile AAA Gun battalions, and also in those types of units previously equipped with 3-in. AA guns. Until mid 1943 one four-gun 90mm (or 3-in.) AA battery was also included in the Special Weapons battalion of a Marine division.

†RF in the ETO (other than Italy) is 1.5 for 6-7/44, 1.4 for 8-9/44, and 1.3 thereafter. RF in Italy and the PTO is 1.5.

³ Allotted according to number of Assault Engineers, see 1.22.

⁴ Not available until Nov. 1942.

⁵ Vs Japanese, reduce this # by one.

⁶ 1943/44/45 models respectively.

U.S. MULTI-APPLICABLE ORDNANCE NOTES

A. The AP ammo has a low Depletion number due to its being intended for use solely in the Coast Artillery role against ships.

B. When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

C. 37mm canister has 12 FP, and is available in all theaters but only after 7/42—as signified by the superscript "A2+" ("Aug. '42 on") on the counter. 75mm canister has 20 FP, and is available in 1944-45 but not in Italy. 105mm canister has 24 FP, and is available in 1944-45 but only in the PTO. Printed canister Depletion numbers are increased by three for use in the PTO unless the superscript "P" is present to indicate that canister is available only in the PTO; e.g., "C7" becomes "C10" when used in the PTO, but "C7P" is used as "C7" and only in the PTO.

D. This weapon requires a crew (C12.2) or two SMC (C12.21) in order to be used without penalty—as signified by "crew" on the counter. (Therefore C12.2-.21 apply to the T32 37mm Manpack Gun as well as to the RCL.) See A15.23 for hero usage. The BPV of this weapon includes a crew as per H1.3.

E. Dates and RF for use in Germany are 3-5/45. For use on Okinawa they are 6/45.

N. This weapon was used in North Africa (Morocco/Algeria/Tunisia) at some time from 11/42 to 5/43 (within the limits of its own given Dates).

P. This weapon was used by U.S. forces only in the PTO [EXC: if "P" appears, it was not used by U.S. forces in the PTO].

BRITISH VEHICLE NOTES

In the 1930s, the British, who had started the whole idea of tank warfare and formulated many of the theories which the Germans later turned into the Blitzkrieg concept, forsook their lead in tank design and the development of armored forces. Indeed, at the time of the Munich crisis in 1938, Britain possessed not a single modern gun-armed tank. This was the result of several factors: the financial austerities of the times; the innate conservatism of certain powerful individuals in the Army; and the high priority given to the Army's role in policing the Empire (for which only light tanks with MG were required). Even as rearmament began, the schism in tank doctrine caused by disagreement over the tank's true function in combat remained unresolved. Three different roles were seen for tanks: reconnaissance, for which the current light tanks would (in theory) suffice; mobile operations, during which the new class of fast, gun-armed but lightly armored Cruiser tanks would engage in pursuit and exploitation in much the same manner as cavalry had in the past; and infantry support, for which slow but heavily armored tanks were being produced. The manufacture of MG-armed light tanks ended when their poor survivability on the modern battlefield became manifest. However, the dichotomy of Cruiser and Infantry tanks, which caused needless dispersion of effort in design and production, and which complicated supply and tactical coordination, lasted until the war's end.

Many early-war British tank designs suffered from unreliability due to being put into production without adequate testing beforehand. This occurred during the hasty rearmament of the late '30s, and again in the frantic months after Dunkirk when, after the loss of over 700 tanks in France, only a few hundred remained in all of Britain. Another factor affecting British tank design was the country's railway gauge, which limited the maximum permissible width of a tank. This restricted the size of the turret ring, in effect rendering the tank incapable of carrying a large-caliber, high-velocity gun such as the 17pdr. On the positive side, Britain led the way in the development of specialized armor such as DD tanks, bridge-layers, mine-clearing tanks and the multi-purpose AVRE. These vehicles, which collectively were known as "Funnies", were Britain's major contribution to armored warfare during WW2.

The British built an estimated 33,000 tanks in the 1936-45 period, including some 2,800 produced in Canada and Australia during the war; however, a number of models (amounting to over 5,000 vehicles) never saw action due to their premature obsolescence and/or chronic unreliability. Total British (only) tank production in the years 1940-45 amounted to some 24,800 vehicles. Between 1938 and 1945 the British also built an estimated 46,000 AFV of other types, including the output of Canada, India and South Africa but excluding tracked Carriers. Of these, about 36,000 were AC, SC, LRC and wheeled Carriers—highlighting the fact that during WW2 the British made far greater use of wheeled AFV than did any other nation. The U.S. Lend-Leased 27,755 tanks and at least 20,000 other AFV to the various "British" forces/countries.

A short glossary is given below to aid those who may be unfamiliar with the British terms used in the Vehicle and Ordnance Notes. Note that the explanations have been intentionally generalized; in many cases exceptions to them do exist, but have been ignored here.

A#: A War Office ordnance designation assigned to a tank design.

(Army) Tank: A term which, when preceding "brigade", "battalion", etc., indicated that the unit in question was equipped with Infantry tanks.

BEF: British Expeditionary Force—the force sent to France subsequent to Britain's declaration of war on Germany.

Brigade: Equivalent to U.S. "regiment".

Cruiser Tank: A tank designed for the pursuit and exploitation role.

CS: An AFV (usually a tank) carrying a low-velocity gun which fired only HE/smoke, designed for the Close Support of other AFV.

Infantry ("I") Tank: A tank designed for the support of infantry in the assault.

Rece: Another term for "reconnaissance".

Regiment: This has several meanings. It can refer to a parent administrative (as opposed to combat) entity—e.g., the Durham Light Infantry Regiment, the Royal Regiment of Artillery, the Royal Tank Regiment, the Reconnaissance Regiment. However, when used in reference to a specific type of combat unit—e.g., a tank or AA regiment—it is equivalent

to the U.S. "battalion". Its use in the latter sense was largely confined to armored, recon, cavalry, and artillery (including AA and AT) units.

RTR: Royal Tank Regiment. When preceded by a number (#), read it as "# Battalion of the Royal Tank Regiment".

Section: When used in reference to an infantry unit, it is equivalent to the U.S. "squad".

Squadron: Equivalent to U.S. "company".

Troop: Equivalent to U.S. "platoon", except when used in reference to artillery in which case it is equivalent to U.S. "battery".

[Note: ETO stands for European Theater of Operations, which in game terms comprises Europe and the Mediterranean islands. NWE stands for Northwest Europe, which in game terms comprises France, Germany and the Low Countries. PTO stands for Pacific Theater of Operations, which in game terms equals "vs Japanese". The term "British" is used as defined in A25.4 unless noted otherwise—though it does not generally apply to Free French in the ETO, where for the most part they were organized and equipped like U.S. forces.]

1. Light Tank Mk VIB & Mk VIC: The Mark VI series formed the bulk of British armored strength

in 1939-40. Although intended for colonial duties and as recon vehicles, they were often forced to act as battle tanks—with predictably heavy casualties. The Mk VIB was numerically the most important model, with 832 produced. Its armament consisted of two water-cooled Vickers MG, one .50-cal and one .303-cal. The end of production in 1940 included 100+ Mk VIC, which carried a 15mm MG and a .303-cal MG, both air-cooled. In all, about 1180 of the Mk VI series were built. Small production runs of other light tanks preceded the Mk VI, but they saw little combat. Mk VI types were used in troops of three in the light tank squadrons of armored and light tank regiments, and in the divisional cavalry regiments in the BEF. Four Mk VI were included in the HQ of both a light tank squadron and an Army Tank battalion, and one was allotted to the HQ of each Army Tank company. Mk VI models other than the VIC fought in Belgium, France, North Africa, and in other areas including Greece (4/41, with the 4th Hussars), Crete (5/41, with a squadron of the 3rd Hussars), Syria (6-7/41, with the Australian 6th and 9th Divisional Cavalry Regiments), Singapore (2/42, with the 18th Infantry Division), and Java (3/42, with C Squadron of the 3rd Hussars). The Mk VIC was used in combat only by the 1st Armoured Division in France; at least some of that division's armored regiments allotted one Mk VIC per light tank troop.

†When using the AP To Kill Table for the Mk VIB, make two To Kill DR—one each on the 12.7 and MG columns; only one DR (firer's choice) is used. This is indicated by "2 TK DR (1 12.7; 1 MG)" on the VIB counter.

†Mk VIB Dates and RF for ETO use are 5-6/40 (Belgium and France; 1.0), 4/41 (1.1), and 5/41 (1.4); for North Africa they are 6/40-3/41 (1.0), 4/41 (1.1), 5-6/41 (1.2), 7-8/41 (1.3), 9-10/41 (1.4), and 11-12/41 (1.5); for Syrian use they are 6-7/41 (1.4); for PTO use they are 2/42 (1.5) and 3/42 (1.2). Mk VIC Dates and RF are 5-6/40 and 1.3.

2. (A17) Tetrarch & Tetrarch CS (Light Tanks Mk VII & Mk VII CS): Intended as the replacement

for the Light Tank Mk VI, the Tetrarch entered production in 1940. However, at about that time it was decided that armored cars—not light tanks—would be used for reconnaissance, so only 171 Tetrarchs were built. A small number (probably about 10%) had, instead of the normal 2pdr MA, a 3-in. howitzer for the CS role. A Tetrarch was the first tank to be fitted with the Duplex Drive (DD) propulsion system. Tetrarchs were first used in action in Madagascar, by a Special Service Tank Squadron; thereafter they were held in reserve for airborne use, with the Hamilcar glider being designed specifically to transport them. One Tetrarch squadron of the 6th Airborne Armoured Reconnaissance Regiment was air-landed in Normandy on the evening of 6 June 1944, and the same unit used them in Operation Varsity, the airborne assault across the Rhine in March 1945. (though these were the only times Tetrarchs saw combat, their Dates have been extended to make them somewhat more available for DYO use.) 20 Tetrarchs were sent to the USSR in 1941.

†Tetrarch Dates and RF are 5/42 (1.3) and 6/44-5/45 (1.6) [EXC: 1.5 for 6/44 and 3/45]. Tetrarch CS Dates are the same.

Vehicle 3

3. Stuart I(a) & III(a): These were the designations given to the U.S. M3 and M3A1 Light Tanks. The British, eager to supplement their supply of tanks in the Middle East and recognizing that the M3 in some ways approximated the effectiveness of their own Cruiser tanks, requested in early 1941 that it be Lend-Leased. Although officially named Stuarts, all light tanks of the M3-M3A1 series were commonly called Honeyys due to their impressive reliability and handling characteristics. The British made certain changes to their M3, such as deleting the fixed BMG (to increase stowage space), altering certain crew positions and responsibilities, and adding smoke dischargers to some vehicles. Stuarts became the first U.S.-built tanks to see action in WW2 when they took part in Operation Crusader; in that battle they fully equipped the 7th Armoured Division's 4th Armoured Brigade and were used as Cruiser tanks. Thereafter in North Africa their numbers diminished as the increasing armor thickness and gun size of German tanks outpaced the Stuarts' development potential. In early 1942, several regiments newly equipped with Grant tanks each received a squadron of Stuarts whose primary function now became screening and reconnaissance; other Stuarts were attached to various units as escort/HQ vehicles. By the second battle of Alamein (10/42), Stuarts were being used in North Africa only in the 7th Armoured Division's 4th (Light) and 22nd Armoured Brigades, and in the 2nd New Zealand and 9th Australian Divisional Cavalry Regiments. In the PTO, Stuarts retained more of a primary combat role since in many ways they remained superior to the Japanese tanks they occasionally encountered. There they were used first in Burma, by the 7th Armoured Brigade's 7th Hussars and 2nd RTR; then later on Papua by elements of the 2/6th Australian Armoured Regiment; and lastly in India and Burma by the 7th Indian Light, and 45th Indian, Cavalry Regiments. A Stuart troop comprised three such tanks—except in HQ squadrons and in 1942 when "mixed" with Grants, where it had four. The recce troop of a 1944-45 armoured regiment or tank battalion was a special case, comprising eleven or twelve Stuarts.

†Stuart I Dates and RF for North Africa are 11/41-3/42 (1.1), 4-5/42 (1.2), and 6/42-5/43 (1.3); for PTO use they are 3-5/42 (Burma only; 1.1) and 12/42-1/43 (Papua only; 1.3). **Stuart III** Dates and RF for North Africa are 10/42-5/43 (1.4); for ETO use they are 1-4/44 (1.4) and 5/44-45 (1.3); for the PTO they are 3/44-45 (India-Burma only; 1.2).

4. Stuart V(a): This was the U.S. M3A3 Light Tank (see U.S. Vehicle Note 5). 3,427 were built. Stuarts apparently were not used in the ETO until 1944, after a recce troop had been added in late 1943 to the HQ squadron of each armoured regiment and tank battalion; by mid '44 most armoured recce regiments also had such a recce troop. The Stuart V was the most common model of the series in the ETO. The Yugoslav Partisans received as many as 56 in late 1944, and three Chinese provisional tank battalions equipped with them by the U.S. saw action in northern Burma in 1944-45.

†RF is 1.3 for 1-4/44 and 1.2 thereafter.

5. Locust(a): In February 1941 the U.S. Army issued a requirement for an air-transportable light tank. Eventually a design was finalized, and by 2/44 830 Light Tanks M22 had been built. Unfortunately the Army Air Corps had failed to develop a suitable transport aircraft; consequently the only way the M22 could be air-lifted was to be slung, with its turret removed, beneath the fuselage of a C-54—a rather unsatisfactory way to land in a combat zone. As a result the M22 was never used operationally by U.S. forces. The British however had received some, which they named Locusts, and found that their Hamilcar glider could carry one. In this way a small number (apparently only six) were air-landed with the 6th Airborne Armoured Reconnaissance Regiment during Operation Varsity—the Locust's only combat use in WW2. (However, its Dates have been extended to make it somewhat more available for DYO use.)

6. A9 & A9 CS [Cruiser Tanks Mk I & Mk I CS]: The A9, first in the Cruiser tank series, replaced the obsolete 1920s-era Medium Mk II. Cost was a primary consideration in the A9's design, resulting in very thin armor being used. Besides mounting the new 2pdr gun it also carried three Vickers water-cooled MG, one coaxial with the main gun and two in small sub-turrets

flanking the driver. 125 were built, including a small number of the CS

version with its 3.7-in. howitzer. A9 types were used by the 1st Armoured Division in France in 1940, and by the 3rd RTR in Greece in 4/41. In North Africa they served in the 2nd and 7th Armoured Divisions, and some were with the besieged garrison of Tobruk in 1941. A troop of Cruiser tanks comprised three such AFV (sometimes four in 1944-45; see British Vehicle Note 14).

†BMG factor (4x2) is actually two 4 FP BMG: one in a starboard fore sub-turret and one in a port fore sub-turret. Neither may be Scrounged, but both may fire in the normal manner at targets that lie within this AFV's VCA. In addition, the starboard sub-turret may fire at a target that lies within this AFV's starboard-side front Target Facing, and the port sub-turret may fire within the port-side front Target Facing. See the accompanying diagram. No CA-change DRM apply to such fire [EXC: VCA-change DRM]. In all AFV with a "4x2" multiple-BMG arrangement, both BMG malfunction, and are repaired or disabled, individually. If the player has no appropriate AFV Card, all such occurrences must be noted on a side record.

†A9 Dates and RF for ETO use are 5-6/40 (France; 1.1) and 4/41 (Greece; 1.5); for North Africa they are 6-11/40 (1.1), 12/40-2/41 (1.0), 3/41 (1.1), 4-6/41 (1.2), 7-8/41 (1.3), 9-10/41 (1.4), and 11-12/41 (1.5). A9 CS Dates and RF for ETO use are 5-6/40 (France; 1.4) and 4/41 (Greece; 1.6); for North Africa they are 6-11/40 (1.4), 12/40-2/41 (1.3), 3-6/41 (1.4), and 7-12/41 (1.5).

7. A10 Mk I & Mk I CS [Cruiser Tanks Mk IIA & Mk IIA CS]: The design requirements of the A10 called for an infantry-support tank with thicker armor than the A9, to be built at as low a cost as possible. As a result the A9 was simply modified: Extra armor plates were bolted on, its cramped and disliked MG sub-turrets were replaced by a normal BMG, and its maximum speed was reduced to improve reliability. But by the time the A10 design was ready in early 1938 its armor was considered inadequate for infantry support, so its designation was changed to Heavy Cruiser even though it was really too slow to be effective in the Cruiser role. A production run of 175 was completed: 10 of the A10 Mk I (with a water-cooled CMG), 135 A10 Mk IIA (with an air-cooled CMG), and 30 A10 Mk IIA CS. They were used more or less interchangeably with A9 and A13 types. Most of the Cruiser tanks sent to Greece in 1941 were A10 types.

†BMG RF is 1.1. CS number is reduced to 4 if BMG is not present.

†A10 Mk I Dates and RF for ETO use are 5-6/40 (France; 1.3) and 4/41 (Greece; 1.1); for North Africa they are 12/40-2/41 (1.1), 3-4/41 (1.4), 5-8/41 (1.3), 9-10/41 (1.4), and 11-12/41 (1.5). For the A10 Mk IIA CS in the ETO they are 4/41 (Greece; 1.4); for North Africa they are 12/40-2/41 (1.4), 3-4/41 (1.6), 5-8/41 (1.5), and 1.6 thereafter.

H

Vehicle 11

8. *A13 Mk I, Mk II, & Mk II CS [Cruiser Tanks Mk III, Mk IVA, & Mk IVA CS]:* The performance of the Russian BT tank sparked consideration of a much faster Cruiser, resulting in the A13 which was based on the same U.S. Christie tank that had inspired the BT—though the A13 omitted the latter's ability to be driven without tracks. Only 65 of the A13 Mk I were built, with

all subsequent models having extra armor plates attached to the hull nose and the turret front and sides. This uparmored version was known as the A13 Mk II—or alternatively as the Cruiser Tank Mk IV or IVA, with the Mk IV having a water-cooled CMG and the Mk IVA an air-cooled CMG. 133 Mk IV and 172 Mk IVA (including a limited number of CS tanks), were built. While somewhat unreliable, the A13 series nonetheless was the design foundation upon which all subsequent Cruisers were based. A13 types were used in the same manner as A9 and A10 in France, Greece and North Africa, forming the striking power of British armoured divisions until replaced by the A15 Crusader.

†*A13 Mk II* Dates and RF for ETO use are 5-6/40 (France; 1.2) and 4/41 (Greece; 1.3); for North Africa they are 12/40-2/41 (1.2), 3-6/41 (1.0), 7-8/41 (1.1), 9-10/41 (1.2), and 11-12/41 (1.3). For *A13 Mk II CS* use in the ETO they are 5-6/40 (France; 1.5) and 4/41 (Greece; 1.5); for North Africa they are 12/40-2/41 (1.5), 3-5/41 (1.3), 6-8/41 (1.4), and 9-12/41 (1.5).

9. *(A15) Crusader I, II, I CS, & II CS [Cruiser Tanks Mk VI, Mk VIA, Mk VI CS, & Mk VIA CS]:* The next Cruiser tank to see action was the Crusader, which was loosely based on the A13 Mk II and the unsuccessful A13 Mk III Covenanter (Cruiser Tank Mk V). It was fast, low-slung, and better armored than its predecessors, but was notoriously unreliable due to having been ordered directly into production in August 1939 without sufficient testing. The Crusader II featured a slight increase in armor thickness, but retained the 2pdr gun which was now obsolete vs the newest PzKpfw III and IV. The Crusader CS carried a 3-in. howitzer. Both the Crusader I and the early Crusader II carried a BMG mounted in a sub-turret that was disliked due to being cramped, poorly ventilated, and often impossible to exit in an emergency; hence it was often removed. For simplicity, all Crusader I counters have this BMG while the Crusader II do not. The Crusader first saw action with the 6th RTR of the 7th Armoured Brigade in Operation Battleaxe—the abortive attempt to relieve Tobruk in June 1941—during which more Crusaders were lost to breakdowns than to combat. Thereafter it became the most numerous Allied tank in the desert until the arrival of Grants and Shermans.

†*A13 Mk II* Dates and RF for ETO use are 5-6/40 (France; 1.2) and 4/41 (Greece; 1.3); for North Africa they are 12/40-2/41 (1.2), 3-6/41 (1.0), 7-8/41 (1.1), 9-10/41 (1.2), and 11-12/41 (1.3). For *A13 Mk II CS* use in the ETO they are 5-6/40 (France; 1.5) and 4/41 (Greece; 1.5); for North Africa they are 12/40-2/41 (1.5), 3-5/41 (1.3), 6-8/41 (1.4), and 9-12/41 (1.5).

†The BMG, if present, can fire in the normal manner at a target that lies within the Crusader's VCA; in addition, it can fire at a target that lies within the area from the "centerline" of its port side Target Facing to its VCA. See the accompanying diagram. No CA-change DRM apply to such fire [EXC: VCA-change DRM].

†*Crusader I* RF is 1.0 for 6-12/41, 1.1 for 1-5/42, 1.2 for 6/42, 1.3 for 7-8/42, 1.4 for 9-12/42, and 1.5 in 1943. *Crusader I CS* RF is 1.4 for 6/41-5/42, 1.5 for 6-8/42, and 1.6 thereafter. *Crusader II* RF is 1.0 prior to 1943 and 1.1 in 1943. *Crusader II CS* RF is 1.3 prior to 1943 and 1.4 in 1943.

10. *Crusader III:* It was planned to mount the new 6pdr gun in the Cavalier, not the Crusader. However, the failure of the Cavalier design made it necessary to adapt other tanks to carry the gun.

Mounting the 6pdr in the Crusader II required that one turret crewman be omitted, thus giving the Crusader III a two-man turret with the tank commander doubling as loader. At the start of the second battle of Alamein, 8th Army had 78 Crusader III available for immediate action. The 6th Armoured Division entered the North African campaign in Tunisia with Crusader III constituting about 40% of its tank strength. 4,350 Crusaders I-III were built, plus another 1,373 special-purpose variants (AA tanks, recovery vehicles, etc.).

†Decrease RF by .1 for each month after 7/42 until 1.3 is reached in 10/42; RF is 1.2 for 1-2/43, and 1.4 for 3-5/43.

11. *Grant(a) & Lee(a):* After the bulk of their modern tanks had been lost in France, the British

sent a tank mission to the U.S. in an attempt to obtain the production of British tank designs in American factories. They were informed, however, that only designs accepted by the U.S. Army could be produced in the U.S., although some modifications for British use would be allowed. The mission therefore placed "cash & carry" orders for the M3 Medium Tank straight off the drawing board, but with a new turret of British design. This they named the "Grant", while "Lee" was used for the standard versions of the M3 series (which were Lend-Leased somewhat later). 167 Grants, divided between the 1st and 7th Armoured Divisions, were present at the start of the Gazala battles (the Grant's first use in combat). They provided a nasty surprise to the Germans, for they substantially increased the effective engagement range of British tank units and for the first time gave them an effective HE-firing weapon to deal with A-T guns. The Lee/Grant design had several drawbacks, such as its bulk and the positioning of its 75mm gun in the hull—but nevertheless it at last provided the British with a tank that could engage the German panzers on more even terms; in fact it was sometimes referred to as "ELH" (Egypt's Last Hope). At Gazala the establishment of a Grant-equipped armoured regiment was either two squadrons of Grants and one of Stuarts or one of Grants and two of Crusaders. By the second battle of Alamein some 170-180 Lee/Grants were available for immediate action and their regiments often contained a mixture of Shermans, Grants and Crusaders. After the North African campaign most Lees and Grants were shipped to India and Australia, with some eventually seeing combat again in eastern India and Burma. 1,685 Grants were built, and 1,202 Lees were Lend-Leased to the British. A Lee/Grant troop comprised three such tanks.

†B11 applies individually to both the 37LL MA and 75 SA. The 37LL MA is a T Gun, while the 75 SA is a bow-mounted NT Gun. Either the MA or SA can claim the possibility of multiple-ROF/armor-leader-direction [ERRATA: this is also true for the U.S. M3 Medium Tank], but only the one that fires first in a phase (treating Defensive First and Final Fire as one phase) can actually use it. Either the MA and SA both have Gyrostabilizer benefits or neither does; i.e., when using H1.42 one dr applies to both Guns.

†Only the 75 SA may fire Smoke ammo—as signified by "s87s" on the counter.

†Due to two of the MG that constitute the BMG FP being in fixed mounts and fired remotely, the BMG receives a cumulative +1 DRM to all fire at a moving/Motion target—as signified on the counter by a white dot behind the BMG factor.

†The Lee's AAMG was mounted in a turreted cupola. For game purposes it can be used as a normal AAMG or, while the crew is BU, like a remotely-controlled AAMG (i.e., while BU, it cannot be used vs an Aerial target but can be used in CC). RF for the AAMG is 1.4.

Vehicle 11

†Grant Dates and RF for use in North Africa are 5-6/42 (1.0), 7-12/42 (1.1), 1-2/43 (1.2), 3-4/43 (1.3), and 5/43 (1.4); for India-Burma they are 12/43-45 (1.6). For the Lee in North Africa they are 6-7/42 (1.6), 8-9/42 (1.4), 10-12/42 (1.3), 1-2/43 (1.4), and 3-5/43 (1.5); for India-Burma they are 12/43-2/44 (1.5), 3-12/44 (1.1), and 1945 (1.0).

12. *Sherman II(a)*: When news of Tobruk's fall on 21 June 1942 reached Churchill, he immediately asked Roosevelt for as many new Shermans as could be made available. In response it was

first proposed that Gen. Patton and the entire U.S. 2nd Armored Division should be sent directly to Egypt. Orders to this effect were issued, but were then cancelled when it was learned that, due to the problems inherent in such a move, the division could not arrive there until late in the year—which might well be too late. Consequently, Shermans were taken from units in the U.S. and shipped to Egypt. By the time of the second battle of Alamein, 8th Army had 285 of which some 250 were available for immediate action; about two-thirds of these were Sherman II (the M4A1 Medium Tank). Only 942 Sherman II were Lend-Leased to the British, and its prominence on the battlefield was soon eclipsed by other Sherman types.

†Dates and RF are 10/42-5/43 (1.0); 9-12/43 (1.1); 1-7/44 (1.2); and 8/44-5/45 (1.3).

13. *Sherman III(a)*: This was the U.S. Medium Tank M4A2. Of all the 75mm Sherman types available in quantity to the British, they liked the Sherman III best due to its better speed, performance and reliability. About one-third of the Shermans available to the 8th Army at the second battle of Alamein were of this type. 5,041 were Lend-Leased to the British, and another 382 to the Free French.

†RF is 1.4 in 10/42, 1.3 for 11/42-2/43, 1.2 in 3/43, 1.1 for 4-6/43, and 1.0 thereafter.

14. *Sherman V(a)*: This was the British designation for the U.S. Medium Tank M4A4. This piece also represents the Sherman I (U.S. M4), which is equivalent in game terms, the main difference between the Mk I and Mk V being the type of engine used. 7,499 Sherman V were built, of which 7,413 were Lend-Leased. Of these, 7,167 went to the British, making the Mk V the most numerous Sherman type available to them. Another 274 Sherman V were Lend-Leased to the Free French. 2,096 Sherman I were Lend-Leased to the British. A Sherman troop officially contained three such tanks, but in NWE and Italy most actually had four, with the extra being a Sherman Firefly or Sherman IIA—with the exact configuration dependent on the date and unit. However, a Sherman troop in the armoured recon regiment of the 1st or 6th Armoured Division in Italy comprised two Shermans and two Stuarts (with the latter often being turretless; see British Vehicle Note 44).

†RF for ETO use is 1.1 for 7-8/43, 1.0 for 9/43-4/44, and .9 thereafter. PTO RF and Dates are 1.3 for 12/44-1/45, and 1.0 thereafter.

15. *Sherman IIA(a)*: This was the U.S. Medium Tank M4A1(76)W. Almost all those received by the British were sent to Italy, as Montgomery wished to avoid additional supply complications in his 21st Army Group. Eventually, however, some were used in NWE by the 2nd Armoured Regiment of the 1st Polish Armoured Division. Initially in Italy, one Sherman IIA was allotted per tank troop if available, but later it equipped entire troops. 1,330 Sherman IIA were Lend-Leased—all to the British. "A" in the British designation denoted the 76mm gun.

†RF and Dates for use in Italy are 1.3 for 9-11/44, 1.2 for 12/44-2/45, and 1.1 thereafter. For other ETO use they are 1.5 and 11/44-5/45.

16. *Sherman IIC(a) & VC(a)*: When it became obvious that the Challenger would not be available in time for the Normandy landings, the Sherman was suggested as an alternative to carry the powerful 17pdr gun. The feasibility of this was doubted, but an experimental installation proved it would indeed work with a minor adaptation of components. Subsequently a rush conversion program produced enough 17pdr-Shermans (nicknamed Fireflies) by June 1944 to provide an average of one per non-DD Sherman troop, and one per Cromwell troop in the 7th Armoured Division's 22nd Armoured Brigade. The Firefly at last gave the British a tank whose gun equalled or bettered those mounted in the majority of German tanks, as

well as being superior to all U.S. tank guns. It was often used from an "overwatch" position; i.e., sitting back behind cover, protecting the forward ranks of 75mm Shermans against Tigers and Panthers. The Panzers rightly feared it, and had standing orders to attack Fireflies first in any engagement. The Firefly had neither a BMG nor its corresponding crewman, his position being used to stow extra MA rounds. The most common version of the Firefly was the VC, a converted Sherman V; the next most common types were the IIC and the Hybrid IC (the latter being based on the Sherman I and equivalent to the IIC in game terms). "C" in the British designation denoted the 17pdr gun. In all, about 600 Fireflies were produced.

†Dates and RF for ETO use are 6-12/44 (IIC: 1.4; VC: 1.2) and 1-5/45 (IIC: 1.3; VC: 1.1)—except for use in Italy where they are 10/44-3/45 (IIC: 1.6; VC: 1.5) and 4-5/45 (IIC: 1.5; VC: 1.4).

17. *Sherman IB(a)*: This was the U.S. Medium Tank M4(105). 593 were Lend-Leased, all to the British who used them only in Italy. They were usually employed as CS tanks (see British Vehicle Note S), often being called upon to provide indirect-fire support. "B" in the British designation denoted the 105mm howitzer.

†Dates and RF for use in Italy are 10-12/44 (1.5), 1-3/45 (1.4), and 4-5/45 (1.3).

18. *(A27L) Centaur IV [Cruiser Tank Mk VIII]*: Initially, the new engine designed for the Cromwell could not be provided in sufficient quantity, so the old Liberty engine used in the A13 and Crusader was installed in some of the early production models. This version was designated the A27L Centaur. About 950 were built, but the only model to see action in its original form was the Centaur IV. (Many of the other models were eventually converted to Cromwells by retrofitting the latter's 75mm gun and engine.) All 80 Centaur IV built were used by the Royal Marine Armoured Support Group, which was formed specifically to assist selected assault units of the 3rd and 50th British, and 3rd Canadian, Infantry Divisions during the initial stages of the Normandy landings. The Centaurs were to fire from their LCTs during the run-in to the beach, then land to provide close support and on-call indirect fire for 24 hours. In the event, only 21 landed on time and able to engage the enemy; by mid morning 48 (plus 12 Shermans) were ashore, and the last dozen landed on D+1. They provided valuable support and, working with a number of different units, ultimately remained in action for more than two weeks. A troop comprised four Centaur IV plus a 75mm Sherman for the troop commander.

19. *(A27M) Cromwell IV & VII [Cruiser Tank Mk VIII]*: Development of the Cromwell, a distant descendant of (and intended replacement for) the Crusader, began in early 1942. It featured the powerful Rolls Royce Meteor engine (a variant of the famous Merlin aircraft engine used in the Hurricane and Spitfire), and by 1944 carried a 75mm gun derived in part from the 6pdr and specifically designed to fire the same ammunition as the Sherman. It was the fastest British Cruiser tank—though later models were geared down to improve the reliability of the suspension—and numerically was the most important British-built tank in 1944-45. Cromwells equipped the 7th Armoured Division's 22nd Armoured Brigade and the armoured recon regiments of the 7th, 11th, Guards, and 1st Polish Armoured Divisions—all of which fought only in NWE. A troop officially comprised three such tanks, but generally a fourth tank was also present—a Sherman Firefly for a troop in an armoured regiment, or a Challenger for an armoured recon regiment troop. Cromwells also saw limited action in Korea.

†Cromwell IV RF is 1.1 in 1944 and 1.2 in 1945. Cromwell VII RF is 1.2 in 1944 and 1.3 in 1945.

20. *Cromwell VI & VIII*: These were the CS versions of the Cromwell. They carried a low-velocity 94mm howitzer which was designated 95mm to distinguish it from the weapon used in the older, obsolete CS tanks. The precise number of Cromwells built is no longer known, but would appear to be about 2,050; in addition, many (probably most) Centaurs were converted to Cromwells.

†Cromwell VI RF is 1.3 in 1944 and 1.4 in 1945. Cromwell VIII RF is 1.4 in 1944 and 1.5 in 1945.

Vehicle 26

H

21. (A30) *Challenger*: Originally intended for long-range tank-vs-tank combat in the desert, the Challenger featured a lengthened Cromwell hull and chassis, with the hull center section widened to accommodate the large turret needed to carry a 17pdr. Unfortunately the Cromwell was basically unsuitable for such a powerful gun, and numerous problems and delays were encountered during development. Many of the Challenger's deficiencies were never fully rectified, and concern about this led directly to the concept of the Sherman Firefly. Even after being put into production the Challenger was still not considered truly battleworthy—but its potent armament was needed in combat, so it was issued to the Cromwell-equipped armoured reconnaissance regiments of the 7th, 11th, Guards, and 1st Polish Armoured Divisions, in which it was used in the same manner as the Firefly. 200 Challengers were built.

†RF is 1.6 in 8/44, 1.5 in 9/44, and 1.4 thereafter.

22. (A34) *Comet*: This, the last of the Cruiser tanks, was originally envisioned as being merely an improved Cromwell, but ultimately it became an almost total redesign. The Comet's gun, officially called the 77mm, was actually a less powerful version of the 17pdr. This seemingly retrograde step was taken to ensure that the gun would not overstress the vehicle as had been the case with the Challenger. Though it was planned to have the Comet replace the Cromwell in 1944, development and testing took longer than expected, and it did not enter combat until after the crossing of the Rhine. It was used only in the armoured regiments and armoured reconnaissance regiment of the 11th Armoured Division, replacing all the Shermans in that division. About 1,200 Comets were built between April 1944 and May 1945. Only a few years after the war they began to be replaced by Centurions, the first six of which had arrived in Germany in May 1945 too late to see combat.

23. *Sherman Dozer(a)*: This was the U.S. M4 Tankdozer as used by the British, who often referred to it as the "Sherdozer". The British Army apparently received tankdozers later and in fewer numbers than the U.S. Army. A tankdozer based on the Cromwell was also designed, but since it saw action only in the last two weeks of the war it has not been included in the game.

†For tankdozer usage, see "Bulldozer" in the Index. See U.S. Vehicle Note 18 for the application of "+2 for HH" on the counter.

†Dates and RF for use in Italy are 9-10/44 (1.6), 11-12/44 (1.5), and 1-5/45 (1.4); otherwise for ETO use they are 1/45 (1.6), 2/45 (1.5), and 3-5/45 (1.4). For use in Burma they are 4-8/45 (1.6).

24. *Sherman Crab(a)*: This is the same mine-clearing vehicle described in U.S. Vehicle Note 20. The British built 689 Crabs between Sept. 1943 and Dec. 1944, and the vast majority were used in the 30th Armoured Brigade of the 79th Armoured Division—though in Italy they were employed in the 51st RTR as part of the 25th Armoured Engineer Brigade. During the Normandy landings, Crabs unintentionally were the first gun tanks ashore on many of the Canadian and British beaches, and the value of their ability to fight as well as flail was immediately proven. A Crab troop comprised five such tanks; generally, three flailed while the other two stood by in reserve, ready to provide covering fire. The common practice in NWE was to allot one or more Crab troops to a local commander when the situation warranted their use; when their mine-clearing tasks were finished, they were withdrawn from his control.

†For usage rules see B28.7-72 and U.S. Vehicle Note 20. As a flail tank enters a woods/building obstacle (even via a TB/Reverse-movement), its flail mechanism becomes disabled for the remainder of the scenario. A flail tank (or other vehicle with special mine-clearing capability) may not attempt to clear mines using Reverse movement. A tank whose flail mechanism is still functional does not suffer Recall due solely to disabled MA.

†Dates for use in Italy are 4-5/45.

25. (A11) *Matilda I [Infantry Tank Mk I]*: This was the first version of what the British referred to as the Infantry ("I") tank, whose sole function was to accompany and support infantry. The design specifications of the Matilda called for it to be small (i.e., inconspicuous) but well armored. A top speed greater than that of infantry was held to be unnecessary. Also of prime importance was that it be inexpen-

sive to manufacture. Series production of the Matilda I began in 1937 and ran to 139 vehicles—77 of which went to France with the 4th and 7th RTR, forming the majority of tank strength in the 1st Army Tank Brigade. They proved nearly impervious to German 37mm A-T guns, but by the end of May all had been destroyed or abandoned. The remaining 63 Matilda I in England were used only for training.

†Minimum road-MP cost is one MP; i.e., it cannot use the 1/2-MP road rate even if CE—as signified by "Road Rate NA" on the counter.

†Optional 6-PP MA is a 12.7mm MG—as signified by "MA: 12.7" on the counter. See also British Vehicle Note B.

26. (A12) *Matilda II & II CS [Infantry Tank Mk II]*: The Infantry Tank Mk II was faster and more heavily armored than its predecessor, and carried a gun capable of destroying any German tank in use in 1940. It was sometimes called the Matilda Senior while the Matilda I was still in service, but later was referred to simply as the Matilda. Its thick hide and well-protected tracks (which were covered by an outer layer of armor) made it virtually invulnerable to all but the German 88—as was shown in France at the battle of Arras. (Indeed, it is said that the Germans developed APCR directly in response to their experiences with Matildas in France.) In North Africa, after playing a large part in the rout of the Italian 10th Army in late 1940, the Matilda was dubbed "Queen of the Battlefield". In 1941 even German tankers showed a marked reluctance to engage it with anything less than overwhelming superiority—a condition the British called "Matilda-itis". However, its lack of speed in the mobile desert war, its inability to be upgunned and the lethality of the 88 eventually caused its demise. Only 23 were used in France—all in the 1st Army Tank Brigade. Many were used in North Africa, seeing action in the 1st and 32nd Army Tank Brigades. In addition, B Squadron of the 4th RTR used Matildas in Eritrea, and eight fought on Crete with the 7th RTR. Matildas were used in the PTO by the Australians, first on New Guinea, then later on Bougainville and in Borneo; they also developed a FT version, a few of which were used 7-8/45. 2,987 Matilda II types were built.

Throughout the war, a troop (called a section, prior to 1941) of Infantry tanks contained three "I" tanks of the same basic model (e.g., Matilda II or Valentines, etc.); CS models were normally found in a fighting troop only in the PTO, where the Australians used one CS and two 2pdr-versions per troop. Very generally, when "I" tanks were available one troop was allotted to each assaulting infantry company. Amazingly, a 1940 Army Tank Brigade—a formation whose sole function was to provide front line armor support for infantry operations—contained not one HE-firing weapon. This was belatedly, but only partially, remedied in early 1941 by the addition of a few CS "I" tanks to each squadron.

†One Matilda variant which saw action after mid 1942 was the *Matilda Scorpion*, an early type of flail tank. 32 were available at the start of the second battle of Alamein, and some were used during the fighting at the Mareth and Wadi Akarit lines. In action they proved rather unreliable due to inherent weaknesses in the flail mechanism. Any Matilda II appearing in a North African scenario in/after 10/42 is a Scorpion (BPV: 56; RF: 1.6). It retains the use of all its armament, and all Flail Tank rules apply. [EXC: A +1 DRM applies to the Mine Clearance DR, and the DR given in B28.7-72 for each possible result is assumed to be a Final DR. In addition, it may not clear wire like the Sherman Crab.] If the use of Vehicle Dust (F11.74) is allowed in the scenario, a +2 gray Dispersed Smoke counter is immediately placed in the Scorpion's Location as it enters a new hex to flail therein (and is removed when it begins its next MPH without a declaration [B28.7] to flail again).

†Before any type of Immobilization result due to an attack [EXC: one caused by mines, or by a Direct Fire hit vs the front or rear Target Facing] takes effect, a subsequent dr must be made. If this dr is ≤ 3 , Immobilization occurs; if ≥ 4 , it does not. This is signified on the counter by "Immob: dr ≤ 3 ".

†*Matilda II* Dates and RF for ETO use are 5/40 (France; 1.4) and 5/41 (Crete; 1.5); for North Africa they are 12/40 (1.1), 1/41 (1.3), 2/41 (1.4), 3/41 (1.5), 4/41 (1.3), 5-12/41 (1.2), 1-4/42 (1.3), 5/42 (1.4), 6/42 (1.5), and 7/42 (1.6); for East Africa (Eritrea) they are 1-4/41 (1.3); for the PTO they are 11/43-2/44 (1.2), and 1945 (1.2). For the *Matilda II CS*, use Matilda II Dates [EXC: the CS version is not available prior to 5/41 nor in Crete] and RF, but increase the RF by .2 for North African use (to a maximum of 1.6), and by .1 for PTO use.

Vehicle 27

27. Valentine II [Infantry Tank Mk III]: The Infantry Tank Mk III, a private venture by Vickers-Armstrong Ltd., was loosely based on the A10 chassis and derived its name from being submitted to the War Office just before Valentine's Day, 1938. Initially deemed unacceptable, in mid 1939 with war imminent it was ordered into production "straight off the drawing board"—and surprisingly proved to be one of the most reliable British tanks of the war. Though designed as an "I" tank it was often used as a Cruiser, in which role it was handicapped by its low speed and poor turret layout. 350 Valentine I were built, but apparently none were sent overseas. 675 Valentine II were built, plus an undetermined number of Valentine IV (which the game piece also represents). The difference between the three models lay solely in the type of engine used. Valentine II and IV made their greatest contribution to the Allied cause with 8th Army in North Africa, where they were used by the 1st and 32nd Army Tank Brigades and the 23rd Armoured Brigade. A small number were also used by a Special Service Tank Squadron in the invasion of Madagascar.

†RF for use in North Africa is 1.3 for 11/41-4/42, 1.1 for 5-6/42, 1.0 for 7-8/42, 1.1 for 9-10/42, 1.2 for 11-12/42, and 1.3 in 1943. Dates and RF for use in Madagascar are 5/42 and 1.1.

28. Valentine V: To overcome the deficiencies of the Valentine's two-man turret, a three-man version entered production around the end of 1941. Those with the new turret were designated Mk III or V depending on the type of engine installed (and are equivalent in game terms). Their main combat use was in Tunisia with the 6th Armoured Division, which used mixed squadrons of Valentine III, Valentine V and Crusader III until re-equipped with Sherman III in March 1943 (at which time the Valentines were turned over to the French Army in Tunisia). In the PTO the three-man-turret Valentine was apparently used just once, with the 3rd New Zealand Division's Special Army Tank Squadron Group during the 2/44 assault on Green Island. 25 Valentine III were employed there, with 9 carrying 3-in. howitzers instead of the standard 2pdr armament—a conversion made by the New Zealanders to give their Valentines a good HE capability.

†Dates and RF for use in Tunisia are 11/42-2/43 (1.1) and 4-5/43 (1.4).

29. Valentine VIII: In order to fit the larger and more potent 6pdr gun in the Valentine, its turret had to be redesigned again, causing the loss of both the third turret crewman and the CMG.

Production of the 6pdr versions, designated Mk VIII and IX depending on the make of engine fitted (and equivalent in game terms), began in March 1942 but a year passed before any saw combat. 8th Army's employment of a few in Tunisia was apparently their only use in action with British forces. The Mk X was a late-production Mk IX with the CMG restored; however, it seems that none were used in combat by the British. Valentines were the original selection for conversion to DD tanks, and at least 650 of the 6pdr and three-man-turret models were so modified—but in late 1943 it was decided in the interests of standardization to use Shermans instead.

30. Valentine XI: The final Valentine production type was the Mk XI, which was identical to the Mk X but carried the British 75mm gun. Being derived from the 6pdr, this gun was not much bigger than the weapon it replaced and was thus able to fit into the Valentine's narrow turret. Valentine XI were used as battery commanders' vehicles in AT regiments equipped with Archers, and apparently also in some equipped with Wolverines/Achilles. A total of 8,275 Valentines were built (inclusive of all variants, and of 1,420 Mk VI-VIIA produced in Canada), making it one of the most important British tanks of the mid-war period. Even so, close to half were sent to the USSR.

31. (A22) Churchill I [Infantry Tank Mk IV]: As a precaution against the possible return of WW1-type trench warfare, a requirement was issued in 1939 for a heavy Infantry tank to succeed the Matilda II. The new tank, designated A20, was to have the ability to cross very wide trenches and ground churned up by shellfire. It was not a success, but after Dunkirk it was hurriedly redesigned as the A22 (later officially named the Churchill) and put into immediate production; not surprisingly, the early models suffered from numerous mechanical defects. 303 Churchill I were built. After first seeing combat in the Dieppe debacle, the Mk I was employed as a CS vehicle in the 21st and 25th Tank

Brigades in Tunisia and Italy. 1,127 Churchill II were also produced, with a BMG replacing the hull-mounted 3-in. howitzer—but most were either sent to the USSR or rebuilt as Mk III and IV.

†The 40L MA is a T Gun, while the 76* SA is a bow-mounted NT Gun. Either the MA or SA can claim the possibility of multiple-ROF/armour-leader-direction, but only the one that fires first in a phase (treating Defensive First and Final Fire as one phase) can actually use it.

†Due to the very limited traverse of the bow-mounted 76* SA, it receives a cumulative +1 DRM when firing at a moving/Motion target [EXC: Infantry expending MF without changing Location]—as signified by a white dot on the counter beside the SA designation.

†Dates and RF for use at Dieppe and in Italy are 8/42 (1.3) and 5-12/44 (1.5) respectively. For use in Tunisia they are 3/43 (1.4) and 4-5/43 (1.3).

32. Churchill IV: A new turret had to be designed to mount the 6pdr in the Churchill. Ultimately, two styles were produced: one of welded armor plate and another which was equivalent but made of cast armor. The Churchill III had the welded turret and the Churchill IV the cast version. The Mk III had its baptism of fire at Dieppe. Later, six Mk III were sent to Egypt for desert trials: Termed Kingforce, under the command of 1st Armoured Division they participated in two engagements during the second battle of Alamein, and were then withdrawn for evaluation. Churchill III and IV also saw action in Tunisia and Italy with the 21st and 25th Tank Brigades, and in NWE with the 6th Guards, 31st and 34th Tank Brigades. Prior to April 1945, Churchill squadrons in Italy contained two troops of Shermans. A TD troop was also often attached to a Churchill squadron in the ETO. 675 Mk III and 1,622 Mk IV were built.

†Dates and RF for use in North Africa are 10-11/42 (1.6), 3/43 (1.2), and 4-5/43 (1.1). For NWE use they are 8/42 (1.0), 6-7/44 (1.2), 8/44 (1.1), 9-11/44 (1.2), 12/44-3/43 (1.3), and 4-5/45 (1.4). For use in Italy they are 5-12/44 (1.2) and 1-5/45 (1.3).

33. Churchill V: This was a Churchill IV fitted with a howitzer for the CS role. It was used only in tank brigades in the ETO. 241 were built.

†Dates and RF for use in Italy are 5/44-5/45 (1.6). For NWE use they are 6-7/44 (1.4), 8/44 (1.3), 9/44-3/45 (1.4), and 4-5/45 (1.5).

34. Churchill VI: As ample supplies of the British 75mm gun became available it was decided to mount it in the Churchill IV, which with this gun was designated Churchill VI. The game piece also represents the Churchill IV as modified in Tunisia by replacing its 6pdr with the 75mm gun and mantlet of a wrecked Sherman. Called the Churchill NA75, about 200 of these were converted; they were used in Italy by the 21st and 25th Tank Brigades.

†Dates and RF for use in Italy are 5-12/44 (1.3) and 1-5/45 (1.4). For NWE use they are 6-7/44 (1.3), 8/44 (1.2), 9-11/44 (1.3), 12/44-3/45 (1.2), and 4-5/45 (1.3).

35. (A22F) Churchill VII & VIII: In 1943 a major redesign of the Churchill was undertaken. The resulting Churchill VII, while in external appearance quite similar to its predecessors, in fact contained many improvements beyond its thicker armor. The Churchill VIII was identical to the VII aside from its low-velocity howitzer for the CS role. About 1,600 Mk VII and VIII were built. The Churchill was the second most numerous type of British-built tank in NWE, and was used in the 6th Guards, 31st and 34th Tank Brigades. The Mk VII and VIII appeared in Italy only late in the war, being used there in the 21st Tank Brigade. Some of the earlier Churchill Mk were improved to roughly Mk VII standards by the addition of applique hull armor and, in some cases, the Mk VII turret; designated Mk IX-XI, these have not been included in the game. Total Churchill production was 5,640 vehicles. Since even the Churchill VII's hull was too narrow to accommodate the large turret needed to carry a 17pdr, a widened version called the Black Prince was developed. However, none of the six prototypes produced prior to VE Day saw combat, and the project was later cancelled in favor of the much superior Centurion.

†Churchill VII Dates and RF for NWE use are 6-7/44 (1.1), 8/44 (1.0), 9/44-3/45 (1.1), and 4-5/45 (1.2). For use in Italy they are 4-5/45 (1.5). For the Churchill VIII use these same Dates and RF, but increase the RF by .4 (to a maximum of 1.6).

H

36. Valentine & Churchill Bridge-layers: These vehicles were converted from Valentine II/III and Churchill III/IV. The Churchill carried a rigid bridge, while the Valentine's "scissors bridge" (as it was termed) was hinged in the middle and carried folded over on itself. Both types were 30 ft. long, and were placed via a series of hydraulically actuated pivoting arms, with the Valentine bridge unfolding as it was laid. Three Valentine or Churchill Bridge-layers were allotted to the HQ of an armoured or tank brigade respectively. Apparently 99 Churchill Bridge-layers were built during the war, of which 25 (plus a few of the Valentine type) were sent to the USSR.

†**Valentine Bridge-layer** RF for ETO use is 1.2; Dates and RF for use in India-Burma are 3-10/44 (1.3) and 11/44-45 (1.2). **Churchill Bridge-layer** Dates and RF for NWE use are 6-7/44 (1.3), 8/44 (1.2), 9/44-3/45 (1.3), and 4-5/45 (1.4); for use in Italy they are 5-12/44 (1.4) and 1-5/45 (1.5).

†A bridgeless Valentine Bridge-layer weighs 13.5 tons, has 11 MP, and its Target Size is +1. A bridgeless Churchill Bridge-layer weighs 36.5 tons, has 10 MP, and its Target Size is 0.

†The following rules apply to both types of Bridge-layer unless specified otherwise.

†**MOVEMENT:** The following apply to a *Churchill* while it is carrying its bridge: it may not use VBM—as signified by "VBM NA" on the counter; if in a Sunken Road hex (B4.), it is treated as being on a one-lane bridge for VCA-change purposes (B6.431).

†**PRC:** Although a Bridge-layer has no armament, it *does* have an Inherent Crew; however, see British Vehicle Note M. A Bridge-layer may carry neither Passengers nor Riders.

†**WRECK:** To indicate a Valentine or Churchill Bridge-layer wreck, use a Valentine II or Churchill VII Wreck counter respectively, and mark it with a Scrounged counter.

†**BRIDGE:** When placed, the bridge is represented by a % Bridge counter. It is One-Lane (B6.43-.431) and has a normal entry cost of one MF or four MP for all units. It is neither an obstacle nor a Hindrance to LOS, and a unit on it is considered to be in Open Ground as if on a road (with no B6.31 TEM).

• **PLACEMENT:** The bridge can be placed "across" only a trench, A-T ditch, canal, the shellholes in a hex, or a gully/stream—and only by a Stopped Bridge-layer (whose crew is neither stunned nor shocked) during its MPH at a cost of 8 "delay" MP (expended in one MPH) while it is ADJACENT to the Location "across" which it wishes to place the bridge. This Location must also be within the Bridge-layer's VCA. Only one bridge may be placed per hex, and may be placed across neither an unbreached wall/hedge hexside nor a Depression Hexside. A bridge placed "across" a gully/stream is at its Crest level. A Bridge-layer that becomes immobilized while Non-Stopped (including via an Unboggging DR), or that is Boggged/Mired, cannot place its bridge. The Bridge-layer's owner first announces the placement attempt, then makes an X# DR to check for possible disablement of the Bridgelaying mechanism. If this *Final* DR (see **DESTRUCTION**) is ≥ 12 the bridge cannot be placed and the Bridge-layer is immediately Recalled; on a *Final* DR of ≤ 11 placement commences, and only then does the AFV begin expending "delay" MP. After thusly expending the 8 MP the bridge is placed; position it such that its "length" is perpendicular to the hexside that is common to both its own hex and that of the Bridge-layer. Once the bridge has been placed, the Bridge-layer is flipped over to its "bridgeless" side and is immediately Recalled; the extra MP gained may be used immediately if the Bridge-layer is otherwise allowed to do so (including having not yet expended $\geq$ its new MP allotment).

• **DESTRUCTION:** A turret hit vs a Bridge-layer that is carrying its bridge is treated as a bridge hit instead. When such a hit is achieved (or when a DC is Placed "on the turret"; C7.346), a dr is made on the following table to see if damage occurs:

TYPE OF HIT:	AP, HEAT, HE ≤ 57 mm ^a HE 58-99mm ^b , DC ^c HE 100mm ^{+d} , DC ^e		
	DAMAGED ON dr OF:	1	1-2 1-3

^aIncludes all HE Harassing/Barrage OBA.

^bIncludes all HE Concentration OBA.

^cSuccessfully Positioned (only).

^d[EXC: OBA].

^eOptimally Positioned (only).

If damage occurs, make another dr, which yields the +DRM that will modify the X# DR made when placement is attempted. All such +DRM are cumulative even if caused by $\geq$ one hit. A hit (or DC Placed) on the bridge can affect its carrying Bridge-layer only via a Collateral Attack vs its CE crew [EXC: any CH vs the bridge renders it unplaceable and Recalls the Bridge-layer]. Types of attacks not listed herein cannot damage the bridge while it is on the Bridge-layer. Once the bridge has been placed, B6.33 (with a +2 TEM for the bridge) and B6.332 apply to attacks vs it.

• **COLLAPSE:** A placed bridge can collapse as per B6.42 if the weight of a vehicle on it exceeds 33 tons (for a Valentine bridge) or 66 tons (for a Churchill bridge).

37. Churchill AVRE: The Dieppe raid in 1942 emphasized the sappers' need for some kind of armored vehicle to assist with the demolition of obstacles while under fire. The Churchill was chosen for this because of its roomy interior and the large hatches on the sides of its hull. In this role it was designated the Armoured Vehicle, Royal Engineer—or AVRE. Churchill III and IV were used for the conversion, with applique armor added to increase their survivability. A new MA, the Petard spigot mortar, was devised: This short-range 290mm weapon fired a 40-lb. projectile (called the "Flying Dustbin" due to its shape) which was filled with 23 lbs. of plastic explosive and capable of destroying heavy concrete obstacles such as pillboxes and sea walls. The Petard was not loaded from inside the turret; rather, it was hinged outside the turret, and was opened and reloaded by the BMG operator through a special hatch above his head. Inside, the AVRE carried a number of special explosive charges which had to be hand-placed outside the vehicle by one or more of its crewmen, but which could be detonated from within the AVRE. A number of bridging, charge-placing, mine-clearing and mat-laying devices (the latter to help vehicles cross soft beach sand) could be fitted to the AVRE, but perhaps its most important secondary role was as a fascine carrier. A fascine was a bundle of brushwood typically about 8 ft. in diameter and 11-14 ft. long, carried on a special frame over the AVRE's front hull. It was used to fill ditches, bomb craters and small streams so that vehicles could cross them.

180 AVRE were available for the Normandy landings; see British Vehicle Note 74. AVRE were used in NWE by the 1st Assault Brigade, Royal Engineers, of the 79th Armoured Division; and in Italy by the 1st Armoured Engineer Regiment of the 25th Armoured Engineer Brigade. An AVRE troop comprised six such vehicles, but normally this was deployed into two three-vehicle halftroops. 754 AVRE were produced during the war.

†RF for NWE use is 1.2. Dates and RF for use in Italy are 4-5/45 and 1.3.

†**CREW:** The original Inherent crew of an AVRE are also Assault Engineers (H1.22) and Sappers (B28.8). An AVRE starts each scenario Inherently carrying four DC which can take counter form only when that AVRE's original crew voluntarily Abandons it; i.e., when the crew voluntarily takes counter form it can automatically possess $\geq$ one of those DC. Moreover, as long as an original AVRE crew counter possesses $\geq$ one of these DC it is considered Fanatic. These DC may not be Thrown, and may be Placed or Set only by an Assault Engineer. In addition to their normal IFT capabilities, these DC may be Set to *Breach* wall/hedge [EXC: bocage] hexsides over which the AVRE crew counter can claim Wall Advantage (even if no enemy unit is present); such an attempt requires the normal all-MF expenditure for Setting a DC, but no US# dr is required. When detonated, a *Final* KIA breaches the wall/hedge; see "**BREACH**" below for effects [EXC: this DC Breach attempt has no TK/IFT effects]. The crew may detonate its Set DC in the normal manner, or while Inherent again in the AVRE provided all other conditions applicable to detonating it are met [EXC: the thusly Inherent crew may detonate it while $<$ two hexes away from it]; if the AVRE expends a Start MP after its crew re-enters it but prior to detonation, the DC is no longer considered Set. If an AVRE's original crew voluntarily Abandons it, taking with them $\geq$ one of their DC, the AVRE retains an Inherent Driver.

†Use a Churchill VII Wreck counter to depict an AVRE wreck.

†**MA:** The AVRE's MA uses the C3 To Hit process [EXC: Area Target Type and TH Case L are NA], but its Basic TH# is "12" and each hex of range reduces this number by two. In addition, if the MA fires while the TCA does not coincide with the VCA, the TCA then immediately (but after any simultaneous Gun Duel shot vs it by an enemy unit), and automatically, changes so that it *does* coincide with the VCA (even if such a Gun Duel shot stuns/shocks the AVRE's crew). An AVRE is not Recalled due solely to MA disablement, provided its crew can still use/detonate

Vehicle 37

≥ one of its DC. An AVRE's MA has normal HE capabilities, and can also perform the following actions:

• **vs MINES:** The MA can clear mines as per B28.62, provided its TH DR would have hit any concealed enemy Infantry in the mined Location (even if none are actually present).

• **vs PILLBOX:** The MA can eliminate a pillbox. To do so it must fire (or, if the pillbox is unoccupied, must be treated as if it were firing) at Known enemy Infantry in that pillbox [EXC: TH Case E is NA]. An Original KIA on the IFT eliminates the pillbox (and all its contents) if that KIA's # is ≥ the pillbox TEM that applied to the TH DR.

• **BREACH:** The MA can Breach a wall/hedge [EXC: bocage] hexside that lies within its TCA and that is *not* parallel to the center hexspine of that TCA, provided the owner declares such an attempt prior to the shot. If the AVRE could claim Wall Advantage over that hexside (even if no enemy unit is present), then its range to that hexside is "zero" and TH Case E is NA; however, such an attack has no effect [EXC: SAN] on anything other than that hexside. Otherwise the MA must fire (or must be treated as if it were firing) at Known enemy Infantry (even if none are present) directly behind that hexside claiming its TEM. The maximum range at which such a Breach may be attempted is limited only by the AVRE's TH ability. An Original KIA on the IFT creates a Breach (in addition to its effects—if any—vs enemy Infantry); thereafter, movement/Manhandling across that hexside are treated as per B9.541. The Breach has no other effect. See the accompanying diagram and example.

EX: Assume the AVRE in the accompanying diagram is not carrying a fascine. Within its current TCA it may attempt to Breach with its MA a wall/hedge that lies along any hexside marked with a thick black bar in the illustration. If the AVRE can claim Wall Advantage and incurs no TH DRM, to hit a wall along hexside F2-G3 or F3-G3 will require an Original TH DR of ≤ 12 (Basic TH# at zero-hex range, with no wall TEM); if it cannot claim Wall Advantage the same shot will require an Original TH DR of ≤ 8 (10 [Basic TH# at one-hex range, since it must be treated as firing at Known Infantry in F2 or F3 respectively] with a +2 TH DRM [wall TEM]). Vs the Breachable hexsides between hexrows E and F it will require an Original TH DR of ≤ 6 (8 [Basic TH# at two-hex range] with a +2 TH DRM [wall TEM]), etc. The AVRE may attempt to Breach such hexsides beyond the area illustrated.

†**FASCINE:** An AVRE can be designated by scenario OB or DYO purchase as carrying one *fascine*—in which case the reverse side of the AVRE counter (whose artwork depicts a fascine mounted on the vehicle) is used, and a Fascine counter is placed on it. The following apply to an AVRE while it is carrying a fascine:

- **WEIGHT & MP:** Its weight is 44 tons, and its MP allotment is 7.
- **BU/CE:** While BU it must pay one extra MP per hex entered, just as if it were towing a Gun (C10.1)—as signified by "Towing MP" on the Fascine counter. Its CE DRM (D5.31) is +1, not +2—as signified by "CE(+1)" on the Fascine counter. If the AVRE becomes BU, flip the Fascine counter to its "BU" side.
- **ARMAMENT:** Its MA cannot fire—as signified by the lack of a Gun Caliber Size on the AVRE counter—but its CMG can. Its BMG receives a cumulative +1 DRM to all fire at a moving/Motion target—as signified on the AVRE counter by a white dot behind the BMG factor.
- **TCA:** Its TCA is considered to be centered on the rearward portside hexspine of its hex; see the accompanying diagram and example. Moreover,

this TCA may not be changed relative to the AVRE's VCA (i.e., the turret is immovable in this position). When placing the Fascine counter on the AVRE, align it to properly indicate the AVRE's VCA and TCA.

EX: An AVRE carrying a fascine has its TCA limited to the one shown in the accompanying diagram.

†**FASCINE USAGE:** A fascine can be placed voluntarily only "into" a trench or A-T Ditch, or INTO a shallow/deep stream—and only by a Stopped AVRE (whose crew is neither stunned nor shocked) during its MP at a cost of one "delay" MP while it is ADJACENT to the Location "into"/INTO which it wishes to place the fascine. This Location must also be within the AVRE's VCA. A fascine placed "into" a trench or A-T ditch Location thereafter allows any vehicle to enter/exit that Location as if it contained foxholes instead; its only effect on Infantry is to force them to leave the trench or A-T ditch (if they are in it) in that Location before they can enter any adjacent Location. Each fascine placed INTO a shallow/deep stream Location thereafter provides a -1 DRM to the Bog DR of a vehicle that is exiting that Location to a non-Depression hex. While a vehicle [EXC: motorcycle] is in a placed-fascine Location it negates all fascine benefits in that Location for another vehicle (as does any wreck created in that Location after the first fascine is placed there). A placed fascine has no game effect other than those just given.

As an alternative to placement, a fascine can be *dropped* voluntarily. Dropping it (whether voluntarily or not; see below) is accomplished in the same manner as placing it, with the following exceptions: it can also be dropped (at no penalty) during the AVRE's *DFPh* upon the owner's declaration of doing so; it can be dropped in any type of terrain, and; a dropped fascine is immediately removed from play with no effect beyond allowing its AVRE counter to be flipped over (see below).

Any Effects [EXC: mine attack] DR vs a fascine-bearing AVRE which fails by one to achieve any effect on the AFV Destruction Table causes its fascine to be dropped involuntarily upon an immediately subsequent dr of "1" [EXC: for a FT/MOL attack, assume a subsequent dr of "1"].

When a fascine is placed/dropped, that AVRE counter is then (after resolving any Defensive First Fire allowed vs it by MP expenditure) flipped to its non-fascine side: its TCA can, at the owner's option, either remain in the side facing shown in the AVRE diagram or can be instantly changed to coincide with the VCA; the extra MP gained can be used immediately if the AVRE is otherwise able (and allowed) to do so.

Once placed/dropped, a fascine cannot be moved/retrieved in any way—nor can it be set Aflame/Ablaze, targeted individually, or affected by an attack [EXC: it is removed if a Blaze or rubble occurs in its Location, or if the trench/A-T ditch it is "in" is eliminated by OBA]. A fascine is neither an obstacle nor a Hindrance to LOS.

†As a form of optional "armament", a fascine has a RF of .9 and a BPV of 2. Extra fascines (i.e., more than the number of AVRE in the player's OB) may not be purchased.

38. Churchill Crocodile: Probably the most famous flamethrowing AFV of WW2, and certainly one of the most fearsome weapons in the Allied arsenal, the Crocodile was a conversion of the Churchill VII. The FT gun, replaced the BMG, and a two-wheeled, armored trailer carried the flame fuel and tanks of pressurized-nitrogen propellant, all this equipment being provided in kit form. The FT fuel was a liquid form of napalm which adhered to almost everything it touched, and whose flame was extremely difficult to extinguish. Crocodiles first saw combat on D-Day, with the 141st Regiment of the Royal Armoured Corps. Shortly thereafter, this unit became part of the 79th Armoured Division, which later also incorporated the 1st Five and Forfar Yeomanry and the 7th RTR—two more Crocodile units. Together these units formed the 31st Armoured Brigade. Crocodiles were occasionally called on to support U.S. units—e.g., during the assault on Brest—and received high praise for their valuable assistance. In Italy, Crocodiles were used in the 51st RTR, which was part of the 25th Armoured Engineer Brigade. In June 1944 a Crocodile troop comprised four such AFV (later sometimes three, depending on the date and unit). About 800 Crocodile kits were produced, but not all were used operationally.

†X# applies only to the SA FT.

†The Crocodile's trailer has an AF of 6, and can be instantly disconnected (even if destroyed) by its non-shocked, non-stunned Inherent crew without need of MP expenditure or losing Motion status. Once the trailer is disconnected, replace the Crocodile with a Churchill VII counter marked with a BMG Disabled counter; the extra MP gained can be used immediately if the AFV is otherwise able (and allowed) to do so. TK Case A never

H

applies to a trailer. [ERRATA: A trailer, regardless of type/towing-vehicle, never leaves a wreck when it is destroyed.]

†Dates and RF for NWE use are 6-9/44 (1.3), 10/44-1/45 (1.2), and 2-5/45 (1.1). For use in Italy they are 4-5/45 and 1.3.

39. Deacon: Designed to increase the mobility of AT guns in North African use and to enhance the protection of their crews, the Deacon was an armored version of the AEC Matador MAT (medium artillery tractor) mounting a 6pdr in a partially open turret with a traverse of 319°. In 1942 some were sent to Egypt, where they equipped 1-2 batteries in at least some non-divisional AT regiments and the AT regiments in armoured divisions. Later in that campaign some were also attached to various armoured car squadrons. Deacons, also known as "Yellow Devils", were used successfully on several occasions but were not well liked due to their slow speed and overloaded chassis. 176 were built, but in 1943 and 1944, 42 were converted to armored ammo carriers for Priest SP guns. The remainder eventually were passed on to Turkey. A Deacon troop comprised four such vehicles.

†The MA may not fire at a target that lies within the starboard side of the Deacon's VCA. In addition, the TCA may not move "across" that area when traversing. See the accompanying diagram and example. These restrictions are signified by "Stbd VCA NA" on the counter.

EX: In the diagram, the Deacon can fire at a target in hex N2 or O3 [EXC: not at vertex O3-O2-P2 or O3-P2-P3], or at one in O2 Bypassing along hexside O2-N2. It cannot fire at a target in P1 or P2, nor at one in P3 that is not in Bypass along hexside P3-O4. If it wishes to fire at a target in Q2 or Q3, it must traverse its turret counterclockwise; i.e., the turret may not traverse across hexside P4-P3.

†The turret's rear Target Facing is unarmored.

†The CE DRM (D5.31) against incoming fire through any armored turret Target Facing is +3 instead of the normal +2. This is signified by "CE: +3" on the counter.

40. Wolverine(a) & Achilles(a): The Wolverine was the U.S. M10 GMC, and the Achilles was the same vehicle with a 17pdr replacing the original 3-in. gun. Both were employed in most types of AT regiments. A troop comprised four such AFV. 1,648 M10 GMC were Lend-Leased to the British. The appearance of the Archer in late 1944 freed additional Wolverines for conversion to Achilles.

†Wolverine RF is 1.3 for 9/43-4/44, 1.2 for 5-10/44, and 1.3 thereafter. Achilles Dates and RF for NWE use are 6/44 (1.4), 7-11/44 (1.3) and 12/44-5/45 (1.2); for use in Italy they are 4-5/45 and 1.5.

Vehicle 43

41. Archer: To help maximize the future availability of SP 17pdrs, the design of a version based on the Valentine tank was begun in mid 1942. Production of the Archer—the first full-tracked, British-built TD of any consequence in the war—began in early 1944, utilizing the late-model Valentine chassis. In July of that year, four were shipped to Normandy and another four to Italy, but not until late that year did Archer-equipped units enter combat. The Archer was unusual in that the gun faced to the vehicle's rear, which nullified its value in an offensive role, but which proved handy when having to quickly pull out of a position. The design also placed the breech of the 17pdr directly behind the driver's head, thus making firing on the move impossible. Archers were used in troops of four in AT regiments, but outside of Italy apparently not in those assigned to armoured divisions. 665 were built.

†The MA can fire only at a target that lies within the Archer's "rear" VCA (i.e., the VCA emanating from its rear Target Facing)—as signified by "MA: RVCA only" on the counter.

†The Archer can use neither Bounding First nor Motion Fire—as signified by "No BndFF" on the counter.

†Dates for use in Italy are 1-5/45.

42. Daimler & Lynx Scout Cars: In early 1938 the War Office requested a very small, partially armored vehicle to be used for scouting and liaison. This eventually resulted in the "Car, Scout, Mk I"—more commonly known as the Daimler Scout Car. Nicknamed the "Dingo", it featured a number of advanced design concepts for its time. Production ran to 6,626 vehicles in five Marks, the last of which was open-topped. (The earlier Mk's had a sliding or folding roof, but as this was rarely closed—and often was actually removed—the game piece is OT.) Dingos proved quite successful, and the resulting demand for scout cars led to several other companies being asked to produce similar types. Ford of Canada answered this call by producing the Lynx, a copy of the Daimler. To get it into production as quickly as possible, already-existing automotive components were utilized, and because of this its exterior dimensions were significantly greater than those of the Daimler. 3,255 Lynx were built. The Daimler's first combat came in Belgium and France, with 21 in the 4th Battalion of the Royal Northumberland Fusiliers, the reconnaissance battalion of the 50th Infantry Division, and 30 more in the various HQ units of the 1st Armoured Division. Thereafter as scout cars became more available they were allotted to many different types of units. From mid 1943 the Daimler SC was most commonly employed in armoured car regiments (see British Vehicle Note 52). The Lynx was used by Canadian units, and by British and Indian troops in the PTO.

†Daimler SC sD is not available prior to 1944—as signified by the superscript "4+".

†Daimler SC RF for non-PTO use is 1.5 through 4/41 [EXC: NA in Norway, 4-5/40], 1.4 for 5-10/41 [EXC: 1.6 for 5/41 use on Crete], 1.3 for 11/41-4/42, and 1.2 thereafter; PTO Dates and RF are 12/41-5/44 (1.5) and 6/44-4/45 (1.4). Lynx SC RF for non-PTO use is 1.6 for 7-11/43, 1.5 for 12/43-5/44, and 1.4 thereafter; PTO Dates and RF are 12/43-44 (1.6) and 11/44-45 (1.5).

43. Humber Scout Car: Another vehicle built to help meet the demand for scout cars was the Humber. It was less mechanically sophisticated than the Daimler and had thinner armor. On the other hand, its roomier crew compartment enabled it to carry a passenger, so it was commonly used as a liaison vehicle—e.g., in HQ units, and in the intercommunication troop of 9-12 SC authorized in mid 1943 to each tank battalion and each armoured, armoured recon, and AC regiment. It was also used by the RAF Regiment, especially in the PTO. 4,300 Humber Scout Cars were built.

†The MA is remotely controlled; it cannot fire if the crew is CE, cannot be fired by a Rider, and cannot fire at an Aerial target. This is signified on the counter by "CE/AA FP NA".

†Dates and RF for ETO use are 7-8/43 (1.4), 9/43-4/44 (1.3), and 1.2 thereafter. For PTO use they are 12/43-10/44 (1.4) and 11/44-45 (1.3).

Vehicle 44

44. Stuart Recce: Some British units using Stuart tanks as recon vehicles removed their turrets and fitted pintle-mounted MG. This was done to make them lighter, faster and less conspicuous.

These conversions were dubbed Stuart Recces and, aside from their reconnaissance role, were occasionally used as command vehicles and APCs. In the PTO the Stuart remained an effective gun tank, so it is doubtful that such conversions were as common there. Since Stuart Recces were nonstandard field-workshop modifications of whichever Stuart models were available, the game piece is generic, representing a typically converted Stuart III.

†The MA may be fired only at a target that lies within this AFV's VCA—as signified by “MA: VCA only” on the counter. The MA is treated as a single weapon for malfunction/repair purposes, but is treated as two LMG for Scrounging purposes.

†Make two To Kill DR when using the MG column of the AP To Kill Table; only one DR (firer's choice) is used. This is signified on the counter by “2 TK DR (MG)”.

†The Scout Car designation is given only in deference to the Stuart Recce's historical use. For all game purposes it is treated as fully-tracked.

†RF for non-PTO use is 1.5 in 1943, 1.4 for 1-4/44, and 1.3 thereafter. PTO Dates and RF are 12/43-45 and 1.5.

45. Humber III & Otter Light Reconnaissance Cars: The Humber LRC evolved from one of the many expedient wheeled-AFV designs rushed into

production in the summer of 1940. The Mk III (and the equivalent Mk IIIA) consisted of a modified Humber 4x4 8-cwt truck with a lightly armored body and a turreted Bren LMG. The Otter was its equivalent as built by General Motors of Canada. LRC were rather unsophisticated recon vehicles compared to purpose-built SC but, being much simpler designs, were less expensive to build and easier to maintain. They were standard equipment in the infantry division's recon regiment (see British Vehicle Note 51). In addition they were employed in ones and twos for scouting and liaison in engineer units (in which role each carried a recon boat—equivalent in game terms to a one-boat Small Raft), and were also used by the RAF Regiment. 3,600 Humbers and 1,761 Otters were built.

†Humber III LRC non-PTO RF is 1.4 prior to 7/43, 1.3 for 7-12/43, and 1.2 thereafter; PTO Dates and RF are 12/43-45 (1.5). Otter non-PTO RF is 1.6 for 4-6/43, 1.5 for 7/43-5/44, and 1.4 thereafter; India-Burma Dates and RF are 12/43-45 (1.6).

46. Morris CS9 Armoured Car: Pending the development of more modern vehicles, 99 of this stop-gap armored car were built in 1938 by converting Morris 4x2 15-cwt trucks. In May 1940,

38 equipped the 12th Lancers in France (the only AC regiment with the BEF), with three per troop; by the end of that month, all 38 had been lost. The 11th Hussars in Egypt received 30 Morris AC in 1939, and used them as HQ and troop leaders' vehicles (see British Vehicle Note 47).

†As used in Belgium and France this AFV had a coaxial LMG, which in North Africa was repositioned as an AAMG. Therefore, the counter has two sets of MG FP factors: “Fr: -/2” and “NAf: -/2”. The former is used in scenarios set in Belgium/France; the latter, those set in North Africa.

†Dates and RF for use in Belgium and France are 5/40 and 1.4. For North African use they are 6/40-4/41 (1.3), 5/41 (1.4), 6/41 (1.5), and 7/41 (1.6).

47. Rolls Royce Armoured Car: The origins of this vehicle go back to the Rolls Royce 1914-Pattern, which was the most widely used AC of WW1. The game piece is representative

of the 34 1920- and 1924-Pattern cars used by the 11th Hussars, who modified them by replacing the standard Vickers MG turret with an open-top type carrying an ATR, LMG and smoke discharger. These saw action against the Italians in the initial phase of the desert war. Despite their age they were quite reliable aside from excessive water consumption caused by the engine's crude cooling system. A Rolls Royce troop in North Africa comprised two such AC plus a Morris AC for the troop leader.

†RF is 1.2 prior to 4/41, 1.4 in 4/41, and 1.6 in 5/41.

48. Marmon-Herrington II ME, III ME & III MFF Armoured Cars: At the start of WW2, after being informed that Britain could not meet

their AC requirements, the South Africans undertook the production of a domestically designed armored car. Its 4x2 Ford truck chassis was supplied by Canada, the armament by Britain, and the armor by South African industry.

After the first 135 had been built, production switched to a 4x4 model using a conversion kit supplied by the U.S. Marmon-Herrington Co. The British contracted for a number of the 4x4 type, stipulating that each be equipped with an ATR, LMG, and an AA Vickers MG in lieu of the original armament of one Vickers. This version they named the Marmon-Herrington II, and the South Africans added the suffix ME (“Middle East”) to distinguish it from the original armament type which they designated MFF (“Mobile Field Force”). 338 ME and 549 MFF Mk II were built, with the former going to North Africa and the latter retained for use elsewhere. In May 1941 the Mk III entered production, featuring improvements derived from its predecessors' use in combat; 798 ME and 1,780 MFF Mk III were built, with about one-third of the latter going to India, Malaya and the Netherlands East Indies. While unsophisticated in design, lightly armored and poorly armed, Marmon-Herringtons (or South African Reconnaissance Cars, as the South Africans themselves designated them) were unfailingly reliable and proved a valuable asset to the Allies in 1941-42. Indeed, of the four British AC regiments that operated mainly in North Africa, only one (the 12th Lancers) was not completely equipped with the “Monkey-Harry” at some time during that period. In addition, South Africa's contribution to the desert war included two AC regiments and two divisional recon battalions, all of which employed Marmon-Herringtons throughout their tours of duty there. Besides North Africa, ME types also saw action in Syria, East Africa and Madagascar. The Union of South Africa ultimately produced 5,746 Marmon-Herringtons during WW2 (including the Mk IV-VII which saw no combat). Prior to mid 1943, an AC troop comprised three armored cars.

†Marmon-Herrington II ME Dates and RF for use in North Africa are 2-3/41 (1.4), 4/41 (1.3), 5-10/41 (1.2), and 11-12/41 (1.4); for use in East Africa they are 2-11/41 (1.3); for use in Syria they are 6-7/41 (1.3). Marmon-Herrington III ME Dates and RF for use in North Africa are 8-10/41 (1.4), 11/41-12/42 (1.2), and 1-5/43 (1.3); for use in Madagascar they are 9/42 (1.2). Marmon-Herrington III MFF Dates and RF for PTO use are 12/41-2/42 (1.2), 3-5/42 (1.4), and 6-12/42 (1.5).

49. Marmon-Herrington IIv & IIIv Armoured Cars: From their very first clash with German

armored cars it was apparent that Marmon-Herringtons needed heavier armament. Though the Mk II and III never had better weapons installed at the factory, authorization was soon granted in North Africa to replace the turret on some vehicles with captured Italian 20mm AA guns. Later, various AT weapons such as the German 37mm, Italian 47mm and British 2pdr were also fitted—but these modifications were not officially authorized. In late 1941 such variants averaged about one per Marmon-Herrington squadron; by late 1942 they averaged about one per troop. The game pieces generically represent two of the more common types; “v” in the name stands for “variant”.

†Despite their Italian-built MA, the IIv and IIIv do not suffer Captured-weapon penalties when British-manned, but always use red To Hit numbers—as signified by “RED THs” on the counter.

†Marmon-Herrington IIv Dates and RF for use in North Africa are 6-10/41 (1.5), 11/41-4/42 (1.4), 5-12/42 (1.3), and 1-5/43 (1.4). For Marmon-Herrington IIIv North African use they are 9-10/41 (1.6), 11/41-4/42 (1.5), 5-7/42 (1.4), 8-12/42 (1.3), and 1-5/43 (1.4).

50. Humber II & III Armoured Cars: The Humber AC, based on a

Quad FAT (field artillery tractor), was an intermediate step between the crude pre-war AC and the more mechanically sophisticated Daimler Armoured Car. The Humber II had a two-man turret, but in the Mk III this was replaced by a larger, three-man version. In North Africa, Humbers were first used by the 11th Hussars and 12th Lancers; later in that theater, several other AC regiments and

H

the RAF Regiment also received them. With some 5,300 of all Marks produced, Humbers were numerically the most important British-built AC of WW2.

†*Humber II* Dates and RF for North African use are 11/41-2/43 (1.3) and 3-5/43 (1.4). For the *Humber III* in North Africa they are 10/42-5/43 (1.2); for ETO use they are 6-12/43 (1.3), 1944 (1.4), and 1945 (1.5); for PTO use they are 11/42-45 (1.5).

51. Humber IV Armoured Car: This was essentially the Humber III AC with a U.S. 37mm gun. Unfortunately, this weapon's bulk allowed only a two-man turret crew. In the ETO, Humbers were generally found in the squadron and regimental HQs of AC regiments, as well as in the various HQ units of other armored formations. In the PTO, Humber IV were used by the 1st Indian Light Cavalry Regiment. From late 1942, Humber AC were most often employed in the recon regiments of infantry divisions, in which a scout troop typically comprised one Humber AC as the troop HQ, a recon section of two car-patrols (each with one Humber AC and one Humber LRC), and two carrier sections containing a total of seven Carriers.

†ETO Dates and RF are 7/43-5/45 (1.2). For use in Burma they are 1945 (1.3).

52. Daimler Armoured Car: This vehicle was inspired by the excellent performance of the Daimler SC, which had led to a suggestion that a larger version be built as an AC. Hence both vehicles had many similar design characteristics, though in certain respects the AC was even more sophisticated (e.g., in having a rear-facing steering wheel for the vehicle commander to use in an emergency). The Daimler's firepower was a great improvement over earlier British AC designs as well, for it carried the turret of the Tetrarch light tank whose 2pdr gun put it on a par with the Cruiser and Infantry tanks of the 1940-41 period. Unfortunately, Daimler AC production was seriously delayed several times by Luftwaffe bombing raids, and it was not until mid 1942 that they finally entered combat. In the desert they were used by the King's Dragoon Guards and the Royal Dragoons, usually with one Daimler and two Marmon-Herrington or Humber AC per troop. In Tunisia, several additional AC regiments arrived with or received Daimlers. At the conclusion of the North African campaign the organization of AC regiments was changed; thereafter an AC troop comprised two AC and two SC, both types usually being Daimlers. Daimler AC were used in India-Burma by the 11th (Prince Albert Victor's Own) Cavalry. 2,694 were built, and the type remained in service until about 1960.

†RF for non-PTO use is 1.5 for 7-8/42, 1.4 for 9-10/42 [EXC: use in Madagascar NA], 1.3 for 11/42-5/43, and 1.2 thereafter. India-Burma Dates and RF are 6/44-45 and 1.3.

53. AEC Armoured Cars: The AEC, an unsolicited design put forth by the Associated Equipment Co., Ltd. (the producer of London's double-decker buses), was a heavy AC—in effect the wheeled equivalent of a tank—derived from the AEC Matador MAT (medium artillery tractor). The Army, having no requirement for such a large and slow AC, initially rejected it—but Churchill personally intervened, and eventually the AEC I went into production. This model carried the turret and main armament of the Valentine II. Late in the North African campaign a small number were issued to certain AC regiments as heavy support vehicles, but apparently were then withdrawn from frontline service after the Axis collapse in Tunisia. The Mk II, which featured increased horsepower and a new three-man turret with 6pdr gun, seems to have been produced in very small numbers—though as many as 24 were supplied to the Yugoslav Partisans in late 1944. The Mk III, the final and most widely used model, was essentially a Mk II with the British 75mm gun. By virtue of its armor and potent, fully traversable MA, it was the most powerful AC of the war. AEC III were used in the same way as M3 GMC (see British Vehicle Note 58), but apparently none were used in Italy. Total AEC production amounted to 629 vehicles, including 122 of the Mk I. AEC were sometimes referred to as "Junies" or "Matadors".

†AEC I RF for use in North Africa is 1.6 for 11/42-1/43 and 1.5 thereafter.

54. Staghound I(a) & II(a) Armoured Cars: The Staghound was the U.S. T17E1, built by Chevrolet. It was large and quite heavy for an AC but, being intended for use in the desert, its size and weight were not considered liabilities. Around the end of 1942 it was about to be cancelled due to the plethora of AC then under development, but the British requested that production be continued for their use. Ultimately 2,844 Staghound I were built, all of which were supplied to Britain and the Commonwealth. The British modified some by installing the 76mm close-support howitzer, thus creating the Mk II (or Staghound CS as it was also known). Staghounds were not well liked by their users, who considered them too large and unwieldy for the narrow streets and lanes of Europe. Nevertheless they found a standard role in AC regiments, with three in the regimental HQ and three more in each squadron HQ. In Italy, Staghounds were also used by the 2nd New Zealand Divisional Cavalry Regiment and by the RAF Regiment. The British also used the U.S. M8 Armored Car, which they received toward the end of 1944 and employed in Italy.

†Staghound I RF is 1.5 in 1943, 1.4 for 1-5/44, and 1.3 thereafter. Staghound II RF is 1.5 for 5-10/44 and 1.4 thereafter.

55. Bishop: In mid 1941 a request was made for a SP version of the 25pdr, which was being used increasingly as an AT gun in the desert. The resulting vehicle utilized the sturdy Valentine tank chassis with a tall, rather crude superstructure for the gun. The Bishop, though mechanically reliable, was not well thought of by its users who found it to be slow yet conspicuously large, with a cramped interior and very little inherent gun traverse (the latter a significant handicap in the AT role). Fortunately, by the time it became available the 6pdr AT was being issued, so the Bishop was used as SPA. But even in this role it proved unsatisfactory, for its MA was so restricted in elevation that its maximum range was less than half that of the towed 25pdr. Bishops saw action with SP field regiments of the Royal Artillery in North Africa, Sicily and Italy before being declared obsolete in Oct. 1944. Only 100 were built since, soon after production had begun, the British decided to use the Priest in the SPA role.

†Due to the very limited traverse of the MA, it receives a cumulative +1 TH DRM when firing at a moving/Motion target—as signified on the counter by a white dot beside the MA designation.

†Use in Madagascar is NA.

56. Priest(a): This was the U.S. M7 HMC. The British requested it in early 1942 but were told that U.S. requirements had first priority. However, when Rommel's forces entered Egypt that summer, 90 were shipped to the 8th Army, the first batch arriving in September. 24 Priests equipped the 11th Royal Horse Artillery in the 1st Armoured Division during the second battle of Alamein—the vehicle's first use in combat. Thereafter, a number of 8th Army field and RHA regiments in Tunisia, Sicily and Italy used Priests, with most eventually being replaced by Sextons. For the Normandy landings, each of the three infantry divisions (3rd and 50th British, and 3rd Canadian) making the initial assault had its three field regiments completely equipped with Priests, as did the 19th Canadian Army Field Regiment in the 1st Canadian Army. In July and August of that year all the former were converted to towed 25pdrs and the latter to Sextons. In the PTO, Priests were used in Burma by the 18th Field Regiment. 828 M7 HMC were Lend-Leased to the British, who named them "Priests" because of their pulpit-like AAMG mount.

†Dates and RF for use in North Africa, Sicily and Italy are 10/42-5/43 (1.5), 6-12/43 (1.4), 1-9/44 (1.3), 10-12/44 (1.4), and 1.5 in 1945. For use in France they are 6-7/44 (1.3) and 8/44 (1.5). For use in Burma they are 11/44-45 and 1.3.

57. Sexton(a): The British were impressed by the sound design of the Priest, but were concerned that its non-standard gun would cause complications in training and logistics. What was needed was a well-designed SP 25pdr, but at the time neither the British nor the Americans felt able to undertake production of a new vehicle. The solution to this problem was found in Canada, where the Ram tank (which, like the Priest, used the chassis and mechanical components of the U.S.

Vehicle 57

M3 Medium) was being produced. Carrying only a 6pdr gun, the Ram by late 1942 was fast becoming obsolete, and early that year the Canadians had begun experimenting with a SP 25pdr variant to equip the artillery battalions of their armoured divisions. The fact that 25pdrs were already being manufactured in Canada was an added plus, for it assured a steady supply of guns. This variant carried the 25pdr in an open-top non-turreted fighting compartment similar to that of the Priest, and the new vehicle, named Sexton by the British, entered production in early 1943. By late 1945 when it ended, 2,150 had been built. Sextons were employed in Royal Horse Artillery and SP field regiments, both non-divisional and those organic to armoured divisions. They eventually replaced most of the Priests being used in the SPA role, and remained in British service until the late 1950s. A troop of full-tracked SPA comprised four such AFV, plus in 1944-45 a Ram (for a Sexton troop) or Sherman (for a Priest troop) OP tank (see H1.46).

†RF for NWE use is 1.4 for 6-7/44 and 1.3 thereafter. Dates and RF for use in Italy are 9/44 (1.5), 10/44 (1.4), and 11/44-5/45 (1.3).

58. M3 GMC(a) Halftrack: As M10 GMC became available in U.S. TD battalions, many of the M3 GMC they replaced were turned over to the British. Their new owners designated them the "75mm SP, Autocar" and issued them to the newly reorganized AC regiments, wherein two M3 (plus a SC) formed the heavy troop of an AC squadron (though in some cases they were grouped together to form a regimental battery of eight such vehicles). A few were used thusly in Tunisia, but most went into action later in Sicily and Italy. A relatively small number were employed in NWE, probably with AC units transferred from the Mediterranean Theater. A few sources state that they were also used in a support role in some infantry recon regiments and tank squadrons—but such use was probably quite rare.

†The CE DRM (D5.31) against incoming fire through the front Target Facing is +3 instead of the normal +2—as signified by "CE: +3F" on the counter.

†Dates and RF for use in Tunisia are 4-5/43 and 1.6. For use in Sicily and Italy they are 7-8/43 (1.4) and 9/43-5/45 (1.3). For use in NWE they are 6-12/44 (1.5) and 1.6 in 1945.

59. Light Tank Mk VI AA: As Mk VI light tanks were withdrawn from service, some were converted to the AA role by heightening the superstructure and replacing the normal turret with one carrying four MG. Though it was capable of putting out an impressive amount of firepower for a short time, the tank commander in the one-man turret had too many duties; as a result it was not a very effective AA weapon. By mid 1942 the HQ of an armoured regiment was authorized four Mk VI AA while that of a tank battalion was authorized eight. It seems, however, that not many of these AFV were used in action.

†RF for use in North Africa is 1.6 for 5-7/42 and 1.5 for 8/42-5/43.

60. Crusader AA: Several types of AA tank were produced for the AA protection of tank units in NWE. They were based on the Centaur and Crusader, with the normal turret replaced by one mounting a 40mm Bofors gun (thus creating the Crusader AA Mk I), twin 20mm guns (the Crusader AA Mk II and Centaur AA Mk I), or twin 20mm guns and a CMG (the Crusader AA Mk III and Centaur AA Mk II). The Crusader AA Mk I was issued to AA regiments, but was withdrawn shortly after the Normandy landings due to the lack of Luftwaffe targets. The Crusader AA Mk II and III (both of which are represented by the game piece), and the Centaur AA tanks as well, were issued to armoured regiments and tank battalions, with a troop of four authorized to the HQ of each such unit. They remained in service somewhat longer as they were found to be useful for infantry support.

†Though this AFV is OT, due to its having RST (D1.321) the crew must be BU to fire its armament—as signified by "CE FP NA" on the counter.

†Make two TK DR when using the 20L column of the AP TK Table; only one DR (firer's choice) is used. This is signified by "2 TK DR" on the counter.

†The optional CMG is always available, and has a 1.2 RF.

61. M17(a) MGMC Halftrack: This was a version of the U.S. "quad-50" halftrack. Some were made available to a few British AA regiments in NWE very late in the war (e.g., in the last few months before VE Day, the gun troops of the 94th Light AA Regiment in the Guards Armoured Division comprised two of these halftracks plus four Morris C9/B Bofors AA trucks). With the Luftwaffe practically non-existent, they were often used for infantry support.

†Due to the height of the gun mount, the crew's CE DRM is only +1 when being fired on through the turret's side/rear Target Facing—as signified by "CE: +1SRT" on the counter.

†The MA may not fire at a target that lies within the VCA and is also at the same or a lower level than the firer [EXC: during CC]—as indicated on the counter by "VCA ≤ level NA".

†Make four To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. This is signified by "4 TK DR" on the counter.

62. Humber AA & Staghound AA(a) Armoured Cars: The Humber AA was a Humber Mk I or Mk II AC with its normal turret replaced by the same type used on the Mk VI AA light tank. The Staghound AA was the U.S. T17E2 AC, which comprised a normal Staghound (U.S. T17E1) with its turret replaced by one mounting twin .50-cal MG. 1000 Staghound AA were built at the request of the British. Both types of AA AC were used in AC regiments, with four authorized to the regimental HQ. In addition, from September 1942 through November 1943 the HQ of an armoured brigade was authorized two AA AC, as was the HQ of a tank brigade. By late 1944, most if not all AA AC had been phased out thanks to complete Allied air superiority.

†For the Staghound AA, make two To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. This is signified by "2 TK DR" on the counter.

†Humber AA RF for use in North Africa and the ETO is 1.6 for 8/42-5/43, 1.5 for 6/43-8/44, and 1.6 thereafter. Staghound AA ETO RF is 1.5 for 6-8/44 and 1.6 thereafter.

63. M5(a), M5A1(a), M9(a) & M9A1(a) Halftracks: These were U.S. halftracks built by the International Harvester Co. Considered non-standard, they were consigned to Lend-Lease stocks, and most went to Britain where they were designated "Truck, 15-cwt, Half-Tracked, Personnel". The British used them as command vehicles, prime movers for AT guns (mostly the 17pdr), and as engineer/pioneer vehicles. Another important role was as an APC for the infantry sections in motor battalions—mostly those employed in NWE. When equipped with halftracks, a motor battalion was the functional equivalent of a U.S. armored infantry battalion. In game terms a 1944-45 motor platoon with halftracks contained four such AFV: three carrying a squad apiece, and the fourth carrying the platoon leader plus two HS, a PIAT and a 2-in. mortar. One thusly organized platoon was also found in each fighting squadron of an AC regiment, and in each recon squadron of an infantry division's recon regiment; however, it was termed a support troop in the former and an assault troop in the latter. Having one or more MG mounted on the halftrack seems to have been more the exception than the rule—and even when present such armament varied from vehicle to vehicle, so in this respect the game pieces are strictly generic. The British were Lend-Leased 5,690 M5 and M5A1 halftracks out of the 7,584 built, plus a large portion of the 3,433 M9 and M9A1 produced. In addition they were supplied with 1,600 M14 halftracks (M5 types that mounted twin .50-cal MG with 360° traverse), most of which they converted to APC.

†M5 RF is 1.6 for 10/42-5/43, 1.4 for 6-8/43, and 1.3 thereafter [EXC: for 6/44-5/45 NWE use it is 1.2]. M9 RF is 1.5 for 10/42-8/43, and 1.4 thereafter [EXC: for 6/44-5/45 NWE use it is 1.3].

H

Vehicle 68

64. Carriers A, B & C: The tracked armored carrier was by far the most common "AFV" in British service. Originally designed to transport the Vickers MG, by late 1939 three different types had evolved: the Bren, Cavalry, and Scout Carrier. Their primary function was to increase the mobility and protection of LMG and ATR crews in infantry, cavalry light tank, and divisional cavalry units respectively. A fourth type, the Armoured OP Carrier, was in development for artillery forward observers. Then in 1940 the Universal Carrier (often generically—but erroneously—referred to as the Bren Carrier) appeared, featuring one basic design which with minor modifications could fill any of these roles. This is the version the Carrier A-C pieces represent, though in some cases their initial Dates actually reflect combat use of the earlier models. (The Universal Carrier was first used in North Africa.) Carriers A and B were most commonly found in the carrier platoon of the infantry battalion and in the scout platoon of the motor infantry company. Both platoons had the same general functions: reconnaissance, direct support, flank protection and mobile reserve. The carrier platoon had 10 Carriers in 1939-40, increased to 13 around 1943. The scout platoon comprised 10-11 Carriers. In both, a section officially comprised one Carrier A (or C), one Carrier B and one 2-in. mortar Carrier. Carriers were also used in the scout troops of the infantry division's recon regiment; see British Vehicle Note 51. They were also employed as command, liaison and artillery observer vehicles. In 1943 a towing attachment was added so that in emergencies they could tow 6pdrs a short distance; however, it seems their use as towing vehicles became a fairly common practice. The Carrier C piece represents a Carrier A uparmed with a "privately obtained" MG. About 100,000 Universal Carriers and related types (Bren, Scout, etc.) were built inclusive of all variants, coming from (in descending order of overall production totals) Britain, Canada, the U.S., Australia and New Zealand. 57 Carriers were used by U.S. forces during the defense of the Philippines in 1941-42. They arrived at Manila on 12 Dec. 1941 en route from Vancouver to Hong Kong, and were released by the Canadian government a few days later. They had no armament, but were quickly provided with .30/.50 cal. MG. 40 were allotted to the Provisional Tank Group while the remainder went to the scout car section of the 26th Cavalry Regiment (Horse) (Philippine Scouts).

†The Carrier A's 2 FP BMG MA may be repositioned as a normal MA AAMG. This can be done only by placing an AA counter on the Carrier at the end of any friendly fire phase (not MPh) in which the BMG has not fired and the Inherent MMC is not stunned, shocked, broken or in Melee. As long as the AA counter remains on the Carrier, its FP is assumed to be "-1/-2" with a zero Multiple ROF. The AAMG may be repositioned as the BMG MA by using these same principles to remove the AA counter.

†The Carrier C's MA may not be Removed, as signified by "Rmvl NA" on the counter, and may be Scrounged only as a British LMG. However, in a scenario set in July 1943 or later it is assumed to be carrying a PIAT (as signified by "PIAT 2-1/2"); see C13.6-63, and U.S. Vehicle Note Z (which also applies to its use).

†Carrier A RF is .9 [EXC: 1.4 for 4-5/40 use in Norway and 5/41 use on Crete]. Carrier B RF is 1.0 through 8/43 [EXC: 1.5 for 4-5/40 use in Norway, and 1.4 for 5/41 use on Crete], 1.1 for 9-11/43, 1.2 for 12/43-5/44, 1.3 for 6-10/44, and 1.4 thereafter. Carrier C RF is 1.5 for 1-6/41, 1.4 for 7-12/41, 1.3 for 1-6/42, 1.2 for 7-10/42, and 1.0 thereafter.

65. Carriers, MMG A & B: The crews of some Carriers replaced the Bren LMG with a Vickers water-cooled MG, though this was not an official modification. In addition, a number of Carriers built in Australia had factory-installed Vickers BMG, and were commonly found in Australian units. Both are represented by the Carrier, MMG A. During the war the British also produced a Vickers-MG Carrier, but this version had the weapon mounted on a pedestal on the engine cover, thus allowing an all-round field of fire. This type—the Carrier, MMG B—became the standard vehicle in the two MMG platoons in each motor battalion, with each platoon having four such Carriers.

†The Carrier, MMG B's MA has a Normal Range of 14 hexes—as signified by "Nml Rng: 14" on the counter.

†Carrier, MMG A RF for non-PTO use is 1.3 through 12/42 [EXC: 1.5 for 5/41 use on Crete], and 1.4 thereafter; PTO RF is 1.3.

66. Carrier, 2-in. Mortar: Some Carriers were fitted with a 2-in. mortar mounted on the side of the gunner's compartment. In 1943 this fitting was made standard on all new Carriers so they could be easily field-converted to this role. It seems that in combat the mortar was rarely fired from the vehicle, the crew usually dismounting instead to fire it from the ground where they were less conspicuous. When available, one 2-in. mortar Carrier was included in each Carrier section (see British Vehicle Note 64). In the latter half of 1943 the 6pdr troops in AT regiments were each authorized two 2-in. mortar Carriers whose main function was to illuminate targets at night.

†The mortar may be Removed dm (D6.631). While Removed, its ROF and all other specifications conform to that of the 2-in. mortar counter with the 2-11 range.

†IR becomes available in 1942—as signified by the superscript "2+1".

†RF for 5/41 use on Crete is 1.4; otherwise it is 1.0.

67. Carrier, 3-in. Mortar: The Carrier was also adapted to transport the 3-in. mortar. The mortar was stowed disassembled on the rear of the vehicle, and its ammunition was carried in racks along the sides of the passenger compartments. Eventually it became the standard mode of transport for 3-in. mortars in motor and infantry battalions and in infantry recon regiments (see British Ordnance Note 2).

†This Carrier starts each scenario *Inherently* carrying a dm 3-in. mortar of the latest model and its ammo. This is signified on the counter by "dm 76* MTR". For Removing and restowing the MTR see D6.82-83. To indicate that the MTR has been Removed, place a "SA Disabled" counter on the Carrier. The MTR must be dm to be restowed. See also British Vehicle Note H.

†The Carrier's DVP value (F.3) is 2 without the MTR in it.

†RF for non-PTO use is 1.5 initially; beginning in 3/42, decrease it by .1 in each six-month period until 1.1 is reached in 9/43. Dates and RF for PTO use are 11/42-11/43 (1.4), 12/43-10/44 (1.3), and 12/44-45 (1.2).

68. Priest(a) & Ram Kangaroos: The idea for these APC originated with the Canadians in

Normandy. The initial type used was derived from the Priest, which was chosen simply because those in the 3rd Canadian Infantry Division had just been replaced by Sextons and were near at hand. An ad hoc workshop detachment code-named "Kangaroo" removed the guns and ammo bins from 76 Priests and plated over their gun apertures. The modified vehicles, at first referred to as "Unfrocked Priests", were used successfully just a few days later during Operation Totalize, the initial drive on Falaise, carrying the 4th Infantry Brigade of the 2nd Canadian Infantry Division and the 152nd Infantry Brigade of the 51st (Highland) Division. But since Priests were in limited supply, the Ram (see British Vehicle Note 57), of which there were many in Britain, was chosen as the standard conversion vehicle. A Ram became a Kangaroo by having its turret removed and the interior stowage altered to provide room for the passengers. The 1st Canadian Armoured Carrier Regiment was formed, and first used its Ram Kangaroos in the assault on Boulogne. The British too formed a Kangaroo unit, the 49th APC Regiment, and at the end of 1944 both formations became part of the 79th Armoured Division which used them on numerous occasions to provide assault transport for infantry battalions. Kangaroos were also employed in Italy, where in late 1944 and early 1945 102 Priests and 75 Shermans (which as Kangaroos are equivalent to Rams in game terms) were converted, and were operated by the 4th and 14th/20th Hussars. De-turreted Rams and Shermans were sometimes used in NWE and Italy respectively for towing 17pdr AT in armored units. A section of Kangaroos comprised three such AFV, and could transport one infantry platoon.

†The Priest Kangaroo's MA is a U.S. .50-cal HMG—as signified by "MA: 12.7(a)" on the counter.

†Priest Kangaroo Dates and RF for NWE use are 8-9/44 and 1.5; for use in Italy they are 2-5/45 and 1.4. Ram Kangaroo RF for NWE use is 1.5 in 1944, 1.4 for 1-2/45, and 1.3 thereafter; Dates and RF for use in Italy are 2-5/45 and 1.5.

Vehicle 69

69. White(a) Scout Car: This vehicle, the U.S. M3A1 SC, was officially designated "Truck, 15-cwt, 4x4, Armoured Personnel" by the British, but was generally referred to as the

White Scout Car after its manufacturer. It was not considered a true SC by the British, who employed it in various other ways; e.g., as a command/liaison vehicle, and as an artillery forward observer vehicle in infantry divisions. Even more importantly it served as an APC for the infantry section in certain motor battalions, primarily those in Italy where halftracks were not as widely available. In addition, in early 1943 a support troop was authorized for each AC squadron; this comprised four White SC (or halftracks; see British Vehicle Note 63) carrying a platoon of infantry trained as sappers.

†This vehicle can retain any unpossessed SW aboard it (D6.4), and its Passengers' FP is not subject to halving for Mounted Fire (D6.1) [ERRATA: Passenger FP from the U.S. M3A1 SC is also treated thusly].

†Dates and RF for use in Italy are 9/43-3/44 (1.3) and 1.2 thereafter. For use in North Africa and otherwise in the ETO they are 5-9/42 (1.5), 10/42-6/43 (1.4), and 1.3 thereafter.

70. IP Carriers Mk IIA, Mk IIB & AOV: The IP Carrier, whose official designation was "Armoured Carrier, Wheeled, Indian Pattern", was produced in India using Canadian Ford automotive components and locally manufactured armor plate. Numerically the most important model was the Mk II, which performed the same roles as the basic Universal Carrier. The models A and B had minor design differences, but either type could actually carry the BMG or BATR. The AOV (Armoured Observation Vehicle) featured a roof-mounted Bren LMG with a turret-like shield and, though designed

as an artillery forward observer vehicle, was often used as a light recon car. Some models were used in North Africa and Italy as well as in India-Burma, while others were used only in the latter theater.

†IP Carrier Mk IIA Dates and RF for use in North Africa and Italy are 5-9/42 (1.5), 10/42-5/43 (1.4), 10-12/43 (1.4), and 1/44-5/45 (1.3); for use in India and Burma they are 11/42-5/43 (1.3) and 6/43-45 (1.2). IP Carrier Mk IIB Dates and RF for use in North Africa and Italy are 5-9/42 (1.5), 10/42-5/43 (1.4), 10/43-44 (1.4), and 1.5 in 1945; for use in India and Burma they are 11/42-45 (1.3).

71. IP Carrier, 3-in. Mortar: Some IP Carriers were converted to carry the 3-in. mortar. The weapon was mounted assembled facing the rear of the vehicle and could be fired from this position. Apparently the IP Mortar Carrier saw action only in India and Burma. A total of 4,655 IP Carriers of all types were produced.

†While Inherent in the Carrier, the mortar can fire only at a target that lies within the Carrier's "rear" VCA (i.e., the VCA emanating from its rear Target Facing)—as signified by "MA: RVCA only" on the counter.

72. Wasp & Badger(a): The Wasp was a Carrier with a FT mounted in place of the BMG. Two

different types were used in action: the Mk II, which carried the flame-fuel and propellant tanks inside the vehicle; and the Canadian-designed Mk IIC, which had only a single flame-fuel tank that was mounted on the rear exterior, thus allowing an extra crewman to be carried. For simplicity the game piece generically represents both types. By 1945 the Mk IIC had replaced the Mk II in NWE. A Wasp platoon (which comprised six such AFV and was sometimes referred to as the "Ronson Cavalry"), was part of the support company in many infantry battalions by 1945. In some cases the motor battalion and/or independent MG company in an armoured division also had a platoon.

The Badger was a Ram Kangaroo converted by the Canadians to carry the Wasp FT. The flame gun replaced the Ram's BMG, and its associated equipment was stowed in the vehicle's interior. Badgers were used in action by the 4th Canadian Armoured Brigade in NWE.

†The Wasp's sD, if successfully fired, allows the placing of a Smoke counter in both hexes that are adjacent to the Wasp and in its VCA. Any VCA change pertinent to using the sD is treated as per D13.32.

†Wasp RF for NWE use is 1.4 in 1944 and 1.3 in 1945; Dates and RF for use in Italy are 2-5/45 and 1.4.

H

73. Buffalo Mk II(a) & Mk IV(a): These were the U.S. LVT2 and LVT4 respectively.

Most used in British service were only partially armored, but many were uparmed with a 20mm gun. In NWE they were under command of the 79th Armoured Division, and were first committed to action with the 5th Assault Regiment Royal Engineers and the 11th RTR during the operations around the Scheldt estuary. By 1945 some 600 were available, and they figured prominently in the battle of the Reichswald and the crossing of the Rhine. Near the war's end Buffaloes were also used in Italy, being referred to as Fantails in that theater. In the PTO, U.S.-type LVT were used by the Australians during their assault landings on Borneo. A Buffalo troop contained six such vehicles.

†These are Partially Armored AFV, with armor only on their front Target Facing.

†The AAMG consists of two 4-FP U.S. MMG. Each has the exact same field of fire as its counterpart on the U.S. LVT4 (see U.S. Vehicle Note 51 and its accompanying diagram). Each AAMG malfunctions and is repaired or disabled independently of the other. Whenever both AAMG are malfunctioned, mark the AFV with an "AAMG Malfunction" counter. However, if only one AAMG malfunctions, mark the AFV with a "One AAMG Malfunction" counter; thereafter, in each friendly fire phase in which that AAMG is not repaired, the remaining functioning AAMG may fire in its own allowed direction or in the malfunctioned AAMG's direction at no extra penalty.

EX: See the diagram for U.S. Vehicle Note 51. A Buffalo Mk IV's "port-side" AAMG malfunctions. As long as that AAMG is not repaired, the "starboard-side" AAMG can be used in either AAMG's side-rear field of fire; i.e., its field of fire is then in any direction except through the VCA.

An Armor/Passenger leader may direct the fire of more than one vehicular-mounted/Passenger-fired MG only if those MG are firing together as a FG.

†All rules in U.S. Vehicle Note 51 headed "PASSENGERS", "PP CAPACITY", "VEHICLE", "GUN" and "SURVIVAL" also apply to the Buffalo Mk IV.

†A Buffalo's sD can be fired in a water Location.

†The Bog DRM for ground specified as "soft, mud, or snow-covered" (D8.21) does not apply to a Buffalo.

†Buffalo Mk II RF for NWE use is 1.4; Dates and RF for use in Italy are 4-5/45 and 1.5. Buffalo Mk IV RF for NWE use is 1.3; Dates and RF for use in Italy are 4-5/45 and 1.4.

74. Sherman III DD(a): The DD (Duplex Drive) amphibious tank was a British invention. Tested first in 1941 on a Tetrarch tank, the system was then installed on more than 600 Valentines. But

by mid 1943 Valentines were obsolete, and it was decided that Shermans would be converted to the DD role for combat operations. For the Normandy landings—the initial combat use of Sherman DD—the British employed three armoured regiments: the 4th/7th Dragoon Guards (all of whose Sherman DD were ship-landed on the beach), the 13th/18th Hussars (34 launched, of which 3 sank; at least 5 ship-landed), and the Nottinghamshire Yeomanry (all ship-landed). In addition, the Canadians used two DD-equipped armoured regiments in the D-Day landings: the 6th (29 launched, of which 8 sank; 6 or more ship-landed) and the 10th (all ship-landed). Each regiment actually contained only two squadrons of DD Shermans; the third squadron, whose Shermans were equipped only for deep-wading, but which alone in the regiment had an allotment of Sherman Fireflies, landed later with the second wave of infantry. The plan for the British and Canadian beaches on D-Day was to have the Sherman DD land first, followed several minutes later by AVRE and Sherman Crabs arriving in LCTs (Landing Craft, Tank), with the first infantry assault companies hitting the beach shortly thereafter. However, due to much of the DD wave being delayed by the rough seas, the AVRE and Crabs were the first tanks ashore in many sectors and found themselves having to engage the AT guns that the DD Shermans were to have dealt with. Later in NWE DD Shermans were used by the Staffordshire Yeomanry in the Scheldt operations and the crossing of the Elbe, and by the 44th RTR during the Rhine crossing. In Italy Sherman DD were used by the 7th Hussars. Apparently 573 Sherman DD were built by the British during the war—all of them being Mk III and V. DD tanks were a closely guarded secret; in fact, their existence was not officially made public until after the war. For details on the functioning of the DD system see footnote D13 and U.S. Vehicle Note 48.

†Dates and RF for use in Italy are 4-5/45 and 1.4.

Vehicle 83

H

75. DUKW(a): This was the U.S. vehicle of the same name. The British, who first used it during the invasion of Sicily, employed it mainly for the ship-to-shore transport of personnel and stores and for river transport. 18 DUKW were allotted to a Sherman DD regiment. DUKW were still in limited British service in the early 1970s.

†RF for ETO use is 1.4 in 1943 and 1.3 thereafter. Dates and RF for PTO use are 12/43-10/44 (1.6) and 11/44-45 (1.5).

76. Terrapin Mk I: This vehicle was produced by the British to supplement the DUKW when it was thought an insufficient number of the latter would be made available to them. This shortage did not occur, so Terrapins were used by the 79th Armoured Division to ferry men and materiel in support of amphibious assaults. The Terrapin was an 8x8 vehicle, but on a hard surface only the four center wheels touched the ground. When in the water each of its two engines drove a propeller. It was generally considered inferior to the DUKW for several reasons: the driver, who was situated in the center of the vehicle, had a very limited view; instead of one large cargo hold it had two smaller ones fore and aft of the driver; and it had a rigid (i.e., no) suspension, which severely limited its land speed. On the other hand, while the DUKW's payload was 5,000 lbs., that of the Terrapin was about 9,000 lbs. 500 Terrapins were built, and were first used during the Scheldt operations. Five Terrapins comprised a section.

77. 2pdr Portee: The 2pdr AT was sometimes damaged by the battering it received when being towed long distances across the rock-strewn desert. The solution to this problem was to mount the gun unlimbered on the bed of a truck specially modified for this purpose, the result being called the 2pdr Portee. This arrangement both saved wear and tear on the gun and increased its mobility. Consequently the Portee became the standard method of transporting the 2pdr in North Africa. In theory the gun was to be unloaded before engaging the enemy, but the rapid movements necessitated by oft-open flanks and highly mobile tank warfare dictated otherwise; more often than not the gunners fought right from the Portees even though their conspicuousness inevitably caused them heavy casualties. On the attack, Portees usually reversed into action so the gunshield could provide some protection for the driver. Aside from North Africa, 2pdr Portees fought in other areas including Greece, Syria and Burma. A troop in an AT regiment comprised four such vehicles.

†This truck starts each scenario Inherently carrying (not towing) a 40L AT. While thusly mounted, the 40L serves as the Portee's MA and is treated as a T Gun [EXC: it may not fire at a target that lies within the Portee's VCA—as signified by "NA VCA" on the counter]. The gunshield provides no protection for the Portee, but Direct (only) Fire attacks vs it which emanate from within its TCA, and which do not destroy it, affect its crew as if they were manning a non-Emplaced, non-vehicular AT.

†The crew (see British Vehicle Note H) Abandons and re-enters the 2pdr Portee as per D5.4-43. However, the Gun can be unloaded only after a crew counter in the Gun's Location has spent its entire MF allotment as unpinning, non-entrenched Good Order Infantry in a declared attempt (which makes it subject to Hazardous Movement) to do so. If this has been accomplished, the Gun is considered unloaded and takes counter form in Limbered mode, and it, the crew and Portee (which is flipped over to its unarmed side) become TI. The crew and Gun are loaded aboard the Portee using these same principles; however, a Gun may not be (un)loaded onto/from any Portee that has expended MP in the same MPH. A voluntarily Abandoned 2pdr Portee retains an Inherent Driver.

†ETO Dates and RF are 4/41 (Greece; 1.2). For Burma they are 3-5/42 (1.4). For Africa they are 6/40-4/41 (1.2), 5/41-3/42 (1.1), 4-6/42 (1.0), and .9 thereafter.

78. Morris C9/B: Known officially as the "Carrier, SP, 4x4, 40mm AA", this vehicle comprised a Bofors AA gun on a chassis derived from the Morris Quad FAT. Similar types based on 3-ton lorries were produced by Ford in Britain, Canada and Australia. Together they were the most numerous SPAA vehicle in British service. A divisional light AA regiment was authorized one battery of 18 SP Bofors guns in three six-vehicle troops.

†May not use Bounding (First) Fire—as signified by "No Bnd(F)" on the counter.

†Dates and RF for ETO use are 7-8/43 (1.5), 9/43-5/44 (1.4), and 6/44-5/45 (1.3). For PTO use they are 12/43-10/44 (1.5) and 1.4 thereafter.

79. Loyd Carrier: This vehicle was designed to transport an infantry section or weapon crew, and to tow a light gun such as the 2pdr AT. For several years it saw limited service, but only as a personnel carrier since the portee doctrine called for AT guns to be carried on trucks. With the demise of the portee in 1943, however, the Loyd was adopted as the standard towing vehicle for the 6pdr AT and 4.2-in. MTR, in which role it served for the remainder of the war. The design allowed for armor plates to be attached, but apparently they were rarely fitted. About 26,000 were built, and were used in all theaters.

†Although this vehicle is a carrier by name, it is not considered a Carrier in game terms.

†Dates and RF for non-PTO use are 41-5/43 (1.5), 6-8/43 (1.3), 9-12/43 (1.1), and 1/44-5/45 (.9). For PTO use they are 12/41-5/43 (1.6), 6-11/43 (1.5), 12/43-10/44 (1.4), and 1.3 thereafter.

80. Quad FAT: The Quad FAT (field artillery tractor), whose official designation was "Tractor, 4x4, Field Artillery", first appeared in 1938 as a purpose-built towing vehicle for the 18pdr and 25pdr artillery pieces. A number of different models were produced by several manufacturers, but all are equivalent in game terms. Later versions were used to tow the 17pdr AT as well, and the game piece also represents other vehicles converted to tow the 17pdr. By war's end some 28,000 Quads had been built in Britain and Canada. The basic Quad chassis was utilized in numerous other softskin vehicles and wheeled AFV.

†Although the Quad is not an AFV and has a cs# rather than a CS#, any Effects Final DR vs it receives a -1 DRM for Burning Wreck determination (only).

†Dates and RF for non-PTO use are 4/40 (1.5), 5/40 (1.3 for France and Belgium; 1.5 for Norway), 6-11/40 (1.2), and 12/40-5/45 (1.1) [EXC: 1.5 for 5/41 use on Crete]. For PTO use they are 12/41-45 (1.3).

81. 15-cwt Truck: In 1939 the British War Department held some 15,000 15-cwt trucks, all 4x2 types. The majority were lost in France in 1940, but by the end of the war over 230,000 were in British service. Most were built in Britain, but a large number were produced in Canada which also shipped chassis to Australia, India, South Africa, etc. for final assembly in those countries. One of the British Army's most common vehicles, the 15-cwt truck could be found in nearly every type of unit. It was used mainly as a supply and load-carrying vehicle, but in motor battalions (and in the assault troops of infantry recon regiments) each section was transported in a 15-cwt until the halftrack and White SC replaced it. In regular infantry battalions each platoon had one 15-cwt for carrying the men's gear. Some of the most common types were the Guy Ant, Bedford MW, Morris CS8, and the Canadian Ford F15 and Chevrolet C15 series. "cwt" stands for "hundredweight" (112 lbs).

†Non-PTO RF is .9 through 6/41 [EXC: 1.4 for 4-5/40 use in Norway and 5/41 use on Crete] and 1.0 thereafter. PTO RF is .9 through 5/43 and 1.2 thereafter.

82. 30-cwt Lorry: In 1939 well over 10,000 of these "light lorries", mostly 4x2 with some 6x4, were in service with the British Army, but the majority were lost in France in 1940. Production continued in Britain and commenced in Canada, and 4x4 models were introduced, but later in the war output was curtailed in favor of the 3-tonner. The 4x4 30-cwt was sometimes used as a prime mover for the 18pdr, 25pdr and 4.5-in. howitzer—especially in Australian units. Some common 30-cwt lorries were the Bedford OX, Austin K2 and K30, and the Canadian Ford F30 and Chevrolet C30 series.

†Non-PTO RF is 1.0 through 6/41 [EXC: 1.5 for 4-5/40 use in Norway and 5/41 use on Crete], 1.1 for 7/41-8/42, 1.2 for 9/42-5/43, 1.3 for 6-12/43, 1.4 for 1-5/44, and 1.5 thereafter. PTO RF is 1.1 through 5/42, 1.2 for 6/42-5/43, 1.3 for 6-11/43, and 1.5 thereafter.

83. 3-Ton Lorry: The 3-tonner was to the British Army what the 2½-tonner was to the U.S.—the backbone of its transport. From slightly less than 10,000 4x2 and 6x4 types in 1939, use of the 3-ton lorry increased to the point that by VE Day about 390,000 were in service with the British alone. 4x4 models entered production at the end of 1940, and were the types usually found in the forward areas; e.g., one 3-tonner was the standard method of transport for an infantry platoon. Specially adapted versions were used to tow the Bofors AA gun and to

Vehicle 83

carry the 6pdr AT *en portee*, and the game piece also represents the AEC Matador MAT (medium artillery tractor) which towed the 6-in. howitzer, 4.5-in. gun and 5.5-in. gun-howitzer. Large numbers of 4x2 3-ton lorries were supplied to the USSR. Some common 3-ton models were the Austin K3 and K5, Bedford OY and QL, and the Canadian Ford F60L and Chevrolet C60L series.

†Non-PTO RF is 1.1 through 6/41 [EXC: 1.5 for 4-5/40 use in Norway and 5/41 use on Crete] and .9 thereafter. PTO RF is .9 through 5/43 and 1.1 thereafter.

84. Jeep(a): In British service the Jeep, or "Car, 5-cwt, 4x4", became almost as common as in U.S. service. It began appearing in North Africa as a command and liaison vehicle in the first half of 1942. As its availability increased, so too did its roles. The recon squadrons in some infantry recon regiments had a six-vehicle Jeep troop, apparently added in late 1942. In January 1943 a three-Jeep recon troop was authorized for each AC squadron in North Africa, but was deleted shortly after the capture of Tunisia. By 1944 the company commanders in infantry and motor battalions had a Jeep as personal transport, with the total number of Jeeps in these battalions being 15 and 6 respectively. Jeeps were vital to the airborne divisions, constituting practically all their front line transport and recon vehicles, as well as towing heavy weapons such as the 6pdr, 20mm AA and 75mm pack howitzer. In the jungles of the Southwest Pacific, Jeeps became the most widely used vehicles in Australian units as they were often the only type of vehicle able to operate anywhere near the front line.

†The Jeep has Low Ground Pressure (D1.51). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending $\geq$ four MF in the vehicle's Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract two (one per crew/HS) from the colored dr of its immediately subsequent unbogging DR. [ERRATA: Apply the change incorporated in the preceding sentence to German, Russian and U.S. Vehicle Notes L as well.]

†RF is 1.5 through 9/42, 1.4 for 10/42-5/43, 1.2 for 6-8/43, 1.1 for 9-11/43, and 1.0 thereafter.

85. U.S. Trucks: The British Empire/Commonwealth was Lend-Leased 292,256 U.S. trucks, making it second only to the USSR in the number supplied. The breakdown was 127,755 trucks of $\leq$ 1-ton capacity (including Jeeps), 97,112 of the 1½- to 2-ton class, 26,898 2½-tonners, and 40,491 of $>$ 2½-tons. The 1½-ton and 2½-ton trucks supplemented the British 30-cwt and 3-ton lorries respectively. The 7½-tonners were used to tow heavy artillery just as in U.S. service. Canadian auto manufacturers, most of which were subsidiaries of U.S. companies, produced 815,729 softskin transport vehicles during the war, with the vast majority of them going to the British also.

†7½-Ton Truck RF is 1.6 prior to, and 1.5 in, 1945.

BRITISH MULTI-APPLICABLE VEHICLE NOTES

A. Non-MG MA uses red To Hit numbers prior to 1944—as signified on applicable counters by "RED TH#s (pre 44)". When present, "(a)" in the piece name stands for "American" for ESB (D2.5), Scrounging/Removal (see F.9), Hammada Immobilization (F3.31) and Sand Bog (F7.31) purposes.

B. The 4-FP CMG is "standard equipment", but can be replaced by the optional 6-FP version as per H1.41. RF for the 6-FP CMG is as follows—*A10 Mk IA*: 1.5 in France, NA elsewhere; *A13 Mk II* and *Matilda II*: 1.1 in France, 1.4 elsewhere; *Matilda I*: 1.3. The BPV of each of these AFV assumes the presence of the 4-FP CMG; add two points if the 6-FP version is used.

C. 37mm canister has 12 FP, but is available only in 1944-45—as may be signified by the superscript "+4". Printed canister Depletion numbers are increased by three for use in the PTO; e.g., "C7" becomes "C10" when used in the PTO. For the *Lee* and *Grant* medium tanks, canister is available only to the 37LL MA. Non-depletable HE (i.e., with no Depletion number) becomes available for the 37LL MA in 1944, as signified by "HE+4".

D. The vehicle's high hull made exit and entry difficult for Personnel who had to climb over the sides. Therefore, the cost to (un)load (D6.4-.5) is doubled to ½ of the vehicle's MP allotment and two MF for the Personnel—as signified by "(un)load $\times$ 2" on the counter [EXC: normal costs apply to the Buffalo Mk IV(a)]. In addition, all attacks made by the Passengers of this vehicle are halved (or receive a +2 TH DRM) as Mounted Fire (D6.1). This vehicle may retain any unpossessed SW aboard it (D6.4), but its crew may not Remove its MG.

E. The optional BMG may fire while the vehicle is HD across its VCA—as signified by "HD FP ok" on the counter. It is always available and has a 1.2 RF.

F. Maximum range of this AFV's 12.7mm MA is 16 hexes for To Hit purposes (A9.61)—as signified by "[16] TH" on the counter. Even though the IFE FP actually comprises more than one MG, it is treated as a single weapon for malfunction/repair purposes. The MA may not be Scrounged or Removed—as signified by "MA Rmvl NA" on the counter.

G. May be equipped with a Gyrostabilizer as per D11.

H. As signified by "Inf Crew" on the counter, this vehicle starts each scenario manned by an Inherent Infantry (i.e., 2-2-8) crew [ERRATA: This is also true of the German SPW 250/7 and SPW 251/2, and of the U.S. M4, M4A1 and M21 MC halftracks (which have a 2-2-7)]. When such a crew exits its vehicle its ID should be recorded since it differs from a normal Infantry crew by having vehicular-crew capabilities.

I. The optional MA is a U.S. .50-cal HMG (as signified by "MA: 12.7(a)" on the counter) if it has a "2" ROF, or a U.S. .30-cal MMG (as signified by "MA: MMG(a)" on the counter) if it has a "1" ROF, and may be Removed (D6.631) as such (i.e., as a British-color 8-16 HMG or 4-10 MMG respectively; see F.9). It is always available with a 1.3 RF. The vehicle, if armed, has an Inherent crew and thus has a CS— instead of a cs# (D5.6).

J. APDS becomes available for the 57L and 57L in June 1944, and for the 76LL in September 1944. APCR for the 76L becomes available in September 1944. These are signified by the superscript "+4" or "+54" where applicable.

K. Optional AAMG is available only after 1940, and has a 1.3 RF.

L. Reverse Movement costs this vehicle three times its normal hex entry cost—as signified by "REV $\times$ 3" on the counter.

M. If this AFV becomes Stunned it may not gain CE status again, may not fire its MA, and is Recalled as per D5.341. These are signified by "Stun = Recall & CE/FP NA" on the counter.

N. This vehicle was used in North Africa at some time from 6/40 to 5/43 (within the limits of its own given Dates). If the superscript "+" appears, its use in North Africa was limited to Tunisia, 11/42-5/43 (within the limits of its own given Dates).

O. All 1MT restrictions apply in the normal manner [EXC: the crew must be CE to fire the CMG]; this is signified by "BU FP NA" on the counter. [ERRATA: The preceding sentence also applies to the German PSW 221.] Make four To Kill DR when using the MG column of the AP To Kill Table; only one DR (firer's choice) is used; this is signified by "4 TK DR (MG)" on the counter.

P. This vehicle was used in the PTO at some time from 12/41 to 8/45, within the limits of its own given Dates.

Q. The ATR has a maximum To Hit range of 12 hexes (as signified by "[12] TH" on the counter) and may be Scrounged/Removed. If optional, it is always available and has a 1.1 RF. If listed as MA, it has a "1" Multiple ROF. If it is a TATR, it fires through the TCA in the normal manner. If it is a SA BATR, it may fire while the vehicle is BU and/or HD across its VCA—as signified on the counter by "BU/HD FP ok" (or "HD FP ok" for the *Carrier*, *MMG A*, which cannot be BU). The MA BATR of the *IP Carrier Mk IIB* may fire while the vehicle is BU, as signified by "BU FP ok" on the counter.

R. This AFV had a very fast and accurate turret traverse, and also a better-than-normal ROF for a MA of its caliber. Therefore, it is allowed the possibility of Multiple Hits (C3.8) even though its MA is $>$ 40mm. Moreover, in a Gun Duel (C2.2401) its total Firer-based TH DRM are halved (FRD) prior to adding any Acquisition DRM. (The final total of all DRM may not be $<$ zero, and applies for Gun Duel calculations only.) These abilities are signified on the counter by the ROF # being printed on a white background.

H

S. The 94* can fire only Smoke—not AP or HE. Smoke fired by the 94* or 76* is not subject to C8.9 Depletion, as signified by “∞ Smoke” on the counter [EXC: the 76* of the *Tetrarch CS*, *Matilda II CS* and the *Churchill I* has s9 and non-depletable HE when used in a scenario set after 10/43; increase their BPV by 10 points for such use]. The 76* and 94* have a maximum range of 50 hexes—as signified by “[50]” on the counter. The 94* is not considered functioning ordnance for OVR purposes (D7.11), nor is the 76* if it has depleted its HE. On the *Churchill I*, only the 76* SA may fire Smoke and HE.

In an armoured regiment or tank battalion equipped with British-built tanks, the HQ of each squadron officially contained two CS tanks. Many of the early CS models could fire only smoke. Other types, which could fire HE, usually carried only a small amount of it in accordance with British tank doctrine. The later versions carried more HE and less smoke.

T. The AAMG, if present, may fire only at a target that lies within this AFV’s “rear” TCA (i.e., the TCA emanating from the turret’s rear Target Facing), as signified by “MG: RTCA only” on the counter. For the non-turreted *Marmon-Herrington IIIV*, the AAMG may fire in the same manner but only through the “rear” VCA—as signified by “MG: RVCA only” on the counter.

U. See D6.8-.84 for the basic rules pertaining to Carriers. If this Carrier has sD/Towing capability, it is not usable prior to 1944—as signified by the superscript “4-”. If this Carrier is to start a DYO scenario as a towing vehicle, an *Infantry* (i.e., 2-2-8) crew may be purchased for it in lieu of its Inherent HS; this is accomplished by adding two points in the “Opt BPV” column of the DYO Roster’s “Vehicle” section. The MF expenditures given in C10.11 and C10.12 for (un)hooking a Gun apply unchanged if the MMC performing that action is simultaneously (un)loading from/into this Carrier. The use of “A”, “B” and “C” in the piece names are our own designations, given to help differentiate between similar models.

V. Of the special rules for Carriers, only D6.82-.83 and H1.43 apply to IP Carriers (and their Inherent HS/crew); for all other purposes they are considered non-Carrier wheeled OT AFV. However, this vehicle may retain any unpossessed SW aboard it (D6.4).

W. WP becomes available in June 1944—as signified by the superscript “4-”.

X. Reverse movement costs this vehicle four times its normal hex entry cost—as signified by “REV × 4” on the counter.

Y. HE with a Depletion number of “7” becomes available in February 1943, as signified by the superscript “F-”. Certain vehicles have an HE Depletion number of “8” for 1944-45, as signified by the additional superscript “4+”.

Z. This AFV has both a sD and a sM. The owning player may make a usage attempt (D13.2) for either (but not for both) during a Player Turn, after declaring which one he will attempt to fire. All other Smoke Dispenser rules also apply unchanged. If the superscript “4+” or “4-” appears after the sD Usage number, this sD is not available prior to 1944.

AA. MA and CMG (if so equipped) have AA capability—as signified by “MA:AA” on the counter.

BB. This vehicle may carry as a Passenger one (only) SMC or IPP SW. This PP capacity may not be used for carrying ammunition (C10.13).

BRITISH ORDNANCE NOTES

1. **OML 2-in. Mortars:** The “Ordnance, Muzzle Loading, 2-in. Mortar” was derived from a Spanish design. The threatening international situation forced it into production in 1938 after only a minimum of testing, but nonetheless it performed well throughout WW2. Its short range was a drawback, but one at least partially offset by its ability to fire smoke, and later, IR. One 2-in. mortar was allotted to the HQ of each infantry (including parachute and airlanding) platoon, each motor platoon, each assault troop in an infantry recon squadron, and each support troop in an AC squadron. In the latter half of 1943, each gun troop in an AT regiment was authorized two 2-in. mortars (those in a 17pdr troop, whether SP or towed, were carried in trucks; see also British Vehicle Note 66). There were 14 variations of the 2-in. mortar, the most noteworthy being the Airborne version which was lighter and had a shorter barrel; it was issued to parachute infantry.

2. **OML 3-in. Mortar:** The Stokes 3-in. trench mortar which entered service in 1917 was the forerunner of the modern infantry mortar. By 1939 the Mk II version was in widespread service, but lacked range compared to its Axis counterparts. Improved ammunition and, later, improvements to the mortar itself partially redressed this problem. In 1940 an infantry battalion contained only two 3-in. mortars, but in 1941 this was increased to a platoon of six. Also in 1941, two were added to the infantry division’s recon battalion, and in 1942 this too was increased to a platoon of six. Some motor battalions began the war with two 3-in. mortars per company, but others apparently had none until 1942. An airlanding (glider) battalion in 1944 had a platoon of four 3-in. mortars, plus two more 3-in. in each of the battalion’s four companies; at the start of 1945 all were placed at battalion level in three four-mortar platoons. In India-Burma the 3-in. saw even more widespread service: Light Mountain, and Jungle Field, artillery regiments were given a battery of sixteen 3-in. in 1943, and in 1944 AT and AA/AT regiments also received them. In Burma, each Chindit company was authorized two 3-in. mortars.

†The mortar’s range is 6-36 initially, but changes to 3-63 in September 1942 as signified by “[3-63]” on the counter.

†Dates and RF for non-PTO use are 4/40-3/41 (1.3), 4-10/41 (1.2) [EXC: 1.3 for 5/41 use on Crete], and 11/41-5/45 (1.1). For PTO use they are 12/41-10/42 (1.3), 11/42-11/43 (1.1), 12/43-10/44 (1.0), and 11/44-45 (1.0).

3. **OSB 4.2-in. Mortar:** This mortar was developed in 1941 to fire chemical rounds, but HE ammo was designed for it as the fighting in North Africa made it clear that a mortar with a range greater than that of the 3-in. was needed. Like the 3-in., the 4.2-in. initially had an unsatisfactory range for a mortar of its caliber, being able to reach out only to about 3100m; improved ammo soon appeared, which increased its range to some 3900m. In North Africa it was used by Royal Engineer mortar companies. In the ETO it was assigned directly to infantry units: an infantry division’s MG/support battalion had a company of sixteen, of which four (one platoon) were in the support company detached from that battalion to each brigade; in an armoured division, the independent MG company attached to the infantry brigade also contained one such platoon. In the PTO the 4.2-in. first appeared in 1944, replacing the 3-in. mortars in AT regiments (except in the West African divisions). More arrived during the advance to Rangoon, and were allotted to divisional artillery regiments. The 4.2-in. was usually towed by a Loyd Carrier. One battery of 4.2-in. accompanied the 29th Brigade to Korea in 1950.

†The 4.2-in. is towed by a vehicle—not carried in it like other 107mm mortars (C10.1 and footnote C26)—as signified by “Towed” on the counter.

†Dates and RF for non-PTO use are 10/42-1/43 (1.6), 2-3/43 (1.5), 4-6/43 (1.4), and 7/43-5/45 (1.3). For PTO use they are 5-9/44 (1.5), 10/44-1/45 (1.3), and 2-8/45 (1.2).

4. **OQF 25mm Hotchkiss:** This was the standard light AT gun of the French Army. The British purchased a quantity in 1938, and used them in nine-gun AT companies allotted to infantry brigades. At least one AT regiment in the BEF (the 14th, of the 4th Infantry Division) was also equipped with them. A number saw action in Norway, but the majority were used (and lost) in Belgium and France. Later, some were used in North Africa by Free French troops who had captured them in Syria. In Europe the BEF found the 25mm too flimsy to be towed, so they began transporting them in the back of trucks. This method of carrying AT guns *en portee* later became widespread in the British Army.

†ETO Dates and RF are 4/40 (1.3) and 5-6/40 (1.2). For North African use they are 1-6/42 (1.5).

5. **OQF 2-Pounder:** With its tripod mounting which permitted rapid all-round traverse, this was the best AT gun in service in 1939. However, the loss of 509 2pdrs in France virtually eliminated the Army’s stock of AT guns, and forced the British to give 2pdr production top priority for another year (thus delaying the development of the 6pdr). In the early desert fighting the 2pdr was entirely adequate, but as the Panzers acquired thicker armor it became less and less able to deal with them. Moreover, when the Germans would locate the position of a 2pdr, if possible they stood their Pz IV off beyond its effective range and leisurely shelled it into submission. By 1942 it was dangerously obsolete—but even so, it fought on until the fall of Tunis. Its usual transport in the desert was the 2pdr Portee (see British Vehicle Note 77). In the PTO the

BRITISH ORDNANCE LISTING

2pdr remained in use throughout the war, though by the end of 1943 in India-Burma it was officially authorized only in the AA/AT regiment of light divisions.

2pdrs were used in AT regiments with four guns per troop, and from early 1942 began appearing in infantry and motor battalions in two or four four-gun platoons respectively. The AT troop of infantry recon regiments that fought in North Africa from late 1942 had six 2pdrs; later these were exchanged for 6pdrs. As a sidenote, HE did exist for the 2pdr, but was rather ineffective and apparently not widely issued. As with many other British guns, the 2pdr was named for the weight of the projectile it fired. "OQF" stands for "Ordnance, Quick Firing", which indicated that the projectile and propellant charge were loaded as a single unit.

†Dates and RF for ETO use are 5-6/40 (Belgium and France; 1.2), 4/41 (Greece; 1.2), and 5/41 (Crete; 1.5). For use in Africa they are 6/40-4/41 (1.3), 5/41-3/42 (1.2), 4-6/42 (1.1), 7-12/42 (1.0), and 1-5/43 (.9). For PTO use they are 12/41-2/42 (1.3), 3-6/42 (1.5), 7-8/42 (1.4), 9-10/42 (1.3), 11/42-11/43 (1.2), and 12/43-45 (1.3).

 **6. OQF 6-Pounder:** This gun was designed in 1938 but, due to the immediate and pressing need for 2pdrs after the fall of France, it was late 1941 before any could be produced even for testing. It was being issued to motor battalions in North Africa just as the Gazala battles commenced in May 1942, but did not have much impact at that time due to its new owners' lack of training with it. AT regiments began receiving it shortly afterward, and used it in four-gun troops. By the second battle of Alamein, three-fourths (on average) of the AT guns in an infantry division's AT regiment, and all the AT guns in an armoured division, were 6pdrs (though in the latter some were Deacon SP guns). AT regiments in North Africa also received some Lend-Lease U.S. 57mm AT guns in late 1942 and early 1943. Infantry battalions began exchanging their 2pdrs for 6pdrs in early 1943, and at the end of the North African campaign infantry battalions destined for the ETO were authorized a platoon of six 6pdrs in their support company. In North Africa, a motor battalion equipped with 6pdrs had sixteen (four platoons) such guns, but by 1944 in the ETO this had been reduced to three platoons. In 1944, airlanding battalions had two six-gun 6pdr platoons; in early 1945 each troop was reduced to four guns. In the PTO, 6pdrs apparently were used only in AT regiments. Prior to the invasion of Italy in 1943, 6pdrs were carried *en portee*; afterwards they were towed—usually by Loyd Carriers. Small numbers of 6pdrs are still in service in a few countries.

†HE with a Depletion number of "7" becomes available in February 1943, as signified by the superscript "7"; the Depletion number becomes "8" for 1944 and 1945, as signified by the additional superscript "4". The printed HE Depletion number is *increased by three* for use in the PTO;

e.g., "HE7" becomes "HE10" when used in the PTO. APDS becomes available in June 1944 but only for use in the ETO—as signified by the superscript "4E".

†Dates and RF for non-PTO use [EXC: NA in Madagascar] are 5-6/42 (1.5), 7/42 (1.4), 8/42 (1.3), 9/42 (1.2), 10-12/42 (1.1), 1-5/43 (1.0), and 6/43-5/45 (.9). For PTO use they are 12/43-45 (1.1).

 **7. OQF 17/25-Pounder:** In the autumn of 1942, British Army Intelligence began to suspect that the new German Tiger tank might soon appear in North Africa. The 17pdr AT was in production at this time but, due to numerous delays, no carriages had yet been completed. In an attempt to get the gun into action quickly, one was rigged onto a 25pdr carriage and test-fired. The carriage was just able to handle the powerful recoil force; and the combination, deemed an acceptable stopgap, was designated the 17/25pdr. Under the codename "Pheasant" (which soon became the gun's nickname), 100 barrel and breech assemblies were hurriedly flown to North Africa where they were mounted on spare 25pdr carriages. Pheasants were used by AT regiments in four-gun troops, first going into action at the battle of Medenine. As standard 17pdrs became available, the 17/25pdrs were withdrawn.

 **8. OQF 17-Pounder:** The requirement for a 3-in. AT to replace the 6pdr was issued in early 1941, and the resulting weapon entered production in mid 1942. It began equipping AT regiments in mid 1943, and in action proved to be one of the very best AT guns of WW2—a fine compromise between weight and hitting power. A troop comprised four guns. Modified versions of the 17pdr were mounted in the Sherman Firefly and Challenger tanks, and in the Achilles and Archer TD. A few countries still employ the 17pdr.

†HE with a Depletion number of "8" becomes available in June 1944, as signified by the superscript "4+"; APDS becomes available in September 1944, as signified by the superscript "4A".

 **9. OQF M1A1 75mm Pack Howitzer:** This was the U.S. weapon of the same name. In British service its use was confined mainly to the 1st and 6th Airborne Divisions. The artillery complement of each was an airlanding light regiment which contained 27 pack howitzers in three-gun troops. In the PTO the Australians used a small number of pack howitzers late in the war. The British also supplied some to the Yugoslav Partisans and the Chinese Army.

†For DYO scenarios the Gun is represented by a 1/2" parachute when being air-dropped, and is considered re-assembled only if its manning

Н

Infantry have spent one *complete* Game Turn TI in the same Location with it.

†Dates and RF for ETO use are 6/44-5/45 (1.5). For PTO use they are 11/44-45 (1.6).

10. Canon de 75 mle 1897: This was the famed "French 75". Some were used by the British on Crete. Its main users, however, were the Free French, who employed it in Africa as artillery and (more often) as an AT weapon. In Free French service a battery of 75s comprised six guns, often carried *en portee*.

†Dates and RF for ETO use are 5/41 and 1.4. For use in Africa [EXC: NA in Madagascar] they are 1-7/41 (1.5), 8/41-6/42 (1.4), and 7-42-5/43 (1.5).

11. **OQF 18-Pounder:** Numerically, 18pdrs formed the backbone of British artillery in WW1. Afterwards they remained in widespread service with British and Commonwealth forces, many (but not all) being modified for vehicular towing in the 1930s. In France and Belgium, 18pdrs (along with 4.5-in. howitzers) were used as divisional artillery in some BEF units; in the hasty retreats and evacuations 216 were left behind. In Africa they were used in the same role until replaced by 25pdrs, and then were put to use as AT guns (mostly, it seems, in Commonwealth units). In the PTO they saw action in many areas including Malaya, Hong Kong, Burma (sometimes in the AT role), and New Guinea. In both artillery and AT use, an 18pdr troop comprised four guns.

*Dates and RF for use in Belgium and France are 5-6/40 (1.4). For Africa [EXC: NA in Madagascar] they are 6/40-4/41 (1.3), 5-10/41 (1.2), 11/41-6/42 (1.3), 7/42 (1.4), 8-9/42 (1.5), and 10-12/42 (1.6). For PTO use they are 12/41 (1.4), 1-2/42 (1.3), 3-7/42 (1.4), and 8-12/42 (1.5).

13. *OQF 25-Pounder*: Work on experimental designs to replace both the 18pdr and 4.5-in. howitzer with a single gun had been conducted since the mid '20s, but it was not until the latter half of 1939 that the 25pdr, the culmination of those efforts, was fully approved. Earlier that year, however, the process of replacing the barrel liners of late-model 18pdrs with new liners of 87.6mm caliber had begun. Well over a thousand were so converted, and it was these guns—designated 25pdr Mk I (but more commonly referred to as 18/25pdrs)—which equipped most of the BEF field regiments in France (where 704 of the Mk I were lost). The Mk I was also used in Africa, but apparently not in the PTO. In game terms it is equivalent to the true 25pdr (the Mk II) except for having a maximum range of 275 hexes.

The 25pdr Mk II first saw action in Norway, but was not used again in the ETO until 1941. It first appeared in Africa in early 1941. In North Africa, the need for a gun more potent than the 2pdr resulted in 25pdr regiments being split up more and more often as the campaign progressed, with individual troops and batteries parceled out to various units and mobile columns. While the 25pdr performed well as an AT gun (with its unique circular firing platform an important aspect of this capability), such use seriously impaired the artillery's ability to provide concentrated fire when needed. It was only when 6pdrs became available that the 25pdrs were able to fully revert to their traditional role.

Once in full production, the 25pdr equipped field regiments in every theater, becoming the standard—and sole—artillery piece in non-PTC infantry divisions. Four guns made up a troop. Well over 12,000 of the Mk II were produced in Britain, plus 1,527 in Australia and many more in Canada. The Afrika Korps used a substantial number of captured pieces, and in the ETO 25pdrs were issued to a few U.S. artillery battalions. 25pdrs saw action in Korea, and remained in first-line British service until 1967. More than a dozen countries still have 25pdrs in their artillery arsenals.

†Dates and RF for ETO use are 5/40 (Norway; 1.6), 5-6/40 (Belgium and France; 1.3), 4/41 (Greece; 1.3), 5/41 (Crete; 1.6), and 7/43-5/45 (1.3). For Africa they are 6/40-2/41 (1.5), 3-4/41 (1.4), 5-10/41 (1.3), 11/41-12/42 (1.2) [EXC: NA in Madagascar], and 1-5/43 (1.3). For the PTO they are 12/41 (1.3), 1/42 (1.4), 2-5/42 (1.5), 6-10/42 (1.4), and 11/42-45 (1.3).

14. QOF 3.7-in. Howitzer: This was a pack howitzer designed for the Indian Army. It was also referred to as a "Screw Gun" since the barrel and breech were separate sections, joined together by being screwed into the opposite ends of a special junction nut. It was well liked by its users despite having a fairly short range. The great majority were used in India-Burma, where they formed a portion (in a few cases all) of a division's artillery. In addition, small numbers of Independent Light Batteries saw action practically everywhere that British troops fought, including Norway, Crete, North Africa, Madagascar, Sicily, Italy, New Guinea and the Scheldt estuary. The 3.7-in. pack howitzer was used in four-gun batteries in Mountain and Light Mountain artillery regiments, and in eight-gun batteries in Jungle field regiments. Independent Light Batteries could contain either six or eight guns.

†HEAT becomes available in 1943 but only for PTO use—as signified by the superscript “^{3+P}”.

†Dates and RF for non-PTO use are 4/40-5/45 (1.6). For PTO use they are 12/41-10/42 (1.5), 11/42-11/43 (1.4), 12/43-4/44 (1.3), and 5/44-45 (1.2).

15. *OQF 4.5-in. Howitzer*: 3,359 4.5-in. howitzers were built prior to and during WW1. During the 1930s the substantial number still in service were modified for vehicular towing even though their short range had already rendered them obsolescent. In 1940 they formed part of the artillery complement in certain BEF divisions, and 96 were left behind in the evacuations. They were also used as divisional artillery in the various African and PTO campaigns until replaced by 25pdrs.

†Dates and RF for ETO use are 5-6/40 (Belgium and France; 1.5), and 5/41 (Crete; 1.6). For use in Africa they are 6/40-4/41 (1.4), 5-12/41 (1.5), and 1-3/42 (1.6). For PTO use they are 12/41-2/42 (1.5) and 3-12/42 (1.6).

16. **OBL 4.5-in. Gun & 5.5-in. Gun-Howitzer:** These guns, termed medium artillery, used the same carriage and were nearly identical in appearance. They were employed in medium regiments, which usually comprised one battery (eight guns) of each type with four guns per troop. (Medium regiments were corps-level units; generally, in the ETO, one was assigned to support each division.) Although the "Four-Five" was fondly referred to as the "long-range sniper", for its size and weight it fired a rather small-caliber projectile with low HE content; consequently, around 1944 it began to be phased out. The "Five-Five", on the other hand, performed well (after some initial problems), and in 1988 remains in service in some half-dozen countries. "OBL" stands for "Ordnance, Breech Loading", which indicated that the projectile and propellant charge were loaded separately.

14.5-in. Gun RF is 1.6 for 1-4/42, 1.5 for 5-9/42 [EXC: NA in Madagascar], 1.4 for 10/42-44, and 1.5 thereafter. 5.5-in. Gun-Howitzer Dates and RF for non-PTO use are 5-9/42 (1.6) [EXC: NA in Madagascar], 10/42-5/43 (1.5), and 6/43-5/45 (1.4); for use in India-Burma they are 12/43-9/44 (1.6) and 10/44-45 (1.5).

17. **OBL 6-in. Howitzer:** A sturdy and reliable piece which dated back to WW1 (during which some 4,000 were built), the 6-in. howitzer formed the backbone of British medium artillery in the interwar years. In 1940, most of the 221 sent to France with the BEF fell into German hands. In Africa the 6-in. remained in combat service (and was supplemented by a number of U.S. M1918 155mm howitzers) until replaced by the 4.5-in. and 5.5-in. In the PTO it saw action during the Japanese conquest of Malaya, but after that was apparently not used again until relatively late in the war when it equipped some medium regiments in India-Burma.

†Non-PTO Dates and RF are 5/40-9/42 and 1.4 [EXC: NA in Norway, Crete and Madagascar]. PTO Dates and RF are 12/41-2/42 (1.5), and 12/43-45 (India-Burma: 1.5).

Ordnance 18

18. OBL 7.2-in. Howitzer Mk I: In July 1940 it was decided that the existing WW1 8-in. howitzers, including some of similar design recently purchased from the U.S., would be upgraded by exchanging their barrel liners for new ones of 7.2-in. caliber, thus increasing their range. These, in their various forms, became the 7.2-in. howitzer Mk I-IV. Unfortunately, the weapon's recoil was now too much for the carriage: each time the gun fired it leapt backwards. To control this, ramps were supplied for placement behind the wheels. When fired, the gun rolled up (and ideally not over) the ramps, then back down again to be stopped by chocks; the gun then had to be re-aimed for its next shot. Occasionally the gun rolled completely over the ramps, effectively putting it out of action until manhandled back into position. 7.2-in. howitzers formed the standard equipment of heavy regiments (though from the latter half of 1943 some of these regiments, which were Army-level units, were equipped instead with U.S. 155mm "Long Toms"). From late 1944, each corps engaged in Burma was allotted one battery of four 7.2-in. howitzers.

†This Gun may not use Target Acquisition (C6.5-.58)—as signified by "Acq. NA" on the counter.

†Dates and RF for non-PTO use are 43-12/44 (1.5) and 1-5/45 (1.6). For use in Burma they are 10/44-45 (1.6).

19. OBL 7.2-in. Howitzer Mk VI: When the U.S. M1A1 155mm "Long Tom" became available to the British, they studied the feasibility of utilizing its carriage for the 7.2-in. howitzer. Since the carriage had been designed to also accommodate the U.S. 8-in. howitzer (which used the same barrel as the 7.2-in.), the conversion was fairly simple. However, at this point the British decided to design a longer 7.2-in. barrel instead of using the old type. This version, the new barrel on the U.S. carriage, was designated the Mk VI. As it became available it replaced the previous Marks in heavy regiments, and served on for many years after the war.

†RF is 1.6 in 1944 and 1.5 in 1945.

20. OQF 20mm AA: The British used three types of 20mm AA guns: Oerlikon, Hispano-Suiza and Polsten. The latter was the preferred type but, being the last into production, was never available in sufficient quantity to replace the others. The 20mm was authorized in a wide variety of units including artillery and AT regiments, the brigade HQs and recon squadrons of airborne divisions, and engineer field squadrons; however, due to production delays and problems with the ammunition, not many actually saw action with Army forces. The difficulty with the ammunition was that, unlike the normal design of AA rounds, the HE projectile did not self-destruct after a set number of seconds in flight, and thus could fall to earth amidst friendly troops and cause casualties. For this reason many commanders declined use of the weapon until self-destructing HE could be provided—which did not occur until the spring of 1945. Apparently the only light AA regiments authorized the 20mm were those in NWE, and only through 8/44 (at which time their 20mm troops were abolished). A 20mm troop generally had eight such weapons, in two four-gun sections.

21. OQF 40mm AA: The British adopted the Bofors Gun in 1938, and purchased quantities from Sweden (its country of origin), Poland, Hungary and Belgium. By 1941, British factories were turning them out in quantity, and both Canada and Australia produced them as well. Bofors equipped light AA regiments in all theaters throughout the war. A troop initially comprised four guns, but by 1943 it had been enlarged to six. The Bofors Gun is still employed in well over a dozen armies.

†Dates and RF for ETO use are 4/40 (1.5), 5-6/40 (1.3) [EXC: 1.4 in Norway], 4-5/41 (1.3), and 7/43-5/45 (1.2). For Africa they are 6/40-4/41 (1.3), 5-10/41 (1.2), and 11/41-5/43 (1.1) [EXC: 1.3 for use in Madagascar]. For the PTO they are 12/41-2/42 (1.4), 3-6/42 (1.6), 7-8/42 (1.5), 9-10/42 (1.4), and 11/42-45 (1.3).

22. OQF 3-in. AA: This was the standard British AA gun during and after WW1. During the interwar years it was modernized in various ways; in 1940, obsolescent but still useful, it formed the mainstay of heavy AA regiments. A wide variety of static and mobile mountings were developed for it; the game piece represents one of the

latter types. It was not designed for firing at ground targets; see British Ordnance Note E. Though the 3.7-in. AA gradually replaced it, a few 3-in. remained in service in 1945.

†RF is 1.4 for 5-6/40 [EXC: NA in Norway], 1.5 for 7/40-2/42, and 1.6 thereafter [EXC: NA in Madagascar].

23. OQF 3.7-in. AA: This gun performed very well in the AA role. However, it was designed solely for AA fire—e.g., the gun layers sat with their backs to the target (see also British Ordnance Note E)—so was little used for direct fire vs ground targets. By 1940 some 500 were in service, dispersed throughout the Empire. Later Marks incorporated an automatic fuze setter and power rammer for the shells, which doubled the gun's ROF. In the latter half of the war, it was often employed as artillery, using indirect fire. The 3.7-in. is still in the AA arsenals of a few countries.

†RF is 1.6 for 5/40-2/42 [EXC: NA in Norway], and 1.5 thereafter [EXC: NA in Madagascar].

BRITISH MULTI-APPLICABLE ORDNANCE NOTES

A. IR ammo becomes available in 1942, as signified by the superscript "2+" on the counter.

B. In a scenario set between 1941 and 8/43 inclusive, this Gun may be carried *en portee*, which means it may be loaded onto a vehicle (during setup/play) and carried as Passenger PP. As a Passenger, the Gun and its ammo together use all but 5PP of the vehicle's Passenger capacity. The 25LL AT may be porteed only by a 15-cwt truck, the 40L AT only by a 30-cwt lorry, and the 57L AT or 75 ART only by a 3-ton lorry. And the vehicle must be one that, prior to setup, was noted on a side record as being able to portee a Gun of that particular Caliber Size (C2.21) and Barrel Length (C4.1).

The principles of (un)loading a Gun to/from portee status are the same as for the 2pdr Portee in British Vehicle Note 77, except that here the Gun crew (un)loads as a Passenger rather than as an Inherent Crew, and a QSU Gun is not (un)loaded limbered. When a Gun has been thusly loaded, it is marked with an En Portee counter. A vehicle porteeing a Gun is not flipped over to its Wreck side if it becomes Immobilized, and the Gun may be unloaded (at which time the vehicle counter is then flipped over). If a vehicle porteeing a Gun is eliminated, the Gun is eliminated too. A vehicle may not simultaneously have one Gun *en portee* and another hooked up for towing. An AT (with a gunshield) being porteed can provide gunshield benefits to its Passenger crew in the same way the 2pdr Portee MA does to its Inherent crew. In a DYO scenario that meets the restrictions given above, the owning player may purchase the correct portee vehicle in lieu of buying a normal towing vehicle as per 1.441.

The 57L AT (only) may be fired by its Passenger crew while being porteed [EXC: it may not use Bounding (First) Fire]. When loaded on the vehicle, its CA must coincide with either the VCA or "rear" VCA, and may not change relative to that VCA while being porteed. This Note also applies to the German 28LL and 37L AT, either of which may be porteed only by an *Opel truck*.

C. When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

D. This Gun (including the U.S.-color 75mm pack howitzer) may be Animal-Packed. Rules for this capability will be provided in the ASL Japanese module.

E. This Gun would merit an "L" suffix for its Caliber Size were it not for the fact that very few were equipped with the proper sights for direct fire vs ground targets. Aside from the few so equipped, it was used only for AA fire—and sometimes for long-range indirect fire.

N. This weapon was used in North Africa at some time from 6/40 to 5/43, within the limits of its own given Dates.

P. This weapon was used in the PTO at some time from 12/41 to 8/45, within the limits of its own given Dates.

DYO THEATER TABLE

The term "British" encompasses several nationalities which fought in diverse corners of the world and whose game characteristics differ from one another. To reflect this—and to make the best use of the British Rarity Factor Charts—players designing a DYO scenario with British units may make a dr on the accompanying table after deciding on the scenario's date and theater (ETO, Africa or PTO). This will determine the area of that theater in which the scenario will be set, and will give a footnote listing which type(s) of British Personnel may be used in that scenario. (The term "British" in these footnotes does *not* include other nationalities mentioned in them [i.e., ANZAC, Gurkha etc.]; however, the use of a "non-British" nationality in this context does not preclude its use of British vehicles, Guns, etc.) If the area chosen for the scenario needs an opposing nationality not yet available (e.g., Italians or Vichy French), roll again. Note that certain minor areas of operations have been omitted for simplicity.

ITALIAN VEHICLE NOTES

In the late 1930s the Italian Army officially committed itself to a program of mechanization, believing that if so equipped it could win swift and decisive victories, thereby avoiding the stalemates and appalling casualties of the Great War. Unfortunately for those ultimately involved in the impending conflict, the implementation of this program was severely impeded by a number of factors. Among these were a basic lack of raw materials, a relatively small industrial base with little experience in AFV design, a general lack of funds due to the financial stringencies of the 1930s, and the conservatism of certain high-ranking officers and officials. In the autumn of 1939 the army possessed about 1,500 hundred "tanks", but the overwhelming majority of them were marginally useful L3 tankettes. When Mussolini declared war in June 1940, his army was far from ready. Its total number of "tanks" had increased only to some 1,660, while the army's rapid expansion had created widespread equipment shortages in areas from those as crucial as motor transport to items as normally taken-for-granted as helmets. Moreover, the approximately 11,700 infantry, artillery and AA guns of ≥ 65 mm in service included less than 250 modern (i.e., '30s-era) pieces—the newest of the remainder being World War One veterans.

The small Italian armaments industry could not, in view of everything working against it, provide prodigious numbers of AFV. From June 1940 to August 1943 it produced only about 3,300 tanks, SP guns and armored cars. The highest monthly total was but 170 vehicles, of which 65 were medium tanks. There was some discussion with the Germans of building the PzKpfw III, IV and V in Italy—but this withered on the vine for a number of reasons, including the opposition of several high Italian officials and industrialists.

Italian AFV were characterized by their light weight, generally low horsepower-to-weight ratio and thin armor (the latter a policy resulting at least in part from the constant shortage of funds and raw materials). The armor plate was of poor quality, tending to crack and split when hit; and was attached by rivets, which further diminished its overall integrity while increasing the danger to the crew inside. The design of new and radically better tanks was not accorded a high priority, due to both military conservatism and the loss in production that extensive retooling would cause. Indeed, Mussolini (who, unlike Hitler, neither fully understood the correct priorities in tank design nor took much interest in such matters) had to order the development of a tank with a 75mm gun (the P26/40), as the army saw no need for one. And yet, despite the absence in the field of more-combat-effective tanks and SP guns until nearly the end, Italian AFV crews continued to fight bravely in their obsolete vehicles even when hopelessly outmatched.

At the start of the war, the nomenclature for Italian tracked AFV followed the format "letter #/#". The letter classed the vehicle as either light ("L"; ≤ 5 tons), medium ("M"; > 8 but ≤ 15 tons) or heavy ("P"; > 15 tons). The first number indicated the design weight in tons, and the second the year of acceptance.

[Note: All Allied Italian combat formations were re-equipped by the British in early 1945. Therefore, for DYO scenarios set in that year, the Allied-Italian player may purchase British SC/LRC/APC/PC/trucks (only; as per their "Type" in the Listing) as if his OB were British. He treats such vehicles as non-Captured.]

1. L5/21 & L5/30: Also known respectively as the Fiat 3000 A Model 1921 and Fiat 3000 B

Model 1930, these were Italy's first series-produced tanks. They were based on the French Renault FT-17 but incorporated numerous improvements. (Indeed, the 3000 A was the fastest tank in the world in 1921.) The L5/21 carried two coaxially mounted 8mm MG, as did some of the L5/30; however, most L5/30 carried a medium-velocity 37mm gun and 48 L5/30 were built. The Italians referred to them officially as assault tanks (*carri d'assalto*), and until mid 1939 considered them first-line AFV. The L5/21 was first used in 1926 against the Senussi in Libya. L5 saw action in 1936 during the conquest of Ethiopia, and in June 1940 a few apparently participated in attacks along the French-Italian border in the Moncenisio region. Two L5 companies, each of nine tanks, were in Sicily when the Allies landed there; one, in XII Corps, was deployed dug-in as pillboxes, while the other, in XVI Corps, was destroyed in the counterattacks on Gela. An L5 platoon comprised four such tanks.

†Availability for WW2 scenarios is limited to 6/40 (France) and 7/43 (Sicily).

2. L3/35: Derived from the British Carden-Lloyd Mk VI tankette, this AFV first appeared in 1933. The original model, designated the CV 33 (*Carro Veloce*; fast tank), carried a single 6.5mm MG, but later versions were equipped with two tandem-mounted 8mm MG (and the older models were thusly retrofitted). In 1935 the CV 35 went into production, featuring a number of minor modifications (but both types are equivalent in game terms). In 1938 their designations were changed to L3/33 and L3/35. When Italy entered the war in June 1940, L3 were by far the most common Italian AFV, equipping all but two of the tank battalions in the three Italian armored divisions, the tank battalion allotted to each motorized division, the light tank squadron group (equivalent to a battalion) in each Celere ("rapid"; i.e., cavalry) division, and numerous independent tank battalions. L3 acquired several nicknames, among which were "Scatoletta" (little can) and "Cassa da Morto" (death box). Between 2,000 and 2,500 (including all variants) were built. A platoon comprised four vehicles.

L3 were used at one time or another almost everywhere Italian units fought: 10/35-4/36 in the conquest of Ethiopia; 2/37-3/39 in Spain (149 were sent); in the Balkans from 1939; 6/40 in France; in North Africa (where in June 1940 about 320 were present, constituting all the armor there at that time); in Italian East Africa (39 were present in June 1940); 9/41-1/42 in Russia (with the 3rd "San Giorgio" Gruppo Squadroni Carri L of the 3rd Celere Division); 7-8/43 in Sicily; and in Italy where after the 9/43 armistice they were used by Italian Fascists and the Germans. L3 imported during the 1930s were used in combat by the Greeks, Hungarians and Chinese. In the Balkans, captured/seized L3 were used by the Germans, Croats and Yugoslavians.

†Dates and RF for use in North Africa are 6-12/40 (.9), 1/41 (1.1), 2/41 (1.2), 3/41 (1.4), 4-11/41 (1.2), 12/41 (1.4), 1/42 (1.5), and 2/42 (1.6). For East Africa they are 7/40-1/41 (1.3), 2-3/41 (1.4), and 4-6/41 (1.5). For Russia they are 9-10/41 (1.2), 11/41 (1.3), 12/41 (1.4), and 1/42 (1.5). For Sicily they are 7-8/43 (1.4). For Italy they are 9/43 (1.2), and 44-5/45 (1.3; Fascist use only). For France they are 6/40 (1.1). For the Balkans they are 10/40-4/41 (.9), 5/41-9/43 (1.1), and 44-5/45 (1.3; Fascist use only).

3. L3 aa: Some L3 were equipped with an AA mount on the superstructure roof in front of the commander-gunner's hatch. One of the AFV's MG could be moved to this mount, giving the vehicle a limited AA capability. Apparently not many were thusly equipped.

†Either MG may be used as the MA. However, the BMG may not be used while the crew is CE, and the AAMG may fire only at a target that lies within the L3 aa's VCA. These are signified respectively on the counter by the MA being given as "MG", by "BMG: CE FP NA", and by "AAMG: VCA only".

†If this AFV is marked with one or more Malfunction/Disabled counters, the owning player may in effect switch the positions of its two MG. He does this by marking the AFV with a TI counter at the start of its MPH provided it has neither fired nor expended MP in the current Player Turn, is in neither Motion nor Melee, and its Inherent crew is/becomes CE. If all these conditions are still met during the APh, he may then exchange the Malfunction/Disabled counter of one MG for that of the other.

EX: Assume an L3 aa has a malfunctioned AAMG. If the above-mentioned rules are followed, and the conditions are still being met in the APh, its owner may at that time remove the AAMG Malfunction counter and replace it with a BMG Malfunction counter.

†RF is always .4 higher (1.6 maximum) than the corresponding (for date and area) RF of the L3/35.

4. L3 cc: During the early months of the war a small number of L3 in Libya were modified by replacing their MG with a Solothurn 20mm ATR. This combination enhanced not only the AFV's A-T capability, but the mobility of the ATR and its crew's survivability as well. Apparently all the L3 cc were lost during the course of Operation Compass, the British counteroffensive of 12/40-2/41.

†RF is 1.5 in 1940 and 1.6 in 1941.

5. L3 Lf: Development of a flamethrower (*Lanciafiamme*) variant of the L3 began in 1935. The flame nozzle replaced one of the AFV's MG, and the FT fuel was carried in a lightly armored trailer. The design of the trailer was less than satisfactory however, and before long new versions of the L3 Lf appeared with the FT fuel carried

Vehicle 11

H

in a shallow, box-shaped tank above the engine compartment. (But apparently not many of the new types saw action.) The L3 Lf first saw combat during April 1936, in Ethiopia. It was used in the Spanish Civil War, and later in France, the Balkans, North Africa and Italian East Africa. Examples of the L3 Lf remained in service after 1941 but apparently did not see significant combat again. Each L3 battalion was authorized one flamethrower platoon (of four L3 Lf) per L3 company; however, the cavalry's squadron groups did not use the FT version. It is not known how many L3 Lf were built, but it was the most numerous L3 variant. One example of the trailered version captured by the British was sent to England for evaluation, and probably was the inspiration for the Churchill Crocodile.

†"B11" applies to the BMG; "X11" applies to the FT.

†The trailer's AF is "0". It may be voluntarily disconnected (unhooked) only at the start of its MPH—but only if the AFV is in neither Motion nor Melee, has not fired in the preceding PFP, and its Inherent crew is/ becomes CE. Under these conditions, unhooking is accomplished by declaring such, expending six MP in Delay, then exchanging the L3 Lf counter for an L3 aa marked with an AAMG Disabled counter; the AFV may then complete its MPH.

†Dates for use in France are 6/40, for North Africa 6/40-41, for East Africa 7/40-6/41, and for the Balkans 10/40-4/41. RF is always .3 higher (1.6 maximum) than the corresponding (for date and area) RF of the L3/35.

6. L6/40: Designed to replace the L3 in its cavalry and reconnaissance roles, the L6 was based on a much-modified L3 chassis, retaining the latter's two-man crew while providing increased firepower, protection and mobility. It was accepted for service in early 1940, though even in 1939 it would have been a barely adequate recon tank. By the time it went into general use in 1942 it was hopelessly obsolete, so after 283 had been built its production was cancelled in favor of the Semovente L40 47/32. A flamethrower version of the L6/40 was developed but did not enter service.

L6/40 were authorized in the RECo (*Raggruppamento Esplorante Corazzato*; armored reconnaissance task force) in the armored and motorized divisions, and were also used in several independent recon units. A total of 72 were sent to North Africa. 55 went to Russia where they equipped the LXVII Battaglione Motocorazzato Bersaglieri in the 3rd Celere Division; they were the heaviest Italian tracked AFV used on that front. In Yugoslavia, L6/40 were employed by the "San Giusto" Gruppo Squadroni Carri L of the 1st Celere Division. Some saw combat in Italy during September 1943, and later were used there by Italian Fascists and the Germans. The latter also employed them in the Balkans, but most of those they seized in September 1943 were exported to Croatia. The Yugoslav partisans also used a small number of captured L6. In Italian use an L6/40 platoon comprised four such AFV.

†Dates and RF for use in North Africa are 12/41-6/42 (1.6), 7-9/42 (1.4), 10-11/42 (1.5), 12/42-1/43 (1.6), and 2-5/43 (1.5). For Russia they are 2-6/42 (1.3), 7-8/42 (1.2), and 9-12/42 (1.3). For Yugoslavia they are 4/41 (1.3) and 5/41-9/43 (1.5). For Italy they are 9/43 (1.3), and 44-5/45 (1.4; Fascist use only).

7. M11/39: This tank carried a small turret with two 8mm MG, plus a medium-velocity 37mm gun in the right-front superstructure. It was intended to be the standard tank in the armored

divisions' medium tank battalions, but the positioning of the gun in a limited-traverse mount proved shortsighted and soon the idea of a tank with a proper turret-mounted gun gained favor. As a result, only 100 were built. 24 were sent to Italian East Africa where, as the Medium Tank Special Company (*Compagnia Speciale Carri M*), they served in the East African Armored Task Force (*Raggruppamento Corazzato Africa Orientale*). Another 70, comprising the I and II Medium Tank Battalions (*Battaglioni Carri M*), were sent to Libya in the summer of 1940—but by early February 1941 all 70 had been destroyed or captured by the British. An M11/39 platoon comprised four such tanks.

†B11 applies only to the 37 SA—as indicated by "B11: SA only" on the counter. All 1MT (D1.322) penalties apply to the CMG MA, which has 360° traverse independent of the bow-mounted NT 37 SA.

†Dates and RF for North African use are 8-12/40 (1.2), 1/41 (1.4), and 2/41 (1.6). For East Africa they are 7/40-1/41 (1.4), 2-3/41 (1.5), and 4-6/41 (1.6).

8. M13/40: Replacing the unsatisfactory M11/39 was the M13/40, which retained the main mechanical features of the M11 but carried a more powerful gun in a fully rotating turret.

Its chief deficiencies were slow speed, unreliability, and a two-man turret in which the commander doubled as gunner. Nevertheless, in 1941 it became standard equipment in the growing number of medium tank battalions, and is perhaps the most famous Italian tank of WW2. It first saw action with the III Battaglione Carri M in the Sollum-Halfaya area of Libya, and later equipped the 132° "Ariete" Divisione Corazzata (132nd "Ram" Armored Division) in North Africa. The M13/40 also saw action with the 131st "Centaur" (Centaur) and 133rd "Littorio" (Bundle of Fates) Armored Divisions in the Greek-Yugoslav campaigns during January-April 1941. For a short time in early 1941 one British armored regiment (the 6th RTR) in Libya was equipped with captured M13/40, but lost them all during Rommel's first offensive. In September 1943, 22 were confiscated by the Germans who subsequently handed them over to the Fascist Italians. Sources conflict as to the total number of M13/40 produced, due to a number later being rebuilt as M14/41; some state as many as 1,049 while others claim only 710, but the figure most often given is 785. An M13/40 (or M14/41) platoon comprised four such tanks until late August 1941 when five were authorized.

†This AFV has no radio in scenarios set prior to 11/41 (see D14). As of 11/41 it is radio-equipped.

†Dates and RF for use in North Africa are 12/40 (1.3), 1/41 (1.2), 2/41 (1.0), 3/41 (1.5), 4-5/41 (1.3), 6-10/41 (1.5), 11/41-6/42 (1.0), 7/42 (1.1), 8-11/42 (1.2), and 12/42 (1.6). For the Balkans they are 1-4/41 (1.3) and 5/41-9/43 (1.6). For Italy they are 9/43 (1.6), and 44-5/45 (1.6; Fascist use only).

9. M14/41: This tank, which entered production in the latter half of 1941, was actually the M13/40 with certain modifications to increase horsepower and enhance its reliability in the desert. The M14/41 saw combat only in North Africa, equipping the tank battalions of the "Littorio" and "Centaur" armored divisions—but first went into action with the XI Medium Tank Battalion of the 101st "Trieste" Motorized Division, which arrived in North Africa with a mixture of M13/40 and M14/41. Sources vary as to the number of M14/41 produced, ranging from 695 to 895—the latter being the most commonly stated figure. Only one was seized by the Germans in September 1943.

†RF is 1.2 for 1-6/42, 1.0 for 7-11/42, 1.5 for 12/42-1/43, and 1.1 thereafter.

10. M15/42: This, the last version of the M13 series, was slightly longer than the preceding models and featured a higher-velocity gun, more powerful engine and improved armor. 112 were built before production was switched to the Semovente M42 da 75/18, and of that number 82 had been issued by September 1943. Their only use in combat by the Italian Army was against the Germans in that same month—most notably by the 135th "Ariete II" Division in and around Rome. The Germans subsequently confiscated 92 and in 1944 oversaw the production of another 28 (see German Vehicle Note 28), some of which they turned over to the Italian Fascists. The Germans also confiscated a prototype AA tank based on the M15/42 which carried four turret-mounted 20mm guns; some sources claim this gave them the idea for the Wirbelwind (German Vehicle Note 86). An M15/42 platoon comprised five such tanks.

†Dates and RF are 9/43 (1.2), and 44-5/45 (1.4; Fascist use only).

11. MR/35(f): The Germans provided Italy with a quantity of ex-French equipment in 1941-42, the most significant of which was 124 Renault R35 tanks. The Italians installed radios in them and renamed them MR/35. They were used to form the CI and CII Battaglioni Carri M, both of which were destroyed in Sicily in the summer of 1943.

†The CE DRM is +1 vs Indirect Fire, as well as vs Direct Fire that emanates from within the turret's rear Target Facing—as signified by "CE: +1RT" on the counter.

†"(f)" in the piece name stands for "French" for ESB, etc., purposes. †RF is 1.2 for 7/43 and 1.4 for 8/43.

Vehicle 12

12. Semovente M40 & M41 da 75/18:

Inspired by the Sturmgeschütz III, the Italians designed a similar AFV in early 1941 using the M13/40 hull and chassis with a box-shaped superstructure and 75/18 howitzer. Apparently 60 were built before production was switched in the latter half of that year to the same vehicle based on the M14/41 tank, of which 162 were ordered. Unlike the StuG III, the SMV 75/18 was intended to provide support and flank protection for medium tank units. In addition, it was often pressed into service as a TD, since compared to the M13 and M14 its armor was somewhat thicker and its gun had a longer effective range. Two SMV 75/18 battalions (*Gruppi Semoventi* 75/18) were assigned to the artillery regiment of each armored division, and several independent gruppi existed as well. Each contained two (sometimes three, in 1943) batteries of four (sometimes six) SMV each.

†SMV M41 75/18 Dates and RF for use in North Africa are 1-6/42 (1.5), 7-11/42 (1.3), 12/42-1/43 (1.5), and 2-5/43 (1.3); for Italy they are 9/43 (1.6), and 44-5/45 (1.6; Fascist use only).

13. Semovente M42 da 75/18 & 75/32:

The last model of the SMV 75/18, ordered in October 1942, was based on the M15/42 tank and originally was intended to carry the new 75/34 gun. However, by March 1943 this gun was still in development so it was decided to install the 75/18 howitzer in the interim. Instead of equipping only Gruppi Semoventi, some SMV M42 75/18 were issued to tank battalions pursuant to a change in the tables of organization of these units at the end of 1942; whereas the old organization had consisted of three medium tank companies, the new TO&E comprised one such company plus two companies of SMV 75/18. In September 1943, SMV M42 75/18 saw action in Italy against the Germans who subsequently confiscated a number of them (see German Vehicle Note 39). The exact number of SMV 75/18 produced is unknown, but 250 (inclusive of those built during the German occupation of Italy) is a generally accepted approximation.

In mid 1943 about 25 SMV M42 were equipped with a version of the 75/32 field gun. In September of that year they saw combat in the Rome area as part of the 135th "Ariete II" Armored Division. Subsequently, a number of those confiscated by the Germans were turned over to the Fascist Italians—as were some SMV 75/34 (see German Vehicle Note 40).

†SMV M42 75/32 Dates and RF are 9/43 (1.5), and 44-5/45 (1.6; Fascist use only).

14. Semovente M43 da 105/25:

Nicknamed the "Bassotto" (Dachshund), the SMV 105/25 was the most potent Italian-designed AFV of WW2. Originally it was to be built on the hull and chassis of the P26/40 heavy tank (see German Vehicle Note 29), but due to delays in the development of the latter a much-modified version of the M15/42 was utilized instead. Apparently its only Italian combat use was with the DCI Gruppo Semoventi in the 235th AT/SPA Regiment of the 135th "Ariete II" Armored Division during the defense of Rome. A battery of SMV 105/25 comprised four such AFV. About three dozen were built prior to the armistice. See also German Vehicle Note 41.

It was envisioned that, once the newest AFV types were available in numbers, SMV 75/34 would be used as TD while SMV 105/25 would provide close support for P26/40 (see German Vehicle Note 29) tank units. The SMV 105/25 would also be used for counterbattery fire, while the older (and shorter-ranged) SMV 75/18 would be relegated to infantry support.

15. Semovente L40 da 47/32:

The SMV 47/32 was derived from the L6/40 in order to increase the mobility of the 47mm gun. It was employed mainly as a TD in SMV 47/32 battalions (*Gruppi Semoventi* 47/32), but was usually relegated to infantry support due to its mediocre AT performance. A squadron of nine was authorized in the RECo (*Raggruppamento Esplorante Corazzato*; armored reconnaissance task force) in the armored and motorized divisions, as were two platoons in the NEC (*Nucleo Esplorante Celere*; fast recon group) of certain 1943-type infantry divisions. It saw action in Russia (19 vehicles in the XIII Gruppo Semoventi 47/32 of the 3rd Celere Division), Tunisia, Sicily and Italy. At least 78 were confiscated by the Germans, who retained a small number for themselves, handed over some to the Fascist Italians, and exported the rest to Croatia. About 300 were built, and a platoon com-

prised four such AFV (two, in an NEC).

†The Inherent crew is always CE (with all this entails) in the same manner as a British Carrier (D6.84)—as signified by "Always CE" on the counter.

†Dates and RF for use in Russia are 7-8/42 (1.5) and 9-12/42 (1.6). For Tunisia they are 12/42-5/43 (1.2). For Sicily they are 7/43 (1.3) and 8/43 (1.4). For Italy they are 9/43 (1.4), and 44-5/45 (1.5; Fascist use only).

16. Semovente M41M da 90/53:

This AFV consisted of the 90mm AA gun mounted on the rear of a lengthened M14/41 hull and chassis, with the engine moved forward from the rear of the vehicle to a central position. It was hurriedly designed and put into production in early 1942 but, due to the large gun's overstressing the chassis and engine, its manufacture was halted after only 30 of the vehicles ordered had been completed. Another drawback was its lack of space for ammo stowage, only six rounds being carried on the SMV; consequently it was accompanied into action by a turretless L6/40 ammunition carrier. Despite having been conceived and built specifically for A-T use on the Eastern Front, due to their unreliability none were ever sent there. Instead, 24 were formed into the 10th Raggruppamento Semoventi (comprising the CLXI, CLXII and CLXIII Gruppi) which remained in Italy until June 1943 when it was sent to Sicily. There it fought against the U.S. 7th Army in the Licata area, where all but two of its SMV 90/53 were lost. The two survivors were ultimately abandoned in Messina. The few left behind in Italy were later seized and used by the Germans. A SMV 90/53 battery contained four such AFV plus four ammo vehicles.

†Most of the crew actually stood outside of and behind the AFV while serving the gun. Therefore, it cannot use TH Case E (i.e., it cannot fire at all if a Known enemy unit occupies its Location), and receives only a +1 DRM for being CE (no DRM if attacked through its unarmored Target Facing; D5.311) as signified by "CE: +1" on the counter. See also Italian Vehicle Note D.

†When an Ammo Vehicle (E10.) is called for by SSR or DYO purchase, use an SMV 47/32. This ammo vehicle has no Gun (place a Gun Disabled counter on it); instead its MA is a 2 FP AAMG (1 ROF; B11) which may fire only at a target that lies within its VCA. (Place an AA counter on it to signify the AAMG.) It also has a red CS#.

†RF for use in Sicily is 1.3 for 7/43 and 1.6 for 8/43.

17. AS 42, AS 42 aa & AS 42 cc:

The AS 42 (AS stands for *Autosahariana*) was derived from the AB 41 armored car but, unlike the latter, was unarmored and lacked a rear driving position. Designed specifically for long-range reconnaissance in North Africa, it had an excellent cross-country range of almost 500 miles. It was also known as the *Camionetta Desertica mod. 42* (Desert Weapons Carrier model 1942), and was nicknamed *la Sahariana* (the Saharan). Its armament varied, so three different versions have been included in the game. AS 42 saw action in North Africa, Sicily and Italy. After the armistice some were used by the Fascist Italians, and by the Germans (including on the Eastern Front and in the Battle of the Bulge). In all, about 200 were built.

†All versions of the AS 42 are termed Scout Cars in deference to their historical role. However, they are considered *trucks* for all purposes [EXC: see Italian Vehicle Note L].

†AS 42 Dates and RF for use in North Africa are 11-12/42 (1.5) and 1-5/43 (1.4). For Sicily they are 7-8/43 (1.4). For Italy they are 9/43 (1.4), and 44-5/45 (1.5; Fascist use only). AS 42 aa and AS 42 cc Dates and RF are the same, but with .1 added to the RF.

18. Lince:

The Lince (Lynx) was a close copy of the British Daimler "Dingo" scout car. It was first considered in 1941, and was accepted for service at the end of March 1943. Production, however, did not start until 1944; hence all went to the Germans, who handed over some to the Fascist Italians. It was used for reconnaissance and liaison. 263 chassis were built, but only 129 vehicles were completed.

19. Lancia IZM:

In late 1912 Italy became the first nation to use armored cars in true war operations, when several fought in North Africa during the Italo-Turkish conflict. Later, in 1915,

H

the Lancia 1Z appeared; then in 1917 came the 1ZM, derived from the 1Z. Both Lancia types saw action in WW1. In 1928 the 1ZMs' MG were replaced by more modern types. Afterwards, 1ZM were used by the Italians from 1937 in the Spanish Civil War, in the conquest of Ethiopia in 1935-36, and later in Italian East Africa. Some were also exported to China in 1937. A squadron comprised six cars; a section two. Each 1ZM was equipped with special rails to enable it to drive through and cut wire.

†This AFV may clear wire as if it were fully tracked (B26.53).

†Availability for WW2 scenarios is limited to East Africa, with Dates and RF of 7/40-1/41 (1.4) and 2-6/41 (1.5).

20. Fiat 611A & 611B: These armored cars, sometimes also referred to as AB 611 or AB 34,

were built on the chassis of Fiat 6x4 military trucks. The 611A had two MG in the front of the turret, while the 611B carried a medium-velocity 37mm gun instead. Both types had a MG in the rear of the turret and another in the rear hull. Fiat 611 were used operationally in the 1935-36 conquest of Ethiopia and later in Italian East Africa. A total of 46 were built.

†For both types, availability for WW2 scenarios is limited to East Africa, with Dates and RF of 7/40-1/41 (1.5) and 2-6/41 (1.6).

21. AB 40 & AB 41: These two automotively advanced designs filled the requirement for

modern AC in the Italian Army. They featured a 4x4 layout with four-wheel steering and fully independent suspension, freely rotating spare wheels (midway along the sides of the hull) to help prevent "bellying" when crossing obstacles, and a rear driving position. The AB 40 carried two coaxial MG in the turret and a third MG in the rear of the superstructure; the AB 41 had a 20mm gun in place of one turret MG, as well as an increase in engine horsepower. 24 AB 40 and about 560 AB 41 were built. They were issued to the reconnaissance units of armored, motorized and cavalry divisions, and were also used in independent recon companies and platoons. An AB platoon comprised four such vehicles. The AB 40 was apparently used only in North Africa, while the AB 41 saw action on all major fronts (including 30 sent to Russia).

The Germans confiscated 37 completed AB 41 plus another 20 in production. They also seized prototypes of the AB 43, a new model with a larger turret, 47mm gun and more powerful engine. After ordering certain modifications (including a reversion to the 20mm gun), they had 102 of this type built for them, which they designated AB 41/43.

†AB 41 Dates and RF for use in North Africa are 8-10/41 (1.5), 11/41-5/42 (1.4), and 6/42-5/43 (1.3); for Russia they are 12/41-8/42 (1.5); for the Balkans they are 42-9/43 (1.4), and 44-5/45 (1.4; Fascist use only); for Sicily they are 7-8/43 (1.4); for Italy they are 9/43 (1.3), and 44-5/45 (1.4; Fascist use only).

22. Autoprotetto S37: This APC was based on the AS 37 truck, which in turn derived from the TL 37 AS, the desertized version of the TL 37 artillery tractor. The S37 was not intended as

a carrier for armored infantry, but rather as a battlefield command/supply vehicle. However, it came to be used mainly for the escort of convoys in partisan-infested areas, predominantly in the Balkans. Apparently few if any were sent to North Africa. About 200 were built.

†This vehicle is treated as an *armored car* for movement (and all related) purposes [EXC: Reverse Movement costs it four times its normal hex entry cost—as signified by "REV x4" on the counter]; otherwise it is treated as an *armored halftrack*.

†Dates and RF for use in Russia are 10-12/42 (1.5) and 1-3/43 (1.6). For the Balkans they are 10/42-9/43 (1.4), and 44-5/45 (1.5; Fascist use only).

23. Autocannoni da 20/65(b) & 65/17(b): These were Morris CS 8 15-cwt trucks captured from the British in North Africa and modified to carry a 20mm AA or 65mm INF gun. Two Gruppi (the XIV and XV) Autocannoni da 65/17 were formed, each of three four-gun batteries, and to each Gruppo was attached a section of four Autocannoni da 20/65. They were assigned to the artillery of RECAM (Reparto Esplorante del Corpo d'Armata di

Manovra, the Italian corps recon unit), later to the North African Fast

Vehicle 26

Task Force (*Raggruppamento Celere AS*), and still later to the 136th "Giovani Fascisti" (Young Fascists) Division. Autocannoni da 20/65 based on various other truck types also existed. The Italians apparently also designed other Autocannoni carrying 75mm and 100mm artillery pieces, but little has come to light regarding their development and use.

†“(b)” in the piece name stands for “British” for Hammada Immobilization and Sand Bog purposes. All Inherent armament on the vehicle is Italian—not British.

†The optional AAMG of the *Autocannoni da 65/17* is always available and has a 1.2 RF. It may fire only at a target that lies within its VCA—as signified by “MG: VCA only” on the counter.

†*Autocannoni da 20/65* use in 1945 is limited to Fascist Italians only. *Autocannoni da 65/17* RF for use in North Africa is 1.5 for 11/41-6/42, 1.6 for 7-12/42, and 1.5 in 1943.

24. Autocannoni da 75/27 CK & 90/53: The Autocannoni da 75/27 CK (*Cannone Krupp*)

originated during WW1 when the Italians mounted Krupp 75mm AA guns on trucks. In 1927 the same guns were remounted on more modern Ceirano vehicles, and these are what the game pieces represent. 24 were used by the Italians in Spain late in that country's civil war. Some also saw action in North Africa during the early stage of that campaign. The Autocannoni da 90/53 was a Lancia 3 RO 4x4 (or, later, a Breda *Dovunque* 6x6) heavy truck modified to carry the 90/53 AA gun. Designed for a multi-purpose AA-AT role, it appeared in 1941 and first entered combat in two Gruppi of the Ariete division's 132nd Artillery Regiment. Apparently no more (and quite possibly less) than 57 were built. For both the 75/27 and 90/53 Autocannoni, a battery comprised four vehicles.

†*Autocannoni da 75/27 CK* RF for use in North Africa is 1.5 for 6/40-2/41 and 1.6 for 3-11/41. *Autocannoni da 90/53* Dates and RF for use in North Africa are 5-11/42 (1.4), 12/42 (1.6), 1-2/43 (1.5), and 3/43 (1.6); for Sicily they are 7/43 (1.5) and 8/43 (1.6).

25. TL 37, TM 40 & TP 32: From about 1926 the Italians produced various light, medium

and heavy prime movers (which they called tractors) specifically for towing artillery. Three of the more common models were, respectively, the Fiat-Spa *Trattore Leggero* 37 and *Trattore Medio* 40, and the Breda *Trattrice Pesante* 32. All were 4x4 vehicles with large, oversize wheels and four-wheel steering (the latter to make them more maneuverable on narrow mountain roads). Most also had fully independent suspension. By 1942 the TL 37 was the authorized divisional-artillery prime mover for Italian units in North Africa. The TP 32 also represents other less common artillery tractors built in the early and mid 1930s. After September 1943, Italian artillery tractors were used by the Germans in Italy and elsewhere in Europe.

†TL 37 Dates and RF for North-Africa/the-ETO [EXC: the Balkans] are 6/40-6/41 (1.3), 7/41-5/43 (1.2), 7-8/43 (1.3), 9/43 (1.2), 10-12/43 (1.6), 1944 (1.5), and 1945 (1.5; Fascist use only). For the Balkans they are 10/40-4/41 (1.3), 5/41-9/43 (1.4), and 44-5/45 (1.5; Fascist use only). For East Africa they are 6/40-6/41 (1.5) and 7-11/41 (1.6).

TM 40 Dates and RF for North-Africa/the-ETO [EXC: the Balkans] are 9-11/40 (1.6), 12/40-3/41 (1.5), 4-6/41 (1.4), 7/41-5/43 (1.3), 7-8/43 (1.4), 9/43 (1.3), 10-11/43 (1.6), 12/43-44 (1.5), and 1945 (1.6; Fascist use only). For the Balkans they are 10/40-9/43 (1.6), and 44-5/45 (1.6; Fascist use only).

TP 32 Dates and RF for North-Africa/the-ETO [EXC: the Balkans] are 6/40-41 (1.5), 42-5/43 (1.4), 7-9/43 (1.4), and 10-11/43 (1.6). For the Balkans they are 10/40-4/41 (1.5) and 5/41-9/43 (1.6). For East Africa they are 6/40-11/41 (1.6).

26. Autocarretta: As the portee method of transporting light guns lost favor, certain types of light trucks were produced/adapted to tow them. These are generically represented by the Auto-

carretta or “little truck”. (The Autocarretta was actually a specialized vehicle originally intended for use in the mountains. Thus its designation applied to the game piece is somewhat of a misnomer, but is used in this broader sense for the sake of convenience.)

†The optional AAMG is always available and has a 1.4 RF.

†Dates and RF for use in North-Africa/Russia/Italy are 8/41-5/43 (1.1),

Vehicle 26

9/43 (1.1), 12/43 (1.3), 1944 (1.2), and 1945 (1.2; Fascist use only). Elsewhere [EXC: NA in East Africa] they are 8/41-9/43 (1.2), 10-11/43 (1.5), and 44-5/45 (1.2; Fascist use only).

27. *Fiat 508 MC*: Derived from the civilian Fiat 1100, the 508 MC (*Militare Coloniale*) was one of the more common field cars used by the Italians. Of 4x2 configuration, it was produced in large numbers and several different variants. However, its use was limited mainly to HQ units (e.g., a normal infantry regiment was authorized only one—for the regimental CO). In German service it was designated the *1100 Mil*. The AAMG version actually represents the *Furgone*—a conversion of the 508 to somewhat the equivalent of a modern-day “mini-pickup” truck—with twin Fiat MG mounted on it. About 50 *Furgoni* were thusly armed, and were used for the AA defense of convoys in North Africa.

†When this vehicle is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle's Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract two (one per crew/HS) from the colored dr of its immediately subsequent unbogging DR.

†The optional AAMG (i.e., the *Furgone* version) has a 1.4 RF, but is available only for 1942-43 scenarios set in North Africa. It may fire only at a target that lies within its VCA—as signified by “MG: VCA only” on the counter. It may not be Removed, but may be Scrounged as one or two LMG. The *Furgone* has no Passenger capacity. See also Italian Vehicle Note A.

†Availability in 1945 is limited to Fascist Italians only.

28. *Autocarri L, M & P*: The Italian Army possessed many diverse types and makes of trucks, and for this reason the game pieces generically represent the light (*Leggero*), medium (*Medio*) and heavy (*Pesante*) classes. The payload capacity and minimum top speed of the latter two were standardized in 1937, but otherwise the

manufacturers were largely free to use whatever engines, tires, etc. they wished. This, along with the existence of many vehicles produced prior to the standardization policy, caused no end of problems with spare parts. Italy began the war with some 42,000 vehicles (excluding cars and motorcycles), and through mid 1943 produced about 108,000 cars, trucks and artillery tractors. Generally speaking, motor transport was in short supply at all levels throughout the war. Efforts were made to keep at least the forces in North Africa and Russia at full establishment, but production could not keep up with losses despite receiving Opel Blitz and French Citroen trucks from the Germans. Even pressing into service as much captured British transport as possible could not greatly alleviate the transport shortage in Africa. Aside from a few specialized types, the Italians generally did not use trucks to tow their artillery.

†RF for all three types is 1.3 for an 8/41-9/43 scenario set in North-Africa/Russia/Italy, and for a 12/43 scenario set in Italy. Otherwise it is 1.4 [EXC: Dates and RF for use in East Africa are 6/40-6/41 (1.5) and 7-11/41 (1.6); RF for 44-5/45 use in Italy is 1.2, and 1945 availability is limited to Fascist Italians only].

ITALIAN MULTI-APPLICABLE VEHICLE NOTES

A. Make two To Kill DR when using the AP To Kill Table; only one DR (firer's choice) is used. This is signified on the counter by “2 TK DR”.

B. The 4-FP BMG may be Scrounged as one or two LMG (as per D10.5); however, it is considered one MG for malfunction, repair and disablement purposes.

C. If this AFV is *non-turreted*, its AAMG may fire only at a target that lies within its VCA—as signified by “AAMG: VCA only” on the counter. If optional, the AAMG is always available with a 1.4 RF.

D. The MA may use neither Motion Fire nor Bounding (First) Fire—as signified by “No Bnd(F)F” on the counter.

E. If Stunned, this AFV may not regain CE status, may not fire any weapon, and is Recalled as per D5.341; these are signified by “Stun=Recall & CE/FP NA” on the counter. The BMG, if present, may fire while the vehicle is HD—as signified by “BMG HD FP ok” on the counter.

H

F. The MA and all MG have BII. This is signified by “BII” in red on the counter (bold in the Vehicle Listing). If the vehicle is equipped with a hull Rear MG, that MG may be Removed as a dm MMG.

G. The MA may not use Bounding First Fire, or Motion Fire, through its VCA—as signified by “BndFF NA VCA” on the counter.

H. HEAT becomes available in September 1942, as signified by the superscript “52+”.

I. The CMG of the *MR/35*, and the hull Rear MG of the *AB 40*, may be repositioned as a 2-FP AAMG. This can be done only by placing an AA counter on the AFV at the end of any friendly fire phase (not MPh) in which its Inherent crew is CE and could have fired the MG (even if malfunctioned) but did not. This AAMG may fire only at a target that lies within the AFV's TCA—as signified by “AAMG: TCA only” on the counter. The AAMG may be repositioned as the *MR/35* CMG, or *AB 40* hull Rear MG, by using these same principles to remove the AA counter.

J. The 20L MA is an ATR, has a maximum To Hit range of 12 hexes (as signified by “[12 TH]” on the counter), and may be Scrounged/Removed. It fires through its given CA in the normal manner. The MA of the *L3 cc* may not be used if it is CE, as signified by “CE use NA” on the counter.

K. If armed, this vehicle has an Inherent crew and thus a CS# instead of a cs#.

L. This vehicle is treated as an *armored car* for movement (and all related) purposes. [EXC: It may not cross a hedge. Note M below also applies.]

M. Reverse Movement costs this vehicle three times its normal hex entry cost—as signified by “REV×3” on the counter.

N. This vehicle was used in North Africa at some time from 6/40 to 5/43 (within the limits of its own given Dates). If the superscript “7” appears, its use in North Africa was limited to Tunisia, 11/42-5/43 (within the limits of its own given Dates).

R. This vehicle was used in Russia at some time from 8/41 to 3/43 (within the limits of its own given Dates).

AA. The MA has AA capability—as signified by “MA: AA” on the counter.

ITALIAN ORDNANCE NOTES

Italian ordnance used a “#/#” system of nomenclature, with the first number giving the caliber size in mm and the second the barrel length in calibers. If additional identification was needed, the model year was added as a suffix.

[Note: All Allied Italian combat formations were re-equipped by the British in early 1945. Therefore, for DYO scenarios set in that year, the Allied-Italian player may purchase British 76*-MTR/AT/88-ART/40L-AA (only), as if his OB were British. He treats such Guns as non-Captured.]

1. *Mortaio da 45 “Brixia”*: This weapon, the standard “assault and support” mortar of the Italian Army, was accepted for service in 1935 and first saw action in East Africa that same year. Its design embodied a number of unusual—and overly complex—features. Instead of being fired by simply dropping a round down the muzzle, a lever arm was pulled to open the top of the breech, and the projectile (a standard grenade with a finned attachment at the rear) was hand-loaded through the opening; the lever was then pushed to insert a firing cartridge (from a ten-round magazine) and close the breech. Firing was accomplished by squeezing a trigger. Range could be varied by the normal method of setting elevation, and also by an adjustable gas port which vented a portion of the propellant gas. In action the firer normally lay prone, with his chest on a padded frame cushion attached to the mortar's rear leg. For transport, the legs folded and the entire weapon was worn like a backpack, with the cushion easing the load on the bearer's back.

The “Brixia” (its designer's name) was normally used in mortar squads of three weapons each. Three such squads formed a platoon, two of which were authorized in the SW company (*compagnia armi di accompagnamento*) of an infantry battalion. The battalion often assigned one or two of these squads to each of its rifle companies. In an Alpini battalion, each company usually contained an inherent Brixia squad instead. Bersaglieri, cavalry and Libyan units were not normally authorized 45mm mortars. Some divisional 81mm mortar battalions contained a company of three Brixia platoons in lieu of one 81mm company until such time as the latter could be provided. Early in the war the Italians also received a number of ex-French 60mm mortars.

Frontline use of the Brixia declined as the war progressed, especially in North Africa where by 1942 it was no longer even authorized in first-line divisions. However, in late 1943 when the first Allied Italian units were being formed, each battalion was authorized 18 Brixias. Large numbers of Brixias and other types of Italian SW were used by partisans in the Balkans.

2. **Mortaio da 81/14:** First used in Ethiopia in 1936, the 81/14 was a close copy of the French Brandt 81mm mortar. It fired both light (7-lb) and heavy (15-lb) bombs, and had the longest range of any medium mortar used during the war. Its ammunition was interchangeable with that of U.S. and French 81mm mortars, and it could also fire German 81mm rounds to just over 2000m. Blackshirt legions, and the infantry regiments in normal, motorized and "truckable" (*autotrasportabile*) infantry divisions were usually authorized one company of 81/14s each. However, 1942 "North-Africa Type" (*Tipo AS*) infantry regiments, as well as Alpini regiments, were authorized a company in each battalion instead. Cavalry, Libyan, parachute and Bersaglieri regiments normally contained no 81/14s (though in North Africa some of the latter actually did at one time or another). Both infantry and *autotrasportabile* divisions—except those designated *Tipo AS*—were also authorized a divisional mortar battalion of three companies. The "Pasubio" and "Torino" *autotrasportabile* divisions each had two such battalions in Russia. An 81mm mortar company comprised three platoons of two (sometimes three, especially later in North Africa) mortars each. A number of Polish prewar M28 81mm mortars were also supplied to the Italians.

†Dates and RF for use in North Africa are 6/40-5/41 (1.3), 6/41-4/42 (1.2), 5-12/42 (1.1), and 1-5/43 (1.0). For East Africa they are 6/40-6/41 (1.3) and 7-11/41 (1.4). For Russia they are 8/41-1/43 (1.1), 2/43 (1.3), and 3/43 (1.5). Elsewhere they are 6/40-9/43 (1.2), 10-11/43 (1.3), 12/43 (1.2), 1944 (1.1), and 1945 (1.1; Fascist use only).

3. **Fucile-cc S:** Like several other nations, Italy adopted a Swiss 20mm ATR—in this case the s18-1000 (and the very similar s18-1100) which in Italian service was designated the *Fucile-controcarrlo S* (anti-tank rifle Solothurn). It was capable of single-shot and semi-automatic fire (or full-auto in the 1100 version) from either a small two-wheeled carriage or an attached bipod. It was first issued in 1940, two per battalion, to troops in North Africa (especially Bersaglieri and Libyan units). Later, as its availability increased, its employment became more widespread and as many as six per battalion were authorized. *Fucile-cc S* were often manned by the ex-crews of 45mm mortars being taken out of frontline service. Another ATR used by the Italians was the Polish Maroszek wz 35. The Germans captured about 2,000 of these in September 1939, and during the winter of 1941-42 they turned over the bulk of them to the Italian forces in Russia.

ERRATA: The AP Basic To Kill number of the 20L ATR is "6"; that of the 1PP (ex-Polish) ATR is "5".

4. **Cannone-cc da 37/45:** This was a license-built version of the German 3.7cm PaK 35/36. Apparently it was not widely used, and little has come to light regarding its employment. (Indeed, even Italian documents rarely mention it.) North-African-type Bersaglieri truckborne and motorcycle companies were each authorized a platoon of two 37/45, and some (carried and usually fired *en portee*) were encountered by the British during the early fighting in Cyrenaica. Apparently this use in North Africa was its only significant combat service—though in the 1930s two companies had been used by Italian troops in the Spanish Civil War.

5. **Cannone da 47/32:** This was the Boehler M1935, designed in Austria, which the Italians produced in several licensed versions. They used it as an AT gun, for infantry support and as pack artillery, while modified versions were used in the M13-M14 tanks and SMV 47/32. One drawback to its design was the lack of a gunshield; another was that those built prior to 1939 lacked a towing eyelet, so had to be manhandled or carried *en portee*. Overall it was a good gun, but due to the lack of a suitable replacement it had to soldier on long after becoming obsolete. In mid 1940 there were 928 in Italian service (including 127 in Libya); by Sept. 1943 more than 3,000 had been produced.

47/32 were employed in the divisional AT company generally authorized in each normal and "truckable" (*autotrasportabile*) infantry, Celere, Black-shirt and Libyan division. Each motorized infantry regiment was authorized a company, as was each Bersaglieri regiment; however, by mid 1941 many of the latter had one company per battalion instead. Since it was planned that 47/32 eventually would replace all 65/17 in the infantry support role, some regiments possessed a 47/32 company instead of their 65/17 battery—and, from early 1942, infantry regiments in North Africa were each authorized twelve 47/32 instead. Since the gun could be para-dropped, the "Folgore" parachute division used it as divisional artillery—and some of this division's regiments and battalions contained a 47/32 company apiece. A number of 47/32 AT battalions also existed; aside from being used at corps level, by mid 1941 one was generally attached to each armored division. Most divisions sent to Russia contained at least two divisional AT companies. A 47/32 company usually comprised eight guns in four platoons. Apparently no 47/32 were sent to Italian East Africa.

Other AT guns used by the Italians included a small number of German 7.5cm PaK 97/38 (36 were turned over to the 8th Army in Russia), 7.5cm PaK 40 (a few) and 8.8cm FlaK (a small number were used in North Africa), and the French 25mm mle 1934.

III Ordnance 5

†The 47/32 may not be towed in any scenario set prior to August 1941—as signified by “Towed[†]” on the counter.

†Dates and RF for use in North Africa are 6/40-5/41 (1.2), 6-10/41 (1.1), 11/41-4/42 (1.0), and 5/42-5/43 (.9). For Russia they are 8/41-1/43 (1.0), 2/43 (1.2) and 3/43 (1.4). Elsewhere [EXC: NA in East Africa] they are 6/40-9/43 (1.3), 10-11/43 (1.6), 12/43 (1.3), 1944 (1.2), and 1945 (1.2; Fascist use only).

6. *Cannone da 65/17*: This was an Italian-made mountain gun dating from 1913. Alpini units used it in WW1, but by 1940 it had been relegated mainly to infantry support. In mid 1940 there were 700 in service, including 146 in Libya and 312 in Italian East Africa. Blackshirt legions, and the infantry regiments in both normal and “truckable” (*autotrasportabile*) infantry divisions, were each authorized one battery of four 65/17 (though some used 47/32 instead; see Note 5 above). In a few rare cases—mostly in East Africa—65/17 were employed as divisional artillery. (They had also been used thusly by the Nationalists during the Spanish Civil War.)

†Dates and RF for use in North Africa are 6-12/40 (1.1), 1-10/41 (1.2), 11/41-4/42 (1.3), 5-12/42 (1.4), and 1-5/43 (1.5). For East Africa they are 6/40-6/41 (1.0) and 7-11/41 (1.1). For Russia they are 8/41-42 (1.1), 1/43 (1.5) and 2-3/43 (1.6). Elsewhere they are 6/40-9/43 (1.1), and 1944-45 (1.3; Fascist use only).

7. *Cannone da 70/15*: This ancient gun, which lacked any type of recoil mechanism, was first produced in 1902 as a mountain artillery piece for Alpini units. It was later superseded by the 65/17 and passed to the infantry. Its only significant use in combat during WW2 occurred in Italian East Africa, where 92 were present in July 1940. It was probably employed at the regimental level, like the 65/17.

†RF for use in East Africa is 1.2 for 6/40-6/41 and 1.3 for 7-11/41.

8. *Obice da 75/13*: The Skoda 7.5cm vz 15 was one of the most successful mountain howitzers ever produced. Many were taken over by the Italians after WW1 and, designated the 75/13, were issued to Alpini units to replace their 65/17. In mid 1940 the army had 1,187 75/13 in service, including 32 in Italian East Africa. An Alpini regiment, whose structure allowed it to operate independently whenever necessary, often had a 75/13 battalion (*gruppo*) directly attached, one battery (four guns) of which could in turn be assigned to each of the regiment's battalions. Each of the three Alpini divisions sent to Russia in 1942 contained two 75/13 battalions in its artillery regiment. 75/13 were occasionally used as divisional artillery by other types of divisions as well.

†Dates and RF for use in Russia are 9-12/42 (1.3), 1/43 (1.2), 2/43 (1.5), and 3/43 (1.6). For East Africa they are 6/40-6/41 (1.5) and 7-11/41 (1.6). Elsewhere [EXC: NA in North Africa] they are 6/40-9/43 (1.2), 1944 (1.4), and 1945 (1.4; Fascist use only).

9. *Cannone da 75/27*: This was the standard light field piece in the artillery regiment of most Italian divisions. The game piece actually represents four different pre-WW1 guns that are equivalent in game terms and historical role: the 75/27 m06, m11 and m12, and the 77/28. The m06 was a license-built Krupp product, 51 of which were later modified by the Italians, becoming the m12. The m11 was an import from France, notable for being the first service artillery piece in the world to have split trails. The 77/28 was a Skoda-built combination field/mountain gun; among other uses it was issued to Italy's two Libyan divisions. In mid 1940 there were 3,091 75/27 in army service (including 499 in Libya and 24 in Italian East Africa), plus 245 77/28. A battery comprised four guns. During the Spanish Civil War the 75/27 was employed by some Nationalist units as divisional artillery.

†Dates and RF for use in East Africa are 6/40-6/41 (1.3) and 7-11/41 (1.4). Elsewhere they are 6/40-9/43 (1.2), and 1944-45 (1.4; Fascist use only).

10. *Obice da 75/18*: This game piece represents two guns: the 75/18 m34, which was a modern mountain howitzer derived in 1934 from the 75/13; and the 75/18 m35, a normal field howitzer derived from the m34. In June 1940 only 114 m34 were in service, and by Sept. 1942 only 230 m34 and 68 m35 had been produced. (Another

54 of the latter were built by mid 1943.) Both types were employed as divisional artillery in a few select units, mostly in North Africa and Russia. A battery comprised four guns. This ordnance was also used as the MA of the Semovente 75/18, which is one reason relatively few of the towed versions were built.

†Dates and RF for use in North Africa are 11/41-5/43 (1.4). For Russia they are 7-12/42 (1.3), 1/43 (1.5) and 2-3/43 (1.6). Elsewhere they are 42-9/43 (1.5), 12/43 (1.5), 1944 (1.4), and 1945 (1.4; Fascist use only).

11. *Cannone da 75/32*: The 75/32 was virtually identical to the 75/18 m35, but possessed a longer barrel for increased muzzle velocity and range. It was accepted in 1937 but did not enter production until 1940. By Sept. 1942 only 39 had been built—and by mid 1943 only 98 more had been produced. Though intended as an artillery piece, the 75/32 was used primarily as an AT gun—most notably in Russia where 36 were employed in the three battalions (*gruppi*) of the 201st Motorized AT Regiment, with four guns per battery. Apparently only a very small number were sent to North Africa, and saw little if any action there.

†Dates and RF for use in Russia are 8-12/42 (1.4) and 1-3/43 (1.6). For Italy they are 9/43 (1.5).

12. *Obice da 100/17*: Another old Austro-Hungarian howitzer—in this case the Skoda 10cm vz 14. A large number were taken over by Italy in 1918, some of which were used in the Spanish Civil War. In mid 1940 there were 1,524 in Italian service (including 172 in Libya and 14 in Italian East Africa), plus 181 Skoda 10cm vz 16, which was a mountain version. In addition, the Germans later gave the Italians 400 of the vz 14/19 (which the latter designated the 100/22), an improved version of the vz 14. The Italians used the 100/17 as a companion piece to the 75/27 in the artillery regiment of various divisions; however, as the war progressed it tended to be supplanted by the 105/28. In Russia the 100/17 was employed only by the “Pasubio” and “Torino” *autotrasportabile* divisions and the 3rd Celere Division; the first two each contained one battalion (*gruppo*) throughout the campaign, while the latter contained one only in 1942. An artillery *gruppo* normally comprised twelve guns in three batteries.

With its M# changed to “9”, the game piece also represents the 105/11, a French mountain gun used by the Alpini divisions sent to Russia.

†Dates and RF for use in North Africa are 6/40-41 (1.3) and 42-5/43 (1.4). For East Africa they are 6/40-6/41 (1.5) and 7-11/41 (1.6). For Russia they are 9/41-42 (1.3), 1/43 (1.4), and 2-3/43 (1.6). Elsewhere they are 6/40-9/43 (1.3), 10-12/43 (1.6), 1944 (1.5), and 1945 (1.5; Fascist use only).

13. *Cannone da 105/28*: This was a license-built version of the French 105mm mle 1913 (also known as the L 13 S). The Italians used it as corps artillery, though it was also employed at divisional level in place of the 100/17. The game piece also represents the 105/32, a modified version of the old Skoda 10.4cm vz 15; it too was used at corps level. In mid 1940 there were 956 105/28 and 227 105/32 in Italian service, including (respectively) 97 and 0 in Libya, and 59 and 4 in Italian East Africa. The 105/28 was also used as a corps-level gun in the Spanish Civil War.

†Dates and RF for use in North Africa are 6/40-41 (1.4) and 1/42-5/43 (1.3). For East Africa they are 6/40-6/41 (1.4) and 7-11/41 (1.5). For Russia they are 9/41-6/42 (1.3), 7-12/42 (1.2), 1/43 (1.3), 2/43 (1.5), and 3/43 (1.6). Elsewhere they are 6/40-9/43 (1.4), 10-12/43 (1.6), 1944 (1.5), and 1945 (1.5; Fascist use only).

14. *Obice da 149/13*: This piece represents two old Skoda howitzers—the 15cm vz 14 and vz 14/16—taken over by the Italians from the Austro-Hungarian Empire after WW1. The first they designated the 149/12, and the second the 149/13. Some were sent to Spain where they were used by the Nationalists as corps/army artillery. In mid 1940 there were 592 149/12 and 490 149/13 in Italian service, including 37 in Libya and 4 in Italian East Africa (all 149/13s). Both types were used as corps artillery. Five battalions (*gruppi*) of 149/13 (48 guns total, four per battery) served in the three corps of the 8th Army in Russia. The Italians referred to corps-level guns and howitzers as “heavy field” (*pesanti campali*) artillery. Another corps gun used by the Italians was

H

the 6-in. howitzer imported from Great Britain after WW1; In June 1940, 88 were in Italian service. Italy also produced a modern, efficient corps howitzer—the 149/19—but its rate of production was low and it apparently saw little combat. The Germans kept it in production after 1943 for their own use.

†Dates and RF for use in North Africa are 6-12/40 (1.5) and 1/41-5/43 (1.4). For East Africa they are 6/40-11/41 (1.6). For Russia they are 7/42-1/43 (1.4) and 2-3/43 (1.6). Elsewhere they are 6/40-9/43 (1.5), and 1944-45 (1.6; Fascist use only).

15. *Cannone da 149/35*: Another ancient gun still in service during WW2 was the 149/35, which was first produced around the turn of the century. It lacked a recoil mechanism, so ramps were placed behind its wheels to keep it from rolling farther backward each time it was fired. To further inhibit rolling, large flat plates were strapped around the rims of its wheels (as was commonly done during WW1), even though this reduced its towing speed to only 4-5mph. In June 1940 there were 895 in Italian service. 149/35 were employed at army level in the Balkans and North Africa, with four per battery.

†Dates and RF for use in North Africa are 6-12/40 (1.5), 1-10/41 (1.6), and 11/41-11/42 (1.5). For the Balkans they are 10/40-4/41 (1.5). For Sicily they are 7-8/43 (1.6).

16. *Cannone da 149/40*: To replace the 149/35 and miscellaneous other old, large-caliber guns, the 149/40 was produced from about 1935. However, as in so many other cases, the Italian arms industry was unable to effect rapid production, and by June 1940 only 39 were in service. In Sept. 1942 there were 36 in Russia, 12 in North Africa and three in Italy. A companion piece to the 149/40 also existed. This was the 210/22, accepted for service in 1938. Again, the number built was small: 16 were in service in June 1940, and only 20 in Sept. 1942. Apparently the 210/22 saw combat only in Russia, with the LXXXIII Gruppo (15 guns). The Germans considered the 149/40 and 210/22 good designs, and kept both types in production after 1943. In 1941 the Italians received 38 German 15cm sFH 18 howitzers; designated the 149/28, 24 were used in Russia (in the XXIV and L Gruppi) and 14 in North Africa (in the CXXXI and CXLVII Gruppi). In Russia, all three of these gun types were employed in the 9th Army Artillery Brigade of the 8th Army, with four guns per battery. The Italians referred to army-level guns and howitzers as "heavy" (*pesanti*) artillery.

†Dates and RF for use in North Africa are 6/41-11/42 (1.6). For Russia they are 8-12/42 (1.5) and 1-3/43 (1.6).

17. *Cannone-mitragliera da 20/65*: This was the standard Italian light AA gun, which the Italians also viewed as a heavy machinegun (*mitragliera*) and light AT gun. Adopted in 1935, it was exported to China in the late 1930s, and about sixty were used in the Spanish Civil War. By mid 1940 there were 1,088 in army service, including 209 in Libya and 24 in Italian East Africa; by Sept. 1942 its total number had increased to 2,788 (including 326 on static mounts). An artillery regiment was normally authorized one battery of 20/65 if in an infantry division, or two batteries in most other types of divisions. By mid 1941 in North Africa, at least some motorized infantry and Bersaglieri regiments contained a 20mm battery as well (or instead). All divisions sent to Russia contained two 20/65 batteries—except for the "Vicenza" occupation division, which had none. A squadron of eight 20/65 (two per platoon) was authorized in the RECo (*Raggruppamento Esplorante Corazzato*; armored recon task force) of armored and motorized divisions. The 1942 armored division was authorized one battery each in its tank and Bersaglieri regiments, and two more (plus an additional section) in its artillery regiment. After 1943 the Germans kept the 20/65 in production for their own use. A 20/65 battery comprised four two-gun sections.

†When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

†Dates and RF for use in North Africa are 6/40-5/41 (1.2), 6/41-4/42 (1.1), and 5/42-5/43 (1.0). For East Africa they are 6/40-6/41 (1.5) and 7-11/41 (1.6). For Russia they are 8/41-1/43 (1.2), 2/43 (1.4) and 3/43 (1.6). Elsewhere they are 6/40-11/43 (1.3), 12/43 (1.4), 1944 (1.3), and 1945 (1.3; Fascist use only).

Ordinance Note C

18. *Cannone-aa da 75/39*: This was a pre-war Vickers AA gun captured by the Germans during their 1940 campaign in the West. Later they turned over 54 to the Italians who used them as AT guns in Russia, each division in that theater (except for the "Vicenza" occupation division) receiving a battery of six.

†This Gun's AP Basic To Kill number is "16"—as signified by "AP TK#: 16" on the counter.

†RF for use in Russia is 1.3 for 7/42-1/43, 1.5 for 1/43, and 1.6 for 2-3/43.

19. *Cannone-aa da 75/46*: Design work on this Italian AA gun started in 1926, and it was adopted in 1934. In mid 1940 there were 76 in army service (including 8 in Libya and 24 in Italian East Africa), but by late 1942 only 226 had been produced. Two 75/46 battalions (*gruppi*) were included in the CSIR (*Corpo Spedizione Italiano in Russia*—Italian Expeditionary Corps in Russia) in 1941; on that front in 1942 the 8th Army contained five such battalions. The 75/46 was sometimes called on to double as an AT gun, a role it performed most effectively. After September 1943 the Germans used a number of 75/46, including on the Eastern Front.

†RF for use in North Africa is 1.5 prior to 1942, and 1.4 for 1/42-5/43. Elsewhere it is 1.5 for 6/40-9/43 [EXC: 1.6 for East Africa, 7-11/41], 1.6 for 10-11/43, and 1.6 for 1944-45 (Fascist use only).

20. *Cannone-aa da 90/53*: This gun originated in 1939; by June 1940, 1600 had been ordered but none were yet available. It was an excellent weapon, comparable in many ways to the German "88". Indeed, its maximum range exceeded, and its armor penetration roughly equalled, that of the German gun. Unfortunately for the Italians the 90/53 was never available in sufficient quantity, there being only 539 available in July 1943—the majority of which were in static emplacements. No 90/53 were employed in Russia. A battery comprised four guns. After Italy's capitulation, the Germans not only seized all the 90/53 they could but also kept it in production for their own use; at the end of 1944 they had 315 in service.

†Dates and RF are 5/42-9/43 (1.5) [EXC: NA in Russia], 10-11/43 (1.6), and 1944-45 (1.6; Fascist use only).

ITALIAN MULTI-APPLICABLE ORDNANCE NOTES

A. This Gun may be Animal-Packed. Rules for this capability will be provided in the ASL Japanese module.

B. This Gun may not use Target Acquisition (C6.5-.58)—as signified by "Acq. NA" on the counter.

C. This Gun may be carried *en portee*, which means it may be loaded onto a vehicle (during setup/play) and carried as Passenger PP. As a Passenger, the Gun and its ammo together use all but 5PP of the vehicle's Passenger capacity. The Gun may be porteed only by an *Autocarro L* [EXC: an *Autocarro M* for the 65/17; an *Autocarro P* for the 75/27] that, prior to setup, was noted on a side record as being able to portee a Gun of that particular Caliber Size (C2.21) and Barrel Length (C4.1).

The principles of (un)loading a Gun to/from portee status are the same as for the 2pdr Portee in British Vehicle Note 77, except that here the Gun crew (un)loads as a Passenger rather than as an Inherent Crew, and a QSU Gun is not (un)loaded limbered. When a Gun has been thusly loaded, it is marked with an En Portee counter. A vehicle porteeing a Gun is not flipped over to its Wreck side if it becomes Immobilized, and the Gun may be unloaded (at which time the vehicle counter is then flipped over). If a vehicle porteeing a Gun is eliminated, the Gun is eliminated too. A vehicle may not simultaneously have one Gun *en portee* and another hooked up for towing. An AT (with a gunshield) being porteed can provide gunshield benefits to its Passenger crew in the same way the 2pdr Portee MA does to its Inherent crew.

The 37L AT (only) may be fired by its Passenger crew while being porteed [EXC: it may not use Bounding (First) Fire]. While loaded on the vehicle, it is treated as a NT Gun able to fire only at a target that lies within its portee's "rear" VCA.

In a pre-8/41 DYO scenario, The Italian player may not purchase (as per H1.4/H1.441) a towing vehicle for a Gun that is capable of being porteed; however, he may purchase a portee vehicle for it if he has paid the 10% expenditure for a motorized unit (H1.4) and/or if the scenario

b: 1.6 for E.A.I.

H

JAPANESE VEHICLE NOTES

After WW1 the Imperial Japanese Army purchased a variety of French and British tanks for use and evaluation, and in 1925 initiated its own tank development program. By 1933 several domestic designs were in or nearing production, and the first four Japanese tank regiments were formed that same year. The layout and many of the components of these early Japanese tanks bore the influence of European (especially British) designs, but as they gained experience the Japanese evolved their own distinctive style of AFV. Generally, Japanese tanks were characterized by their small size, light weight, good cross-country speed, and small-caliber armament with relatively poor anti-tank capability. Size and weight were kept down by both a low priority on materials and the consideration that all AFV going abroad would have to be transported on ships. Engines were of sufficient size and horsepower in most cases, and in 1933 the Japanese pioneered the use of air-cooled diesel powerplants in military vehicles. Suspensions were simple but effective. However, interiors were usually cramped and turret layouts were poor. Radios were the exception until late in the war. Crew survivability was reduced by (among other things) the extensive use of riveted/bolted armor plates, despite the Japanese having developed one of the finest methods in the world for welding armor.

Tactically, the use of tanks by the Japanese was unimaginative. With the Army dominated by its ultraconservative Infantry arm and lulled into complacency by the fighting in China (where its opponents had few effective AT weapons), tanks were simply attached to infantry units for fire support and the possibilities of armored *manoeuvre en masse* were left largely unexplored. The misleading 'lessons' of combat in China also blinded the Army to the gun-vs-armor race that occurred in the West after 1940, thus leaving Japanese tanks thinly armored and undergunned compared to the Allied tanks they encountered. (Indeed, by 1945 the Japanese often felt it necessary to dig in their tanks for use as mere armored pillboxes.) No tank divisions were formed until mid 1942, and none were used as complete formations in battle until 1944. The tank regiment (which was actually of battalion size, with 4-5 companies) remained the standard combat unit, and piecemeal assaults of platoon or company strength (often conducted in the form of nighttime *banzai* charges) were the norm for tank attacks.

The low priority given to AFV manufacture combined with subsequent U.S. bombing raids kept AFV production low throughout the war. Around 3,000 tanks were built from 1931 through 1940 and approximately another 3,500 (including SP guns) in 1941-45, with about half produced by Mitsubishi Heavy Industries. Peak output was achieved in 1941-42 when some 2,200-2,500 were built. Several types of bridging, engineer, command, etc. variants were developed but few were used in combat. About 1,700 AFV remained at the end of the war to be surrendered to the Allies. (And of the equipment seized by the Russians in Manchuria, most was passed on to the Chinese Communists.)

There were two main styles of nomenclature for Japanese ordnance equipment. An item accepted for service prior to 1926 had a model number corresponding to the year of the emperor's reign in which it was adopted; e.g., a gun's being designated a 'Year-38 Type' meant that it had been adopted in the 38th year of the then-current emperor's reign. From 1926 the model number was based on the year of adoption expressed in relation to 660 BC (the beginning of the first Japanese emperor's reign); thus the designation 'Type 97' indicated that the item had been adopted in the Japanese year 2597 (1937 according to the Western calendar), while 'Type 1' meant adoption in 2601 (1941). For vehicles, the type designation was usually completed with an abbreviation using two symbols from the *Katakana* phonetic alphabet; however, beyond 'KE' standing for 'Light' and 'CHI' for 'Medium', they were assigned with little rhyme or reason and most are not translatable into English.

[For the sake of brevity, the following abbreviations are used herein: IJA Imperial Japanese Army; IJN Imperial Japanese Navy; SNLF Special Naval Landing Force. Also note that, as used herein, the name "China" includes Manchuria (Manchukuo), where Japanese and Russians fought each other in 7-8/38, 5-9/39 and 8/45.]

1. Types 92A & 92B Combat Cars: In the late 1920s the Japanese studied the use of armored cars by the cavalry; however, due to the paucity of roads on the Asian mainland they

decided to produce a full-tracked vehicle instead. This resulted in the Type 92 Combat Car, one of the earliest AFV of welded construction and probably the very first to use an air-cooled engine. Its standard BMG was a 13.2mm piece with special optics enabling it to engage low-flying aircraft; however, a regular tank LMG was often installed in its place, due perhaps to an insufficient supply of the larger-caliber weapon. During production the suspension of the Type 92 was altered, but its tendency to shed tracks was never fully rectified. Besides equipping the armored car company of certain cavalry brigades, the Type 92 served as a recon vehicle in some infantry divisions and was issued to a few tank units. It apparently saw action only in China. An amphibious version was built but never advanced beyond the prototype stage. The Type 92 was not produced in large numbers and apparently was withdrawn from service by 1941. Allied wartime intelligence erroneously called it the Type 93 (or M2593) Light Tank. "A" and "B" in the piece names are our own designations, since the Japanese nomenclature did not distinguish between the different versions. "Combat Car" is actually a loose translation of *Jusokosha*, which literally means "Heavy Armored Car". Alternatively, the Japanese sometimes referred to the Type 92 as a "Light Armored Vehicle" (*Keisokosha*), their equivalent of the term "Tankette".

† For the Type 92B (only), whichever MG fires first in a phase is considered the MA for both that attack and the remainder of that phase (treating Defensive First and Final Fire as one phase). If both MG fire as a FG, before making that attack the owning player must declare one MG to be the MA for that phase; if he fails to do so, the MA is determined randomly. The Type 92B (only) does not suffer Disabled MA Recall (D3.7) until both of its MG are disabled.

† When the BMG of the Type 92B achieves an ordnance hit vs an AFV (A9.61), use the 12.7 column of the AP To Kill Table. This BMG also has AA capability within the Type 92B's VCA, even if HD, and without consideration of AA mode (E7.5; i.e., no AA counter is required). These abilities are signified by "BMG: 12.7; AA*" on the counter.

† RF for both versions is 1.3 in 1937, and increases by .1 in each year thereafter [EXC: use vs Russians in 1938 is NA].

2. Type 94 Light Armored Vehicle: This tankette resulted from a requirement for a very small armored vehicle with good cross-country ability, to be used for the resupply of frontline troops and garrisons in hostile areas. To this end it was designed to tow a fully-tracked trailer, and for self defense it had a turreted MG on the rear of the superstructure. Those produced from 1936 had a revised suspension; U.S. intelligence called this later version the Type 94 (or M2594), having incorrectly labelled the original model the Type 92 (or M2592). Beginning in 1935, selected infantry divisions received a company of 6 (later 10) Type 94. Since these divisions normally had no other AFV under direct command, their tankettes came to be used mostly for reconnaissance and infantry support. Eventually a number of infantry regiments also acquired their own tankette companies (probably when the division's tankette company was updated with Type 95 HA-GO light tanks). Tankettes were used as command/liaison vehicles as well. Type 94 were employed widely during the early part of the war, but most ended their days dug in as not particularly effective pillboxes. A tankette platoon normally comprised three such AFV.

† This Passenger capacity may not be used to carry ammunition or a dm 70-90mm MTR (C10.13).

† Dates and RF for use in China are 1937-39 (1.1), 1940 (1.2), 1941-42 (1.3), 1943 (1.4), 1944 (1.5) and 1945 (1.6) [EXC: vs Russians they are 1939 (1.4) and 8/45 (1.6)]. For use in Malaya-Burma-India they are 1941-5/42 (1.2), 6/42-43 (1.5), and 1944-5/45 (1.6). For use elsewhere they are 1941-1/42 (1.5), 2/42 (1.4), 3/42 (1.2), and 6/43-45 (1.5) [EXC: vs U.S. they are 1941-4/42 (1.2) and 6/43-7/45 (1.6)].

3. Type 95 SO-KI Armored Railway Vehicle: This unusual AFV, like the earlier Type 91 Armored Car (Japanese Vehicle Note 10), was developed by the Corps of Railroad Engineers as a rail-line patrol vehicle. However, unlike the Type 91, the SO-KI could change from rail to tracked mode while the crew remained aboard; its four steel flanged wheels were raised hydraulically into the vehicle's belly, so bringing the tracks to rest on the ground. Thus it was a much more practical design than the armored car, being able to launch an "off-rail" attack quickly when necessary. Like the Type 91, the SO-KI had front and rear couplers so it could be used to move small trains, and its wheels were adjustable to compensate for tracks of different gauges. The SO-KI looked like an

enlarged Type 94 tankette but had no standard main armament; instead, its crew used their small arms and/or an infantry light machine gun through firing slits. (For simplicity the game piece is assumed to have the LMG mounted in the turret slit.) Most SO-KI were employed in China, but a few were used in Burma as well.

† The MA has a Normal Range of eight hexes, but may be Removed or Scrounged. These are signified by "Nml Rng 8" and "Rmvl/Scrng OK" on the counter.

† Dates and RF for use in China are 1937-43 (1.4) and 1944-45 (1.5) [EXC: use vs Russians in 1938-39 is NA]. For use in Burma they are 1944-5/45 (1.6). Availability is otherwise NA.

4. Types 97A & 97B TE-KE Light Armored Vehicles: Unlike in the West where the Spanish

Civil War had shown the limited value of tankettes, their use against the poorly equipped Chinese proved successful. Combat experience led to progressive experiments with and improvements to the Type 94, and ultimately brought about its successor, the Type 97 TE-KE. The new design featured a medium-velocity 37mm gun, well-sloped armor and an air-cooled diesel engine, making it the most technically advanced tankette of its time. Since it was designed to function in the same roles as its predecessor it retained the ability to tow a trailer. Some Type 97 retained the MG of the Type 94 in lieu of the 37mm gun; these were intended primarily for the supply role, while the gun-armed versions were to be used for infantry fire support. Allied intelligence sometimes referred to the TE-KE as the M2597. "A" and "B" in the piece names are our own designations, since the Japanese nomenclature did not distinguish between the two models.

† For both versions, Dates and RF for use in China are 1938 (1.5), 1939 (1.3), 1940-43 (1.1), 1944 (1.2), and 1945 (1.3) [EXC: use vs Russians in 1938 is NA]. For use in Malaya-Burma-India they are 1941-5/42 (1.3), 6/42-3/44 (1.4), 4/44 (1.3), 5/44 (1.4), 6/44 (1.5), 7-10/44 (1.6), 11-12/44 (1.4), 1-2/45 (1.5), and 3-5/45 (1.6). For use elsewhere they are 1941-1/42 (1.5), 2/42 (1.4), 3/42 (1.2), 6/43-4/45 (1.5), and 5-8/45 (1.3) [EXC: vs U.S. they are 1941-4/42 (1.3), 6/43-3/45 (1.5), and 4-7/45 (1.6)].

5. Type 95 HA-GO Light Tank: The inability of the lumbering Type 89 CHI-RO to function effectively with motorized units led to a call in 1933 for a lighter and faster gun-armed tank. The

result was the Type 95 HA-GO, with a medium-velocity 37mm gun and the same air-cooled diesel engine used in the Type 89B but with an armor basis of only 12mm. Upon testing the prototype, the Infantry School called for heavier armor and armament while the Cavalry School found the design acceptable. Since the latter were expected to be its main user, their view prevailed and it was put into production without the infantry's suggested changes. Once in service the HA-GO quickly gained an excellent reputation due to its high standard of reliability. In fact, so great was its popularity that it was kept in production until 1943—far longer than its combat value warranted—while more up-to-date light tank designs languished on paper. The HA-GO first saw combat in 1937 with the Kwantung Army (*Kantogun*) in China. In due course it superseded the combat cars and tankettes in their various roles (most importantly in the divisional tank companies) and equipped several light tank regiments. By 1941 a company of light tanks had also been authorized in each medium tank regiment and a number of independent light tank companies had been created. In addition, the HA-GO was used by some SNLF units. A platoon (*shotai*) of light tanks comprised three such AFV, while a company (*chutai*) normally had ten. The Type 95's official designation was KE-GO, but the pre-production name HA-GO assigned to it by Mitsubishi was more commonly used. Its nickname was KYU-GO ("nine-five"). Allied intelligence sometimes referred to it as the M2595. Around 1,250 were built. The HA-GO, along with the CHI-HA medium, formed the mainstay of Japanese tank regiments (*sensha rentai*) during WW2.

The IJA built several other types of light tanks after the HA-GO, but apparently all were assigned to units that remained in Japan. A number of M3 Stuart tanks were captured in Burma in early 1942, and the Japanese 14th Tank Regiment was still using them in mid 1944, losing the last one on the Tiddim Road in June of that year. M3 Stuarts were also seized in the Philippines in 1942; see U.S. Vehicle Note 2.

† The center hexspine of the turret Rear (D1.82) MG's CA is always the second hexspine clockwise from the center hexspine of the current TCA; i.e., the Rear MG is located at the 4:00 position relative to the MA—as

H

signified by "4:00 from MA" on the counter. See the accompanying diagram.

† Dates and RF for use in China are 1937-38 (1.6), 1939 (1.4), 1940 (1.3), 1941 (1.2), 1942 (1.1), 1943 (1.2), 1-3/44 (1.3), 4-5/44 (1.2), 6-12/44 (1.3), 1-2/45 (1.4), 3-4/45 (1.2), and 5-8/45 (1.4) [EXC: vs Russians they are 1939 (1.1) and 8/45 (1.4)]. For use in Malaya-Burma-India they are 1941-5/42 (1.0), 6/42-2/44 (1.3), 3/44 (1.1), 4/44 (1.2), 5/44 (1.3), 6/44 (1.4), 7-10/44 (1.6), 11/44-2/45 (1.3), 3-4/45 (1.5), and 5/45 (1.6). For use elsewhere they are 1941-1/42 (1.4), 2/42 (1.3), 3/42 (1.1), 8-9/42 (1.5), and 6/43-45 (1.5) [EXC: vs U.S. they are 1941-4/42 (1.0), 8-10/42 (1.5), 6-10/43 (1.5), 11/43-6/44 (1.3), 7-9/44 (1.2), 10-12/44 (1.3), 1-2/45 (1.2), 3/45 (1.4), 4-5/45 (1.5), and 6-7/45 (1.6)].

6. Type 2 KA-MI Amphibious Tank: The IJA built three different types of amphibious tanks in the period 1933-41, but only as prototypes. In 1941 the IJN took over the development of such vehicles, and the next year produced the KA-MI—based loosely on the Type 95 HA-GO. The KA-MI featured two multi-compartment pontoons of steel plate, one fore and one aft, attached to the hull by clamps opened remotely from inside the tank. Propulsion and steering in water were provided by twin propellers and rudders. Another novelty for a Japanese tank was a MG mounted coaxially with the main gun. 180 were built, and were used by SNLF units. A few KA-MI saw action in the Japanese defense of the Philippines and various Pacific islands (e.g., Kwajalein and Saipan). Allied wartime intelligence sometimes referred to the KA-MI as the M2602.

† PONTOONS: The KA-MI is amphibious only while its pontoons are attached and functional. To detach them, the tank must be BU and Mobile, and must expend one MP in its MPH for no other purpose (but may expend it whether Stopped or not). Whenever the pontoons become detached, the tank counter is immediately (i.e., prior to further Defensive First Fire) flipped over to its non-amphibious side; its CA remain the same, but the extra MP gained may be used subsequently in that MPH if the tank is otherwise allowed to. Detached pontoons have no game effect and cannot be re-attached.

Vehicle 7

While the pontoons are attached, the following apply:

- If the KA-MI is BU it must expend one extra MP per hex entered, just as if towing a Gun.
- It may not use VBM, enter a building [EXC: hut] or cross over a wall.
- Unless utilizing a road/TB, it may not enter rubble, woods, jungle or bamboo.
- It may not push a wreck (D10.42).
- It may not assist in another vehicle's unbogging attempt (D8.3).
- Any ordnance attack vs it that misses by one renders its pontoons non-functional, provided it is not HD to that attack and the colored dr of that TH DR is $\geq$ the white dr. Any non-ordnance attack (including Small Arms, but excepting mines and MOL) vs its Location whose Original IFT DR, plus all applicable TEM and Hindrance/SMOKE DRM, is $\leq$ the number in the ★ Vehicle line of the IFT column used for that attack renders its pontoons non-functional, provided the KA-MI is not HD to the attack (or is HD to none of the firers, for a FG attack). Non-functional pontoons are not automatically detached; they remain attached until a MP is expended to detach them in the normal manner. CC does not affect the pontoons. If the KA-MI is in an unfordable Water Obstacle when its pontoons become non-functional, it sinks (D16.5).

† If a KA-MI becomes a wreck, use the wreck side of a Type 95 HA-GO.

† RF is 1.5 for 1-10/44 and 1.6 thereafter. Availability vs other than U.S. is NA.

7. Types 89A & 89B CHI-RO Medium Tanks:

The Type 89, accepted for service in 1929 and built by Mitsubishi from 1931, was the first tank of Japanese design to be mass-produced. It was intended expressly for infantry support and first saw action during the 1932 "Shanghai Incident", being used there by a SNLF unit. During production a wide variety of changes were made, including a revised front hull, redesigned turret, and (in 1936) the installation of an air-cooled diesel engine. With the new engine it was called the Type 89 OTSU ("B"), and the earlier, gasoline-powered version was then

Vehicle 7

renamed the Type 89 KO ("A"). The 89B game piece represents the final model with all improvements. Allied wartime intelligence had several designations for the various models: M2589A, M2589B, Type 92, and Type 94 (M2594); however, the Japanese used none of these names. The Type 89 was employed mainly in China; however, the 7th Tank Regiment used them in the conquest of the Philippines and a small number reportedly participated in the overrunning of Malaya and Burma. Most Type 89 were withdrawn from service in/by 1943, but the 7th Independent Tank Company was still equipped with them in late 1944 when it fought against U.S. troops on Leyte. A platoon of Type 89 comprised three such AFV; a company, ten. **ERRATA:** The 57* AP Basic To Kill number is "8".

† For the Type 89B (only), the center hexspine of the turret Rear (D1.82) MG's CA is always the second hexspine *counterclockwise* from the center hexspine of the current TCA; i.e., the Rear MG is located at the 8:00 position relative to the MA—as signified by "8:00 from MA" on the counter. See the accompanying diagram.

† Type 89A Dates and RF for use in China [EXC: NA vs Russians] are 1937-38 (1.2), 1939-40 (1.4), 1941-42 (1.5), and 1943 (1.6); availability is otherwise NA. Type 89B Dates and RF for use in China are 1937 (1.4), 1938 (1.3), 1939-41 (1.2), 1942 (1.3), and 1943 (1.4) [EXC: vs Russians they are 1939 (1.1) only]. For use in Malaya-Burma they are 1941-5/42 (1.5). For use in the Philippines they are 1941-4/42 (1.2), 1943-9/44 (1.6), and 10/44 (1.4).

armored warfare were proving the Type 89 CHI-RO obsolete, so the Japanese decided to produce a faster, more modern replacement. Two very different prototypes—the CHI-HA with a 12-cyl. air-cooled diesel engine, and the less-expensive but lighter and slower CHI-NI with a one-man turret—were built and tested; but when full-scale war broke out with China in 1937, the more sophisticated CHI-HA was immediately chosen. At that time the CHI-HA was probably the most technically advanced tank in production anywhere, in all respects save its gun. The Japanese belief that tanks were best used for infantry support had not yet been shattered, so no need was seen to give the CHI-HA a potent AT capability. However, with the possibility of future upgunning in mind, the designers made the diameter of its turret ring as large as possible. This proved to be a wise decision, for after the Japanese experiences against masses of Russian tanks at Nomonhan in 1939, the CHI-HA's turret was redesigned to carry an adapted version of the Type 1 47mm AT gun. The *Shinhoto* ("new turret") CHI-HA or CHI-HA Kai ("Modified"), as this model was variously known, entered series production in 1942 but, aside from two prototypes used on Corregidor in April of that year, was not encountered by the Western Allies until 1944. Besides equipping many tank companies, the *Shinhoto* CHI-HA was used by platoon/company commanders in tank regiments that retained the 57mm-armed CHI-HA. In addition, numbers of the 57mm version were fitted with the new turret and gun when sent back to Japan for repairs. Over 1,500 CHI-HA were built inclusive of both types—the vast majority by Mitsubishi. Three CHI-HA normally comprised a platoon (*shotai*), and ten a company (*chutai*). However, in the latter part of the war some tank regiments (*sensha rentai*) reportedly contained platoons of four or even five CHI-HA in companies of up to seventeen tanks, and quite often the companies contained one or two additional HA-GO platoons. Allied wartime intelligence sometimes referred to the CHI-HA as the M2597 Medium; the *Shinhoto* CHI-HA was also called the Type 97 Improved by the Americans and the Type 97 Special by the British. "A" and "B" in the piece names are our own designations.

† Type 97A Dates and RF for use in China are 1939 (1.6), 1940 (1.5), 1941 (1.3), 1942-3/44 (1.2), 4-5/44 (1.0), 6-12/44 (1.1), 1-2/45 (1.2), 3-4/45 (1.1), and 5-8/45 (1.2) [EXC: vs Russians they are 1939 (1.5) and 8/45 (1.5)]. For use in Malaya-Burma-India they are 1941-5/42 (1.0), 3/44 (1.1), 4/44 (1.2), 5/44 (1.3), 6/44 (1.4), 7-10/44 (1.6), 11/44-2/45 (1.2), 3/45 (1.4), and 4/45 (1.5). Vs U.S. they are 1941-4/42 (1.3), 10/42 (1.3), 6/44 (1.2), 7-8/44 (1.3), 1-2/45 (1.3), 3-4/45 (1.5), and 5-6/45 (1.6)].

Type 97B Dates and RF for use in China are 1943-3/44 (1.5), 4-5/44 (1.4), 6/44-2/45 (1.5), 3-4/45 (1.4), and 5-8/45 (1.5). For use in India-Burma they are 4/44 (1.5), 6-10/44 (1.6), 11/44-2/45 (1.5), and 3-4/45 (1.6). Vs U.S. they are 5/42 (1.4), 6/44 (1.4), 7/44 (1.5), 1-2/45 (1.1), 3-4/45 (1.3), 5/45 (1.4), and 6/45 (1.5).

9. *Type-1 CHI-HE Medium Tank:* At Nomonhan in 1939, Russian 45mm tank and AT guns easily penetrated Japanese tanks. Afterwards the Japanese decided that the Type 97 Medium had to be uparmored as well as upgunned. This eventually resulted in the Type 1 CHI-HE, which also featured a new air-cooled diesel engine of greatly increased horsepower. 587 CHI-HE were built, all by Mitsubishi. The vast majority were issued to units stationed in Japan. However, a few, used as command tanks, are claimed to have been with the 2nd Tank Division on Luzon (though none were mentioned in subsequent U.S. evaluations of captured Japanese materiel). Since that division had been transferred there from Manchuria, it is possible that other CHI-HE saw action in China, and against the Russians in August of 1945.

In 1944-45 Mitsubishi also built sixty Type 3 CHI-NU Medium Tanks, which consisted of the CHI-HE with a much larger turret carrying a modified Type 90 75mm field gun. An attempt was made to send some to Okinawa but no shipping could be made available, so the CHI-NU ended the war in tank regiments stationed in Japan.

† Dates for use in China are 4-5/44 and 3-4/45 [EXC: vs Russians they are 8/45 only]. Vs U.S. on Luzon they are 1-6/45.

10. *Type 91 Armored Car:* This vehicle was based on a Sumida 6x4 truck, and hence is often called the Sumida Armored Car. It was actually a gasoline-powered "armored railway tractor" developed by the Corps of Railroad Engineers and used mainly for pulling small supply trains and patrolling the all-important rail lines in China. To increase its usefulness, the distance between the wheels on each axle could be altered so it could run on tracks of various gauges. In addition it was provided with four built-in jacks by means of which the crew could raise the vehicle high enough to place solid rubber tires over the hubs of its six railroad-type wheels, thus enabling it to leave the tracks and move cross-country. This operation was said to take ten minutes. Considering the Sumida's low power-to-weight ratio and very narrow tires, its "off-rail" mobility was probably quite poor except on very hard ground. One source states that over 1,000 were built (inclusive of all variants), beginning in 1933, for use by the IJA and the Manchurian Railways. Though not intended for frontline use, the Type 91 was employed in an offensive role on several occasions; however, it apparently saw little if any combat outside the Chinese mainland. Western sources usually refer to the Type 91 as the Type (or Model) 2593. When equipped with all optional MG, the game piece also represents several other armored cars such as the *Hokoku ICHI-GO* and Type 92 Naval (*Hokoku SAN-GO*) vehicles. These were similar to the Type 91 in game terms and theaters of operation, but were not designed for use on rails.

† The Type 91 has one hull-mounted two-FP MG on its starboard side and another on its port side—as indicated by "S2x2". Each has a Normal Range of eight hexes, but can fire only at a target that lies within the Type 91's respective side Target Facing. See the accompanying diagram. No CA-change DRM apply to such fire [EXC: VCA-change DRM].

† Reverse Movement costs this vehicle three times its normal hex entry cost—as signified by "REV×3" on the counter.

† The optional BMG has a RF of 1.5. That of the optional AAMG is 1.4.

† Dates and RF for use in China are 1937-38 (1.3), 1939-42 (1.4), 1943-44 (1.5), and 1945 (1.6) [EXC: use vs Russians in 1938-39 is NA].

Vehicle Note C

H

11. *Type 92 Armored Car*: This vehicle, not to be confused with the Type 92 Naval Armored Car mentioned in the previous Note, was used by the IJA. In the West it is usually referred to as the Osaka Armored Car. It apparently saw action only in very small numbers, and was probably little used outside China. (U.S. wartime intelligence does indicate that at least one was encountered by the Allies in Burma.) With the optional BMG the Type 92 also represents the Army's Aikoku Armored Car, which had on- and off-rail capabilities like the Type 91 Sumida AC.

Given the very primitive road net in most of eastern Asia and the generally mountainous terrain of China, armored cars were not held in much favor by the Japanese. They employed a half-dozen or so different types (including some imported from the British) but generally they relegated their armored cars to combat in urban areas. Aside from the Type 91 Sumida it seems that most were built in such small numbers they could hardly even be called production vehicles. For this reason, each of the Japanese armored car types in the game is somewhat genericized to represent several vehicles with characteristics similar to the one actually named.

† Reverse Movement costs this vehicle four times its normal hex entry cost—as signified by “REV×4” on the counter.

† The optional BMG has a RF of 1.5.

† Dates and RF for use in China are 1937-38 (1.5) and 1939-45 (1.6) [EXC: use vs Russians in 1938-39 is NA]. For use elsewhere they are 1941-5/45 (1.6).

12. *Type 1 Gun Tank HO-NI I*: This vehicle consisted of a CHI-HA chassis carrying a modified Type 90 75mm field gun. It was used in China (apparently by the 3rd Tank Division), and also saw combat with the 2nd Tank Division on Luzon. The HO-NI I could be employed as a self-propelled artillery piece (those on Luzon were part of the 2nd Mechanized Artillery Regiment), or as a combination tank destroyer and light assault gun (in which case a company of ten was included in a tank regiment). It is claimed that 124 were built, all by Hitachi. U.S. wartime intelligence referred to the HO-NI I as the Type 2 75mm SP Gun.

† Dates for use in China are 4-5/44 and 3-4/45. For use vs U.S. on Luzon they are 1-6/45. Availability is otherwise NA.

13. *Type 4 HO-RO Self-Propelled Howitzer*: This was a token attempt by the IJA to provide some form of mechanized heavy artillery. The HO-RO utilized the CHI-HA chassis, and was similar in appearance to the HO-NI I aside from mounting an obsolete Type 38 150mm howitzer (which was a licensed copy of a turn-of-the-century Krupp gun). A few HO-RO were encountered in 1945 by U.S. troops on Luzon. Some postwar sources have erroneously called this vehicle the Type 38 or Model 98.

† Availability is NA except vs U.S. on Luzon.

14. *Type 1 HO-KI Armored Troop-Vehicle*: The HO-KI was developed in 1941 to provide a vehicle that would enable infantry to accompany tanks in combat. It could also be used as an artillery prime mover. It was apparently first issued overseas at the beginning of 1944 when some were allotted to the 2nd Tank Division in Manchuria. A few months later that division was transferred to the Philippines, where afterwards some HO-KI were encountered by U.S. troops. Whether it was used there as an APC or prime mover remains unclear.

† Availability is NA except vs U.S. in the Philippines.

15. *Type 98 SHI-KE 4-ton Tractor*: This unarmored, full-tracked prime mover had an air-cooled gasoline engine, and was used primarily for towing the Machine-Moved version of the Type 90 75mm Field Gun. It was developed in 1938 to replace the Type 94 4-ton YO-KE. The latter, which appeared in 1934, was quite similar to the SHI-KE aside from a different suspension. The two are equivalent in game terms, and this piece represents both.

† RF is 1.4 prior to 1945 and 1.3 in 1945.

16. *Type 92 I-KE 5-ton Tractor*: The Japanese produced a variety of unarmored, full-tracked prime movers for their medium and heavy artillery. The Type 92 I-KE, developed in 1932, had a water-cooled gasoline engine and was used for towing the 105mm field gun. About 1938 a new version with an air-cooled diesel engine entered production. This was designated the Type 92B and the original model was renamed the Type 92A. The game piece also represents two other prime movers whose characteristics are similar to those of the I-KE: the Type 92 NI-KU 8-ton tractor, which appeared in A and B versions like the I-KE but was used for towing the 150mm howitzer; and the 6-ton Type 98 RO-KE, which towed the 105mm howitzer, 105mm gun or 150mm howitzer.

17. *Type 95 Small Personnel-Vehicle*: This 4×4 car was the Japanese equivalent of the Jeep, and in fact predated the latter by about five years. It was also known as the “Black Medal”, and had an air-cooled V2 gasoline engine. About 4,800 (inclusive of several variants) were built by Kurogane between 1935 and 1940 when production ceased due to changing military priorities. After the war some were used by the French in Indo-China.

† The Type 95 has Low Ground Pressure (D1.51). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle's Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract two (one per crew or HS) from the colored dr of its immediately subsequent Unboggng DR.

18. *Type 94 & Type 97 Trucks*: In 1925-27 Ford, Chrysler and GM set up manufacturing plants in Japan, and rapidly came to dominate that nation's domestic and military automotive scene. In fact, the IJA was forced to use quantities of American cars and trucks in its invasion of Manchuria in 1931. As the 1930s progressed, the Japanese government began the establishment of a strong domestic motor industry while at the same time passing a series of ever more restrictive laws regarding the production of foreign vehicles. As a result, by 1939 the U.S. manufacturers were forced out altogether and their facilities were taken over by the rapidly growing Japanese companies.

In 1931 the IJA purchased several British and Czech 6×4 trucks which it turned over to domestic firms with the order to study the basic designs and develop their own version. This led to the Isuzu Type 94, which became the most widely used tactical truck of the IJA. It was produced in two main versions: the 94A with a gasoline engine and the diesel-powered 94B. Both are equivalent in game terms. One variant of the Type 94 was used as an artillery prime mover.

The Type 97, also known as the Nissan 80, was a 4×2 truck patterned after an American design. The game piece also represents its successor and militarized version, the Nissan 180, which continued in production after the war.

Japanese infantry only occasionally rode to war. The IJA never had a plentiful supply of trucks, and most of those it possessed were assigned to independent transport regiments which were generally reserved for logistics work.

JAPANESE MULTI-APPLICABLE VEHICLE NOTES

A. The MA and all MG have B11. This is signified by “B11” in red on the counter (**bold** in the Vehicle Listing).

B. sD becomes available in 1941 or 1944—as signified by the superscript “+1” or “+4” respectively.

C. This tank has no radio in scenarios set prior to 1945 (see D14). As of 1945 it is radio-equipped.

Ordinance 1

JAPANESE ORDNANCE NOTES

[For the sake of brevity, the following abbreviations are used herein: IJA Imperial Japanese Army; IJN Imperial Japanese Navy; IMB Independent Mixed Brigade; IMR Independent Mixed Regiment; SNLF Special Naval Landing Force. Also note that, as used herein, the name "China" includes Manchuria (Manchukuo), where Japanese and Russians fought each other in 7-8/38, 5-9/39 and 8/45.]

1. **Type 89 Heavy Grenade Launcher:** The Type 89 "knee mortar" was developed to provide the infantry with an indirect-fire capability at ranges out to 600m (the minimum range of the Year-11 Type 70mm mortar). Adopted in 1929, it replaced the older and much shorter-ranged Year-10 Type light grenade launcher. The Type 89 was unusual in having a rifled barrel and being trigger-fired, and unique in that range alteration was accomplished by turning a knob to move the firing pin up or down inside the barrel. Its projectiles included standard infantry HE and WP grenades (to which a finned propellant container would first be attached), and unfinned smoke and HE shells. Since a soldier could carry the dismantled mortar strapped to his leg, the Japanese sometimes referred to it as the "leg mortar". However, a translation of this term as "knee mortar" led some Allied troops to believe

it was meant to be fired with its curved baseplate resting on one's thigh—a notion that led to a number of shattered femurs. Initially, two Type 89 mortars were authorized per rifle platoon; about 1940 this allotment was increased to three (or in some cases four). One was also authorized in the infantry battalion headquarters. The Type 89 was used by both IJA and SNLF troops.

† The following special rules apply to the use of HE/SMOKE:

- When firing HE at a range of $\leq$ two hexes, the ROF is lowered to "1" for that shot and Air Bursts are NA.
- WP can be fired only at a range of 1-5 hexes, reduces the ROF to "1" for that shot, is considered Dispersed even when fired in the PFPh, and Air Bursts are NA.
- Smoke can be fired only at a range of 3-10 hexes.

2. **Year-11 Type Curved-Fire Infantry Gun:** This mortar dated from 1922. It comprised a large, metal-reinforced wooden baseplate to which were attached the barrel, traversing gear and elevating screw. Unlike most medium mortars it had no bipod, its barrel was rifled and it fired unfinned projectiles. To facilitate rapid movement it could

H

be carried on two poles which fit under hooks on the sides of the baseplate. Two 70mm mortars were authorized in the infantry-gun company of infantry battalions; however, in the 1930s they were gradually replaced by Type 92 70mm infantry guns. By 1942 few 70mm mortars remained in frontline service.

† Dates and RF for use in China are 1937-41 (1.3), 1942-43 (1.4), and 1944-45 (1.5) [EXC: vs Russians they are 1938 (1.0), 1939 (1.5), and 8/45 (1.6)]. For use elsewhere they are 1941-42 (1.5) and 1943-45 (1.6).

3. *Type 97 Curved-Fire Infantry Gun*: This was a licensed copy of the famed Stokes-Brandt mortar, and as such was almost identical to the U.S. 81mm mortar; in fact, the light HE rounds of either weapon could be fired from the other. The Type 97 was generally used in non-divisional mortar battalions and independent mortar companies, though at times it could also be found in the infantry-gun company of the infantry battalion (in lieu of 70mm infantry guns). Toward the end of the war, some IMB contained an 81mm mortar platoon in each of its independent infantry battalions and/or one or two companies of 81s as brigade artillery. An 81mm mortar platoon contained four mortars, and a company comprised 2-3 such platoons.

† RF is 1.6 for 1938, 1.5 for 1939, 1.4 for 1940, 1.3 for 1941-43, 1.2 for 1944, and 1.1 for 1945. Use vs Russians is NA in 1938-39.

4. *Type 97 Light Close-Attack Gun*: During the Manchurian Incident of 1931 the IJA found their 70mm mortars outclassed by the French-built 81mm mortars used by the Chinese. Noting that many nations were adopting this French weapon, the Japanese secretly developed a more powerful, longer-ranged mortar. This was the Type 94 90mm Light Close-Attack Gun which was adopted in 1934. However, due to having two heavy recoil cylinders which greatly increased its weight, this model was only a partial success. The recoil cylinders turned out to be unnecessary anyway, so in 1937 the IJA adopted the Type 97 which was nearly identical to the Type 94 aside from the absence of the recoil cylinders. As the Type 97 supplanted the Type 94 the latter was relegated to largely static roles. 90mm mortars were employed in the same ways as 81s but were more often found in non-divisional mortar units. Both 90mm types were normally carried in special wagons or on pack animals.

† Dates and RF for use in China are 1937-39 (1.4) and 1940-45 (1.3) [EXC: use is NA vs Russians in 1938-39]. For use elsewhere they are 1941-42 (1.5), 1943 (1.4), 1944 (1.3), and 1945 (1.2).

5. *Type 97 Medium Close-Attack Gun*: This was the largest-caliber Japanese mortar of conventional design. It was used mainly in non-divisional medium mortar battalions. By 1945 some IMB included one or two companies of 150mm mortars as all or part of their "heavy artillery". 150mm mortars were sometimes used as coast defense weapons as well. A platoon comprised two pieces; a company, four.

† Dates and RF for use in China are 1937-39 (1.5) and 1940-45 (1.4) [EXC: use is NA vs Russians in 1938-39]. For use elsewhere they are 1941-43 (1.6), 1-8/44 (1.5), and 9/44-45 (1.4).

6. *Type 97 Automatic Gun*: This ATR was developed in 1937 to provide the infantry with a light-weight AT weapon. As originally designed it fired only full automatic, but later many were modified to fire semi-automatic also/only. It weighed 150 lbs. including its carrying poles and small gunshield, and was normally carried by four men using two handlebar-shaped poles. The Type 97 was apparently not built in large numbers for it was encountered infrequently by the Allies. Occasionally it was used for beach defense. When available it was issued to the infantry battalion's MG company or infantry-gun company, or to the regimental AT company. In many IMB, a platoon of two was authorized per rifle company.

† This ATR requires a friendly crew in order to be fired with no B# penalty; G1.611. Its BPV includes a crew as per H1.3.

† RF is 1.4 for 1938-39 [EXC: 1.1 vs Russians in 1938], 1.3 for 1940-43, and 1.4 for 1944-45.

7. *Type 94 Rapid-Fire Gun*: This gun was used for infantry support and AT defense. It was small and light, and could be dismantled for man- or animal-pack transport, but was not designed to be towed by a vehicle. In most infantry divisions, a company of 4-6 Type 94 was allotted to each infantry regiment, and another platoon was sometimes present in the divisional recon unit. In IMB and IMR, the infantry-gun company authorized in each independent infantry battalion sometimes contained a platoon of Type 94. There were also a number of independent rapid-fire gun companies (with eight guns) and battalions (with twelve guns) equipped with the Type 94. Two guns formed a platoon.

Following the crushing defeat inflicted on them by Russian tanks at Nomonhan, the Japanese purchased a number of PaK 35/36 37mm AT guns from Germany; after making minor modifications they designated them Type 1 Rapid Fire Guns, but it seems that few if any of these weapons actually saw combat.

† Dates and RF for use in China are 1937-45 (1.2) [EXC: vs Russians they are 1938 (1.3), 1939 (1.0), and 8/45 (1.1)]. For use elsewhere they are 1941-45 (1.0).

8. *Type 1 Machine-Moved Gun*: The Type 1, developed in 1941, was the first Japanese gun designed specifically for the AT role. It incorporated features of both the German 37mm and Russian 45mm AT pieces, including pneumatic tires which enabled it to be towed by vehicles (hence its "Machine-Moved" designation). It entered production in 1942, by which time it was already becoming obsolete against the heavier Allied tanks. The Type 1 was authorized in the same ways as the Type 94 Rapid-Fire Gun except that few were issued to regimental AT companies, IMR or IMB. In addition, each armored division was authorized both an AT battalion equipped with eighteen Type 1 and a mobile infantry regiment in which each rifle company had a platoon of two such guns.

† Dates and RF for use in China are 1943-3/44 (1.6), 4-5/44 (1.5), 6/44-2/45 (1.6), 3-4/45 (1.5), and 5-8/45 (1.6) [EXC: 1.3 vs Russians in 8/45]. For use elsewhere they are 4/44-45 (1.3) [EXC: vs U.S. they are 7/43-5/44 (1.3), 6-12/44 (1.2) and 1-7/45 (1.1)].

9. *Year-11 Type Flat-Trajectory Infantry Gun*: This diminutive gun was a copy of the French 37mm mle 1916. After WWI the Japanese modified it to increase its portability and rate of fire, and adopted it in 1922. In service it complemented the Year-11 Type 70mm mortar by providing direct-fire support for the infantry battalion, each of which was authorized two Year-11 Type 37mm guns in its infantry-gun company. It could be dismantled for man- or animal-packing, or could be carried fully assembled by four men using special poles which attached to its tripod. The Type 92 70mm mortar and Year-11 Type flat-trajectory gun gradually relegated it to second-line and garrison use, but it remained in production until at least 1937.

† As signified by "crew" on the counter, this weapon requires a friendly crew in order to be used without the applicable penalties of A21.11-13. Its BPV includes a crew as per H1.3.

This weapon may enter and be fired from all terrain types allowed to a HMG (e.g., an upper building level). As a SW it incurs no CA-change DRM penalty (C9.2), but is subject to the woods/building CA restrictions of A9.21. It has no Gunshield, and it portage cost while dm is 3 PP.

† Dates and RF for use in China are 1937-41 (1.3), 1942-43 (1.4), and 1944-45 (1.5) [EXC: vs Russians they are 1938 (1.0), 1939 (1.5), and 8/45 (1.6)]. For use elsewhere they are 1941-42 (1.5) and 1943-45 (1.6).

10. *Type 92 Infantry Gun*: Commonly referred to as the "battalion gun" (*daitaiho*), the Type 92 was developed to replace the Year-11 Type 70mm mortar and Year-11 Type flat-trajectory infantry gun with a single weapon capable of both direct and indirect fire. Though much heavier than the other two guns, it was still extremely light for its caliber and could be rapidly manhandled from one position to another. In addition, it could be disassembled and animal-packed, or even man-packed if necessary. Its short range was not seen as a detriment, for it was to be used right up with the forward troops. Allied intelligence spoke of its unreliability and unpopularity, but its users do not seem to have shared these opinions. Each infantry battalion was authorized a platoon of two

Ordnance 10

Type 92 in its infantry-gun company; sometimes two platoons were allotted, especially in independent infantry battalions. As originally organized, a SNLF generally had one or two Type 92 platoons; however, by 1943 they were often replaced by coast-defense/AA artillery. After WW2 the Type 92 saw further action in the Chinese civil war, and in the Korean, Indo-China and Vietnam conflicts. **ERRATA:** 70mm HEAT has a Basic To Kill number of "12".

† This Gun may also use Indirect Fire, for which purpose its range is "3-70" hexes (if using Direct Fire it has no such minimum range). All rules applicable to firing a MTR (including the possibility of Spotted Fire and of retaining Multiple ROF) apply to this Gun for Indirect Fire purposes. However, it may not use both Direct and Indirect Fire in the same phase (treating the MPH and DFPh as one). Switching from Direct to Indirect Fire or vice-versa does not cause loss of Acquisition.

† RF vs Russians in 1938 is 1.3; otherwise it is always 1.0.

11. Year-41 Type Mountain Gun: This was originally the Krupp Mod. 1908 mountain gun, which the Japanese modified to reduce weight and proceeded to license-build. It equipped mountain (i.e., pack) artillery units initially, but in 1936 was turned over to the infantry who authorized a company of four in each infantry regiment for direct-fire support (sometimes two companies were allotted). Appropriately, it came to be known simply as the "regimental gun" (*rentaiho*). As originally organized, a SNLF generally had one or two regimental gun platoons (each with two guns); however, by 1943 they were often replaced by coast-defense/AA artillery. Despite its design age, the Year-41 Type remained in production and was frequently encountered by the Allies. The game piece also represents the Type 94 Mountain Gun which, in addition to replacing the Year-41 Type in pack artillery units (which themselves were commonly used as divisional artillery), was issued to certain IMB and IMR.

† HEAT becomes available in 1944—as signified by the superscript "44" on the counter.

† RF is 1.3 for 1937, 1.2 for 1938, and 1.1 for 1939-45.

12. Year-38 Type Field Gun (Improved): After the Russo-Japanese War the Japanese imported 400 Krupp Mod. 1905 field guns, then built another 300 as the Year-38 Type. Later the guns were modified, resulting in the Improved Year-38 Type which remained the main divisional artillery piece of the IJA through the end of WW2. It also equipped independent field artillery battalions and was issued to some IMB and IMR. The game piece also represents the Type 95 Field Gun (which was adopted in 1935 to replace the Type 90 Field Gun) and the Year-41 Type Horse (i.e., cavalry) Gun. Two 75mm field guns formed a platoon, and four a company.

† This Gun's AP Basic To Kill number is "12"—as signified by "AP TK#: 12" on the counter.

† Use vs Russians is NA in 1938.

13. Type 90 Field Gun: The Type 90, based on a modern French design (the Schneider 85mm mle 1927), was the intended replacement for the Improved Year-38 Type. It was adopted in 1930 amid great secrecy, and was produced in two versions: with wooden spoked wheels for horse draft, and with pneumatic tires for vehicular towing (the latter being dubbed the "Machine-Moved" version). Once in service, however, it was found to suffer from excessive bore wear and, reputedly, recoil malfunctions. Consequently not many were built and, aside from appearing briefly during the initial advances of 1941-42, their use was confined largely to theaters like Manchuria and China where they would not be overused in heavy combat. However, the Type 90's anti-tank potential was noted as early as 1939 in combat against the Russians at Nomonhan, so later in the war some were used as AT guns, primarily against the Americans. The horse-drawn version was intended for use in divisional, and the vehicle-towed model was to be used in independent, field artillery battalions.

† Dates and RF for use in China are 1937-45 (1.3) [EXC: use vs Russians is NA in 1938]. For use elsewhere they are 41-5/42 (1.3), 6/42-44 (1.6), and 1945 (1.3) [EXC: 1.5 vs British in 1945].

H

14. Type 91 10cm Field Howitzer: The Type 91 was a fairly conventional howitzer, though somewhat archaic looking and extremely light-weight for its caliber and range. Adopted in 1931 and reportedly based on a French Schneider design, it was produced in both wooden-wheel and pneumatic-tire versions. It was used as the divisional medium artillery piece but was issued only to certain divisions. Some IMB and IMR employed it as well. Two Type 91 made up a platoon, and four a company.

† Use vs Russians is NA.

15. Type 92 10cm Cannon: Adopted in 1932 to replace the older Year-14 and Year-38 Type 105mm cannons, the Type 92 was a modern design with excellent range for its weight. It equipped certain field heavy-artillery regiments (*yasen juhohei rentai*), which generally used it for long-range and counterbattery fire. Two formed a platoon, and four a company.

† Use vs Russians is NA in 1938 and 8/45.

16. Year-38 Type 12cm Howitzer: Adopted in 1905, this was a modified Krupp weapon manufactured in Japan. It was issued to field heavy-artillery regiments, and despite its age was still being used in 1945 (e.g., a company of four was present on Iwo Jima). It was the only standard 120mm artillery piece used by the IJA. **ERRATA:** The 120* AP Basic To Kill number is "13".

† RF is 1.5 for 1937-42 and 1.6 thereafter [EXC: use vs Russians is NA in 1938 and 8/45].

17. Year-3 Type 14cm Naval Seacoast Gun: During WWI these Vickers-designed 5.5" guns were the secondary armament of some battleships and the main armament of certain light cruisers, as well as being used on other types of IJN vessels. Later, many were converted to coast defense weapons and, still manned by naval personnel, employed in the defense of various Pacific islands. A company generally comprised four guns. **ERRATA:** The 140L AP Basic To Kill number is "32".

† Use is NA vs other than Americans. See also Japanese Ordnance Note E.

18. Year-4 Type 15cm Howitzer: Adopted in 1915 to replace the older Year-38 Type 150mm howitzer, the Year-4 Type was one of the earliest (some say the very first) artillery piece of Japanese design. It was issued as heavy artillery to certain infantry divisions, and otherwise equipped field heavy-artillery battalions and regiments. For towing it was normally broken down into two loads (a time-consuming process beyond the scope of the game); towing it as a single load was possible, but overstressed the gun's long trail and often damaged it, rendering the gun useless. **ERRATA:** The 150* AP Basic To Kill number is "17".

† While this Gun is being towed (i.e., not during the [un]hooking procedure), its owner must immediately make a dr (Δ) every time the towing vehicle has expended a whole multiple of six MF/MP [EXC: all Stop, Start and Delay MF/MP] in its current MPH. If this Original dr is a 6, the Gun becomes disabled (mark it with a Gun Disabled counter). This is signified by "Tow Disable: 6 MF/MP&dr*" on the counter. When thus disabled the Gun is still considered hooked up, but once unhooked it is immediately removed from play.

† Use vs Russians is NA.

19. Type 96 15cm Howitzer: The Type 96 was a modern, indigenously designed weapon adopted in 1936. It used the same ammunition as the Year-4 Type howitzer, but had a longer range and could be towed as a single load. Although it was the intended replace-

● Ordnance Note E

H

ment for the Year-4 Type, a low production priority resulted in its merely augmenting the IJA's supply of 150mm howitzers. The Type 96 was used primarily in field heavy-artillery battalions and regiments. A 150mm howitzer platoon comprised two such weapons, and two platoons formed a company.

† RF is 1.6 for 1938-39 and 1.5 thereafter [EXC: use vs Russians is NA in 1938]. See also Japanese Ordnance Note E.

20. Type 93 Twin-Mount High-Angle Machine Gun: In 1933 the IJA adopted a licensed, modified copy of the Hotchkiss mle 1930 13.2mm machine gun, designating it the Type 93. (Which is represented in the game by the Japanese .50-cal HMG SW. Its caliber was actually 13.2mm like that of its French counterpart, but is considered 12.7mm for game purposes.) Also adopted, as the Type 93 Twin-Mount High-Angle MG, was another version with two Type 93 HMG mounted side by side on a 600+ lb. tripod that incorporated traverse and elevation gears and a seat for the gunner. Neither weapon was normally organic to IJA infantry units; rather, they were issued to various independent AA companies and battalions. Both types were also used by IJN troops, with a company of ten Type 93 sometimes being organic to a SNLF. Apparently, two guns formed a platoon.

† Make two To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. Maximum range for To Hit purposes is 16 hexes.

† RF is 1.4 for 1937-10/43 and 1.3 thereafter [EXC: use vs Russians is NA in 1938-39]. See also Japanese Ordnance Note E.

21. Type 98 High-Angle Machine Cannon: Adopted in 1938, this was the standard light AA weapon of the IJA, and was also considered a light AT gun. Aside from its carriage and special AA sights it was quite similar to the 20mm ATR; in fact, both could fire the same projectiles. Like many other Japanese weapons, it could be disassembled for animal- or even man-pack transport. Multi-barrel versions on towed and SP mounts were developed but did not see action against Allied ground forces. The Type 98 equipped field machine-cannon companies, which in all but a few cases were not organic to divisions, IMB or IMR. Such a company comprised six Type 98 machine cannons and six Type 93 AAMG. The Type 98 was sometimes referred to as the HO-KI Gun, apparently due to having been derived from a Hotchkiss design.

† When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

† Decrease RF by .1 for each year after 1939, until 1.2 is reached in 1944.

22. Type 96 Single- & Triple-Mount Naval High-Angle Machine Cannons: These guns were the standard light AA armament of IJN vessels. As the war went on, large numbers, still on their shipboard mountings and manned by naval personnel, were used on land to protect airfields, harbors and beaches. For beach defense they were often employed in bunkers positioned to bring fire on any approaching landing craft. A company of Type 96 generally comprised 4-6 mountings, with two per platoon.

† The Type 96 Twin-Mount and Type 96 Triple-Mount cannot achieve Multiple Hits (C3.8). However, when using the 25LL column of the AP To Kill Table, make two (for the Type 96 Twin-Mount only) or three (for the Type 96 Triple-Mount only) To Kill DR; only one of these DR (firer's choice) is used.

† Dates and RF for the Type 96 (single-mount) and Type 96 Triple-Mount are 1944 (1.6) and 1945 (1.5) [EXC: vs U.S. they are 1-4/44 (1.6), 5/44-1/45 (1.5), 2-3/45 (1.3), and 4-7/45 (1.6)]. Dates and RF for the Type 96 Twin-Mount are the same, but with all RF reduced by .1. See also Japanese Ordnance Note E.

23. Type 88 7.5cm Mobile Field High-Angle Gun: Reportedly a loose copy of a 1922 Vickers weapon, the Type 88 was adopted in 1928 and remained the standard mobile AA gun of the IJA through 1945. There was nothing outstanding about its design or performance, but it was available in numbers and hence was widely used, not only in the AA role but also for defense against ground attack and as a coast-defense gun. It proved to be an effective AT gun on more than one occasion. About 2500 were in service during the war. It was issued to the various types of independent/field high-angle-gun regiments, battalions and companies; and, by 1943, some SNLF also contained a company. Two guns formed a platoon, and four (sometimes 6) a company.

† RF is 1.4 for 1937-10/43 [EXC: use vs Russians is NA in 1938-39] and 1.3 thereafter. See also Japanese Ordnance Note E.

24. Year-10 Type 12cm Naval High-Angle Gun: Originally designed for use aboard destroyers and various other IJN vessels, this 4.7" gun was the most common Japanese dual-purpose AA/coast-defense weapon of > 100mm. It was still being produced in 1944, and relatively large numbers were employed both to protect airfields and on the more important Pacific islands. A company generally comprised four guns, manned by naval personnel. By 1943, some SNLF contained two companies of these guns. **ERRATA:** The 120L Basic AP To Kill number is "27".

† Dates and RF are 1944 (1.6) and 1-7/45 (1.5) [EXC: vs U.S. they are 7/43-4/44 (1.6) and 5/44-7/45 (1.4)]. See also Japanese Ordnance Note E.

JAPANESE MULTI-APPLICABLE ORDNANCE NOTES

A. This weapon may be Animal-Packed (G10).

B. This weapon is equivalent to an 82mm MTR for the purposes of dismantling (A9.8), SMC usage (A15.23; A21.13), rooftops (B23.85), Passenger PP reduction (C10.13) and Rider PP (D6.2).

C. As signified by "Tow NA" on the counter, this Gun cannot be towed. However, it may be carried on a vehicle in the same manner as a 76-107mm MTR (C10.1). It is (un)loaded using normal (un)hooking procedures [EXC: the vehicle need not have a T#; ignore its T# if one is present], and reduces that PP capacity by 8 PP while loaded. Section C10 applies otherwise unchanged.

D. As may be signified by "M*" and "NM*" on the counter, this Gun must set up statically emplaced (i.e., immobile). It may be set up in a building only if that building Location is Fortified; and may not be Pushed, limbered, hooked up to, towed by or carried on a vehicle. In addition, the Japanese player may not use 1.441 to purchase a motorized-vehicle/wagon for this Gun.

E. This Gun's applicable RF may be reduced by .2 if all of the following conditions are met:

- The scenario is set in 1945 (or, for Japanese vs U.S., in any month indicated by "e" in the line for this Gun in the Japanese Ordnance Rarity Factor Chart);
- The scenario contains ocean Water Obstacle hexes (/an airfield, if the Gun is an "AA" type); and
- Japanese Ordnance Note D will apply to the Gun for all relevant purposes (even if that Note normally does not apply to it).

[A normally "mobile" Gun whose RF is thusly reduced actually represents the same (or an equivalent naval) weapon on a fixed mount employed for airfield/coast defense.]

⁴: Allotted according to Equivalent number of all squads (including Assault Engineers). DC thusly received are in addition to any allotted to Assault Engineers.

THE GENERAL

Now that you know how to play the game, the next problem is probably **who** to play it with and how to **win**. We can help you with that problem, and many others, through your subscription to our bi-monthly gaming journal, **The GENERAL**. In **The GENERAL** you'll not only read all there is to know about this game, but will also learn about our dozens of other exciting simulation games of skill. Every full-color issue is crammed full of the best articles on the strategy and tactics of the games from The Avalon Hill Game Company and Victory Games. And in 1988, **The GENERAL** expanded to 64 pages. Just look at what **The GENERAL** offers:

Advertising: Our **OPPONENTS WANTED** COLUMN allows you to advertise, for a minimal fee, for opponents, discontinued games or competition of any sort. Each issue contains dozens of ads which are seen by our many readers worldwide. The fastest way to find an opponent for this game, whether it is across the street or across the Atlantic Ocean, is in the pages of **The GENERAL**.

Contests: In every issue, we pose challenging game situations which you can enter to win free games by utilizing your playing skills for this or any of The Avalon Hill Game Company's many other simulations.

Tactics & Strategy: Learn why you lose or how to win. The nation's best players and our design staff members write many thought-provoking articles on the entire gamut of games by The Avalon Hill Game Company and Victory Games. Many issues contain a **SERIES REPLAY** in which an actual move-by-move game by master players, profusely illustrated and with commentary by a recognized expert, is printed.

History: Curious about the events portrayed in the game? Articles in **The GENERAL** explain these events and discuss parallels in other games and in other periods of history.

Game Design: Wonder why this game was designed the way it was? Read **The GENERAL** and find out! Our regular **DESIGN ANALYSIS** column features explanatory treatises by our designers and playtesters.

Variants: Tired of the same old game? Playtested variant rules and scenarios by dedicated experts for this game, and dozens of others, are printed regularly in **The GENERAL**. These bring many more hours of enjoyment, and often serve to highlight the finer points of strategy and tactics. And starting in 1988, **The GENERAL** will also annually include a die-cut variant counter sheet for select game variants. These counters will be free only to regular subscribers to **The GENERAL**.

Questions Answered: In our **QUESTION BOX** in each issue, you'll find the only official source of rules interpretations and changes for this and our other games.

Product Reviews: Interested in other titles from The Avalon Hill Game Company or Victory Games? Check them out in the **READER'S BUYERS GUIDE**. The RBG is a game review compiled by our subscribers at large—the people who play the games—not a self-appointed critic. Realism, complexity, components, play-balance and game time are only a few of the categories rated in the RBG.

What's Happening: Most gamers like to know what's going on in the gaming hobby. Each issue contains an installment of **AH PHILOSOPHY** where we discuss developments in the industry and hobby, and generally strive to keep you informed. Full-page ads announce new titles from The Avalon Hill Game Company. In addition, the **INFILTRATOR'S REPORT** keeps you abreast on tournaments, conventions, club news, awards and unusual happenings.

Value: In every issue you'll find a value coupon to be applied against the cost of postage when purchasing games directly from The Avalon Hill Game Company.

Since its inception in 1964, **The GENERAL** has stood the test of time. It remains the oldest and most-respected periodical devoted to simulation gaming on the market. And its subscription rates remain the best value. Increase your enjoyment of this and our other games many-fold with a subscription. If you're convinced, send your check for a two-year subscription. See the **PARTS LIST** enclosed with your new game for prices.

REPLACEMENT PARTS

The **Game and Parts Price List** brochure is available listing prices of all games and components; send a stamped self-addressed envelope with current 1st class postage. To get a complete description of our games, send \$1 and ask for our **Consumer Game Catalog** to The Avalon Hill Game Company, 4517 Harford Road, Baltimore, MD 21214. Credit Card (only) purchases may be made at 1-800-999-3222.

H

CHINESE VEHICLE NOTES

During the early 1930s China possessed not a single factory capable of producing a tank, truck or airplane. Consequently, all AFV and transport vehicles were imported, leaving Chinese forces not only with a myriad of different makes and models but also highly dependent on a steady flow of parts and ammunition from the various manufacturers thousands of miles away. The first tanks to arrive in China were Renault FT-17s, 36 of which were purchased by the commander of the Manchurian Army in 1924. They were used in fighting between several of the northern warlords; later the survivors became the first tanks in the Nationalist armory, being used in Manchuria against the Japanese in 1931. It appears that when the 1937-45 War of Resistance against Japan broke out in July 1937, the Nationalists fielded three armored battalions comprising some 96 "tanks" (probably inclusive of tankettes and armored MG carriers). However, by 1938, after the fall of Shanghai and Nanjing (Nanking), more than half of them had been lost. Subsequent purchases from the Soviet Union and Italy brought the total up to about 200 by early 1941. From that time the U.S. and, to a lesser degree Britain and the Commonwealth, took over as the main suppliers of war materiel to China.

Chinese ordnance nomenclature was similar to the Japanese in its use of a "Type #" dating system. However, the Chinese based theirs on the year 1911, the founding year of the Republic. Thus the Type 22 armored car dated from 1933 (22+11=33), while the Type 31 mortar was accepted in 1942. Unfortunately, most of the Chinese designations for their various types of equipment are unavailable in Western sources.

One interesting historical note, not directly relative to Chinese vehicles but nonetheless worth mentioning, is the influence of German and Soviet advisors on the Nationalist military in the 1930s. During that decade, such famous figures as von Seeckt and von Falkenhausen—and later, Zhukov and Chuikov—were top military advisors to Jiang Kai-shek. The German influence, being both of longer duration and politically more akin to the beliefs of the Generalissimo, were by far the greater.

1. *VCL M1931(b)*: This diminutive amphibious tank first appeared in 1930-32 in two slightly different versions. The British War Office designated them the A4E11 and A4E12 for testing purposes, but declined to accept them for service. They were then offered for sale abroad, and numbers were purchased by several countries including Siam and the Netherlands East Indies. The Soviet Union bought eight, and from them developed the T-37 (Russian Vehicle Note 1). China ordered twenty-nine, the last of which was delivered in May 1935. These were assigned to the 1st Tank Battalion in Shanghai where they participated in the battles for that city in 1937. The Chinese version carried a Vickers 7.92mm machine gun in its one-man turret, and had balsawood floats encased in sheet metal over its tracks to provide additional buoyancy. Water propulsion and steering were provided by a propeller and rudder on the rear hull. "VCL" stands for "Vickers Carden-Loyd".

† The Target Size TH DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream.

† RF is 1.2 for 1937, 1.4 for 1938, and 1.6 thereafter.

2. *L3/35(i)*: In the latter half of the 1930s Italy sold about 100 late-production L3/35 (Italian Vehicle Note 2) to China. They were still being used in 1945. Chinese L3/35 differed from the standard Italian versions by carrying different machine guns designed to fire Chinese-made ammunition. Twenty L3/35 were assigned to the 3rd Tank Battalion in Nanjing (Nanking).

† If Stunned, this AFV may not regain CE status, may not fire any weapon, and is Recalled as per D5.341; these are signified by "Stun=Recall & CE/FP NA" on the counter.

† The BMG may be Scrounged as one or two LMG (as per D10.5), but is considered one MG for malfunction, repair and disablement purposes.

† RF is 1.2 for 1937-38, 1.3 for 1939-40, 1.4 for 1941-42, and 1.5 thereafter.

3. *PzKpfw IA(g)*: This was the original version of the PzKpfw I (German Vehicle Note 1). A small number—perhaps as few as ten—were sold to China in the mid 1930s. Upon arrival they were assigned to the 3rd Tank Battalion in Nanjing (Nanking), where they very likely saw action in late 1937. The PzKpfw IA was felt to be underpowered for its size, due to the modest horsepower of its Krupp air-cooled gasoline engine (which also had a tendency to overheat).

† RF is 1.3 for 1937, 1.5 for 1938, and 1.6 thereafter.

4. *Vickers 6-Ton Mk E(b)*: The Vickers 6-tonner was one of the more influential tank designs of the 1930s. Although not adopted by the British, it was sold (in a number of different versions) to over a dozen countries and provided the basis for the Russian T-26 (see Note 5 below) and Polish 7TP tanks. A total of twenty 6-tonners were purchased by China; sixteen of the Mk E type and four Mk F. Assigned to the 1st and 2nd Tank Battalions stationed at Shanghai, many were lost to the Japanese during the fighting around that city in 1937.

† RF is 1.2 for 1937, 1.4 for 1938, and 1.6 thereafter.

5. *T-26TU M33(r)*: In 1938-39, with tensions high between the U.S.S.R. and Japan, the Soviets supplied China with eighty-eight T-26 M33 tanks (Russian Vehicle Note 6). Photographic evidence indicates that they were radio-equipped; hence the TU designation in the name. They were assigned to the 1st Tank Regiment, of which at least a part was attached to the newly forming 200th Division, the only entirely motorized division in the Chinese Army. In early 1942 the 200th, along with a small number of (one source says only nine) T-26, was sent to Burma. It fought well there, but most if not all of its tanks were lost. Thereafter, Chinese T-26 saw action only in China.

† Each time a Mechanical Reliability DR (D2.51) is made for this AFV, an "11" result indicates that it has Stalled. Its owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to Stop, but excluding the MP expended to Start) that the AFV has used in the unsuccessful attempt to move. It may again attempt to move (if otherwise allowed), but must expend another MP to Start—and must undergo another Stall DR as it does so. An AFV that stalls is subject to Defensive First Fire during the MPH (since it has expended a MP to Start), but not as a moving target unless it started the phase in Motion or had already entered a new hex during that phase. Should a Stall DR result in more Delay MP being expended than the AFV has available, it is considered to have expended its entire MP allotment in Delay.

† Optional AAMG RF is 1.2.

† Dates and RF for use in Burma are 3/42 (1.3), 4/42 (1.4) and 5/42 (1.5). RF for use in China is 1.4 for 1939-42 and 1.5 thereafter.

6. *M3A3(a)*: In October 1943 the 1st Provisional Tank Group (Chinese-American) was formed in Ramgarh, India, using Chinese personnel and Stuart V light tanks (British Vehicle Note 4) transferred from British Lend-Lease stocks. It was envisioned that the Group would eventually comprise six tank battalions, but not enough tanks could be supplied to achieve that goal, so only two were actually outfitted. Attached to X-Force, the 1st Tank Battalion, Provisional, saw action in northern Burma, while the 2nd was apparently used only for supply-line patrol duty. Later in the 1940s these two battalions formed the core of Nationalist armor in the Chinese civil war.

† Optional AAMG RF is 1.1.

† RF is 1.2 for 2-4/44 and 1.3 thereafter.

7. *M4A4(a)*: These were Sherman V medium tanks (British Vehicle Note 14) supplied by the British. The 1st Provisional Tank Group (Chinese-American) attached to X-Force in Burma contained one platoon of M4A4 to provide supporting fire, and this platoon was evidently assigned to the 1st Provisional Tank Battalion (see Note 6 above).

† This AFV is allowed the possibility of Multiple Hits (C3.8) even though its MA is > 40mm. Moreover, in a Gun Duel (C2.2401) its total Firer-based TH DRM are halved (FRD) prior to adding any Acquisition DRM. (The final total of all DRM may not be < zero, and applies for Gun Duel calculations only.) These abilities are signified on the counter by the ROF # being printed on a white background.

† WP becomes available in June 1944—as signified by the superscript "36—"

† Optional AAMG RF is 1.3.

† RF is 1.4 for 2-4/44 and 1.5 thereafter.

8. *M3A1(a)*: As part of their initial Lend-Lease request in early 1941, the Nationalist government asked the U.S. for 400 scout cars. In October of that year the first 35 M3A1s (along with 48 75mm pack howitzers, 100 .50-cal. HMGs, 500 Bren LMGs and 11,000 Tommy guns) were shipped from New York aboard the *SS Tulsa*. However, in late December of that year, much of its cargo was turned over to the British

at Rangoon, which leaves it unclear as to how much (if any) of its cargo ever reached the Chinese. A total of 129 M3A1s were eventually Lend-Leased to the Nationalists, with most (if not all) probably being used by X-Force in Burma.

† This AFV starts the scenario with an Inherent crew, and also with a 2-2-7 crew as a Passenger that applies to the vehicle's PP capacity (D6.1) and is additional to all 2-2-7 crews listed in the scenario OB. This AFV may retain any unpossessed SW aboard it (D6.4), either of its crews may Remove either of its MG, and Mounted Fire penalties (D6.1) do not apply to its Passenger(s). **ERRATA:** For both the Chinese and U.S. versions of the M3A1 Scout Car, the MA is Removed as a dm .50-cal. HMG and the other MG is removed as a dm MMG.

† The AAMG FP actually consists of two MG: one .50-cal HMG (MA; 4 FP) and one secondary .30-cal MMG (2 FP)—as signified by "4MA&[red]2" on the counter. The Inherent crew may fire only the .50-cal MA unless it is malfunctioned or disabled, in which case the Inherent crew may fire the secondary AAMG instead. Otherwise, only a Good Order Passenger may use the secondary AAMG (as signified on the counter by printing its FP in red). Assuming they are properly manned, the MA AAMG and secondary AAMG may be fired together as a FG or at separate targets (as per D3.5). The secondary AAMG, when being fired by a Passenger, counts as use of a SW by that Passenger.

Each AAMG malfunctions and is repaired or disabled independently of the other. If the MA AAMG malfunctions, mark the vehicle with a "MA Malfunction" counter to show that its secondary AAMG is still usable. If the secondary AAMG malfunctions, mark it with an "AAMG Malfunction" counter. Since the ROF applies only to the MA (A9.2), the owner must announce before he fires that he is using the MA if he wishes to possibly retain a multiple ROF. An Armor/Passenger leader may direct the fire of more than one vehicular-mounted/Passenger-fired MG only if those MG are firing together as a FG.

† RF is 1.3 for 11/43-2/44 and 1.4 thereafter.

9. *Stuart Recon(a)*: A small number of M3A3 tanks in the 1st Provisional Tank Group (Chinese-American) had their turret removed in order to add a slightly built-up superstructure with pintle-mounted machine guns. These altered Stuarts were used as command/reconnaissance vehicles.

† The MA may be fired only at a target that lies within this AFV's VCA—as signified by "MA: VCA only" on the counter. See also Chinese Vehicle Note D.

† The cost for Passenger(s) to (un)load is doubled to ½ of the AFV's MP allotment and two MF for the Personnel—as signified by "(un)load × 2" on the counter. All attacks made by the Passenger(s) of this AFV are halved (or receive a +2 TH DRM) as Mounted Fire (D6.1). This AFV may retain any unpossessed SW aboard it (D6.4), but its MG may not be Removed.

† The AAMG may be Scrounged as one or two LMG (as per D10.5), but is considered one MG for malfunction, repair and disablement purposes.

† The "Scout Car" designation is given only in deference to the vehicle's historical use. For all game purposes it is treated as fully tracked.

† RF is 1.5 for 11/43-2/44 and 1.6 thereafter.

10. *Type 22*: Both warlords and Nationalist forces converted foreign trucks into armored cars at various times. Unfortunately, very little is known about these vehicles—not even their names in most cases—and few photographs of them exist. This game piece is therefore a generic representation of such indigenously produced AFV, based on one historical type.

† The CMG MA actually comprises two 2-FP CMG. Each has a 360° traverse independent of the other, and thus can have its own TCA. Each has a Normal Range of eight hexes and may be Removed or Scrounged—as signified by "Nml Rng 8" and "Rmvl/Scrng OK" on the counter. The two CMG may fire at separate targets in different Locations or at the same Location; D3.5 applies unchanged. Each MG malfunctions, and is repaired or disabled, independently of the other. Disabled-MA Recall (D3.7) occurs only when both MG are disabled.

Whichever of the two MG fires first in a phase is considered the MA for both that attack and the remainder of that phase (treating Defensive First and Final Fire as one phase). If both fire as a FG, only one can be considered MA (and thus might retain Multiple ROF); if one of them in that FG malfunctions, determine randomly whether or not it was the one considered MA for that phase.

† Reverse movement costs this vehicle three times its normal hex entry

H

cost—as signified by “REV×3” on the counter.

† RF is 1.5 for 1937-42 and 1.6 thereafter.

34. **PSW 221(g) & PSW 222(g):** A small number—perhaps a few dozen in all—of these armored cars (German Vehicle Notes 69 and 70), along with a few PSW 223 long-range-radio variants, were purchased from Germany in the mid 1930s. The PSW 221 was apparently the most common German armored car in Nationalist service. Some of these vehicles are reputed to have been used in the 3rd Tank Battalion stationed at Nanjing (Nanking), and most likely saw action there in late 1937.

Several WW1 Lancia 1ZM armored cars (Italian Vehicle Note 19) were shipped from Italy to China in 1937, evidently intended for the Italian garrison in Tianjin (Tientsin). It is not known if any were turned over to the Chinese.

† All IMT restrictions apply in the normal manner to the PSW 221(g) [EXC: the crew must be CE to fire the CMG]; this is signified by “BU FP NA” on the counter.

† The MA of the PSW 221(g), and both the MA and CMG of the PSW 222(g), have AA capability—as signified by “MA: AA” on the counter.

† Reverse movement costs the PSW 221(g) four times, and the PSW 222(g) three times, its normal hex entry cost; these are signified by “REV×4” and “REV×3” on the respective counters.

† PSW 221(g) RF is 1.3 for 1937, 1.4 for 1938, and 1.5 thereafter. PSW 222(g) RF is 1.4 for 1937, 1.5 for 1938, and 1.6 thereafter.

21. **BA-20(r) & BA-6(r):** The Nationalists purchased a small number of Soviet BA-6/BA10/BA-20/FAI armored cars in the late 1930s. (In game terms, the BA-10 is equivalent to the BA-6 and the FAI is equivalent to the BA-20.) What use the Chinese made of these vehicles is unknown; however, given the scarcity of roads in the country and the poor off-road capability of these AFV, they probably saw little action outside of urban areas.

14. **VCL Mk VI Carrier(b):** This tiny AFV, which utilized a Ford Model T engine and drive train, first appeared in 1927. It was designed to provide increased mobility for the Vickers MG, and could also be used to tow a light gun. Besides being adopted by the British Army, several hundred were sold abroad, leading to such foreign designs as the Italian L3/35 (Note 2 above) and Polish TK tankettes. Twenty-four Mk VI Carriers were ordered by China, with the first shipment arriving there in May 1929. Those still operational in the late '30s were assigned to the 2nd Tank Battalion in Shanghai.

† The VCL Mk VI is considered a Carrier (D6.8) [EXC: it has a Passenger capacity of one PP for ammunition (C10.13) or one SMC or one 1PP-SW, but may not carry a Rider(s); it contains an Inherent crew even if unarmed, and that original crew always takes counter form as a 2-2-7 infantry-crew].

† The MF expenditures given in C10.11 and C10.12 for (un)hooking a Gun apply unchanged if the MMC performing that action is simultaneously (un)loading from/into this Carrier.

† If Stunned, this AFV may not fire and is Recalled as per D5.341; this is signified by “Stun=Recall & FP NA” on the counter.

† Optional BMG RF is 1.2.

† RF is 1.3 for 1937, 1.5 for 1938 and 1.6 thereafter.

16. **Carriers A(b), B(b) & C(b):** The British, Canadians and Australians apparently all supplied Carriers to China. Various sources state that 1500 were provided by Australia and 1200 by Canada, but it seems unlikely that the Chinese successfully took delivery of that many prior to the end of hostilities. Nor is it clear just how these Carriers were employed; however, at least one Chinese “armored carrier” company was present in Burma in 1942, and Carriers were also used there in 1944-45 by the 1st Provisional Tank Group (Chinese-American). The use of “A”, “B” and “C” in the piece names are our own designations to help differentiate between similar models.

† See D6.8-.84 for the basic rules pertaining to Carriers. Towing capability is not usable prior to 1945—as signified by the superscript “5”. If

a Carrier A, B or C is to start a DYO scenario as a towing vehicle, a 2-2-7 infantry-crew may be purchased for it in lieu of its Inherent HS; this is done by adding two points in the “Opt BPV” column of the DYO Roster’s “Vehicle” section. The MF expenditures given in C10.11 and C10.12 for (un)hooking a Gun apply unchanged if the MMC performing that action is simultaneously (un)loading from/into a Carrier A, B or C.

† The Carrier A’s MA BMG may be repositioned as a normal MA AAMG. This can be done only by placing an AA counter on the Carrier at the end of any friendly fire phase (not MPH) in which the BMG has not fired and the Inherent MMC is not stunned, shocked, broken or in Melee. As long as the AA counter remains on the Carrier, its FP is assumed to be “-1/-2” with a zero Multiple ROF. The AAMG may be repositioned as the BMG MA by using these same principles to remove the AA counter.

† The Carrier B’s BATR has a “1” Multiple ROF, has a maximum TH range of 12 hexes (as signified by “[12] TH” on the counter), and may be Scrounged/Removed.

† The Carrier C’s MA may not be Removed, as signified by “Rmvl NA” on the counter, and may be Scrounged only as a LMG.

† Carrier A(b) and Carrier B(b) Dates and RF for use in China are 1942-45 (1.6); for use in Burma they are 3-5/42 (1.5), 11/43-4/44 (1.3) and 5/44-3/45 (1.4). Carrier C(b) Dates and RF for use in China are 1943-45 (1.6); for use in Burma they are 11/43-4/44 (1.4) and 5/44-3/45 (1.5).

23. **Henschel 33(g) Truck:** As with so many other types of materiel, the Chinese acquired transport vehicles from many different nations (including the U.S.) during the 1930s. By 1939 there were some 7,000 German trucks alone in China, of which probably a good number were Henschel 33, a widely exported model. Due to bad roads, few spare parts and the lack of proper maintenance, vehicles in China were invariably in poor mechanical condition (as evidenced in the game by the large percentage of Chinese vehicles with red MP allotments), and only a fraction of the total number were in operating condition at any one time. Moreover, no organized transport system for the army even existed. Of the more than 300 Chinese divisions, only one—the 200th—was completely motorized.

† RF for use in China is 1.3 for 1937-38, 1.4 for 1939-41, 1.5 for 1942-43, and 1.6 thereafter. Dates and RF for use in Burma are 3-5/42 (1.4) and 5/44-1/45 (1.5).

37. **Jeep(a) & 2½-Ton(a) Truck:** The very first Lend-Lease shipment to China, consisting of 300 2½-ton trucks, left New York in May 1941 bound for Rangoon. By the end of that year vehicles were trickling across the Chinese border via the Burma Road, but bottlenecks along the route were creating a substantial backlog around Burma’s capital. As a result, when the invading Japanese neared the city in March of 1942, 972 Lend-Lease trucks in various stages of assembly had to be destroyed, and 683 more plus 260 Jeeps were hurriedly transferred to British control. Once the Burma Road was cut, all transport vehicles bound for China proper had to be flown over the Hump and re-assembled in Kunming. U.S. trucks and Jeeps were supplied to X-Force, and Y-Force was provided with 475 Jeeps. By the end of 1944 there were approximately 10,000 trucks in Nationalist-controlled China, but according to one estimate only about 2,000 of them were in operating condition. To make matters worse, they were dispersed among various Chinese agencies and private owners. Despite pleas from U.S. advisors, it was not until 1945 that even a half-hearted attempt was made to exercise some degree of control over motor transport for the army.

During the course of Lend-Lease, a total of 24,991 trucks were released to China, comprising 11,982 of ≤ one ton (including Jeeps), 2,616 of 1½ to 2 ton, 10,230 2½-ton and 163 of > 2½ tons. It should be noted, however, that many of these probably arrived after the end of hostilities in 1945.

† If armed, the Jeep has an Inherent crew and thus a CS# instead of a cs#. The Jeep’s optional AAMG is a .50-cal HMG (RF 1.3) if 4 FP or a MMG (RF 1.1) if 2 FP—and may be Removed (D6.631) as that type of MG (i.e., as a .50-cal. or MMG respectively).

† Jeep(a) Dates and RF for use in China are 1942-43 (1.6) and 1944-45 (1.5); for use in Burma they are 3-5/42 (1.5) and 11/43-3/45 (1.3). 2½-Ton(a) Dates and RF for use in China are 1942-43 (1.6) and 1944-45 (1.5); for use in Burma they are 3-5/42 (1.5) and 11/43-3/45 (1.4).

Vehicle Note A

CHINESE MULTI-APPLICABLE VEHICLE NOTES

A. "(a)", "(b)", "(g)", "(i)", or "(r)" in the piece name stands for "American", "British", "German", "Italian" and "Russian" respectively. For ESB (D2.5) purposes, a Chinese tracked vehicle is treated as being of the nationality indicated by the parenthesized letter in its name, but must also add an extra +1 DRM to its ESB DR.

B. This vehicle was used by the Chinese *only* in Burma [EXC: if "B" appears, it was *not* used by them in Burma].

C. 37mm and 47mm canister have 12 FP.

D. Make two TK DR on the MG column of the AP TK Table; only one DR (firer's choice) is used. This is signified by "2 TK DR" on the counter.

E. The MA and all MG have B11. This is signified by "B11" in red on the counter (bold in the Vehicle Listing). If "B (11)++" appears on the reverse side of the counter, the MA's B# is a circled "11" (D3.71) for scenarios set in/after 1941 (non-circled B11 remains applicable to the vehicle's MG in such scenarios).

F. This vehicle, despite being non-tracked, has its MP allotment printed in red (bold in the Vehicle Listing) and thus is subject to Mechanical Reliability DR as per D2.51.

G. May be equipped with a Gyrostabilizer as per D11.

H. When this vehicle is Bogged, one (only) CX squad (even a prisoner, but not a Guard) on foot expending $\geq$ four MF in the vehicle's Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract two (one per crew or HS) from the colored dr of its immediately subsequent unbogging DR.

CHINESE ORDNANCE NOTES

1. **Type 27 Grenade Launcher:** This small mortar was designed and produced in China. The designation "Type 27" indicates its acceptance for service in 1938 (1911 [founding year of the Chinese republic] + 27 = 1938). A lever-type trigger was pulled to fire the grenade, and a two-hole gas regulator cap at the bottom of the tube bled off propellant gas for range adjustment. The weapon was not standard issue, its presence/quantity in a given unit being dependent on its availability and the commanding officer's preference.

† Air Burst TEM never applies to an attack by this mortar (i.e., normal woods/jungle/bamboo TEM would apply). This is signified by "Air Bursts NA" on the counter.

2. **Mortaio da 45 "Brixia", 5cm leGrW 36, 50mm RM obr. 38 & Type 89 Heavy Grenade Launcher:** The Nationalists imported various types of foreign light mortars, with those from Germany ["50mm MTR(g)"],

the U.S.S.R. ["50mm MTR(r)"] and Italy ["45mm MTR"] being numerically the most important. The Red Chinese received some light mortars from the Soviets, and captured (as well as clandestinely purchased) numbers of Nationalist mortars. Both also employed the knee mortar ["50mm MTR(j)"], which, aside from machine guns, was the most common captured Japanese support weapon in Chinese service; all that could be obtained were put to use, with the number growing as the war went on. Chinese arsenals manufactured copies of the German and Soviet weapons, plus ammunition for them (and for the knee mortar), while Resistance forces built a small number of knee mortars. Unfortunately, information on the tactical employment of these mortars is nil.

† The following special rules apply to the 50mm MTR(j):

- When firing HE at a range of $\leq$ two hexes, the ROF is lowered to "1" for that shot and Air Bursts are NA.
- WP can be fired only at a range of 1-5 hexes, reduces the ROF to "1" for that shot, is considered Dispersed even when fired in the PFPh, and Air Bursts are NA.
- Smoke can be fired only at a range of 3-10 hexes.
- A Japanese Personnel unit may use it with no Captured-use penalty (and it may be fired from a cave; G11.83).

3. **M2 60mm Mortar:** This mortar (U.S. Ordnance Note 1) was supplied to the Chinese divisions of X-Force and Y-Force in Burma (1,238 were furnished to the latter, plus perhaps as many as 810 to X-Force), and to those that

were U.S. trained-and-equipped to fight in China. In X-Force, each rifle company was authorized six M2. The game piece also represents the French 60mm mle 35 (from which the M2 was derived) and the Type 31, a Chinese copy of the French/U.S. model(s). The Type 31 entered production in 1942 or shortly thereafter, and 5,150 had been built by mid 1945. Total Chinese production of light mortars during the war years is estimated to have been about 12,000.

† Three M2 60mm may be used as OBA as per U.S. Ordnance Note 1 and G17.5.

4. **Stokes 3-in., 8cm GrW 34 & 82mm BM obr. 37:** The Stokes 3-in. mortar (see British Ordnance Note 2) was produced in China from 1925,

being built initially in the Manchurian arsenal at Mukden, and was still being manufactured at other arsenals in 1937. The Nationalist government also imported, and eventually produced its own versions of, standard German and Soviet medium mortars. Chinese arsenals produced ammunition for all these types as well. Since most Chinese divisions lacked organic field guns and howitzers, mortars were usually their sole source of artillery support. A Nationalist infantry regiment generally contained a company of 6-8 medium mortars, giving the division an average of 18-32 such weapons (depending on its structure). One source states that 5,242 82mm mortars were built in China between early 1941 and mid 1945. In mid 1942 some 8,000 trench mortars of all sizes were in service. Aside from its different maximum range, the 82mm piece (along with its initial availability Date) also represents the French 81mm mle 27/31 and the Italian Mortaio da 81/14, small numbers of which were in Nationalist service.

5. **M1 81mm & M2 4.2-in. Mortars:** These mortars (U.S. Ordnance Notes 3 and 4) were used

by X-Force in Burma (with perhaps as many as 180 81mm being furnished). A company of twelve 81s was authorized in each infantry regiment, while the 4.2s were formed into a nondivisional heavy mortar regiment. At the end of 1944 a number of 4.2s were shipped to China for use by U.S.-trained forces, but apparently saw no action there prior to the war's end. The Chinese also used captured Japanese medium mortars whenever available. In addition, by the early '40s (perhaps even earlier) they had a small number of 150mm mortars in service, but it is not clear whether these were an indigenous design (around 1930, the Mukden arsenal had produced some experimentally) or captured Japanese models.

† The Area Target FP of the 4.2-in. is "12" (rather than "8"). This is signified by "12 Area FP" on the counter.

6. **3.7cm PaK 35/36 & M3A1 37mm:** The PaK 35/36 (German Ordnance Note 6) was the

standard AT gun of Nationalist forces. In addition to purchasing numbers of it, production facilities were imported which allowed the gun to be manufactured in China. An infantry regiment might have two such guns, but most were formed into independent AT regiments controlled at army (U.S. corps) level or higher. In mid 1942 China possessed 600-750 "modern", and about 250 "obsolete", AT guns. The M3A1 (U.S. Ordnance Note 6) was issued to X-Force and Y-Force divisions (189 were supplied to Y-Force, and perhaps as many as 120 to X-Force) for use in Burma; each X-Force infantry regiment was authorized an eight-gun AT company. From mid 1944 a small number of M3A1 were provided to Chinese forces in southeast China.

† M3A1 Dates and RF for use in China are 7/44-45 and 1.6.

7. **37mm PP obr. 15R & Cannone da 70/15:** Small numbers of this WW1 infantry gun (Russian Ordnance Note 11) and pre-WW1 mountain gun (Italian Ordnance Note 7) saw service with the Chinese. However, these counters mainly represent, in a generic manner, the many diverse types of antiquated artillery pieces used in China's provincial armies.

† The 70/15 may not use Target Acquisition—as signified by "Acq.

H

NA" on the counter.

† Both the 70/15 and PP obr. 15R have a circled B# (italicized in the Listing), indicating that they suffer from Low Ammo (D3.71). This status can be negated only by SSR, an Ammo Vehicle (E10.1) or an Ammo Dump (E10.6).

    8. 7.5cm Krupp M08 & Obice da 75/13: The M1908 75mm mountain gun was one of several old Krupp artillery pieces used by the Nationalists, who even produced their own version of this particular model (one source states that in the 1930s up to 54 were built in Chinese arsenals). The game piece also represents other similar pre-WWI guns acquired in fair numbers, such as the 76mm 00/02 P (Russian Ordnance Note 13) and the 75/27 (Italian Ordnance Note 9). China also purchased some 75/13 mountain guns (Italian Ordnance Note 8); this piece is equivalent in game terms to the Krupp 7.7cm C 96 nA employed by the Nationalists, and may also be used to represent the Bofors M34 mountain gun, "a batch" of which was obtained by the Nationalists. Chinese forces employed small amounts of captured Japanese mountain artillery as well. In mid 1942 the Nationalists possessed about 1,000 75mm guns and howitzers (probably inclusive of 76-77mm types as well).

    9. 7.5cm leIG 18 & 76.2mm PP obr. 27: A relatively large number of these infantry guns

(German Ordnance Note 15 and Russian Ordnance Note 12) were supplied to the Nationalists, who used them primarily in the field artillery role. However, some infantry regiments—probably those in the elite divisions—did contain a company of (apparently two) 75mm pieces; and given the leIG 18's short range, it may have been the weapon of choice for this role. Chinese forces also employed small numbers of captured Japanese 70mm and 75mm infantry guns.

† Dates and RF for the use of these Guns in Burma are 3-5/42 (1.4) and 5/44-1/45 (1.5).

  10. M1A1 75mm Pack Howitzer: By April 1942 the Chinese 5th Army in Burma had received about thirty U.S. pack howitzers, while others reached China at about the same time. By 1944 the M1A1 was the standard divisional artillery piece in X-Force and Y-Force, with 244 supplied to the latter and probably about sixty (taken from British Lend-Lease stocks) to the former. The divisional artillery of an X-Force division was a single battalion of horse-packed M1A1s. Y-Force pack-howitzer battalions were generally held at army (U.S. corps) level, and detached to divisions or regiments as the need arose. (Some of the Y-Force battalions were actually man-packed; i.e., the disassembled howitzers, along with their ammunition and other accoutrements, were carried by coolies.) In China, twenty-five pack howitzer battalions were available by early 1945 to the ALPHA (a U.S. training-and-equipment program) divisions.

† Dates and RF for use in Burma are 3-5/42 (1.4) and 1944-3/45 (1.3). For use in China they are 1942-6/44 (1.6) and 7/44-45 (1.5).

Ordnance 11

11. 7.7cm FK 16, 76.2mm P obr. 02/30 & OOF 18-Pounder: The FK 16 was a Krupp-designed field gun (FK: *Feldkanone*) used by the Germans in the latter half of WW1, with 3,000+ being built from 1916 to 1918. The obr. 02/30 (Russian Ordnance Note 14) was an old Tsarist gun updated by the Soviets. Both types were purchased in relatively large numbers by the Nationalists. The FK 16 piece also represents the Canon de 75 mle 1897 (the famous "French 75"), used in small numbers. The 18pdr (British Ordnance Note 11) was the mainstay of British artillery in WW1; some (apparently only a few) were acquired by the Nationalists. Other (evidently 75mm) pieces employed by Nationalist forces were those of the Dutch firm Siderius. Whenever possible, Chinese forces also used captured Japanese field guns.

Almost all Chinese field artillery was organized into independent battalions and regiments controlled at army (U.S. corps) level or higher, and much of it was retained in the Central Artillery Reserve controlled by Jiang Kai-shek, who personally doled out guns as he saw fit (sometimes one or two at a time). An artillery battalion comprised two to three batteries of two to four guns each; at least in the early war years, a common battalion configuration was two 150mm and ten 75mm pieces. The total Nationalist artillery park in 1937-38 has been variously estimated at 800-1,000 guns. By Sept. 1943 the total was about 1,330.

12. 10.5cm leFH 16, Cannone da 105/28 & M2A1 105mm Howitzer: The leFH 16, a Krupp design using the same carriage as the FK 16 (Note 11 above), was the standard light field howitzer of the German Army by the end of WW1, replacing the M1898/09 which the Nationalists also possessed. The leFH 16 piece may also be used to represent the small number of foreign 105mm mountain howitzers in Nationalist service.

The 105/28 (Italian Ordnance Note 13) was acquired by the Nationalists in relatively fair numbers—as was the leFH 18 (German Ordnance Note 20), which the 105/28 piece also represents. In addition, the Nationalists possessed a few 10cm K 18 (German Ordnance Note 21), 107mm P obr. 10/30 (Russian Ordnance Note 18), and 100/17 (Italian Ordnance Note 12), while both they and the Red Chinese captured a small number of Japanese 105mm howitzers. China's Chief of Ordnance stated in mid 1942 that his government's forces possessed a total of 91 105mm howitzers.

M2A1 howitzers (U.S. Ordnance Note 14) were supplied to X-Force, which used them in Burma. In addition, 157 were sent by aircraft (and, from the end of 1944, by truck) into China, but these apparently saw no action prior to the war's end.

† leFH 16 RF for use in China is 1.5; Dates and RF for its use in Burma are 3-5/42 (1.6) and 5/44-1/45 (1.6).

13. 122mm G obr. 10/30 & G obr. 38: The U.S.S.R. supplied war materiel to China from 1924 to 1927, then again from 1938 to mid 1941 (though in a steadily decreasing trickle after Zhukov's crushing victory over the Japanese at Nomonhan in mid 1939). Among the Soviet artillery types sent to the Nationalists were obr. 10/30 and obr. 38 122mm howitzers (Russian Ordnance Notes 19 and 20), both of which were provided in fair numbers. However, when the stream of supplies from the U.S.S.R. dried up, so did the source of ammunition for most Soviet weapons, leaving their usefulness severely handicapped.

14. Obice da 149/13: The Chinese government purchased a number of these howitzers (Italian Ordnance Note 14). The game piece also represents various other WW1-era heavy howitzers such as the Krupp sFH 13 and the M1918 155mm (U.S. Ordnance Note 17). The latter was supplied in small numbers to X-Force in Burma, where it was used by elements of the Chinese 12th Field Artillery Battalion. In China the Nationalists also employed some Japanese Year-4 Type 150mm howitzers, some imported and others captured, plus a few Soviet 152mm guns/howitzers. One source states that the first use of 150mm

artillery by the Chinese during the War of Resistance (i.e., the 1937-45 Sino-Japanese conflict) occurred in the fighting around Taierzhuang (Tai-erh-chuang) in early 1938. China's Chief of Ordnance stated in mid 1942 that Nationalist forces possessed 60 howitzers of "6-in." caliber.

† WP is available only in scenarios set in Burma—as signified by the superscript "B". In scenarios set in China, this Gun may be towed only by a Wagon—as signified by "h-dc".

† RF for use in China is 1.6. Dates and RF for use in Burma are 6/44-3/45 and 1.5.

15. Oerlikon FF, Cannone-mitragliera da 20/65 & 2cm FlaK 30: The Oerlikon was derived from a 1914 German design. Produced in Switzerland from 1921, it proved to be the first successful light AA gun and was sold in large numbers to armies and navies around the world. One customer was the government of China, which purchased 120 Oerlikons in 1929. The Italians too sold 20mm AA ordnance to China, theirs being the 20/65 (Italian Ordnance Note 17). At about the same time, the Nationalists began purchasing the FlaK 30 (German Ordnance Note 25) and also arranged with German firms to have production facilities for the gun set up in China. Yet another type of 20mm AA in Nationalist service was the Madsen M35 from Denmark. 20mm AA guns were often used in the AT role, as a supplement to the standard (but sometimes unavailable) 37mm AT gun. The Chinese also obtained 12.7-13.2mm AAMG from France, the U.S.S.R. and the U.S.A.

† Dates and RF for the use of these Guns in Burma are 3-5/42 (1.5) and 5/44-1/45 (1.5).

16. 3.7cm FlaK 36 o. 37 & Bofors 40mm L/60: The famed Bofors gun was purchased from Sweden, and also from Hungary where a licensed version was produced; later more were obtained from the Soviet Union, Britain and the United States. X-Force in Burma contained a battalion of Bofors 40mm, but it probably saw little action in the ground combat role. About 1937 the Nationalist government bought a number of (one source suggests 36) FlaK 36 o. 37 guns from Germany; later it apparently also received 37mm guns from the U.S.S.R. and U.S.A. Yet another type used by the Nationalists was the static-mounted Vickers 40mm. AA guns were organized in independent battalions, with three batteries per battalion and four guns per battery.

† Bofors Dates and RF for use in Burma are 2/44-3/45 and 1.6.

17. Bofors 75mm M29 & 8.8cm FlaK 18: These two heavy AA guns were bought from Sweden and Germany respectively. Other such guns in Nationalist service were Vickers 75mm, Soviet 76mm and Czech 90mm. Heavy AA guns were emplaced around important cities and key installations; hence they probably saw little use in ground combat. One source states that the Nationalists possessed 32 75mm AA guns in 1937; another says they had 211 AA guns of all sizes in mid 1942.

H

CHINESE MULTI-APPLICABLE ORDNANCE NOTES

- A. This weapon may be Animal-Packed (G10).
- B. This Gun was used by the Chinese *only* in Burma [EXC: if "B" appears, it was *not* used by them in Burma].
- C. 37mm canister has 12 FP. 75mm canister has 20 FP. 105mm FP has 24 FP.
- D. This Gun's B# is "11" in scenarios set prior to 1941. In scenarios set in/after 1941 it has a circled B# treated as per D3.71, as signified by "B (11)++" (or "B (10)++" for certain LF Guns) on the counter. This circled B# status can be negated only by SSR, an Ammo Vehicle (E10.1) or an Ammo Dump (E10.6).
- E. Dates for use in Burma are 3-5/42 and 5/44-1/45.
- F. Dates for use in Burma are 3-5/42.
- G. When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for TH purposes but the AP Basic TK# is still determined using the Caliber Size and Length printed on the unlimbered side.

LC 1

LANDING CRAFT NOTES

[Note: "PTO" = "vs Japanese"]

 **1. LCP(L):** The Landing Craft, Personnel (Large), built by the Higgins Company of New Orleans (hence its nickname of "Higgins boat"), was an adaptation of one of its standard motor boats. Its wooden hull offered little protection beyond that provided by three armored transverse bulkheads. 2,193 LCP(L) were manufactured between 1940 and 1942. Following it in production was the LCP(R), which differed by having a narrow bow ramp (reportedly inspired by a photograph of a Japanese Daihatsu LC). 2,631 LCP(R) were built in 1942-43. The early-war U.S.M.C. designations for the LCP(L) and LCP(R) were T-Boat and TP-Boat, respectively. In U.S. service, LCP were usually transported aboard APD (high-speed destroyer-transport), APA (attack transports) and AKA (attack cargo ships).

The British received 500 LCP(L) and 600 LCP(R), the vast majority through Lend-Lease. However, 400 of the British LCP(L) comprised the initial production run which lacked the armored bulkheads and MG positions present in the later (U.S.) version. British LCP were generally transported aboard various types of LSI (Landing Ship, Infantry).

As fully armored LC became more widely available, most LCP(L) were relegated to use as command/guide boats.

† In British use the LCP(L) is considered completely unarmored and unarmed (but still has an Inherent crew). BPV for this version is "8".

† Dates and RF for British use are 5-12/40 (1.1), 1941 (1.0), 1942-6/43 (.9), 7/43-5/44 (1.2), and 6/44-5/45 (1.4) [EXC: PTO use is limited to Burma and 1944-45 (1.2)]. Dates and RF for U.S. use are 11/42-6/43 (.9) and 7-12/43 (1.0) [EXC: for PTO use they are 8/42-5/43 (.9) and 6-12/43 (1.0)].

 **2. LCA:** The Landing Craft, Assault, was a British design that entered production in 1939. Constructed of wood covered over by armor plating, it became the standard infantry LC of British forces; 2,030 were built (including 50+ in India) before production ended in 1944. The original designation of ALC was changed to LCA in 1942. Although slower than the LCV (its American counterpart), the LCA had better armor protection including a partial roof over the passenger compartment. Small numbers of LCA were used by U.S. troops (especially Rangers) in the North African, Mediterranean and European theaters from the time of Operation Torch through the Normandy assaults. One source states that 486 LCA were available to Allied forces for the Normandy landings, while another says the British had 448 and the U.S. 54.

† Contrary to G12.41, the LCA may carry only Personnel/SW as Passengers despite its having a ramp. This is signified by "Pers/SW only" on the counter.

† Each Indirect-Fire hit vs an LCA, as well as each attack vs an LCA which treats it as unarmored, has its *Collateral-Attack* FP halved (cumulative with all other applicable modifications, including the halving of FP specified in G12.672).

† Dates and RF for British use are 5/40-5/45 and .9 [EXC: PTO use is limited to Burma and 1944-1/45 (.9)]. Dates and RF for U.S. use are 11/42-6/44 and 1.3 [EXC: PTO use is NA].

 **3. LCVP:** The original U.S. design for a LC capable of carrying a light vehicle was the LCV (Landing Craft, Vehicle), 2,366 of which were constructed in 1942. However, being both unarmed and unarmored, it was quickly succeeded by a much improved version, the Landing Craft, Vehicle Personnel. Both were of wooden construction (with armor plates added on the LCVP), and were built by Hig-

gins of New Orleans. With 23,358 produced from 1942, the LCVP rapidly supplanted the LCV and LCP(L). 400 LCVP (and 300 LCV) were Lend-Leased to the British. 839 LCVP were available to the Allies for the Normandy landings. Many different ship types (e.g., APD, AKA, LST, LSD and LSV) were used to transport LCV and LCVP. Use of the LCVP in scenarios set prior to 6/43 actually represents the LCV.

† For use in a scenario set prior to 6/43, the LCVP is considered completely unarmored and unarmed (but still has an Inherent crew). BPV for this version is "11".

† Dates and RF for U.S. use are 11/42-6/43 (1.0) and 7/43-5/45 (.9) [EXC: for PTO use they are 8/42-5/43 (1.0) and 6/43-45 (.9)]. Dates and RF for British use are 11/42-6/43 (1.2) and 7/43-5/45 (1.3) [EXC: for PTO use in other than Burma they are 9/43-7/45 (.9); for Burma they are 1944-1/45 (1.3)].

 **4. LCM(3):** The Landing Craft, Mechanized (Mark 3), was one in a series of vessels whose concept originated with the British MLC(1), which was designed specifically to carry a light tank and entered production in 1939 (the designation was changed to LCM in 1942). Some 600 LCM(1) were built through 1944, and saw active service throughout the war. The LCM(2), an adaptation of a shallow-draft river tug, was built by Higgins of New Orleans—but only 147 of this mark were produced. Next came the LCM(3), also built (in the main) by Higgins but based on British ideas for carrying a medium tank. With 861 constructed in 1942-44, it was the most numerous version and saw widespread service. U.S. LCM were generally transported aboard APA, AKA and LSD. 650 LCM(3) were Lend-Leased to the British. In the Royal Navy, some LSI could carry one or two LCM, but a number of ships were converted to LCM carriers (designated LSS, LSC or LSG depending on the type of ship used). 358 LCM(3) and 128 LCM(1) were available to the Allies for the Normandy landings.

† For British use in a scenario set prior to 11/42, the LCM(3)'s Passenger capacity is "49PP"—and its two MG (see Note B below) are *not* 12.7mm, each has a FP of "2", and the MA ROF is "1" (B12, as well as LC Notes B and C, still apply otherwise); BPV for this version is "20". For U.S. use in a scenario set prior to 11/42, the LCM(3)'s Passenger capacity is "49PP"; BPV for this version is "26".

† Dates and RF for British use are 5/40-5/45 and 1.1 [EXC: for PTO use in other than Burma they are 9/43-7/45 (1.2); for Burma use they are 12/44-1/45 (1.1)]. Dates and RF for U.S. use are 11/42-6/43 (1.1) and 7/43-5/45 (1.0) [EXC: 8/42-45 and 1.0 for PTO use].

 **5. LCI(S):** The Landing Craft, Infantry (Small), was designed and built in Britain, and was intended mainly for raiding operations. It was of wooden construction with a covering of armor plates. No more than a hundred (and perhaps as few as forty) were built, all in 1943. The hold of the LCI(S) was completely decked-over; passengers exited troop compartments to topside, then disembarked down four gang-planks pushed out over the bow as the vessel beached. LCI(S) carrying Royal Marines were in the forefront of the landings in Normandy and on Walcheren Island—unlike the much larger (and more common) LCI(L), which were generally not used in the initial waves if opposition was expected. 39 LCI(S) were available for the Normandy landings.

† The AAMG FP actually represents two 2-FP MG. This is signified by "MG: 2&2" on the counter. Each has an eight-hex Normal Range and its own 360° field of fire. Each malfunctions, and is repaired or disabled, independently of the other. Scrounging may result in the creation of one or two British LMG as per D10.5. For the 20L MA, see Note E below.

DP: Damage Point rating (G12.601)

Bog: Bog DRM (G12.21)

Ramp: "•" signifies presence of Ramp (G12.41)

H

LC Note G

† Passengers aboard the LCI(S) remain in a Cloaking Box even when their LC is Beached; when they expend MF to unload (see also Note D below), they appear onboard already unloaded (the reverse of this applies when they load). When an LCI(S) is Beached *across a hexside that lies within its VCA*, Passengers (un)load from/onto it across that hexside (despite its having no ramp).

† PTO use is NA.

6. **LCT(4)**: The Landing Craft, Tank (Mark 4) was, like its predecessors the Marks 1-3, designed and built by the British. Prior to early 1942 these craft were designated TLC. 865 LCT(4) were constructed in 1942-45, making it the second most numerous mark of LCT. It was the largest of all wartime LCT in terms of payload capacity, being able to carry six Churchill tanks or nine Shermans or 350 short tons of cargo. 768 standard LCT were available to the Allies for the Normandy landings, plus another 105 converted to specialist roles. For the Normandy invasion the British planned to land their specialized armor (Crabs, Crocodiles and AVRE) in LCT right at H-Hour—five minutes after DD tanks launched from other LCT were to have reached the shore, and seven minutes before the first infantry wave was to arrive.

Two types of U.S. LCT were used operationally during the war: the Mark 5 (500 built in 1942-43 of which 159 were Lend-Leased to the British), and the Mark 6 (964 built in 1943-44 with only two Lend-Leased to Britain). However, unlike the British, the Americans generally did not include LCT in the initial waves if they knew the landing would be opposed, preferring instead to use LCM carrying individual tanks.

LCT were capable of travel on the open sea, but had a fairly short range. Several could be carried fully laden in the hold of an LSD (Landing Ship, Dock). The LCT(S) was designed to be transported on the deck of an LST (Landing Ship, Tank), and was unloaded by listing the LST 11° which enabled the LCT to slide off into the water.

† For British use in a scenario set prior to 7/43, and for *all* U.S. use, the LCT(4)'s Passenger capacity is "330PP". BPV for this version is "82".

† Contrary to G12.421-43, items in an LCT(4)'s Infantry Stack (G12.151) may unload despite the presence of any vehicle(s)/non-burning-wreck(s) aboard it, provided its Vehicle Stack currently comprises < 50% of its total Passenger capacity *and*, if that Vehicle Stack contains > one vehicle/wreck, no wreck or Immobile vehicle is the topmost non-Gun ¼" counter in that Vehicle Stack. Any burning Passenger wreck aboard the LCT would still restrict (un)loading as per G12.44.

† Dates and RF for British use are 1941 (1.5), 1942-6/43 (1.3), and 7/43-5/45 (1.2) [EXC: for use in Burma they are 12/44-1/45 (1.3); for PTO use in other than Burma they are 5-7/45 (1.3)]. Dates and RF for U.S. use are 7/43-5/44 (1.4), 6/44 (1.3), and 7/44-5/45 (1.4) [EXC: for PTO use they are 1943-45 (1.5)].

7. **DAIHATSU**: Appearing in 1935 in response to a requirement of the Imperial Army, the Daihatsu was the world's first ramped landing craft. Its design was based on that of the traditional Japanese fishing boat. Several different versions, differing slightly in length, speed, armament and capacity, were ultimately built for the Army and Navy (hence the game piece is a generic version). Daihatsu were by far the most common type of Japanese LC, with apparently at least 5,000 built. Some were converted to river gunboats, particularly for use in China. U.S. Intelligence referred to the Daihatsu as the Type A landing craft. They were generally transported stacked on the decks of converted merchant ships, and set into the water by cargo booms.

† The AAMG may fire only at a target that lies within the Daihatsu's rear/port-side Target Facing.

8. **SHOHATSU**: This LC was a steel-hulled motor launch with a low armored shield across the front of the passenger compartment. U.S. Intelligence called it the Type B landing craft. Shohatsu were presumably carried to the landing site slung from the davits of troop transports.

† Shohatsu Passengers *cannot* be BU—as signified by "PRC BU NA" on the counter. Hence they are Vulnerable through their LC's front Target Facing in the same manner as any non-BU Passenger of an OT AFV (including use of the +2 CE DRM if otherwise applicable). G12.124 applies unchanged, however.

LANDING CRAFT MULTI-APPLICABLE NOTES

A. This LC is OT (like an AFV) through its front (i.e., armored) Target Facing.

B. The AAMG FP actually represents two 4-FP MG [EXC: that of the LCM(3) represents two 6-FP .50-cal HMG]. This is signified by "MG: 4&4" (or "MG: 6&6") on the counter. Each has a 360° field of fire and eight-hex Normal Range. See also Note C below. The last sentence of F.9 applies for Scrounging purposes (and the D10.5 dr determines if one or two LMG are Scrounged).

C. Whichever of the two weapons eligible to be MA fires *first* in a phase is considered the MA for both that attack and the remainder of that phase (treating Defensive First and Final Fire as one phase). If both fire as a FG, only one can be considered MA (and thus might retain Multiple ROF); if one of them in that FG malfunctions, determine randomly whether or not it was the one considered MA for that phase. Each of the two weapons malfunctions, and is repaired or disabled, independently of the other.

D. Since this LC has no ramp, as per G12.41 the normal cost to (un)load Passengers is 50% of its MP allotment and two MF for the Personnel—as signified by "(un)load×2" on the counter. However, this does *not* further increase the G13.731 cost to (un)load Passengers at a pier.

E. The MA is actually two 20L AA, each with 6 IFE and AA capability—as signified by "MA:×2; AA" on the counter. Each 20L has a 360° field of fire and 16-hex IFE Normal Range. However, neither 20L may fire at a target that lies within the LC's front Target Facing and/or in/adjacent to the LC's hex unless that target is at a higher level than the LC. Each 20L maintains its own separate TCA [EXC: whenever the LC itself receives a *turret* hit, both of its TCA are considered to *coincide with its VCA* for the determination of the Target Facing that was hit]. See also Note C above.

EX: Ordnance lying within the VCA of an LCI(S) achieves a turret hit on the LC. Even if neither of the LC's TCA coincide with its VCA, that hit will be resolved as a hit on the front Target Facing of the turret.

F. The -3 Target Size of the *LCI(S)* is indicated by one red dot, and the -4 Target Size of the *LCT(4)* is indicated by two red dots, beneath the two red Armor Factors on its counter.

Due to its large size, this LC is considered a one-level *obstacle* to LOS through its hex across two hexsides (of its hex) that lie within its *side* Target Facing. This applies at all times; i.e., regardless of whether or not the LC is Non-Stopped/(un)Beached/Immobile/a-wreck.

Any unit that enters this LC's Location, but does not become PRC aboard it, may exit that Location during the same phase only across a hexside on the same (port or starboard) side of that LC as the hexside that unit crossed when it entered the Location.

G. Whenever this LC's Inherent crew suffers a Stun result, its owner makes a subsequent dr. If this dr is ≤ 4 the LC neither ends its MPH, nor changes its VCA randomly, as would otherwise be mandated by G12.111. This LC also receives an extra -1 DRM to its G13.442 (un)Beaching DR.

H FRENCH VEHICLE NOTES

In 1921, all aspects of French tank design, development and use were given to the Infantry arm, which saw close support of the foot soldier as the true function of armor. To this end, various types of light, medium and heavy *chars* ("tanks") were developed throughout the '20s and '30s. In 1931 a separate tank arm for the Cavalry was created—but its tracked AFV, like its armored cars, were required to be designated *automitrailleuses* ("machinegun cars") since legally only the Infantry could possess *chars*. This separation (which also existed in the U.S. Army at the time) led to much duplication of effort and ultimately to the fielding of many different designs. (In May 1940, no less than nine different basic tank types—excluding the FT-17—were in French service.) In 1935 this distinction was finally dropped, and all new tanks were called *chars* regardless of whether intended for infantry or cavalry use.

French infantry tanks, though well-armored, were generally slow with a short radius of action, and the lighter models carried a small-caliber low-velocity gun with a limited supply of AP ammunition—all of which belied their role of support for the foot soldier. Moreover, the use of one-man turrets and poor or no radio equipment made all French tanks tactically clumsy and inefficient. On the other hand, they were usually well-built, and the newer, larger tanks had guns with better anti-tank performance than those of the Germans. Despite the fact that France's first divisional-sized armored unit—the 1st DLM—was created a year before the appearance of the first panzer division, the defensive-minded French failed to grasp the striking power of combined-arms tank formations used *en masse*. When the Germans launched their attack with approximately 2,500 tanks (of which only about 1,000 had a gun of ≥ 37 mm) concentrated in ten panzer divisions, the 3,132 French tanks (excluding FT-17) opposing them were spread out among 30+ independent tank battalions and companies, three DCR (plus a fourth in the process of creation), three DLM and five DLC. To make matters worse, these tank units were themselves dispersed more or less all along the front. In the end, the Germans' advantages in tactics, organization and experience proved stunningly decisive despite both their inferiority in number of tanks (not even counting the 300 British tanks in France at that time) and the gun/armor superiority of certain Allied models.

For the sake of brevity, the following French acronyms are used herein:

- BCC (Bataillon de Chars de Combat): tank battalion
- BCP (Bataillon de Chasseurs Portés): mechanized infantry battalion of DCR
- BDAC (Batterie Divisionnaire Antichar): divisional 47mm or 75mm anti-tank battery
- BFL (Brigade Française Libre): Free French brigade
- CA (Compagnie d'Accompagnement): support company of (motorized) infantry battalion
- CACC (Compagnie Autonome de Chars de Combat): independent tank company
- CDAC (Compagnie Divisionnaire Antichar): divisional 25mm anti-tank company of (motorized) infantry division
- CE (Compagnie d'Engins): heavy-weapons company of BCP
- DB (Division Blindée): Free French armored division
- DCR (Division Cuirassée): armored division
- DIM (Division d'Infanterie Motorisée): motorized infantry division
- DLC (Division Légère de Cavalerie): light cavalry division
- DLM (Division Légère Mécanique): light mechanized division
- EDAC (Escadron Divisionnaire Antichar): divisional 25mm anti-tank squadron of DLC or DLM
- GRCA (Groupe de Reconnaissance de Corps d'Armée): corps reconnaissance group
- GRDI (Groupe de Reconnaissance de Division d'Infanterie): infantry division reconnaissance group
- RAM (Régiment d'Automitrailleuses): armored car regiment
- RCA (Régiment de Chasseurs d'Afrique): African chasseur regiment
- RDP (Régiment de Dragons Portés): vehicle-borne dragoon regiment (usually of DLC or DLM)

1. **FT-17M, FT-17C & FT-17SBS:** With its revolutionary combination of 360°-traverse armament, rear-mounted engine and fully tracked chassis, the FT-17 was the direct ancestor of the modern tank. Designed and developed by Col. (later Gen.) Jean-Baptiste Estienne and the in-

Vehicle 4

dustrialist Louis Renault, and known officially as the *Char Léger Renault FT mle 1917* ("FT" being the production code assigned by Renault), almost 3,200 of various models had been manufactured by the end of WW1, with the number rising postwar to some 3,800. First to be built was the MG-armed FT-17 *Mitrailleuse*, followed by the FT-17 *Canon* with a 37mm gun derived from the infantry support weapon, and then the FT-17 75BS with a Blockhaus Schneider 75mm howitzer. (A fourth type, not included in the game, was an unarmed radio vehicle designated the FT-17 TSF.) Due to its slow speed, short range of 12-21 miles and general fragility, the FT-17 was usually transported by truck for journeys of any length. FT-17 were exported to a large number of foreign countries after WW1, and saw more action between the wars (including use by both sides in the Spanish Civil War) than any other tank type. In the 1930s the FT-17M received a newer type of MG; this version is referred to in some sources as the FT-31. Modified versions of the FT-17 were built in the U.S.A. (the 6 Ton Tank), Italy (the Fiat 3000; Italian Vehicle Note 1) and the U.S.S.R. (the KS and MS series). In May 1940 the French still possessed almost 1600, of which some 536 were on active duty in France, equipping nine BCC (most of which were behind the Maginot Line), three CACC, and about a hundred independent sections used primarily for the defense of certain cities, airfields and military installations. In addition, 244 were stationed in French North Africa, 54 in the Levant, and one company in Indo-China. A section (i.e., platoon) theoretically comprised a mixture of five FT-17M and FT-17C plus one FT-17 75BS; independent sections, however, contained five FT-17M. The Germans captured hundreds of FT-17, and used them in action on a few occasions; e.g., one FT-17C at Dieppe in 1942 (which allegedly managed to immobilize a Churchill), and seventeen FT-17 that operated against the Paris Resistance in August 1944.

†Minimum road-MP cost is one MP; i.e., no FT-17 may use the 1/2-MP road rate even if CE—as signified by "Road Rate NA" on the counter.

‡Dates for all three versions are 5-6/40 [EXC: NA in Norway], 6-7/41, 11/42 (NA vs Axis), and 3/45 (Indo-China; FT-17M and FT-17C only).

2. **AMR 33:** In 1932 a requirement for the AMR (*Automitrailleuse de Reconnaissance*) class of cavalry AFV was issued. The AMR was to be fully tracked, fast and lightly armed, with local reconnaissance as its designated role. The first vehicle of this type to be accepted was the AMR 33, of which 120 were built, all by Renault. In service it was found to suffer from fragile tracks and suspension. When the Germans invaded, AMR 33 were being used in the 5th, 3rd, 14th and 15th RDP of the 1st, 2nd, 4th and 5th DLC respectively, with a half-squadron of eleven (two five-vehicle platoons) in each of the RDP's two battalions; each platoon usually worked in conjunction with a motorcycle platoon. In June 1940, the 4th RAM of the newly forming 7th DLM received fifteen AMR 33.

†Availability is limited to 5-6/40 (French Vehicle Note E also applies).

3. **AMR 35 & AMR 35(L):** A number of significant modifications to the AMR 33 led to the AMR 35 which, thanks to its bigger engine and improved suspension, was faster and more maneuverable than its predecessor despite being slightly larger and heavier. 167 MG-armed AMR 35 were built, all by Renault; approximately half carried the more potent 13.2mm MG. (Ten others were equipped with a bow-mounted 25mm anti-tank gun, but these saw little if any action.) "(L)" in the piece name stands for "late model", since the French did not distinguish between the MG-armed versions. On May 10th, 1940, AMR 35/35(L) were being used in the 1st and 4th RDP of the 2nd and 1st DLM respectively, with one squadron of 23 (five per platoon) in each of the RDP's three battalions; in addition, eight were present in the 1st GRDI of the 5th DIM. In June of that year, several squadrons of AMR 35/35(L) were issued to the 14th and 31st RDP of the newly forming 7th DLM.

†Availability is limited to 5-6/40 (French Vehicle Note E also applies).

4. **R35:** The *Char Léger mle 1935 Renault* (as the R35 was officially designated) was the light tank design chosen to replace the FT-17 in the infantry-support role. At the time it was quite novel in being of largely cast construction. Its MA was the same as that of the FT-17C, and its suspension was based on that of the AMR 35. In May 1940 about 900 were on active service in France, wholly equipping twenty (and partially equipping two more) independent BCC allocated to the various armies. No R35 were assigned to the DLC or DLM; de Gaulle's 4th DCR contained three R35-equipped BCC (the 2nd, 24th and 44th), and later the attached 3rd Cuirassiers were partially re-equipped with forty R35—but none of the other three DCR used R35 until late-May/early-June,

Vehicle 11

H

when each received one or more R35-equipped BCC to replace losses. In June 1941, the 6th and 7th RCA in the Levant possessed some 48 R35 each. In November 1942, about 140 R35 were used in the 1st (and probably the 11th) RCA in Morocco and the 2nd RCA in Algeria. In an R35 BCC a section normally comprised three, while a *compagnie* had thirteen, such AFV. In RCA, however, R35 were organized in two *escadrons* (squadrons) of four five-tank *pelotons* (platoons) each. One source states that 1,464 R35 had been built by May 1940, plus another 146 prior to the French surrender; others, however, allege that some 2,000 were built. In either case, the R35 was the most common tank in French (and Vichy) service in 1940-42. Of those produced, 190 were exported: 50 each to Poland, Yugoslavia and Turkey, and 40 to Romania.

Captured R35 were used by the Germans primarily in France and the Balkans (though some sources allege that 200 were sent to the Eastern Front in 1941 for use as recon vehicles). The Germans also converted numbers of R35 to other uses, perhaps the most common example being the Panzerjäger 35R(f) carrying an ex-Czech 47mm anti-tank gun (German Vehicle Note 44). More than a hundred captured R35 were turned over to Italy (Italian Vehicle Note 11).

†Dates and RF are 39-5/40 (1.0) [EXC: NA in Norway], 6/40 (1.1), 6-7/41 (1.1), and 11/42 (NA vs Axis; 1.2).

5. *H35*: This tank, known officially as the *Char Léger mle 1935 Hotchkiss*, was designed to compete with the R35 for the infantry-tank production contract. Initially rejected for that use, it was adopted by the cavalry to complement the S35 (French Vehicle Note 12) in the DLM. The R35 and H35 were very similar in construction and appearance, both being largely of cast construction and using the same turret. 400 H35 were built, with 300 going to the cavalry of the DLC, DLM and GRDI, and 100 to the independent 13th and 38th BCC for infantry support. In May 1940, the 4th Cuirassiers and 18th Dragoons in the 1st DLM, and the 13th and 29th Dragoons in the 2nd DLM, contained two H35 squadrons (i.e., one *groupe d'escadrons*) apiece—while the 2nd Battalion of the 11th RDP in the 3rd DLM contained one squadron of H35. Each such squadron ideally comprised four five-tank platoons. In addition, the 1st-4th RAM in (respectively) the 1st-4th DLC each had a squadron of sixteen H35 (comprising three five-tank platoons), as did the 5th GRDI of the 25th DIM. In June of 1940, the 4th RAM in the newly formed 7th DLM contained two squadrons of H35.

†Dates and RF are 5/40 (1.2) and 6/40 (1.3).

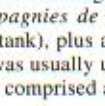

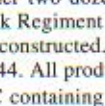

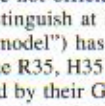

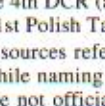

6. *FCM 36*: Built by the firm of *Forges et Châtiers de la Méditerranée* to increase the number of infantry-support tanks, the *Char Léger mle 1936 FCM* had several unusual features for a French light tank. Both its hull and turret were of entirely welded construction, and it was the only production French tank of the time to have a diesel engine. Its armor was thin but well-sloped to increase its ballistic effectiveness. Due to their high cost, only a hundred FCM 36 were built, of which ninety were used to equip the 4th and 7th BCC assigned to the 2nd Army. 29 were lost on 14 May during a counterattack by the 7th BCC near Chémery, nine miles south of Sedan.

†RF is 1.4 for 5/40 and 1.5 for 6/40.

7. *H39*: This was an improved version of the H35, featuring a modified suspension and more powerful engine. Some sources refer to it as the H38, but this was not a French designation. Some 600 were built prior to May 1940, plus about another 100 by late June of that year. H39 were issued to the 25th and 26th BCC of the 1st DCR, the 14th and 27th BCC of the 2nd DCR, the 42nd and 45th BCC of the 3rd DCR, the 342nd CACC (which saw action in Norway and later, as the Free French 1st *Compagnie de Chars*, in Syria), and the 351st CACC. In the 3rd DLM, the 1st and 2nd Cuirassiers each contained two H39 squadrons (i.e., one *groupe d'escadrons*) while the 1st and 3rd Battalions of the 11th *Dragons Portés* contained one H39 squadron apiece. Each such squadron comprised four five-tank platoons. The 5th RAM of the 5th DLC contained a squadron of sixteen H39 (three five-tank platoons), as did the 2nd GRDI of the 9th DIM. In June, the 7th Cuirassiers received one squadron of H39 while the 4th and 8th RAM of the newly formed 7th and 4th DLM received two and one H39 squadron(s) respectively.

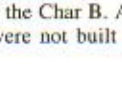

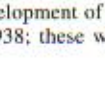

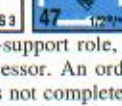

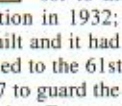

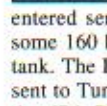

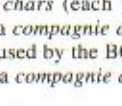

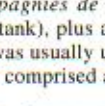

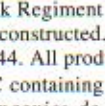

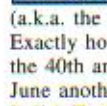

†Dates and RF are 5/40 (1.1), 6/40 (1.2), and 6-7/41 (Free French only; 1.3).

8. *H39(L)*, *H35(L)* & *R35(L)*: The relatively poor anti-tank performance of the 37mm mle 1916 TR infantry gun during the Spanish Civil War led the French to redesign the SA 18 version used in their light tanks. This resulted in the more powerful SA 38, of which 358 were installed in H35, H39 and a few R35 in 1940 just prior to the German invasion. Several hundred more SA 38 were manufactured in May-June of that year. The upgunned H35 and H39 were issued to the DCR and DLM, mainly as section/platoon leader vehicles in the battalions equipped with the same type of tanks. The R35(L) were probably employed in the same manner in a few of the R35-equipped BCC—however, at least one source states that none were used in the 2nd, 24th or 44th BCC of the 4th DCR (at the end of May some were issued to the 1st Battalion of the 1st Polish Tank Regiment in France).

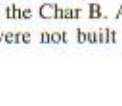

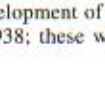

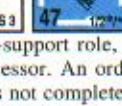

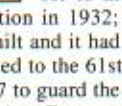

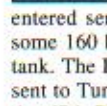

Several sources refer to the upgunned R35 as the R39, and call the H39 the H38 while naming the upgunned version the H39; however, "H38" and "R39" were not official French designations. In fact, French nomenclature did not distinguish at all between the differently armed versions, so "(L)" (for "late model") has been added to the piece names for game purposes. Some of the R35, H35 and H39 equipped with the original SA 18 gun were modernized by their German captors, who retrofitted them with the SA 38. A small number of recaptured R35(L) and H39(L) were used by the Free French in 1944.

†*R35(L)* Dates are 5-6/40, and 9/44-5/45 (Free French only). *H35(L)* Dates and RF are 5/40 (1.3) and 6/40 (1.4). *H39(L)* Dates and RF are 5/40 (1.2), 6/40 (1.3), and 9/44-5/45 (1.6; Free French only).

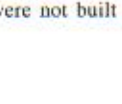

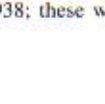

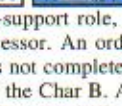

9. *R40*: In 1939 the Moulineux arsenal (AMX) developed a new type of track and suspension (derived in part from the Char B tank) for the R35. The resulting variant, designated the R40 (a.k.a. the R35 AMX or AMX 40), went into production in March 1940. Exactly how many were built is not known; however, in May of that year the 40th and 48th BCC each contained thirty R40 and fifteen R35, and in June another two dozen or so were issued to the 2nd Battalion of the 1st Polish Tank Regiment at Camp de Satory near Paris—so it would seem that 80+ were constructed. A few R40 were seized by the Paris Resistance in August 1944. All production R40 carried the more powerful SA 38 gun.

A BCC containing *chars légers* (other than FT-17) normally comprised three *compagnies de chars* (each with four three-tank sections and one command tank), plus a *compagnie d'échelon* of six replacement tanks (one of which was usually used by the BCC's commanding officer). A CACC of such tanks comprised a *compagnie de chars* plus (usually) two replacement tanks.

10. *D1*: The *Char Moyen D1* was a Renault light-tank design derived (via the NC tank of the 1920s) from the FT-17 and the intended successor to the latter in the infantry-support role. It entered series production in 1932; by 1935 when its manufacture ended, some 160 had been built and it had been reclassified as a medium (*moyen*) tank. The D1 was issued to the 61st, 65th and 67th BCC, all of which were sent to Tunisia in 1937 to guard the border with Italian Libya. In June 1940 the 67th BCC returned to France where it fought against the 6th and 8th Panzer Divisions. All but about 60 of the 107 D1 remaining in Vichy North Africa were disarmed by order of the Germans after France surrendered. By November 1942 only fifteen (the 7th Squadron of the 4th RCA) were immediately available to contest the Axis occupation of Tunisia, while several squadrons of the 9th RCA engaged elements of the U.S. 1st Armored Division south of Oran. Afterwards, about 45 D1 of the 5th and 9th RCA were sent to reinforce the French in Tunisia. A D1 platoon in French North Africa comprised five such tanks, while a squadron had four platoons.

†Dates and RF are 6/40 (1.5) and 11/42-3/43 (1.4).

11. *D2* & *D2(L)*: The *Char Moyen D2*, derived essentially from the D1 and intended as its successor in the infantry-support role, was faster, larger and more heavily armored than its predecessor. An order for fifty was placed with Renault in January 1934, but was not completed until 1938 due to a diversion of funds to the development of the Char B. A contract for another fifty was awarded in June 1938; these were not built until early 1940, and differed from the

Vehicle 11

first batch by having the same turret and 47mm gun as the S35 and Char B1-bis; "(L)" for ("late model") has been added to the piece name of this version since French nomenclature did not distinguish between the two models. The Chars D2 and some D2(L) were assigned to the 19th BCC, which for a time in May 1940 was part of de Gaulle's 4th DCR. The remaining D2(L) were used to form the 345th (also assigned to the 4th DCR), 346th and 350th CACC. Those BCC and CACC containing *chars moyens* were organized in the same way as those equipped with *chars légers* (see French Vehicle Note 9).

†Dates and RF for both versions are 5/40 (1.5) and 6/40 (1.6).

12. S35: Designed by the *Société d'Outillage Mécanique et d'Usinage d'Artillerie*, a subsidiary of the Schneider firm, the S35 was based loosely on the Char D2. At first it was designated an *Automitrailleuse de Combat* (AMC—escort AFV for the AMR and AMD reconnaissance vehicles). However, it performed so well that the cavalry decided to use it as the standard medium tank in the new DLM. (The infantry arm refused to adopt it.) Officially called the *Char de Cavalerie mle 1935 SOMUA*, the S35 represented a notable advance in AFV design, for it was the first production tank of entirely cast construction: the hull was a single bathtub-shaped casting, while the superstructure consisted of one casting to cover the engine compartment and another over the rest of the hull; the APX-4 turret was a single cast piece also. 430 (some say 450) S35 were built. At the start of the German invasion, two S35 squadrons (forming one *groupe d'escadrons*) apiece had been issued to the 4th Cuirassiers and 18th Dragoons of the 1st DLM, to the 13th and 29th Dragoons of the 2nd DLM, and to the 1st and 2nd Cuirassiers of the 3rd DLM. The 3rd Cuirassiers also had one S35 *groupe*, while in June 1940 the 7th Cuirassiers and 8th RAM received one such *escadron* each. As part of the *Groupe Blindé Français*, one *escadron* of the 12th RCA used 23 S35 vs Axis troops in Tunisia (these tanks had been evacuated from France in June 1940, and were transported overland to Tunisia from Dakar). An S35 *escadron* comprised 23 tanks, with four *pelotons* (platoons) of five tanks each. Due to its good gun, armor and speed, it was considered by many to be the best tank of its day; unfortunately, combat showed these factors to be largely offset by the limitations of its one-man turret and poor radio equipment.

The Germans captured 297 S35, thirty of which they gave to the Italians (who assigned them to the garrison of Sardinia); the rest they used in the Balkans, France and on the Eastern Front. In 1945, sixteen S35 in the 1st Squadron of the Free French 13th Dragoons saw action along the southwest coast of France.

†Dates and RF are 5/40 (1.2) [EXC; NA in Norway], 6/40 (1.3), 4-5/43 (1.3), and 3-4/45 (Free French only; 1.5).

13. B1-bis: Intended originally as a heavy infantry-support tank, the first prototype of the Char B appeared in January 1929. Testing and altered design requirements resulted in the Char B1, which entered service at the end of 1935. 35 of this model were built (but in 1940 were being used as training vehicles and consequently saw little or no combat). Further modifications led to the *Char de Bataille B1 bis* which, compared to its predecessor, featured heavier armor, a bigger engine, and a more powerful gun in a new turret. The B1-bis was a sophisticated and powerful weapon for its time, but suffered from a number of drawbacks, among which were its one-man turret, poor communications equipment, relatively slow speed and short radius of action, and a complexity that hampered mass production. The turret and gun were the same as used on the S35. The bow-mounted 75mm howitzer and MG were aimed and fired by the driver. They could be elevated, but had no lateral traverse; i.e., the tank itself had to be turned in order to aim them horizontally. For this purpose a hydrostatically controlled auxiliary differential allowed infinitely fine variations in steering. This system was quite complex, however, and prone to breakdowns. By May 10th 1940, some 243 were deployed in combat units. They formed the main striking force of the DCR, equipping the 28th and 37th BCC of the 1st DCR, the 8th and 15th BCC of the 2nd DCR, the 41st and 49th BCC of the 3rd DCR, and the 46th and 47th BCC of the 4th DCR. They were also used to form the 347th-349th, 352nd and 353rd CACC. In late June a few were issued to the 10th BCC as well. A B1-bis *section* normally comprised three, and a *compagnie* ten, such AFV. A total of 368 were built. In action, the armor of the B1-bis proved nearly impervious to all but the German 88, aside from a vulnerable engine grille on the port-side hull (very few German units actually discovered this Achilles' heel during the fighting). Many B1-bis, however, were lost prematurely through breakdown or fuel shortage.

H

Of the 161 B1-bis captured by the Wehrmacht, 60 were converted to flamethrower tanks in 1941-42 by substituting a flame gun for the 75mm and adding an armored fuel container at the rear of the vehicle; these saw action in France, Holland (some being used against British paratroopers around Arnhem), the Balkans and the Crimea. 16 more were converted to SP 105mm howitzers. The Free French used 17 recaptured B1-bis to form the 2nd Squadron of the 13th Dragoons, which fought along the Gironde river in 1945.

†The 47 is a 1MT Gun, while the 75* SA is a bow-mounted NT Gun. Either the MA or SA can claim the possibility of armor-leader direction, but only the one that fires *first* in a phase (treating Defensive First and Final Fire as one phase) can actually use it.

†The 75* SA cannot use Intensive Fire—as signified by "No IF?" on the counter.

†"AP9" applies only to the 75* SA—as signified by the superscript "9".

†The 75* SA receives an extra +1 TH DRM when firing at a moving/Motion target—as signified by a white dot beside the SA designation on the counter. Whenever the 75* SA fires at a moving/Motion target and/or without using an Acquired-Target DRM, and whenever the BMG fires at a target that is *not* currently Acquired by the 75* SA, all Acquisition currently held by the 47 MA is immediately lost.

†In addition to normal CH possibilities, a hit on the *port-side hull* of a B1-bis achieved by a weapon using the Vehicle Target Type (or a LATW TH Table) is a CH if its Original TH DR was a "3".

†Dates and RF are 5/40 (1.2), 6/40 (1.4), and 3-4/45 (Free French only; 1.5).

14. Valentine V(b): In March 1943, 62 Valentine III/V tanks (British Vehicle Note 28) were transferred from the 6th Armoured Division to the French army in Tunisia. They were used to outfit three squadrons of the 5th RCA which, in conjunction with a squadron of S35 (see French Vehicle Note 12) and miscellaneous support units, formed the *Groupe Blindé Français*. As part of the French XIX Corps, the GBF subsequently saw action around Pont-du-Fahs.

†AAMG RF is 1.3.

15. AM Dodge(a): This vehicle was originally a 1940 Dodge 4x2 truck purchased in Egypt by the French. About thirty were modified by the Vichy army in Syria in 1940-41 by adding 12mm armor plates around the flatbed, an armored visor for the windshield, and a pedestal-mounted 37mm mle 16 TR gun with coaxial LMG. They were issued to the 6th (and possibly the 7th) RCA and used in five-vehicle platoons. Those captured by the Free French were later employed as reconnaissance vehicles in North Africa by the 1st BIM (*Bataillon d'Infanterie de Marine*) of the 1st BFL. The AM Dodge was nicknamed *Tanaka* (an Arab term for an all-purpose steel vessel).

†This partially armored AFV is treated as an armored target (with "0" AF) only vs an ordnance/OBA hit on (or DC "hit" vs; C7.346) its turret, and vs any Collateral Attack resulting from such a hit. However, both the vehicle and its Inherent crew receive an extra +2 DRM to any attack that treats it as an *unarmored* target [EXC: no such DRM applies vs a CC/FT/-minefield attack, or if the attacker's elevation advantage is > the range, or if the vehicle is destroyed].

†The MA of both versions uses black TH numbers unless captured—as signified by "Black THs" on the counter.

†The CMG has AA capability—as signified by "CMG: AA" on the counter. The MA cannot fire while the vehicle is marked with an AA counter (but its Multiple ROF is not lowered when that AA counter is removed).

†The AAMG is available only in 1942, and its RF is 1.0.

†Dates and RF are 6-7/41 (Vichy only; 1.2), and 2-6/42 (Free French only; 1.3).

16. AMD 20 cv TOE: This vehicle, also known variously as the 20 cv Panhard, AMD Panhard TOE, or Panhard 165/175 TOE, was produced specifically for colonial use ("TOE" stands for *Territoire d'Opérations Extérieures*). A total of thirty were built. One squadron was sent to the Levant where it was issued to the 6th RCA, while the remainder were shipped to French North Africa. An advanced feature of the vehicle for its time was the use of an additional, rear-facing, driver.

†Dates and RF are 6-7/41 (1.3), and 11/42-5/43 (1.3 for 11/42 and 1.4 thereafter).

H

20. AMD 50 AM & AMD 80 AM: These were more modern versions of the WW1-era White armored car. 98 of the AMD 50 (a.k.a. the White-Laffly or Laffly 50 AM) were built in 1932-34, and most were used in French North Africa. 28 of the AMD 80 (a.k.a. the Laffly-Vincennes or Laffly 80 AM) were built in 1934-35 and sent to Tunisia where some later fought against Axis troops. Both designs had a second driver facing the rear of the vehicle. AMD in French North Africa were issued mostly to RCA. "AMD" stands for *Automitrailleuse de Découverte*, which indicated an AFV used for long-range reconnaissance.

†With a WGT of "6" and a printed MP allotment of "16", the AMD 50 may be used to represent the White armored car, which during WW2 saw action in the Levant with the 6th (and perhaps the 7th) RCA, and with the 1st Foreign Legion Cavalry Regiment in Tunisia. BPV for use as the White is "22".

‡Dates and RF for the AMD 50 AM are 6-7/41 (1.3), 11/42-5/43 (1.2 for 11/42 and 1.3 thereafter), and 3/45 (Indo-China; 1.4). For the AMD 80 AM they are 11/42-5/43 (1.4).

28. AMD 35: Often referred to as the Panhard 178 or P-178 (or less often as the Panhard mle 1935 or AMD 178), and nicknamed the "Pan-Pan", this was the standard long-range reconnaissance vehicle of the French cavalry in Europe. Its combination of rear-mounted engine, four-wheel drive, front and rear drivers, and 25mm main armament made it one of the more advanced and powerful recon vehicles of the pre- and early-war period. On the downside, it lacked independent suspension, and only command versions were radio-equipped. On May 10th 1940 some 480 existed, of which about 360 had been issued to units in the field. Another 47 were built in May-June of that year. The 6th, 8th and 12th Cuirassiers of (respectively) the 1st, 2nd and 3rd DLM each contained two squadrons of AMD 35, each of which comprised four five-vehicle platoons (with each platoon normally accompanied by a platoon of motorcycle infantry—the combination being referred to as a *Détachement de Découverte* or DD). Similarly, the RAM of each DLC and the GRDI of each DIM was authorized a squadron of sixteen AMD 35 in three platoons. Each BCP was authorized (but the 4th BCP of the 4th DCR lacked) one section of five AMD plus another of motorcyclists. Several other miscellaneous formations employed it as well (e.g., the 32nd GRDI; the 6th and 10th Cuirassiers, and 8th RAM, in June).

The Germans captured at least 190 AMD 35 and, after making certain modifications, issued them to several Wehrmacht and SS reconnaissance units for use in the invasion of the Soviet Union.

†If present, the AAMG may fire only at a target that lies within the AMD 35's TCA—as signified by "AAMG: TCA only" on the counter. AAMG RF is 1.4.

‡Dates and RF are 5/40 (1.2) and 6/40 (1.3). French Vehicle Note E also applies.

21. Laffly W15T Chasseur de Chars: The idea of mounting the powerful 47mm anti-tank gun on a cross-country truck was first put forth in the fall of 1939. The following January a prototype was constructed, using the 6x6 chassis of a Laffly-Hotchkiss W15T with the gun welded onto the bed pointing to the rear. Aside from being open-topped over the gun, the vehicle was also completely armored. Trials proved successful, but production did not begin for several months. Finally, between the 24th of May and the 17th of June, seventy W15T CC were built. Unfortunately, given the desperate military situation at that time, most of the armor protection envisaged in the original design had to be omitted in order to speed up production. As the vehicles came off the assembly line they were assigned to newly forming independent anti-tank batteries which, after only a day or two of training, were rushed to the front. Each *batterie* ideally comprised five W15T CC, four towed or SP 25mm AA guns and miscellaneous support vehicles. They performed well in action (the 54th *Batterie* was credited with destroying 28 tanks and five armored cars in eight days), but suffered heavy losses in the process. *Chasseur de Chars* means "Tank Hunter".

†The MA may fire only at a target that lies within the W15T CC's "rear" VCA (i.e., the VCA emanating from its rear Target Facing)—as signified by "MA: RVCA only" on the counter.

‡Direct Fire attacks vs this vehicle which emanate from within its front/rear VCA, and which do not destroy it, affect its Inherent crew as if they were manning a non-Emplaced, non-vehicular AT. No Gunshield benefits apply to the vehicle itself.

Vehicle 23

20. Autocanon de 75 mle 97 & Autocanon de 75 Conus(b): In Vichy North Africa about 30 mle 1897 field guns were mounted on trucks in such a way as to allow 360° traverse of the gun. Incorporated into several artillery regiments, they apparently saw action only in Tunisia. At the other end of the Mediterranean, a Lieutenant Conus of the Free French designed an armored SP version of the same gun in early 1942, using a Canadian Ford F60L 4x4 3-ton lorry and the turret-traverse parts from an Italian tank. About 12 "Conus guns" were built, eventually forming the 3rd Squadron of the 1st RMSM (*Régiment de Marche de Spahis Marocains*) armored car unit which fought as part of the British 8th Army.

†Neither vehicle may fire at a target that lies within the VCA and is also at the same or a lower level than the firer—as signified by "VCA: ≤ level NA" on the counter.

‡The AAMG of the *Autocanon de 75 Conus* may fire only at a target that lies within its TCA [EXC: during the CCPH; as per the preceding paragraph]—as signified by "AAMG: TCA only" on the counter.

†*Autocanon de 75 mle 97* RF is 1.4 in 1942.

21. Camion de Mitrailleuse Contre-Avions, Camion de 13.2 CAJ, Camion de 20 CA, & Autocanon de 25 CA: At various times and places before and during the war, French light AA weapons were mounted on trucks. However, it appears that relatively few vehicles were so altered, and that most were field rather than standardized modifications. The MG-armed versions were used mainly for convoy/column escort. The motorcycle reconnaissance section in the 5th, 17th and 16th BCP of (respectively) the 1st, 2nd and 3rd DCR contained a few truck-mounted AAMG. Several (perhaps three) W15T CC batteries (French Vehicle Note 19) employed *Autocanons de 25 CA* in lieu of towed 25mm AA guns. The Free French captured some 25mm AA guns in the Levant and mounted twelve of them on trucks; nicknamed "Dervishes", these later saw limited action in North Africa.

†None of these vehicles may use Bounding First, nor Motion, Fire vs a target that lies within its VCA—as signified by "Bnd FF NA VCA" on the counter.

‡When using the AP To Kill Table for an attack by the *Camion de 13.2 CAJ*, make two TK DR; only one DR (firer's choice) is used. This is signified by "2 TK DR" on the counter.

†"B(11)" on the counter signifies that the *Autocanon de 25 CA* suffers from Low Ammo (D3.71) in scenarios set in 1940. For later scenarios it is assumed to have normal B12, and a BPV 10% (FRU) > its printed BPV.

‡*Camion de Mitrailleuse CA* Dates and RF are 39-5/43 (1.3) [EXC: NA in Norway; 1.4 for Madagascar, 5/42 and 9/42], and 3/45 (Indo-China; 1.3). *Camion de 13.2 CAJ* RF is 1.6 through 11/42 and 1.3 thereafter. *Camion de 20 CA* Dates and RF are 5/40-10/42 (1.6) [EXC: NA in Norway], 11/42-5/43 (1.4), and 3/45 (Indo-China; 1.4). *Camion de 25 CA* (Vichy) French Dates and RF are 6/40 and 6/41-5/43 (all 1.6); for Free French they are 3-4/42 (1.3) and 10/42-5/43 (1.5).

22. Autocanon de 40 Contre-Avions(a): a.k.a. the "GMC Bofor", this was a CCKW-353-120 6x6 GMC truck modified to carry a Bofors AA gun. 32 such vehicles formed the 22nd *Groupe Colonial des Forces Terrestres Antiaériennes*, which provided AA protection for the 2nd DB. Each *batterie* contained eight such *autocanons*. It is not clear whether the 1st and/or 5th DB also used them.

23. Autocanon de 75 mle 13/34: Designed in 1913, this was one of the world's first SPAA guns. It essentially comprised a turntable-mounted mle 1897 field piece on a De Dion-Bouton automobile chassis. By the end of WW1 some 160 had been delivered. Production continued after the war, and in the 1930s a modernization program was carried out (e.g., to allow accurate fire at ground targets). No ammunition was carried aboard the vehicle itself; instead, a second vehicle of the same type—but carrying an ammo caisson in place of the gun—accompanied it in action. On May 10th

Vehicle 23

1940, 236 *Autocanons de 75 mle 13/34* were available in France, employed in four-gun batteries, with between one and four *groupes* (of three batteries apiece) attached to each field army. Eight such *groupes* participated in the defense of Dunkirk. Other batteries/*groupes* were used in several of France's overseas possessions. The Germans still had 45 captured *Autocanons de 75 mle 13/34* in their inventory at the start of June 1944; some of these were seized intact by the Free French, who used them as SP artillery pieces.

†This vehicle requires the use of an Ammo Vehicle (E10.) or Ammo Dump (E10.6) in order to fire at all (i.e., to be considered functioning armament). For the French-color version, use a *Renault AGR2* truck counter as its Ammo Vehicle [EXC: assume its printed MP allotment to be "12"]; for the U.S.-color version, use a U.S. 2½-Ton truck.

†The MA may use neither Motion Fire nor Bounding (First) Fire—as signified by "No Bnd(F)" on the counter.

†The MA may not fire at a target that lies within the mle 13/34's rear Target Facing—nor may the TCA ever coincide with the vehicle's "rear" VCA, even when changing the TCA. These restrictions are signified by "rear TF NA" on the counter. See the accompanying diagram.

†(Vichy) French Dates and RF are 39-6/40 (1.3) [EXC: NA in Norway], 7/40-5/43 (1.4) [EXC: NA in Syria-Lebanon; 1.5 for Madagascar, 5/42 and 9/42], and 3/45 (Indo-China; 1.4). For Free French they are 9/44-5/45 (1.6).

24. AMC 29: The design of this vehicle (also known variously as the Schneider P16 M29, AMC Schneider-Kégresse, AMC 29, AMR P16, AMC P16 or simply the P16) dates back to 1923 when the Citroën-Kégresse and Schneider firms collaborated to produce the M23, a fully armored, closed-top halftrack with a multi-faceted MG turret. Successive improvements led ultimately to the P16, of which 100 were built—all for the cavalry. In 1932 its name was changed to *Automitrailleuse de Combat mle 1929*. In May 1940, a total of about seventy AMC 29 were still being used in the 1st, 3rd, 4th, 6th and 7th GRDI of the 5th, 12th, 15th, 3rd and 1st DIM respectively—a squadron of 16 (three five-vehicle platoons) being authorized in each. One squadron of AMC 29 with the 5th RCA saw action against U.S. forces in Algeria, and later as part of the 4th RCA fought against Axis troops in Tunisia.

†Dates and RF are 39-4/40 (1.4), 5/40 (1.3) [EXC: NA in Norway], 6/40 (1.4), 11/42 (NA vs Axis; 1.3), and 12/42-5/43 (1.4).

25. Citroën-Kégresse P17 & P19: The very first halftracks, designed by Adolphe Kégresse for the Tsar of Russia, were built in 1910-1911. After WW1 Kégresse returned to France where he collaborated with Citroën to produce a whole series of halftracks for the French Army in the '20s and early '30s. The most numerous of these was the small Citroën-Kégresse P17, first ordered in 1929 and built mainly for towing the motorized version of the mle 1897 75mm field gun. By 1940 most had been replaced by the Unic P107 (French Vehicle Note 27), but some were being issued as prime movers for the 25mm AA gun, and for the 47mm anti-tank gun in the motorized

BDAC of the DLM, DLC, DCR and DIM. Overseas, P17 also remained in use as 75mm artillery tractors. 1,442 P17 *tracteurs d'artillerie légère* were in French service in September 1939. One source of dissatisfaction with the P17 was its inability to transport a gun, its crew and ammunition all in one vehicle. A batch of Citroën-Kégresse halftracks (including a P17) purchased by the U.S. Army in the early 1930s was the direct inspiration for the family of American halftracks used in WW2.

The P19 first appeared in 1930, and was produced in two main types: the VLTT P19B, a cross-country liaison vehicle of which about 600 were built (in 1940 each infantry regiment was authorized six, with others assigned to various motorized, mechanized and armored units); and the VDP P19, designed to transport the *fusiliers portés* (i.e., the "infantry"), machine guns and mortars in the RDP of the cavalry divisions. 547 VDP P19 were in service in September 1939, but by May 1940 were apparently used in only one battalion (each) of the 5th and 2nd RDP in the 1st and 3rd DLC respectively (all other such battalions being transported in either 6x6 or 1½-ton 4x2 trucks).

The P17 game piece also represents the P19BT, used for towing (and from 1937 for the *en portée* transport of) the 25mm anti-tank gun in those RDP battalions equipped with P19.

†Use of these vehicles in Norway is NA. P17 Dates otherwise are 39-5/43, and 3/45 (Indo-China).

26. SOMUA MCG: This piece represents the MCG4 and MCG11, used for towing the motorized version of the 155mm C 17 S, and the MCG5 which towed the motorized version of the 105mm L 36 S (and, in certain artillery units in French North Africa, the 75mm mle 1897). All were derived from a SOMUA-Kégresse recovery/repair halftrack of the 1920s. One problem with the MCG was that, despite its size, two were needed to transport a gun along with its crew and ammunition. Other drawbacks were its noisy engine/tracks and relatively slow speed. Nevertheless, by the end of June 1940 some 1,500 such *tracteurs d'artillerie moyen* (inclusive of several variants) had been built. Many were captured by the Germans who, aside from using them as prime movers, modified some for use in the APC role and converted others to armored SP anti-tank guns; these saw action in France in 1944.

†Dates are 5-6/40 [EXC: NA in Norway], 6-7/41, and 11/42-5/43.

27. Unic P107: By 1934 the French Army increasingly favored the use of 6x6 wheeled vehicles instead of halftracks, but the artillery still preferred the latter. In 1935 a new Citroën-Kégresse halftrack designated the P107 appeared, and after trials was accepted as a *tracteur d'artillerie légère* for the motorized versions of both the mle 1897 75mm field gun (supplanting the P17 in this role) and the new 105mm howitzer. By the time the first production order was received, however, Citroën had gone bankrupt, so all P107 were built by the Unic firm. By the time of France's surrender 3,276 (inclusive of several variants) had been produced, making the P107 the most common halftrack in French service. Of the large number of P107 captured by the Germans, many were converted to partially/fully armored halftracks and issued to units in France for use in the APC role, and for towing anti-tank guns and light artillery.

†RF is 1.5 only for 5/42 and 9/42 use in Madagascar.

28. Renault UE: This *chenillette* ("small tracked vehicle") was originally designed to carry a mortar, machine gun and/or ammunition across bullet-swept ground. By 1940, however, it was used primarily as a supply vehicle, and for towing the 25mm anti-tank guns in the CDAC of certain non-motorized infantry-type divisions and in the CDAC, CA and CRME of the DIM. Its official designation was *Chenillette de Ravitaillement d'Infanterie UE mle 1931 Renault*—sometimes abbreviated to CRI 31R. (The improved mle 37R version, a.k.a. the UE 2, was introduced in the late '30s; both types are equivalent in game terms.) One drawback to the design was its inability to transport a weapon plus its ammunition and crew—the latter having to either ride in another vehicle (in motorized units) or walk (in leg-infantry units). A very small number of UE were built with a partially raised superstructure to house a ball-mounted LMG. About 3,300 UE types had been issued to units in France by May 10th 1940, with another 1,278 in various vehicle parks and depots. A total of some 5,150 of both models had been built by the end of that month. A leg-infantry regiment was normally authorized nine UE, used mainly for transporting supplies but also available for the emergency movement of heavy weapons. A motorized infantry regiment was authorized eighteen

Vehicle 33

H

UE, twelve of which were prime movers for the regiment's twelve 25mm anti-tank guns. Thousands of UE were captured by the Germans, who used them not only as supply vehicles and light gun tractors, but also converted some to MG carriers (similar to the French BMG version) or to carry a 37mm anti-tank gun on the superstructure, or to mobile launchers for 280/320mm rockets.

†Each Passenger SMC counts as one Passenger PP, and is considered always CE (as if in a Carrier; D6.84) even if the vehicle's Inherent crew (if any) is BU.

†Optional BMG is available only in 6/40 (RF: 1.6), and in 3/45 (Indo-China; 1.3). If Stunned, the crew may not regain CE status and may not fire the MA, and the AFV is Recalled as per D5.341; these are signified by "Stun = Recall & CE/FP NA" on the counter.

†Vehicle RF is 1.3 through 6/40, 1.4 for 7/40-5/43 [EXC: 1.5 for Madagascar, 5/42 and 9/42], and 1.2 for 3/45 (Indo-China).

29. *Lorraine 38L*: Derived from the Lorraine mle 37 tank supply *chenillette*, the *Véhicule Blindé pour Chasseurs Portés 38 Lorraine* (or VBCP 38L) was a stopgap APC used by the mechanized infantry in the DCR's BCP. It was a most unusual design, in that four members of its passenger squad were carried in the vehicle while the remainder rode in a tracked armored trailer. Of the 240 ordered at the end of 1939, only about 150 had been delivered by the end of May 1940. They were issued to the 5th, 17th and 16th BCP of the 1st, 2nd and 3rd DCR respectively—with the 16th BCP receiving only a partial allotment. The Germans captured more than 300 Lorraine *chenillettes* of all types, and converted most of them to SP guns; see German Vehicle Notes 45 and 82.

†RF is 1.4 for 5/40 and 1.5 for 6/40.

†To depict a Lorraine 38L wreck, use a Lorraine 37L 44 Wreck counter with a Scrounged marker on it.

†C10.4-41 apply to the trailer except as stated otherwise below. The trailer's AF are "0", and it can be disconnected instantly (even if destroyed) by the vehicle's Inherent Driver without need of MP expenditure or losing Motion status [EXC: disconnecting is NA if the trailer is carrying any Passenger Personnel]. Disconnecting is accomplished by the owner's announcing the action in the vehicle's MPH and flipping the trailer over to the side showing no trailer; the extra MP gained may be used immediately if the vehicle is otherwise able and allowed to do so. A disconnected trailer leaves no separate (not even a Wreck) counter, and hence can neither be hooked up again nor become a burning wreck. TK Case A never applies to a trailer. The vehicle's WGT without the trailer is "7". The trailer is always assumed to be hooked up at the start of a scenario.

†The vehicle's Passenger capacity is 6PP, and the trailer's is 8PP; both may retain unpossessed SW [EXC: all unpossessed SW aboard a disconnected trailer are immediately eliminated]. Upon loading, each Passenger unit must immediately choose to occupy either the vehicle or the trailer (PP permitting). A squad instantly Deploys (without need of a leader/TC) once it has loaded. All Passengers in the trailer must be placed above a Trailer Passenger counter, whose sole purpose is to show that they occupy the trailer rather than the vehicle. Should the combined Passenger PP total of a crew, or HS, counter and its possessed SW exceed the *individual* PP capacity of both the trailer and the vehicle, the excess SW must go, unpossessed, into whichever "passenger compartment" it will fit in, and requires the unit carrying it to expend two (instead of the normal one; D6.5) MF to load. Passengers are considered to be stacked together for all purposes [EXC: minefield attacks do not affect the trailer/its occupants Collaterally; Transfer/Recovery/"movement" directly between the vehicle and trailer are NA; HS cannot Recombine while aboard the vehicle/trailer]. If the vehicle is destroyed, so is the trailer—but in this case each Personnel Passenger in the trailer is assumed to automatically pass a D6.9 Survival DR. The cs# of the vehicle is "3", while that of the trailer is "2". A hit on this trailer can cause a Collateral Attack. See also French Vehicle Note H.

EX: Assume an "empty" Lorraine 38L (i.e., one that is devoid of Passengers) with its trailer attached. A hero, and a squad carrying a LMG, load onto the Lorraine 38L. The squad now automatically Deploys, with one HS going into the vehicle and the other into the trailer; both the hero and LMG may join either HS in the latter's passenger compartment, or the hero may join one HS and the LMG the other. The ATTACKER must now also place a Trailer Passenger counter so that it is above all of the vehicle's Passengers and beneath all of the trailer's Passengers. If a HS carrying a dm 60mm MTR (3PP) loads onto an "empty" Lorraine 38L, both must occupy the trailer, and a Trailer Passenger counter is placed beneath the two Passenger counters to indicate this. If, however, the HS were carrying a dm 81mm MTR instead, their combined total of nine Passenger PP (5 [HS] + 4 [dm 81mm MTR; C10.3] = 9) would exceed the *individual* PP capacity of both the vehicle and trailer, so the HS would have to expend two

MF to load, and if it loads successfully (see the D5.43 example) it will be in either the vehicle or trailer (ATTACKER's choice) while the now-unpossessed MTR will be in whichever passenger compartment the HS does not occupy (and that MTR could be unloaded only by Infantry in the vehicle's Location who Recover it while the vehicle is Stopped). In this case the Trailer Passenger counter would go between the HS and dm 81mm MTR counters. If two CE HS are Passengers aboard a Lorraine 38L, any non-minefield Collateral Attack will affect both of them with the same DR (even if the original attack was a Direct Fire ordnance hit on one of them) since they are considered to be stacked together.

30. *Lorraine 37L 44*: After the fall of France, the Lorraine factory at Bagnères de Bigorre undertook the construction of a smaller, unarmored version of the company's *chenillette*. Built ostensibly for the forest service, the vehicle was nevertheless designed so that armor plates produced secretly in conjunction with each vehicle could be quickly attached to turn the machine into an APC for use by the Resistance. A record was kept of each vehicle's whereabouts, and in the summer of 1944 they were recalled to the factory and their transformation into AFV begun. Designated the *Tracteur Lorraine 37L 44*, some 30-50 participated in the liberation of southwest France, with about 150 more being made available by the end of the war. In appearance they looked somewhat like the Universal Carriers used by the British.

†The Passenger(s) and Inherent crew of this vehicle are always CE (with all that entails) in the same manner as those in a Carrier (D6.84)—as signified by "Always CE" on the counter.

†Contrary to H1.27, this vehicle may be purchased by the Partisan side for a scenario set in France—assuming all of its RF and Date requirements are met. Purchase for an OB that contains no such "French partisan" squads is NA.

†If the vehicle is manned (or its Removed/Scrounged LMG is being used) by other than "French partisans" or Free French, Captured-use penalties apply.

31. *Carrier AC(b)*: After the campaign in the Levant, some of the Vichy 25mm anti-tank guns captured there were mounted on Carriers by Free French Foreign Legion units. These vehicles were subsequently used in North Africa (e.g., during the defense of Bir Hakeim).

†This vehicle is a Carrier; therefore D6.8-84 apply to it [EXC: it contains an Inherent vehicle-crew instead of a HS, and has no Passenger capacity].

†RF is 1.2 for 3-6/42, 1.5 for 7-11/42, and 1.6 thereafter.

32. *Latil TAR H2*: Latil tractors of various types had been used for hauling French guns since WW1. The TAR H2, adopted in 1934 for towing heavy artillery, featured 4x4 drive and four-wheel steering. By 1940 it was the most common prime mover for the 155mm GPF and was also used for transporting other mobile heavyweights such as the 75mm mle 32 AA gun. Some 600 had been delivered by the time of the French surrender. Afterwards, Latil was taken over by Daimler-Benz, who produced a number of these tractors in a special *Ostfront* version.

†With a WGT of "4.5", a Target Size of "0" and a Passenger capacity of "5PP", this game piece may also be used to represent the Latil KTL4. 163 were built in the latter half of the 1930s, and were used for towing the 105mm L 13 S (French Ordnance Note 14). For DYO purposes, the KTL4 would be available wherever and whenever the L 13 S ART is, but with a RF of .1 (to a maximum of 1.6) > that of the Gun. BPV for use as the KTL4 is "11".

†Dates and RF are 5-6/40 (1.5) [EXC: NA in Norway], 7/40-7/41 (1.6), 11/42-5/43 (1.6), and 3/45 (Indo-China; 1.6).

33. *Laffly S15T*: In 1936 the French Army began ordering a whole series of cross-country wheeled vehicles from the Laffly firm. One of the numerically more important types was the S15T, of which 396 were built for towing 75mm field guns and 105mm field howitzers. By May of 1940 all S15T had been issued to various motorized artillery *groupes*. Lafflys were 6x6 vehicles (the V15T was a 4x4) of advanced design, with fully independent suspension, two small anti-ditching wheels beside the radiator, and two small anti-bellying wheels below the front seats. The Germans put to use all they could capture, and kept at least one model (the V15T—French Vehicle Note 34) in production. Some German units later used the S15T as a prime mover for the PaK 40 75mm anti-tank gun.

†Dates and RF are 39-1/41 (1.5) [EXC: NA in Norway], and 3/45 (Indo-China; 1.4).

Vehicle 34

34. Laffly S20TL: The *Voiture de Dragons Portés S20TL* was Laffly's replacement for the Lorraine 28 truck previously used to transport the *fusiliers portés* (i.e., the "infantry") and heavy weapons in the RDP of each DLM. Five main versions were produced: command, squad transport, MG transport, mortar transport, and prime mover for the 25mm anti-tank gun (early versions towed the gun; later ones carried it *en portée*). "L" in the name stood for *Long*, indicating a lengthened chassis. A total of 935 S20TL trucks were ordered through the end of May 1940, of which about 630 were delivered—the last 190 or so actually built by Hotchkiss. They were issued to the 1st and 11th RDP of the 2nd and 3rd DLM respectively, to the 7th RDP attached to the 4th DCR, and perhaps to a battalion in one or two of the RDP in DLC. The *portée* version was also issued to most (if not all) other RDP.

†With a WGT of "6.5", a Target Size of "0", and truck-type (instead of armored-car-type—see French Vehicle Note J) MP expenditures, this game piece may also be used to represent the Lorraine 28 truck, which in 1940 was still being used for troop transport in the 4th RDP of the 1st DLM, and possibly in one or two RDP battalions in DLC. Apparently they partially equipped the 16th BCP of the 3rd DCR as well. BPV for use as the Lorraine 28 is "12".

†Dates and RF are 5/40 (1.3) and 6/40 (1.4).

35. Laffly V15T: This 4x4 vehicle was accepted in August 1938. 100 were delivered during the winter of 1939-40, and about a hundred more—built by Licorne—were produced in May-June of 1940. They were used for towing 25mm anti-tank guns in some/all EDAC. Some German units later used the V15T as a prime mover for the PaK 38 50mm anti-tank gun. The game piece also represents the Latil M7T1, a rival 4x4 design first ordered in February 1939. Its intended use was for towing the 25mm anti-tank guns in the CDAC of the DIM, but as it did not become available until March 1940 it was instead used to transport the 81mm mortars and 25mm anti-tank guns in the CE. About 130 were delivered prior to the armistice.

36. Peugeot 202, Citroën 23, & Renault AGR2: Like other nationalities, the French Army utilized many different types of softskin vehicles (hence only a token representation is made in the game). In the automobile class over 4,000 Simcas, Renaults and Peugeots were used, plus tens of thousands more cars requisitioned from the public. One car that could be armed for use in combat was the Peugeot 202, a petite four-seater whose convertible version sometimes carried a LMG. About 900 were delivered. They were often employed in GRDI and GRCA, and as replacements for motorcycles and sidecars in some units. In the light truck (*camionnette*) class, the most common vehicle was the 1½-ton Citroën Type 23. Ordered at the time of mobilization in September 1939, about 12,500 were delivered through June of 1940. Some other light trucks used were the 1½-ton Renault ADK and AGC, and the 1.2-ton Peugeot DK5J. One of the most common medium trucks in French service was the 3½-ton Renault AGR2, a cab-over-engine design of which approximately 3,150 were delivered. This game piece also represents the 3½-ton Citroën Type 45, which was produced in greater numbers (about 4,000 in all) but was sometimes used as a SPAA vehicle. Both types were also used as *porte-canon*s; i.e., to carry various kinds of artillery pieces *en portée*.

The French Army employed some 400,000 cars and trucks in 1940; almost all were 4x2 civilian designs, and about 75% were requisitioned from civilian use. The overall total included a number of trucks purchased from the U.S., including 1,500 Dodge VH-48 3-ton 4x2, several hundred Studebaker K30 5-ton 4x4, and the GMC ACK 353 1½-ton 4x4 (the last used in the 5th DLC).

†When the Peugeot 202 is bogged, one (only) CX squad (even a prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle's Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract two (one per crew or HS) from the colored *dm* of its immediately subsequent Unbogging DR.

†The Peugeot 202's AAMG is always available with a RF of 1.3, and may be Removed. If equipped with the AAMG (even if Removed), its printed Passenger capacity is 4PP.

†Increase the initial RF by .1 for use after 6/40. Availability is NA for 6/43-2/45 inclusive.

LEND-LEASE VEHICLES

From November 1941 through V-J Day the United States supplied the French with military and civilian aid worth (at the time) more than \$2.8 billion, including 1,406 tanks, 3,941 other combat vehicles, 27,176 trucks, and 1,523 additional vehicles. In addition, Britain and Canada provided goods and services totalling an estimated \$460 million. In 1943-44, under the ANFA rearmament program, the U.S. used Lend-Lease equipment to outfit eight French divisions (five infantry and three armored) plus various supporting units. With a few exceptions, these formations were organized along the same lines as their U.S. counterparts.

The following Listing denotes those vehicles included in *YANKS* or *WEST OF ALAMEIN* that may be used in a Free French scenario OB [EXC: an illustration of the counter below indicates that the vehicle is provided in *CROIX DE GUERRE* in other than its previous nationality color (e.g., the M3A3 Light Tank)]. All pertinent data and Notes relating to the characteristics and game capabilities of each vehicle apply as given for it originally in *YANKS/WOA*, except as noted otherwise (see also F.8A-9). This Listing does not include vehicles that are available to the Free French but not included in any form in *YANKS/WOA* (e.g., the Carrier AC). For a complete list of all Free French vehicles, see the Free French Vehicle Rarity Factor Chart.

H

37. M3A3 & M5A1 Light Tanks: A total of 651 U.S. light tanks were Lend-Leased to the Free French. By D-Day this included 273 M3A3 and 230 M5A1 (see U.S. Vehicle Note 5). The entire light tank complement of the 2nd DB consisted of M3A3 when it landed in France, while the 1st and 5th DB (as well as three of the five armored recon battalions organic to Free French infantry divisions) had a mixture of M3A3 and M5A1. The two non-divisional armored recon battalions—the 1st and 2nd *Spahis Algériens*—were also equipped with M3A3 but not M5A1.

†M3A3 MA must use red TH numbers in scenarios set prior to 1944—as signified by “Red THs (pre 44)” on the counter. U.S. Vehicle Notes F and Y also apply to the Free French M3A3.

†M3A3 RF is 1.2 for 12/43-7/44 and 1.1 thereafter. M5A1 RF is .1 > that of the M3A3 for the corresponding Date.

38. Crusader II & III Tanks: In the autumn of 1942, the 1st Free French Tank Company (*Compagnie de Chars*) was re-equipped with 14 Crusader tanks. Each section had two with 2pdr (40mm) main armament and one Crusader III (British Vehicle Notes 9 and 10).

39. M4, M4A1 & M4A2 Medium Tanks: 382 M4A2 (U.S. Vehicle Note 10) and 274 M4A4 (which in the U.S. color is represented in the game by the M4; see British Vehicle Note 14) were Lend-Leased to the Free French. Of these, 368 and 268 respectively had been provided by June 1944. They equipped the three tank battalions in each of the three DB, with the 2nd DB receiving only M4A2 while the 1st and 5th DB used both types. Later, small numbers of M4A1 (U.S. Vehicle Note 9) were made available to the DB via in-theater transfer.

†U.S. Vehicle Note Y also applies to the Free French M4A2.

40. M4A3(75)W, M4A3(76)W & M4A3(105) Medium Tanks, & M4 Tank-dozer: During the course of the campaign in Europe, a number of M4A3(75)W, M4A3(76)W and M4A3(105) (U.S. Vehicle Notes 13, 16 and 17 respectively) were transferred in-theater to the Free French. Given that 1944-45 Free French tank battalions used U.S. tables of organization, it is a fairly safe assumption that they also received tankdozers.

41. M10 GMC: Initially the U.S. Army wanted to issue M3 GMC halftracks (U.S. Vehicle Note 34) to the Free French, since so many were available in North Africa. The French protested vigorously, however, and in the end new M10 (U.S. Vehicle Note 23) were shipped from America. By mid May of 1944, 115 had been Lend-Leased for use in the TD battalion in each DB.

42. Daimler Scout Car: A small number of these (British Vehicle Note 42) were used by the Free French—e.g., the 1st RMSM (*Régiment de Marche de Spahis Marocains*) contained two in January of 1943.

†RF is 1.5 for 6/41-1/42, 1.4 for 2-9/42, and 1.3 for 10/42-11/43.

43. M3A1 & M20 Scout Cars, & M8 Armored Car: An undetermined number of these AFV (U.S. Vehicle Notes 39, 40 and 42 respectively) were supplied to the Free French (though a fair guess regarding the M8 would be about 550). One major difference between the U.S. infantry division's table of organization and that of a U.S.-equipped Free French infantry division was the latter's armored reconnaissance battalion, which was roughly triple the size of the mechanized cavalry recon troop in the U.S. division. The M8 were issued to the ten Free French armored recon battalions (one per infantry division, one per DB, and two non-divisional), as were at least some of the M3A1 and probably the M20.

†Each Free French M3A1 scout car's at-start HS or crew Passenger (see U.S. Vehicle Note 39) is a 2-4-8 or 2-2-8 respectively.

†Contrary to U.S. Vehicle Note Z, the BAZ carried aboard the Free French M20 scout car is always a BAZ 44(a) (F.9).

44. Marmon-Herrington III ME & IIIV Armoured Cars: In the fall of 1942 the 1st RMSM (*Régiment de Marche de Spahis Marocains*) became an armoured car unit. 21 Marmon-Herrington III (British Vehicle Note 48) formed the bulk of its vehicles, with three per platoon and four platoons per squadron. Some mounted non-standard ordnance (British Vehicle Note 49).

45. Humber Armoured Car: A total of three Humber armoured cars (British Vehicle Note 50) were listed as being used in the 1st and 2nd Squadrons of the 1st RMSM in January 1943.

46. M7 HMC & M8 HMC: Excluding those shipped to the British, 179 M7 HMC (U.S. Vehicle Note 44) were Lend-Leased. It is quite possible that all were sent to the Free French, who used them in the armored artillery battalions of their three DB. (As per the U.S. table of organization, each such division would have required 54 M7.) M8 HMC (U.S. Vehicle Note 43) were used in Free French tank, armored infantry and armored recon battalions. To fully equip these units would have required about 140 M8.

Vehicle Note A

47. U.S. Halftracks: The Free French received > 1,400 U.S. halftracks, most of which were of the M5 and M9 types built by the International Harvester Co. solely for Lend-Lease

purposes. They were employed by the Free French in the same way as U.S. forces used them; e.g., each DB contained three armored infantry battalions fully equipped with halftracks (see U.S. Vehicle Notes 29 and 30). Fifty-four M21 MC and eight T30 HMC (U.S. Vehicle Notes 33 and 35) were used, the latter by one of the armored recon battalions. The M4A1 MC (U.S. Vehicle Note 32) were apparently in-theater transfers to cover losses of M21. Some M3 GMC and T28E1 MGMC (U.S. Vehicle Notes 34 and 37) were turned over to the Free French in Tunisia, but evidently were used by them only for training.

†Regardless of the scenario date, each Free French M5A1 halftrack carries a BAZ 44(a) (F.9). Otherwise, this AFV is treated like the U.S. M3A1 halftrack [EXC: see F.9 for Scrounging/Removing its MG].

†The MG armament of the Free French M9 halftrack is treated like that of the M2 halftrack [EXC: see F.9 for Scrounging/Removing its MG].

†Each M5(MMG) and M5(HMG) halftrack's at-start Passenger squad (see U.S. Vehicle Note 30) is a 4-5-8 (or its two HS). Otherwise, these two AFV are treated like the U.S. M3(MMG) and M3(HMG) [EXC: see F.9 for Scrounging/Removing their MG].

†Each M21/M4A1 MC halftrack starts the scenario with an Inherent infantry-crew (i.e., a 2-2-8) in lieu of a vehicle-crew.

†M5 RF is 1.3 for 1-7/44 and 1.0 thereafter. M5A1 RF is .2 > that of the M5 for the corresponding Date.

48. Carriers: Various types of Carriers (British Vehicle Notes 64-65) were used by the Free French—apparently excluding the mortar versions. The 1st BFL had 63 Carriers at Bir Hakeim in May 1942; each of its infantry battalions contained 14-18 (normally in five-vehicle sections), each of which mounted a French MG or 25mm anti-tank gun.

†Each Free French Carrier [EXC: the Carrier AC(b); see French Vehicle Note 31] begins the scenario containing an Inherent 2-4-8 HS. In a scenario set prior to 5/43, any MG Scrounged/Removed from a Free French Carrier (or its wreck) takes counter form as a British-color MG(f) of the same FP that it had as an Inherent MG.

†Decrease Carrier A, B and C initial RF by .2 for use in/after 5/42. Carrier, MMG A RF is 1.2 for 3-6/42, 1.3 for 7/42-5/43, and 1.4 for 6-11/43.

49. Quad FAT: Forty or more of these prime movers (British Vehicle Note 80) were issued to the Free French for the transport of 25pdr field pieces. Some of them were used instead for towing the French 47mm anti-tank gun.

50. British Jeeps & Trucks: The British provided a number of different types of transport vehicles to Free French units, which in the North African desert were completely motorized.

†Jeep(a) RF is 1.5 through 9/42, 1.4 for 10/42-5/43, and 1.3 thereafter.

51. U.S. Jeeps & Trucks: The Free French were Lend-Leased 15,880 transport vehicles of ≤ one ton, 4,402 of 1½-2 tons, 5,806 2½-tonners, and 1,088 of > 2½ tons. Despite these numbers, there were periodic complaints of shortages—especially in regard to Jeeps (the GPA amphibious version often being substituted in Italy), and trucks of 1½- and 2½-ton capacity.

FRENCH MULTI-APPLICABLE VEHICLE NOTES

A. The CMG may be repositioned as a 2-FP AAMG. This can be done only by placing an AA counter on the AFV at the end of any friendly fire phase (not MPH) in which its Inherent crew is CE and could have fired the MG (even if malfunctioned) but did not. This AAMG may fire only at a target that lies within the AFV's TCA—as signified by “AAMG: TCA only” on the counter. The AAMG may be repositioned as the CMG by using these same principles to remove the AA counter.

ERRATA: Any functioning CMG that may be repositioned as an AAMG may be Scrounged, regardless of the vehicle's/wreck's nationality.

Vehicle Note B

B. The BMG receives an extra +1 DRM when firing at a moving/Motion target—as signified by a white dot behind the BMG factor on the counter.

ERRATA: Scrounging such a Fixed-Mount (D1.81) BMG is NA, regardless of the vehicle's/wreck's nationality.

C. The CE DRM is +1 vs Indirect Fire, as well as vs Direct Fire that emanates from within the turret's rear Target Facing—as signified by "CE: +1 RT" on the counter.

D. Reverse movement costs this vehicle twice its normal hex-entry cost—as signified by "REV×2" on the counter.

E. Availability is limited to use in Europe [EXC: Norway], regardless of whether the counter is French, British or U.S. color.

F. If this counter is illustrated in the British or U.S. color in its Vehicle Note, it may be used in a Free French OB as per F.8A-.8C. The following apply regardless of this counter's nationality color(s), except as stated otherwise:

- "(a)", "(b)" or "(f)" in the piece name stands for "American", "British" or "French" respectively, for ESB (D2.5), Hammada Immobilization (F3.31), Sand Bog (F7.31), etc., purposes;
- "(a)" or "(b)" also indicates that the MA uses black TH numbers (unless captured), as signified by "Black TH#s" on the counter;
- "(a)" also indicates that this vehicle is treated as Captured if crewed by other than Free French or U.S. [EXC: by other than Vichy French, for the French-color version of the AM Dodge(a)];
- "(b)" also indicates that this vehicle is treated as Captured if crewed by other than Vichy French or British (including Free French, etc.; A25.4);
- "(f)" also indicates that the MA always uses red TH numbers if this vehicle is an AFV, that a MG Scrounged from this vehicle (or its wreck) takes counter form as a British-color LMG(f) (with Captured-use penalties unless being fired by Free/Vichy French; F.8A), and that this vehicle is treated as Captured if crewed by other than Free/Vichy French (F.8C).

G. If armed, this vehicle has an Inherent crew and thus a CS# instead of a cs#.

H. Prior to setup, and in addition to the normal A2.9 10% Deployment allowance, the French player may freely Deploy a number of squads sufficient to provide one Passenger HS for each C-K P19, and two Passenger HS for each Lorraine 38L, in his OB—excluding each such vehicle that will set up towing-a-Gun/carrying-a-crew. These HS may Recombine (and the resulting squads may Deploy) as if they were Carrier HS and these vehicles were Carriers (D6.82).

I. Before any type of Immobilization result *due to an attack* [EXC: one caused by mines, or by a Direct Fire hit vs the front or rear Target Facing] takes effect vs this AFV, a subsequent dr must be made. If this dr is ≤ 4, Immobilization occurs; if ≥ 5, it does not. This is signified on the counter by "Immob: dr ≤ 4".

J. This vehicle is treated as an *armored car* for movement (and all related) purposes [EXC: it may not cross a hedge; Reverse movement costs three times its normal hex-entry cost, as signified by "REV×3" on the counter].

K. This AFV may retain any unpossessed SW aboard it.

L. Ammunition of ≥ 100mm being carried by this vehicle (C10.13) reduces its Passenger capacity by 4 (not 8) PP—as signified by "Ammo: 4PP" on the counter.

M. The MA may use neither Bounding *First* nor Motion Fire—as signified by "No Bnd FF" on the counter.

R. This AFV was equipped with a radio that could send/receive only morse code. It is therefore treated as a radioless AFV, but is assumed to have a morale of "9" for movement NTC (D14.23) purposes—as signified by "@9" on the counter.

U. Provided in *CROIX DE GUERRE*. Since it is U.S.-built, this vehicle does *not* suffer Captured penalties if manned by any U.S. Inherent SMC/MMC/Driver.

W. Provided in *WEST OF ALAMEIN*.

Y. Provided in *YANKS*.

AA. The MA has AA capability—as signified by "MA: AA" on the counter.

H

FRENCH ORDNANCE NOTES

For the sake of brevity, the following French acronyms are used herein:

BCP (*Bataillon de Chasseurs Portés*): mechanized infantry battalion of DCR
BDAC (*Batterie Divisionnaire Antichar*): divisional 47mm or 75mm anti-tank battery

BFL (*Brigade Française Libre*): Free French brigade

CA (*Compagnie d'Accompagnement*): support company of (motorized) infantry battalion

CDAC (*Compagnie Divisionnaire Antichar*): divisional 25mm anti-tank company of (motorized) infantry division

CE (*Compagnie d'Engins*): heavy-weapons company of BCP

CRE (*Compagnie Régimentaire d'Engins*): heavy-weapons company of infantry regiment

CRME (*Compagnie Régimentaire Motorisée d'Engins*): heavy-weapons company of motorized infantry regiment

DCR (*Division Cuirassée*): armored division

DIM (*Division d'Infanterie Motorisée*): motorized infantry division

DLC (*Division Légère de Cavalerie*): light cavalry division

DLM (*Division Légère Mécanique*): light mechanized division

EDAC (*Escadron Divisionnaire Antichar*): divisional 25mm anti-tank squadron of DLC or DLM

EME (*Escadron Mitrailleuses et Engins*): heavy-weapons squadron of GRCA, GRDI, cavalry regiment or RDP battalion

GRCA (*Groupe de Reconnaissance de Corps d'Armée*): corps reconnaissance group

GRDI (*Groupe de Reconnaissance de Division d'Infanterie*): reconnaissance group of (motorized) infantry division

RAM (*Régiment d'Automitrailleuses*): armored car regiment

RDP (*Régiment de Dragons Portés*): vehicle-borne dragoon regiment (usually of DLC or DLM)

1. *Lance-Grenades de 50 mle 37(f)*: Ordered at the end of 1939, one LG was supposed to replace the four rifle grenade-launchers (one per squad) in the infantry section (i.e., platoon). It used a fixed 45° elevation, with range adjusted by altering the diameter of propellant-gas vents, and was trigger-fired. 20,000 had been manufactured by June 1940, but very little ammunition was available. It seems that the only ones in service at the time of the German invasion were a dozen installed in special rotating, retractable armored cupolas in the Maginot Line. Some LG were used by French infantry near the end of the war; e.g., the 18th RCC (*Régiment de Chasseurs à Cheval*) had twelve during its campaign in southwest France in 1945. (This was one of several units raised in late 1944 using ex-Resistance fighters and a mixture of U.S., British, French and German equipment.) The LG also saw action after WW2 vs the Viet Minh in Indo-China.

2. *Mortier de 60 mle 35*: Designed by the Edgar Brandt firm and derived from the 81mm mle 27/31, the mle 35 was the standard light mortar of the French Army. One was normally issued per (motorized) infantry *compagnie*, and per cavalry/motorcycle reconnaissance *escadron* (squadron) in GRDI and GRCA. In the DLC, the 5th (heavy weapons) squadron of each cavalry regiment was authorized a *peloton* (platoon) of four, while each motorcycle *escadron* in the RAM (as well as each combined motorcycle-AMR (see French Vehicle Note 2), and each motorized infantry, *escadron* in the RDP) had one 60mm mortar. In May 1940, some 4,940 (possibly excluding those in France's overseas possessions) were in service. In November 1942, 360 were present in Vichy North Africa. Copies of the mle 35 were produced in the U.S.A. (U.S. Ordnance Note 1), China (Chinese Ordnance Note 3) and Romania. The mle 35 fired both light (2.9-lb.) and heavy (4.9-lb.) HE bombs. See also French Ordnance Note 22.

†IR ammunition becomes available in 1942, but only for the Free French—as signified by "IR2" on the *British-color* version.

‡Unlike the U.S. 60mm mortar [including its British-color "(a)" version; F.9], French 60mm mortars [including their British-color "(f)" version; F.8C] cannot be exchanged for OBA.

†Dates and RF for Free French DYO purchase purposes are 6-7/41 (1.3) and 5-11/43 (1.4); for other Dates, use the Free French SW Allotment Chart.

H

3. *Mortier de 81 mle 27/31*: Designed by the Edgar Brandt firm in 1927 and further improved four years later, this mortar became the classic design of the era, being copied during the 1930s and '40s by at least a dozen countries. It fired both light (7-lb.) and heavy (14.3-lb.) HE rounds, as well as smoke. In 1940 about 5,000 were in service in France, with two (i.e., one *groupe*) normally allotted per (motorized) infantry battalion (in the heavy weapons platoon [section d'engins] of its CA) and another *groupe* in the regiment's CRE (two *groupes* [one section] in the CRME if the regiment was motorized); these mortars were usually carried in wagons, even in motorized infantry regiments. In DLC and DLM, each RDP had two *groupes* (one *peloton*) in the EME of each of its battalions. The BCP of each DCR had a section of four in its CE. MG battalions were authorized three *groupes* each. A number of mle 27/31 were also used in casemates and armored cupolas in the Maginot Line, and by the Free French in North Africa (e.g., the 1st BFL had 20 at Bir Hakeim in May 1942—four per infantry battalion and four in the reserve company). In November 1942, 600 were present in Vichy North Africa.

†(Vichy) French Dates and RF are 39-5/43 (1.2) and 3/45 (Indo-China; 1.2). For Free French they are 9/40-5/41 (1.3), 6-7/41 (1.4), 8/41-4/43 (1.1), and 5-11/43 (1.5).

4. *Fusil Antichar Boys*: This was the standard British ATR, a number of which were issued to certain GRDI and GRCA due to the shortage of 25mm anti-tank guns. When present, they were allocated to the EME of these units. The Boys' violent recoil and mediocre armor penetration made it unpopular among its French users. Free French units fighting with the British were issued Boys ATR, and the British also supplied 446 to the Vichy troops fighting the Axis in Tunisia.

French troops in Indo-China possessed a goodly number of pre-WW2 Russian ATR. Some had originally been brought into France by Republican troops during/after the Spanish Civil War, and the rest had been purchased from China. These Russian ATR were models (most likely of several different designs) that had been rejected for use by the Red Army.

†For use in Indo-China, treat this ATR as having "B11".

†Availability, Dates and RF are: Europe [EXC: Norway], 39-6/40 (1.5); Indo-China, 9/40, 1/41 and 3/45 (all 1.0); and Tunisia, 1-2/43 (1.4), 3/43 (1.3) and 4-5/43 (1.2).

5. *Canon Antichar de 25 SA-L mle 34*: Built by Hotchkiss, the SA-L 34 was accepted in 1934 as the standard battalion and regimental anti-tank gun of the French Army. By the end of June 1940, some 4,500 were in service. Production lagged behind demand, however, so the SA-L 37 (somewhat lighter, but equivalent in game terms) was

introduced to supplement it; about 1,600 of this version were delivered prior to the armistice. In service it was found that the light weight of the SA-L made it rather flimsy for high-speed towing, so it was often horse-drawn or (primarily in motorized/cavalry units) carried *en portée*. The heavy-weapon section of a CA was authorized a *groupe* of two, with another six (in two three-gun sections) in the CRE/CRME, and a further section in the EME of the GRDI. Each cavalry regiment in the DLC, and each battalion of the RDP in the DLC and DLM, had two *groupes* of SA-L in its EME. Each (motorized) infantry division was authorized a CDAC, and each DLC and DLM was authorized an EDAC, of twelve SA-L. The BCP of each DCR contained four SA-L sections in its CE. GRCA were authorized two *groupes* (plus, if non-motorized, a third in their *groupe d'escadrons à cheval* horse-cavalry element). MG battalions were authorized three sections each. 75+ modified 25mm anti-tank guns were employed in various types of Maginot Line fortifications. The number of SA-L available in May 1940 was several thousand short of the Army's full requirement, leaving many infantry-type divisions with only part of their anti-tank gun allotment and a few with none at all. In November 1942, 101 SA-L were present in Vichy North Africa; there (or at least in Tunisia), the CA had no anti-tank *groupe*—instead, most SA-L were used in (apparently independent) six-gun *compagnies/batteries*, though some infantry-type regiments contained one section. See also French Ordnance Note 23.

†Dates and RF are 39-6/40 (1.2) [EXC: 1.3 for Norway], 7/40-5/43 (1.3) [EXC: NA in Madagascar], and 3/45 (Indo-China; 1.3).

6. *Canon Antichar de 47 SA mle 37 APX*: First ordered in 1936 from the Puteaux arsenal (APX), this weapon fired a tungsten-core AP round, making it the world's most powerful purpose-built anti-tank gun when it entered service. (Its very existence was so secret that delivery to units was withheld until September 1939.) 841, including 135 in the general reserve, were in France when the Germans invaded; however, a lack of sufficient ammunition kept many from ever being issued. Each non-alpine division in France was authorized a BDAC comprising twelve (ideally, but in practice only eight) SA 37 APX. In reality though, most BDAC contained only six (or sometimes four) such guns—while others were equipped with converted 75mm pieces instead (see French Ordnance Note 7), and some divisions had no BDAC at all. Oddly, the BDAC was usually assigned to the divisional artillery, thus in effect placing it at the rear of the division—which in conjunction with its general scarcity gave rise to the nickname "ghost gun" for the weapon because it was so rarely seen by front-line troops. The SA 37 APX in non-motorized infantry divisions were horse-drawn. A version of the gun with a tripod mounting to allow full 360° traverse (very similar in concept to the British 2pdr) was developed as the SA 39, but in 1940 existed only in prototype form.

Despite their potent anti-tank capability, most of the SA 37 APX captured

Ordnance 6

by the Germans remained in France (where some saw action vs the Allies in 1944); this was probably due to Germany's chronic shortage of tungsten. A small number of SA 37 APX captured in the Levant were used by the Free French in North Africa, seven being with the 1st BFL at Bir Hakeim in May 1942—one in the 2nd Foreign Legion Battalion and the rest in the 1st Anti-Tank Company. In November 1942, some 45 were present in Vichy North Africa (apparently all in Tunisia) where they were used in batteries of 6-12 guns, again usually as part of artillery regiments.

†This Gun fires only APCR.

†(Vichy) French Dates and RF are 5/40-5/43 and 1.4 [EXC: NA in Norway, Indo-China and Madagascar]. For Free French they are 2-6/42 (1.3) and 7/42-5/43 (1.5).

7. Canon de 75 Antichar mle 97/35: This little-known gun was actually the mle 1897 (French Ordnance Note 11) modified to use a circular firing platform beneath its wheels (like the British 25pdr), thus allowing a more rapid traverse of the gun. Several hundred of these platforms were manufactured beginning in 1935, but it is unclear how many of the converted guns were used in action. It seems that, despite their potent tank-killing capability, they were unpopular due to their weight and longer (un)limbering time. Those issued were assigned to various BDAC.

8. Canon de 37 mle 16 TR: This small gun, a Puteaux design of 1916, was intended to provide close support for infantry, especially vs enemy machine guns. It remained in service after WW1, but in France by 1940 was used mainly as a substitute anti-tank weapon to help offset the shortage of 25mm anti-tank guns. Two small wooden wheels were provided for ease of movement, but were usually removed before firing. Alternatively, the gun could be broken down into three loads for pack transport. In France the mle 16 TR was found mainly in second-line and reserve units, but each GRDI was authorized one in its EME. 1,036 (probably excluding those outside of France) were available in May 1940. In November 1942, 303 were present in Vichy North Africa; there (or at least in Tunisia), each infantry-type regiment was authorized one section of (most likely three or four) mle 16 TR. "TR" stands for *Tir Rapide* (rapid fire).

During WW1 the U.S. had adopted the mle 16 TR as the M1916, and retained some in storage in 1941 (at that time it was still listed as the official anti-tank gun of the U.S. Marines). A number of mle 16 TR were used by Republican forces in the Spanish Civil War, and a modified version of the gun was produced in Japan (Japanese Ordnance Note 9).

†This weapon may enter and be fired from all terrain types allowed to a HMG (e.g., an upper building level). As a SW it incurs no CA-change DRM penalty (C9.2), but is subject to the woods/building CA restrictions of A9.21. It has no Gunshield, and its portage cost while dm is 3 PP. See also French Ordnance Note C.

†RF is 1.3 prior to 7/40 [EXC: NA in Norway], and 1.2 thereafter.

9. Canon de 65 M mle 06: In May 1940 only seventy examples of this pre-WW1 mountain gun were still in active service in France, equipping several fortress- and mountain-artillery units—the remainder having been replaced by the 75mm mle 28 (French Ordnance Note 10) or relegated to the general reserve. However, the mle 06 was also used overseas in French North Africa (where 109 were present in November 1942), the Levant, and Indo-China (22 present in December 1944). In action it was usually positioned in or near the front line for direct-fire support. The gun itself was unusual in employing the counter- or soft-recoil system, wherein the barrel travels forward when the lanyard is pulled, and the gun fires as the barrel's forward travel limit is reached, thus utilizing its momentum to help offset the recoil force.

†Dates and RF are 5-6/40 (1.6) [EXC: NA in Norway], 7/40-5/43 (1.4), and 3/45 (Indo-China; 1.4).

10. Canon de 75 M mle 28: Produced by Schneider, this was an improved version of the firm's earlier Canon de 75 Montagne mle 19, which had been designed to replace the 65mm mle 06. (Both 75mm guns are equivalent in game terms.) In 1940 the 75 M equipped mountain and colonial artillery *groupes*, with 156 mobilized in France on May 1st of that year. They were also used in French overseas territories. The mle 19 was exported to Greece, Poland, Romania and Yugoslavia, while the mle 28 was sold to Poland. French mountain gun *batteries* comprised four guns.

†Dates and RF are 5-6/40 (1.5) [EXC: NA in Norway], 7/40-5/41 (1.3), 6/41-5/43 (1.5), and 3/45 (Indo-China; 1.3).

11. Canon de 75 mle 1897: The "French 75" (or *soixante-quinze*—"75") was a Puteaux design built by Schneider and the Bourges arsenal. It was revolutionary in being the first field gun with a successful hydraulic recoil system and fast-acting breech block. The details of its design were a closely guarded secret prior to WW1, but afterwards it went into service in so many countries that it became the most widely used field gun ever produced. Even though it was rather outdated by the start of WW2 (despite many having been retrofitted with pneumatic tires for high-speed towing), the sheer numbers of mle 1897 in the French artillery park made the cost of replacing them prohibitively high. In France alone, some 4,500 (including those converted to the anti-tank role; see French Ordnance Note 7) were in active service at the start of May 1940, with another 68 in the general reserve. The mle 1897 was the standard light artillery piece in most French divisions, and was also used in a number of armored cupolas in the Maginot Line. A *batterie* comprised four guns, with three *batteries* forming a *groupe*. In November 1942, 334 mle 1897 were present in Vichy North Africa. Other users of the gun during WW2 were the United States (U.S. Ordnance Note 13), Poland, Greece, Romania, and Germany (captured pieces; see also German Ordnance Note 9).

†Dates and RF are 39-5/43 (1.3) [EXC: 1.4 in Norway], and 3/45 (Indo-China; 1.3).

12. Canon de 105 M mle 28: Designed by Schneider to complement the 75mm mle 28, the 105 M—like the 75 M—originally appeared just after WW1 with the designation mle 19, and after undergoing further development became the mle 28. (Both versions of the 105 M are equivalent in game terms.) It was used mostly in the French overseas territories; only 24 (two *groupes*) were in France in May 1940, all apparently in the Alps defenses. Due to its relatively short range, the 105 M was often positioned for use in a direct-fire role. Some were exported to Yugoslavia.

†Dates and RF are 6/40 (1.6), 7/40-7/41 (1.5), 8/41-5/43 (1.6), and 3/45 (Indo-China; 1.5).

13. Canon de 105 C mle 35 B: In the early 1930s it was decided to replace the existing stocks of WW1-vintage 155mm howitzers with lighter 105mm pieces. The first of the new guns to appear was the 105 C mle 34 S ("C": *Court*—i.e., short-barreled) built by Schneider. Shortly thereafter the 105 C mle 35 B, produced by the Bourges arsenal, was accepted as well. Both were very similar in characteristics and performance, and were referred to collectively as 105 C. A total of 376 (of which 210 were mle 35 B) had been mobilized in France by the start of May 1940. Two *groupes* (of three four-gun *batteries* apiece) were authorized in each DCR and DLM; in addition, 105 C were issued to certain DLC and DIM, in which case one such *groupe* replaced one of the division's standard C 17 S (French Ordnance Note 16) *groupes*. One interesting feature of the mle 35 B was that its large, solid pressed-steel wheels were attached to the gun trails in such a manner that when the trails were opened, the wheels "toed in" at the front to provide extra cover for part of the crew. On the other hand, many 105 C were built only for horse traction despite their otherwise-modern design. Few if any were used outside of France.

14. Canon de 105 L mle 13 S: In 1940, France still possessed almost 11,000 artillery pieces of ≥ 65 mm designed before/during WW1. Among the elderly guns still doing first-line duty was the L 13 S ("L": *Long*—i.e., long-barreled), produced by Schneider based on a Russian 107mm design. It entered service in 1914, and after WW1 was widely exported. Only the later models had pneumatic tires for vehicular towing. In May 1940 some 857 were available in France, used as corps (and in a few cases as divisional) artillery. Sixteen 105 L were present in Vichy North Africa in November 1942. During WW2 the L 13 S (or derivatives thereof) also saw action in the armies of Italy (Italian Ordnance Note 13), Belgium, Yugoslavia, Poland, China (Chinese Ordnance Note 12) and Germany (captured pieces).

†Dates and RF are 5-6/40 (1.4) [EXC: NA in Norway], 6-7/41 (1.4), and 11/42-5/43 (1.6).

H

15. Canon de 105 L mle 36 S: This gun, designed by Schneider to replace the L 13 S, was the most modern field piece in the French artillery park in 1940. Surprisingly though, some were still built to be horse-drawn. At the time of the German invasion, 145 had been mobilized in France with another four in the general reserve. They were employed primarily as corps heavy artillery, and in a few cases replaced C 17 S as divisional heavy guns. The mle 36 was sold to Romania, and some sources allege that it (or one of its prototypes) also served as the basis of the Type 92 field gun (Japanese Ordnance Note 15). In French service, all 105mm field artillery batteries normally comprised four guns.

16. Canon de 155 C mle 17 S: Originally designed by Schneider as a 152mm piece for Tsarist Russia, the C 17 S heavy field howitzer was adopted by the French during WW1, and afterwards was widely exported and license-built. In 1940 the French possessed over 2,000, of which 1,852 were in France (including 25 in the general reserve). The majority were horse-drawn. Most French infantry-type divisions were authorized a regiment of C 17 S comprising two twelve-gun *groupes*. 36 C 17 S were present in Vichy North Africa in November 1942. In French service, all 155mm artillery batteries normally comprised four guns. Other users of the C 17 S (or derivatives thereof) during WW2 included Belgium, China (Chinese Ordnance Note 14), Finland, Greece, Italy, Yugoslavia, Poland, Romania, the U.S.S.R., and the U.S.A. (U.S. Ordnance Note 17). The Germans issued many captured C 17 S to their own artillery units. (Most other types of ex-French artillery they relegated to coast defense.)

†Dates and RF are 5-6/40 (1.4) [EXC: NA in Norway], 7/40-5/41 (1.6), 6-7/41 (1.5), 11/42-5/43 (1.5), and 3/45 (Indo-China; 1.6).

17. Canon de 155 GPF: The GPF, as this gun was often referred to, first saw action in 1917 and proved to be one of the best heavy artillery pieces of WW1. Later, two variants (both equivalent to the GPF in game terms) were produced in small numbers: the GPF-CA and the GPF-T, the latter being the most modern gun in French service in 1940. At the time of the German invasion, 402 of all types had been mobilized in France, equipping a number of twelve-gun *groupes d'artillerie lourde à tracteur* employed at corps level. The GPF was also used by the U.S., who in addition produced a license-built version (U.S. Ordnance Note 19). Many of the French guns were captured by the Germans, who for a time used them as first-line heavy artillery (e.g., in the Afrika Korps). Nine GPF were present in Vichy North Africa in November 1942. "GPF" stands for *Grande Puissance* ("High Power") Fillieux (the designer's name).

The game piece also represents the *Canon de 155 L mle 17 S*, which comprised a WW1 155mm barrel on the carriage of a pre-WW1 design. Produced by Schneider, it had been accepted in 1917. At the start of May 1940, 407 L 17 S had been mobilized in France to equip *groupes d'artillerie lourde de corps d'armée*—corps heavy artillery groups, each with twelve guns. In addition, over a hundred more were formed into other such *groupes* in the general reserve.

France retained large stocks of other heavy artillery designs from WW1 and earlier, ranging in caliber from 120mm to 280mm, some of which dated as far back as 1877. A small number were even self-propelled—but in the rapid war of movement that swept across France in 1940, few of these archaic and unwieldy pieces could be put to effective use.

†Dates and RF are 5-6/40 (1.5) [EXC: NA in Norway], and 11/42-5/43 (1.6).

18. Mitrailleuse de 13.2 CAJ mle 30: Designed and manufactured by Hotchkiss, this was a twin-barreled 13.2mm MG on a heavy tripod mount. 540 (including a small number of single-barrel versions) had been delivered by the start of May 1940, but a shortage of ammunition kept many from being used. They were employed in independent sections of two guns (four tubes), either attached directly to the various armies or providing low-altitude protection for AA guns of ≥ 75mm. Due to its weight, the CAJ mle 30 was adopted by neither the infantry nor the cavalry. Small numbers were exported to Belgium, Greece, Italy, Poland, Romania and the U.S.S.R., while the Japanese produced their own copy (Japanese Ordnance Note 20). Those captured by the Germans were used either in the standard AA role or incorporated into the Atlantic Wall defenses. The 1st

Free French Division had six when it invaded Syria in June 1941. "CA" stands for *Contre Avions* ("AA"), and "J" for *Jumelé* ("twin").

†As signified by "Tow NA" on the counter, this Gun cannot be towed. However, it may be carried on a vehicle in the same manner as a 76-107mm MTR (C10.1). It is (un)loaded using normal (un)hooking procedures [EXC: the vehicle need not have a T#; ignore its T# if one is present], and reduces that PP capacity by 8PP while loaded. Section C10 applies otherwise unchanged.

†(Vichy) French Dates and RF are 5-6/40 (1.3) [EXC: NA in Norway], 6/41-12/42 (1.6), and 1-5/43 (1.5). For Free French they are 6-7/41 (1.4).

19. Mitrailleuse de 20 CA mle 39 O: This weapon was ordered from the Swiss firm of Oerlikon in late 1939. By the time the Germans launched their attack in the West, 357 had been received by the French. It was intended that the CA would be provided with an AA section of four Oerlikons to replace four of its Hotchkiss MG. This was never achieved in full, but all seven of the DIM and more than a dozen other infantry-type divisions had at least a complement of the guns by May 10th 1940. Some sources allege that the French also acquired a license to produce the CA 39 O. In the colonies, the CA 39 O was sometimes mounted on the bed of a truck for greater mobility.

†When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes but the AP Basic To Kill number is still determined using the Caliber Size and Length printed on the unlimbered side.

†Dates and RF are 5-6/40 (1.3) [EXC: NA in Norway], 7/40-5/41 (1.5), 6/41-10/42 (1.6), 11/42-5/43 (1.4), and 3/45 (Indo-China; 1.5).

20. Canon Automatique de 25 CA mle 38: Aircraft tactics during the Spanish Civil War led to a French requirement for a light AA gun of larger than MG caliber, in order to engage planes flying at higher altitudes. This ultimately resulted in the 25mm CA 38 and CA 39, produced by Hotchkiss. (The CA 39 featured a stronger platform and carriage, but in game terms the two guns are equivalent.) A twin-barrel version—the CAJ mle 40—was also designed, but appeared too late to see much action. By May 10th 1940, 512 CA 38 and 62 CA 39 had been delivered—but at the end of April a total of only 327 had actually been mobilized in France (another 62 were in Africa and the Levant). A further 159 and 96 (respectively) of the two models were delivered before the June armistice. At the time of the German invasion 39 batteries were assigned to the various armies, while the three DLM, the seven DIM and three other infantry-type divisions contained one organic *batterie* apiece. During the campaign, all five DLC, the 4th DCR and fifteen other infantry divisions also received a *batterie*. All of these batteries normally comprised six guns. Each *batterie* of W15T CC was authorized four CA 39 (see French Vehicle Note 21). Most of the 25mm AA guns captured by the Germans were issued to occupation troops in France; in June 1944 the Luftwaffe had 639 in service. The French 25mm AA appears to have been the inspiration for the Soviet and Japanese AA weapons of that caliber.

†Dates and RF are 5-6/40 (1.4) [EXC: 1.5 for Norway], and 6/41-5/43 (1.5) [EXC: 1.6 for Madagascar, 5/42 and 9/42].

21. Canon de 75 CA mle 32: This was the most numerous mobile AA gun available to the French in 1940. It was accepted for service in 1932, but production was delayed by the need to incorporate several important design changes (for which reason many sources refer to this gun as the mle 36). 332 had been delivered by May 10th, 1940—plus another 24 later in that month. The game piece also represents three other types of mobile 75mm AA guns: the mle 17/34, the mle 30 and the mle 33, of which 127, 132 and 192 (respectively) were available at the time of the German invasion. The French employed more than 600 statically mounted 75mm AA guns as well. 149 75mm AA guns (probably including both static and mobile types) were present in Vichy North Africa in November 1942. One drawback common to all of the mobile 75mm guns was their long setup time of 20-30 minutes. In addition, while the mle 32 could be towed at speeds of up to 24 mph, the others were limited to only about 6 mph. A *batterie* normally comprised four guns. The mle 32 was kept in production by the Germans; in June 1944 they had 580 captured French 75mm AA guns on mobile carriages in service.

†Dates and RF are 5-6/40 (1.5) [EXC: NA in Norway], 7/40-7/41 (1.6), 11/42-5/43 (1.6), and 3/45 (Indo-China; 1.6).

H

LEND-LEASE ORDNANCE

The United States supplied the French with a total of 1,694 artillery, anti-tank and AA guns through the Lend-Lease program. In addition, more were doubtlessly given via direct transfers in-theater, which were not always included in Lend-Lease calculations. Britain and Canada also provided much equipment, though the exact quantities remain unclear. With a few exceptions, Free French units operating under British or U.S. command were organized along the same lines as their respective Allied counterparts.

The following Listing denotes those Guns and SW-mortars included in *YANKS* or *WEST OF ALAMEIN* that may be used in a Free French scenario OB. All pertinent data and Notes relating to the characteristics and game capabilities of each weapon apply as given originally for it in *YANKS/WOA* except as noted otherwise. This Listing does *not* include Guns and SW-mortars available to the Free French that were not included in *YANKS/WOA* (e.g., the LG de 50 mle 37 mortar). For a complete list, see the Free French Ordnance Rarity Factor Chart.

22. U.S. & British Mortars: The mortars initially available to the Free French were primarily those they possessed when they declared for de Gaulle. Britain soon began supplying 2-in. and 3-in. models (British Ordnance Notes 1 and 2), but these were used mostly for training except when the supply of French mortars was insufficient. The fall of Vichy Syria and Lebanon provided enough French mortars and ammunition to fully equip the Free French in the British 8th Army until the end of 1942.

A total of 1,504 U.S. mortars were Lend-Leased to the French. The M2 60mm (U.S. Ordnance Note 1) was used three per infantry company, and the M1 81mm (U.S. Ordnance Note 3) was issued six per infantry battalion, just as in American units.

†2-in. Mortar Dates and RF for DYO purchase purposes are 9/40-5/41 (1.3) and 8/41-4/43 (1.6). For 6-7/41 and 5-11/43, use the Free French SW Allotment Chart.

†3-in. Mortar RF is 1.5 for 9/40-5/41, 1.2 for 6-7/41, 1.6 for 8/41-4/43, and 1.1 for 5-11/43.

23. OQF 25mm Hotchkiss: This was the French SA-L light anti-tank gun (French Ordnance Note 5; British Ordnance Note 4). The 1st Free French Division had nine (survivors of the 1940 Norwegian expedition) when it invaded Syria in June 1941, but at the end of that campaign it acquired more. 18 were used at Bir Hakeim in May 1942, with each infantry battalion of the 1st BFL having four (one battalion had six), some of which were mounted on Carriers (see French Vehicle Note 31).

†RF is 1.3 for 3/41-1/42, 1.1 for 2-6/42, and 1.5 for 7-11/42.

24. OQF 6-Pounder & M1 57mm AT Gun: After the loss of most of their anti-tank guns during the fighting at Bir Hakeim, the Free French in North Africa were re-equipped with 6pdrs (British Ordnance Note 6). Later, the divisions outfitted by the Americans were issued M1 57mm guns (U.S. Ordnance Note 7). To fully equip them as per U.S. tables of organization required 375 such guns.

25. Canon de 75 mle 1897: Initially the Free French had only a few of these guns (French Ordnance Note 11; British Ordnance Note 10), leftovers from the expeditionary force sent to Norway in 1940. Only a single battery of four was included in the 1st Free French Division when it invaded Syria in June 1941; however, dozens more became available at the end of that campaign. 54 were available at Bir Hakeim in May 1942—six (as anti-tank

guns) per infantry battalion, six in the 1st Anti-Tank Company, and 24 in the 1st Artillery Regiment. Most were lost in that battle, and the gun's prominence diminished significantly thereafter.

†RF is 1.5 through 1/42, 1.0 for 2-6/42, 1.4 for 7/42-4/43, and 1.6 for 5/43.

26. OQF 25-Pounder Gun-Howitzer: Two of these (British Ordnance Note 13) were used by the Free French at Bir Hakeim, as part of their 1st Artillery Regiment. Later that year the regiment received sixteen 25pdrs, and by May 1943 the 1st Free French Division contained a second 25pdr-equipped regiment.

†RF is 1.5 for 5-9/42, 1.6 for 12/42-4/43, and 1.3 for 10-11/42 and 5-11/43.

27. M2A1 & M3 105mm Howitzers: These (U.S. Ordnance Notes 14 and 15) were used in the Free French infantry divisions just as in their U.S. counterparts; i.e., the M2A1 was the divisional light artillery piece, and six M3 formed the regimental cannon company.

28. OBL 5.5-in. Gun-Howitzer: A troop of four (some sources allege a battery of eight) of these (British Ordnance Note 16) was issued to the Free French 1st Artillery Regiment in time for the Second Battle of Alamein.

†Dates are 10-11/42 and 5-11/43.

29. M1 155mm Howitzer & M1918M1 155mm Gun: The M1 155mm Howitzer (U.S. Ordnance Note 18) formed the divisional heavy artillery in the five U.S.-equipped Free French infantry divisions, while the M1918M1 (U.S. Ordnance Note 19) provided non-divisional support in the hands of the RACL (*Régiment d'Artillerie Coloniale du Levant*). 85 American heavy artillery pieces were Lend-Leased to the Free French; with twelve guns to a battalion (as per the U.S. table of organization), that equates to five battalions of divisional M1 and two of non-divisional M1918M1.

30. OQF 40mm & M1 40mm AA Guns: The British provided the Free French with 40mm Bofors guns (British Ordnance Note 21) just prior to the Gazala battles in 1942. At Bir Hakeim and again during the Second Battle of Alamein, twelve were possessed by the 1st BFM (*Bataillon de Fusiliers-Marins*), the AA element of the 1st BFL. From mid 1943, as the newly forming Free French infantry divisions were being outfitted with U.S. equipment, each was authorized a battalion of (presumably 32) M1 Bofors guns (U.S. Ordnance Note 24). In all, 758 American AA guns were Lend-Leased to the Free French.

FRENCH MULTI-APPLICABLE ORDNANCE NOTES

A. This weapon may be Animal-Packed (G10).

B. A British-color version of this counter is provided, for use in Free French OBs as per F.8A-.8C, either in *CROIX DE GUERRE* (if so illustrated in its Ordnance Note) or *WEST OF ALAMEIN*.

C. As signified by "crew" on the counter, this weapon requires a friendly crew in order to be used without the applicable penalties of A21.11-.13. Its BPV includes a crew as per H1.3.

D. Use one of the British-color dm 81mm MTR counters provided in *CROIX DE GUERRE* to represent a dismantled Free French 81mm MTR.

E. Availability is limited to use in Europe [EXC: Norway].

F. Dates of availability are 5-6/40. Note E above also applies.

G. "B(1)40" on the counter signifies that this Gun suffers from Low Ammo (D3.71) in scenarios set in 1940. This status can be negated only by SSR, an Ammo Vehicle (E10.1) or an Ammo Dump (E10.6). For later scenarios it is assumed to have normal B12, and a BPV 10% (FRU) > its printed BPV.

P. This Gun may be carried *en portée*, which means it may be loaded onto a vehicle (during setup/play) and carried as Passenger PP [EXC: porteeing a 47L AT or 75 ART is NA in scenarios set prior to 1941]. The 25LL AT may be porteeed by a C-K P17, Laffly S20TL or Citroën 23; any other Gun must use a Renault AGR2. Prior to setup, the vehicle must be noted on a side record as being able to portee a Gun of that particular Caliber Size (C2.21) and Barrel Length (C4.1). As a Passenger, the Gun and its ammo together use all but 5PP of the vehicle's Passenger capacity (note that this allows a C-K P17 to carry both a 25LL AT and its crew despite the vehicle's total Passenger capacity of only 5PP).

The principles of (un)loading a Gun to/from portee status are the same as for the 2pdr Portee in British Vehicle Note 77, except that here the Gun crew (un)loads as a Passenger rather than as an Inherent Crew, and a QSU Gun is not (un)loaded limbered. When a Gun has been thusly loaded, it is

H

marked with an En Portee counter. A vehicle porteeing a Gun is not flipped over to its Wreck side if it becomes Immobilized, and the Gun may be unloaded (at which time the vehicle counter is then flipped over). If a vehicle porteeing a Gun is eliminated, the Gun is eliminated too. A vehicle may not simultaneously have one Gun *en portee* and another hooked up for towing. An AT (with a gunshield) being porteed can provide gunshield benefits to its Passenger crew in the same way the 2pdr Portee MA does to its Inherent crew. In a DYO scenario, the French player may purchase the correct portee vehicle in lieu of buying a normal towing vehicle as per 1.441.

Only the 25LL AT and 75 ART may be fired by its Passenger crew while being porteed [EXC: it may not use Bounding (First) Fire]. While loaded on the vehicle, its CA must coincide with its portee's VCA or "rear" VCA [EXC: "rear" VCA of the C-K P17 is NA] and may not change relative to that VCA.

ERRATA: No Gun counter—regardless of nationality—may use Motion Fire while being carried *en portee*.

V. Vichy French may use even the British-color version of this weapon without Captured penalties.

W. Provided in *WEST OF ALAMEIN*.

Y. Provided in *YANKS*.

POLISH VEHICLE NOTES

For the sake of brevity, the following Polish acronyms are used herein:

BCL (batalion czołgów lekkich): light tank battalion

BK (Brygada kawalerii): cavalry brigade

BKM (Brygada kawalerii Mechanizowanej): mechanized cavalry brigade

DPty (Dywizja Piechoty): infantry division

DPny (dywizjon pancerny): armored troop

GO (Grupa Operacyjna): operational group

KCL (Kompania czołgów lekkich): light tank company

SK (samodzielna kompania czołgów rozpoznawczych): independent scout tank company

WBP-M (Warszawska Brygada Pancerno-Motorowa): Warsaw Mechanized Brigade

1. TKS & TKS(L): After the acquisition and trial of the British Carden-Lloyd MK VI tankette in 1929, Poland purchased the rights to produce the vehicle and set about developing a Polish version dubbed the TK-3. The first models started to roll off the assembly lines of the PZInz Works in August of 1931 and 300 were produced before the introduction of the TKS in 1934 (both vehicles are represented by the TKS counter since they were similar in all aspects). Production of the TKS ended in 1937 with 293 being built. Modest efforts were made to upgun the TKS tankette with two open-topped prototypes mounting a 47mm ATG and the Swedish 37mm Bofors ATG, both being labeled TKS-D. Neither was accepted, and the final version of the TKS mounted a 20mm autocannon. This version was designated "TKS z 20mm działem" or "nkm 20mm TKS" after the gun denomination. The TKS(L) was to be a workshop modification of both the TKS and TK-3 models. A total of 150 conversions were planned, but by August of 1939 only 26 were finished with just 23 being delivered to fighting units. The TKS(L) were delivered to the 101st BKM, the SK of the 10th and 11th BKM and of the WBP-M, and to the 71st Armored Group (Wielkopolski BK) and the 81st Armored Group (Pomorska BK). Each of these units received 4 vehicles, except the 81st Armored Group which only received 3. The TKS(L) were used as platoon leader vehicles.

† Most of the TKS series of tankettes were in poor mechanical condition—lack of spare parts was always a problem, along with short track life. Therefore, each time a Mechanical Reliability DR is made for a TKS or TKS(L), an 11 indicates that the AFV has stalled or suffered some other mechanical problem that has prevented it from starting normally. Its owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to stop, but excluding the MP expended to start) that the AFV has used in the unsuccessful attempt to move. It can again attempt to move, but must expend another MP to start—and must undergo another Mechanical Reliability DR as it does so. Should the Stall result in more Delay MP being expended than the AFV has available, the AFV is considered to have expended its entire MP allotment in Delay.

2. Vickers Edw(b) & Ejw(b): In 1931 the Polish Army purchased 38 Vickers-Armstrong 6-ton tanks from Great Britain. Two different models were purchased, 16 vehicles of the Model E Mk A version mounting a 47mm Vickers-Armstrong gun and a single water-cooled 7.92mm Browning machine gun and 22 of the Model E Mk B version featuring twin turrets, each housing a wz.30 7.92mm machine gun. The tanks were dubbed Vickers Ejw (for the single turret version) and the Vickers Edw (dw denoting double turrets). In 1939, the Vickers tank served in the 12th KCL of the WBP-M and the 121st KCL of the 10th Mechanized Brigade. Both formations consisted of 16 tanks (plus one in reserve), 1 for each commander and 3 platoons of 5 tanks each, with dw and jw models evenly dispersed.

† The Edw version of the Vickers possesses a 6FP CMG in each of two separate turrets, one on each side of the tank's chassis, as its MA. Each turret's CMG rolls its TH/TK/IFT DR separately. Furthermore, the tank must use two different TCA markers. The turrets are restricted in their TCA per the following diagram:

† Use separate TCA/MA Malfunction (Disabled) counters for each turret (bottom counter port turret, top counter starboard turret). Treat each turret independently with regards to CE status, ROF, TH/TK/IFT, and MA malfunction. The vehicle does not suffer MA recall unless both MGs are disabled. Any adverse effect (e.g., Stun, Recall, etc.) applies to the entire tank as if it had one turret. Only one of the turrets need be CE for the Edw to qualify for the 1/2 MP road rate.

† **TURRET KNOCK OUT:** Whenever the modified TK DR of a Direct Fire non-HE (C7.7) turret hit is equal to the final modified TK number, the vehicle suffers a Turret Knock Out (TKO) instead of a Shock, and is marked appropriately. Which turret is affected depends upon the side of the vehicle—Port or Starboard—from which the fire emanates. If the fire emanates from directly along the hexspine of the vehicle's (rear) CA, a subsequent dr is made: 1-3 Port turret hit, 4-6 Starboard turret hit. The affected turret must BU, cannot become CE, cannot change its TCA, and has its MA Disabled. The crew then takes an Immobilization TC (D5.5). An AFV suffering a TKO must pay an additional +1 for all subsequent shots (from the still functioning turret) that incur a Case A To Hit Modifier. All subsequent hits on a knocked out turret are treated normally.

† **TCA & CASE A:** Vickers Edw turrets may change TCA simultaneously but must pay Case A (D3.52) penalties independently (and cumulatively).

• EX (see above diagram): The Port MG can attack the 4-6-7 with 6FP and +3 DRM for the TCA change, or the Starboard MG could attack with 6FP and +2 DRM, or the two MG could firegroup to attack the 4-6-7 with 12FP and +5 DRM for the cumulative TCA changes.

• † **ARMOR LEADER:** An AL can use his leadership modifier for the first, and only the first, turret firing its MA separately in any friendly fire phase, and for both turrets whenever they form a firegroup.

3. 7TPdw & 7TPjw: In 1934 workers at the PZInz factory began working on modified versions of the British Vickers tank. In an effort to increase armor protection yet maintain running performance, a 110hp Saurer-designed diesel engine was incorporated, replacing the existing 80hp air-cooled gasoline engine. This project became known as the 7TP and would result in Poland's finest combat tank and the world's first mass produced diesel-powered tank. Two models were designed, the first being a twin-turreted version utilizing the Vickers twin turrets and designated the 7TPdw. The 7TPdw appeared in late 1934, with the first series being built and finished in early 1935. During that same year, plans for the second version—called the 7TPjw—were finalized around a brand new single turret mounting the Swedish-designed 37mm Bofors gun and a single 7.92mm machine gun. The production of this version began in the latter stages of 1937. On September 1, 1939 there were 139 examples of the 7TP in commission, with 22 dw's in active service. Used partly to train tank crews, the dw did see action but most were destroyed early in the fighting or

H

during the final days of retreat. There were two battalions (the 1st and 2nd *BCL* with 49 tanks each) and two companies of 7TPs (the 1st and 2nd *KCL*, both of the Warsaw HQ, with 11 tanks each) in existence. The 1st *KCL* is known to have been composed entirely of 7TPdws. A platoon of 7TPs consisted of five tanks.

† The 7TPdw uses all special rules for two turrets (Polish Vehicle Note 2).

near the Ukrainian Front.

cars were integrated into the "Freikorps" group of the National Defense, renowned for having defeated the Germans near the mines of Michalkowic.

vehicles.

† The wz.29 "Ursus" has two MG: one rear BMG that fires through the vehicle RCA (as signified by "BMG=RVCA only" on the counter) and a rear CMG that fires through the vehicle's left rear TCA (as signified by "CMG=LRTCA only" on the counter). See diagram below:

They consisted of a commercial chassis along with turret armor from obsolete Polish wz.28 armored cars. Three models of this armored car were built: the wz.34 and wz.34-I were both armed with a 7.92mm Hotchkiss MG and the wz.34-II was armed with a 37mm Puteaux SA 18 gun. The three models are referred to as either version I (representing both the original wz.34 and the wz.34-I) or version II. In September 1939, eighty wz.34s of all types were in front-line service, with several more serving in training schools of the Polish Cavalry. The wz.34 was used in 10 of the 11 armored groups of the *BK* (21st, 31st, 32nd, 33rd, 51st, 61st, 62nd, 71st, 81st and the 91st Armored Groups) with eight wz.34 AC in each: the HQ vehicle, the AC squadron leader, and 2 platoons of 3 vehicles.

4. *H35(f)*: Three French H35s were in Poland making trial runs for the Polish Army on September 1, 1939. These three tanks were integrated into the improvised unit "Polkompania J. Jakubowicza" and fought with group Dubno

5. *Peugeot 1918(f)*: In 1920, Poland purchased twenty Peugeot armored cars from France. Only a handful still existed in 1939, and these were in the hands of the *Katowicz* Police Forces. At the beginning of September 1939, these armored cars were integrated into the "Freikorps" group of the National Defense,

6. *wz.29 "Ursus"*: Only eight of these ancient vehicles existed by September 1939, all in the 11th *DPhy* of the *Mazowska BK*. They proved durable until taken off-road where they quickly earned a reputation as "incredibly unreliable"

7. *wz.34-I & II*: 86 of these light armored cars were manufactured by Poland in 1934.

Vehicle 13

8. *De Dion-Bouton wz.24(f)*: Four World War I French De Dion-Bouton AA mobile guns (French Vehicle Note 23) with their De Dion-Bouton ammo trucks were still in service with the Polish Army in September 1939. These eight vehicles were used by a section of motorized AA Guns of the 1st Anti-Aircraft Artillery Regiment in Warsaw.

† This vehicle requires the use of an Ammo Vehicle (E10.) or Ammo Dump (E10.6) in order to fire (i.e., to be considered functioning armament).

† The MA may not fire at a target that lies within the Dion-Bouton's rear target facing, nor may the TCA ever coincide with the vehicle's rear VCA, even when changing the TCA. These restrictions are signified by "Rear TF NA" on the counter. (For example, see the diagram accompanying French Vehicle Note 23.)

† Reverse movement costs this vehicle twice its normal hex-entry costs—as signified by "REVx2" on the counter.

9. *PF 621L SPAA*: In 1936 the Polish Army decided to remount twelve of the wz.18/24 AA guns onto the more modern Polski Fiat 621L chassis. These twelve vehicles served in the 1st Anti-Aircraft Artillery Regiment in Warsaw.

† The MA may not fire at a target that lies within the Polski-Fiat's rear target facing, nor may the TCA ever coincide with the vehicle's rear VCA, even when changing the TCA. These restrictions are signified by "Rear TF NA" on the counter. (For example, see the diagram accompanying French Vehicle Note 23.)

10. *302T*: An armed version of the Polish Polski-Fiat 508/518 light truck, dubbed the 302T, was produced at the PZInz factory in 1938-39 for the Cavalry and was to serve as a motorized *Taczanka* ("gun-cart"). The rear of the 302T was modified with a platform on which a wz.30 Browning HMG was fixed on an anti-aircraft mount. The 302T served in the heavy weapons sections of the 10th *BKM* and the *WBP-M*. Twelve 302Ts was the normal allotment to a cavalry MG company. A total of 86 motorized "Taczanka" were built.

† The 302T carries a 5FP AAMG which can be Removed (D6.631) as a 6FP dm HMG.

11. *C2P*: The C2P artillery tractor was a conversion of the TKS tankette chassis. Entering service in 1937, the first batch of 196 C2Ps was delivered in 1937 and into early 1938. A second production run (about 120 vehicles) was finished in 1939. Approximately 270 were in service in September 1939. The C2P artillery tractor was used to tow the 40mm Bofors wz.36 in various Polish Army formations (usually in four-gun batteries).

12. *C4P*: In 1934, studies were conducted by PZInz to modify the Polski-Fiat 621L truck into an artillery halftrack able to tow guns upwards of 155mm. Four hundred C4P/wz.34 tractors were produced, including approximately 330 tractors and ambulances. Thirty were of the "workshop" version. The game piece represents all three variants.

13. *Horse-Drawn "Taczanka"*: A horse-drawn version of the 302T "Taczanka" was developed for use within cavalry units. Each infantry division had 132 wz.30 MG while the four Regiment Cavalry Brigades had 95. Most cavalry MG were mounted on horse-drawn Taczankas. The older wz.28 version was designed for the HMG Maxim Model 08 fitted with a shwarlose sledge mount. These were gradually replaced by the wz.37 which was hinged in the center to provide better turning and designed for the wz.30 MG (an unlicensed copy of the Browning water-cooled .30 caliber MG). The game piece represents both versions.

† The "Taczanka" is treated as a Horse-Drawn Transport (D12.) for all purposes except as noted.

Vehicle 13

† The “Taczanka” starts each scenario with a 2-2-8 crew as a Passenger that applies to the vehicle’s PP capacity (D6.1).

† The AAMG of a “Taczanka” is fired by a Good Order Passenger, but may neither Motion Fire nor Bounding (First) Fire—as signified by “No Bnd(F)F” on the counter. Furthermore, the AAMG of a “Taczanka” may not fire at a target that lies within the VCA as signified by “Fire VCA NA” on the counter. The AAMG may never be scrounged/Removed as signified by “AAMG no Scrounge/Removal” on the counter. Captured use penalties apply to the use by opposing forces of the AAMG but not to the “Taczanka” itself (A21.22).

† D12.2 **TRANSPORT**: A “Taczanka” may never combine with another Wagon.

† D12.3 **TARGET STATUS**: A “Taczanka” is treated as a Small Target (D1.73).

† D12.4 **GALLOP**: The AAMG of a “Taczanka” is eliminated on a Wreck Check dr of 6 as signified by “Wrck Chck dr 6=Elim” on the counter.

BELGIAN VEHICLE NOTES

14. VCL Mk VI/c47(b): In the early 1930s, Belgium ordered the British Vickers Carden-Lloyd carriers to perform towing duties for the 7.6cm mortar. The vehicle was ill-suited to the task. The Belgian army then decided to mount the 4.7

FRC mle 32 anti-tank gun on these vehicles, making it one of the very first self-propelled anti-tank guns in the world. The first six vehicles were allotted to the *Chasseurs Ardennais*. In May 1940, several were in service with the 8th Company and the 2 Regiment *Cyclistes Frontières* and saw combat along the Meuse River. In order to deliver accurate fire, the vehicle had to be anchored into the ground. The traverse of the gun was only 5 degrees so that the entire vehicle had to move to adjust the gun’s line of fire.

† The Inherent crew receives a +2 CE DRM only to Direct Fire traced through the VCA as signified by “CE DRM VCA Only” on the counter.

† This vehicle may not change VCA and fire its MA during the same phase (MPH and DFPH are counted as one phase) of any player turn as signified by “VCA change=No Fire” on the counter.

15. T-13 Type II(b): After rejecting the VCL Mk VI as too light for general use, the Belgians turned their attention to the export version of the Vickers Carden-Lloyd “Dragon” Mk I. At least 56 chassis were ordered, with 14 to be set aside

for use as artillery tractors. The rest were equipped as “*auto-porté C 47 sur T-13*” (T-13 for short) for use with the *Chasseurs Ardennais* (30 vehicles) and the *Cyclistes Frontières* (12 vehicles) divisions. In 1938 330 of these vehicles were ordered. The T-13 was to equip the 16th Company of each of the 3 regiments in the *Chasseurs Ardennais*. Each of the twelve active divisions was to contain a company of twelve vehicles. Four vehicles were assigned to the 7th Squadron of each cavalry regiment, while the Brigade of Dragoons also had a company of 12 vehicles. The *Cyclistes Frontières* and two light regiments were also equipped with the T-13. The T-13s were an unusual vehicle in every sense of the word. The MA and CMG were mounted in a turret that was rear-facing. This rear-facing turret was unarmored in its rear (the vehicle’s forward covered arc). To fire the weapons of this tank through any direction other than the rear of the vehicle, the crew had to fold down the armored sideplates of the turret—which also required the driver to exit the vehicle. Obviously this was not a tactic commonly used, nor was it encouraged, but should a situation arise in which the vehicle were to become immobilized or bogged it was used as a last resort if the crew needed to bring the guns to bear on a target outside the vehicles rear covered arc. This design concept was meant to show the defensive role of the vehicle as the Belgian government did not want to appear aggressive in that delicate era of neutrality.

† This vehicle’s turret aspect (C3.9) is treated as unarmored to Direct Fire through its RTCA. If the TCA is different than the RVCA, however, the vehicle’s turret aspect is treated as unarmored to Direct Fire emanating from outside the TCA, it receives a +1 CE DRM to Indirect Fire as signified by “Ind Fire +1 CE DRM” on the counter, and its CS# becomes 2.

† This vehicle must be Stopped to change TCA and may not change TCA in the same phase (MPH and DFPH being counted as one phase) of any player turn it fires its MA/CMG and/or moves as signified by “TCA Change=No Fire/Move” on the counter.

EX: Under normal circumstances, the T-13 II(b)’s TCA will be facing to the rear as shown. The 4-6-7’s IFT attack (emanating from within the VCA) would treat the vehicle as unarmored, whereas both the IFT attack of the 4-6-8 and any hit by the ATR would treat the vehicle as armored. If, however, the TCA coincided with the VCA, then the IFT attack of the 4-6-7 would treat the vehicle as armored; any Turret Hit by the ATR would be against an unarmored Aspect and the IFT attack of the 4-6-8 would treat the vehicle as unarmored (since both attacks emanate from outside the TCA).

16. T-13 Type III(b): The late version of the T-13, designated Type III, received a new suspension and had a forward facing turret with full traverse capabilities. Weight was added which increased both MA accuracy and vehicle stability. The new Vickers Carden Lloyd chassis for this vehicle was built entirely in Belgium. An initial order for 194 T-13 Type III “tractors” was placed with the *Familleureux Construction Works* (FRC) in 1938. An additional 158 vehicles were ordered in September of 1939. The T-13 Type III was used by the *Cyclistes Frontières*, as well as infantry and cavalry units.

T-13s and T-15s (Vehicle Note 17) were often mixed at the platoon level. In actual use, T-13 units were often split up and the tanks used singly or in pairs.

17. a.b./Mi T-15 (b): In 1933 the Belgian Army decided to acquire a light tank to provide fire support to the newly motorized cavalry regiments. In March 1934, 18 Vickers Carden-Lloyd (VCL) light tanks (with a special turret) were ordered from Vickers Armstrong Ltd. in Britain. A second order of 24 vehicles was shipped in April 1935. The 1935 model of the VCL light tank built for Belgium had a more powerful engine than its English predecessor (model 1934) and its turret had a conical instead of a cylindrical shape. In Belgium, the tank was designated the *auto blindée mitrailleuse* (a.b./Mi for short) T-15 as an attempt to conceal the offensive potential of the vehicle. The T-15s were delivered without any armament but were fitted with 13.2mm Hotchkiss MG in the turret by the Belgians. After some trials, the 42 T-15s were dispatched to the three Regiments of the 1st *Division Chasseurs Ardennais* and to the six motorized regiments of the 1st and 2nd Cavalry Divisions. Theoretically, one platoon (*peloton*) of three should have equipped the 10th Motorcyclist Company of each *Chasseurs Ardennais* regiment, and one platoon of six should have equipped the 7th *escadron* of each of the six motorized cavalry regiments, but not all units received the full complement.

18. ACG1(f): Although actually a tank, this French design was considered an armored car. The ACG1 was supposed to equip the three French cavalry divisions, but the first vehicles delivered in March 1937 were unsuitable for service and discarded. After modification, Belgium purchased 12 AMC 35 ACG1 carriages in 1937, the first of which was used during the *Chasseurs Ardennais* trials in August 1937. The tank was judged too heavy for the terrain and given to the cavalry corps. The other eleven tanks were delivered on January 11, 1938 and sent to a factory in Gand where they were stored in an open

H

field without turrets. In the event of mobilization, the plan was for the ACG1 to be formed into a single tank company to be known as the *Escadron d'autos blindées du Corps de Cavalerie* (or a.b.C.C. for short), a name designed to conceal the fact that these actually were tanks. On January 9, 1939, the *Escadron* was mobilized even though its tanks were still turretless. In February 1939, eight of the tanks were fitted with the Belgian 47mm *FRC* anti-tank gun and a Hotchkiss 13.2mm CMG. The *Escadron* had two platoons of 4 ACG1s. The Germans captured a few of the surviving vehicles and used them as instructional vehicles, naming them *PzKpfw 738(f)*.

† The ACG1's CMG is treated as a 12.7mm machine gun, with a normal range of 16 hexes as signified by "CMG range=16 hexes" on the counter.

YUGOSLAV VEHICLE NOTES

At the time of the German invasion in 1941, the Yugoslav Army had two tank battalions. The *I Bataljon bornih kola* (I Bbk) was composed of 48 FT-17 and similar French-built tanks, and in 1937 a further squadron of 8 Skoda Sld Czech tanks was added. The II Bbk was formed in 1940 with French Char R35s, but it is not clear how many arrived in Yugoslavia prior to French surrender. The III Bbk was to be equipped with Polish 7TP light tanks but this fell through with Poland's surrender in 1939; instead the unit was formed in the Soviet Union and composed of 120 BT-7s. The III Bbk was not fully formed when the Germans invaded in 1941 and never saw action. The actual role of the II Bbk during the invasion is not clear but upon Yugoslavia's demise, the equipment from this unit was turned over to the Rumanian army.

The Yugoslavs had a long tradition of guerrilla resistance to foreign invaders and no sooner had things quieted down after the German invasion than partisan bands began to form in the hills of the Yugoslav countryside. Over the next four years some of these bands united under Josef Broz Tito and became the largest and most successful of all of Europe's underground forces, being the only partisan force to liberate its own country. It was also the only resistance group to field substantial armored forces. The first tank of Tito's armored force was a French Char 39H which was captured from the Germans in Serbia on September 9, 1941, and saw extensive service well into 1944. Throughout 1942 additional tanks were captured, mostly from the Italians who had assumed the bulk of anti-partisan duties in this area of the Balkans. The Italian capitulation in 1943 and increased partisan activity led to the formation of a number of *tenk bataljon* (tank battalion) and *tenk ceta* (tank companies). The two largest were the *Tenkovski bataljon gs nov i po Hrvatke* in Croatia, which fielded three *tenk ceta* with a total of 12 Fiats, 1 Hotchkiss, 1 Somua, and assorted auxilliary vehicles, and the *Tenkovski Bataljon 4. korpusa novj* in Slovenia, which fielded 1 AB41, 1 M13/40, 6 L6s, and 4 L3s. Both of these units were supported by motorized anti-tank sections using Italian trucks and 47mm Italian anti-tank guns, as well as captured German PaK 40 anti-tank guns. In the fall of 1943, Tito's partisans began to receive substantial Anglo-American assistance, in terms of both arms and training, and in early 1944 it was decided that an armored brigade would be formed. Veteran partisans were sent to North Africa and trained in the use of American and British armored fighting vehicles. In July 1944 the *I Tenkovski Brigada* (1st Tank Brigade) was formed at Bari, Italy. The tank component was broken into 4 battalions, each with two companies. Initially, brigade strength was 56 M3A1 and M3A3 Stuarts, 24 AEC Mk II Armored Cars, and additional soft-skinned vehicles. Brigade anti-tank companies were formed with the British 6-pounder. During 1945, the brigade strength was increased to 75 Stuarts. At the same time that the 1st Brigade was being formed in Italy, the *II Tenkovski Brigada* was formed in the Soviet Union, consisting of 2 battalions of two companies each, for a total strength of 64 T-34/85s. Both the 1st and 2nd Brigades saw action before the war ended. During the course of the war, Yugoslav partisans claim to have destroyed or captured nearly 900 German and Italian armored fighting vehicles.

19. T-32: In 1937, the Yugoslav army purchased 8 Czech-made Sld assault guns from Skoda and designated them T-32. These 8 vehicles formed their own squadron and served in the I Bbk of the Yugoslav army during the fighting in 1941.

These vehicles featured a 37mm vz 34 gun with a 7.92mm machine gun mounted in the right front portion of the hull. This tankette featured a crew of two and was used in action in 1941 against Germany in the fighting at the gates of Belgrad. The German Army designated captured vehicles of this type the *PzKpfw 32(j)*.

Vehicle 24

20. M3A1(a) & M3A3(a): 56 Stuarts were part of the initial allotment of vehicles given to Tito's partisans in Italy in July of 1944 by the British. This number was increased to 75 Stuarts in 1945. These tanks formed the backbone of the *I Tenkovski Brigada* (1st Tank Brigade). RF is 1.4 in 7/44-12/44. RF is 1.2 and 1.3 respectively from 1/45-5/45

21. M3A3(a) PaK 40: During the Yugoslav 1st Tank Brigade's drive to recapture their homeland, a battery of M3A3 Stuarts were upgunned and re-armed with captured German PaK40 to provide infantry fire support and an increased anti-tank capability. The turret of the Stuart was removed, and the gun, carriage and all, was mounted in its place.

† A TK DR on a turret hit is resolved as if against an unarmored target.

† The Gunshield provides no protection for the vehicle, but Direct (only) Fire attacks vs the vehicle which emanate from within its VCA, and which do not destroy it, affect its crew as if the crew were manning a non-Emplaced, non-vehicular AT Gun.

fully traversable.

† A TK DR on a turret hit is resolved as if against an unarmored target.

22. M3A3(a) FlaK38: This was another Yugoslav partisan effort to increase the firepower of the American Stuart, in the form of the German 2cm FlaK 38 anti-aircraft gun. Unlike the PaK 40 model, the gun on this vehicle was

23. AEC II(b): In 1944, Tito's partisans received 24 AEC II armored cars from Great Britain which were used in the *I Tenkovski Brigada* (1st Tank Brigade).

DANISH VEHICLE NOTES

24. Nimbus 20mm TD Motorcycle: Mounting a 20mm anti-tank cannon on the sidecar, this quick, mobile anti-tank platform proved to be a somewhat effective solution. The gun could be driven into position quickly and immediately engaged by the dismounted crew. The Nimbus sidecar counter actually represents a team of soldiers and motorcycles. The sidecar mounting the 20mm cannon was supported by another sidecar mounting an anti-aircraft machine gun and 4-6 other motorcycles. Although the Nimbus frequently jammed, access to the drum made unjamming and repairing it a rapid process.

† All rules pertaining to motorcycles (D15.) apply unchanged to the Nimbus except as noted below.

† This vehicle starts each scenario with two 2-2-8 crews as Riders. Contrary to D15.4, a Nimbus with a disabled MA/AAMG may move even with only a HS or crew riding it. A SMC may create a single machine from a Nimbus Motorcycle counter but that machine cannot transport either of the weapons inherent on the Nimbus Motorcycle. Nimbus Riders may not Deploy.

† The Nimbus has no portage capacity.

† The B# for the 20L MA is decreased by one to B10 when using IFE as signified by "IFE=B10" on the counter. The MA is repaired on a Repair dr of 1 or 2 or disabled on a dr of 6 as signified by "R2" and "X6" on the counter.

† The Nimbus MA may be fired by dismounted Infantry (only) in possession of the Nimbus and may do so as Bounding First Fire during its MPH. Such a possessed Nimbus (and its manning Infantry) may expend MP to change its VCA during the MPH while *Stopped* (even though unmounted) but at twice the normal MP cost (D2.11). Provided the manning Infantry retains possession of the Nimbus throughout the MPH, it may even (contrary to D6.4) mount the Nimbus after the vehicle has expended MP.

† Case C: Despite being NT, the Nimbus incurs a +2, not a +3, Case C To Hit DRM.

† The 20mm M-35 AT Gun (see Danish Ordnance Note 19) may be (un)hooked by dismounted Infantry in possession of the Nimbus at a cost of 2 MF (and 1/2 of the Nimbus' MP allotment); place a disabled MA counter on the motorcycle when unhooking the Gun.

Abandoning requires all the crew's MF). The dismounted crew fires the AT Gun and retains ROF. Wishing to fire again outside the VCA, the Nimbus (although still Stopped) changes its VCA (2 MP) and fires again (with the same +4 Case C DRM). The crew then re-mounts the Nimbus for another 6 MP (and a total of 15 1/2 MP). If the AAMG wishes to fire this turn, it must do so now (D3.51). The Nimbus then starts, enters X5, and stops for 2 1/2 MP (total of 18 MP). The crew dismounts again for 6 MP more, and fires on its last MP. Despite still retaining ROF, it cannot fire again in the MPH, but may fire once more in AFPh (D3.32).

In the Nimbus' next MPH, the dismounted crew unhooks the AT Gun for 2 MF while the mounted crew uses all its MF to Abandon the Nimbus and Remove a dm MMG. If both crews were mounted, one would first have to dismount at a cost of 1 MF before unhooking the Gun. If the crews had merely dismounted and moved away, a squad could subsequently enter X5 and Recover the Nimbus. It could then fire both the AT Gun and the AAMG (unqualified use for the former, but not the latter) or mount the Nimbus and drive away.

† A Rider may Remove the 2FP AAMG as a dm Allied Minor MMG by dismounting the Nimbus as if it were a crew Abandoning a vehicle and placing a disabled AAMG counter on the Nimbus.

† D15.46 *Wreck Check*: A Wreck Check dr of 6 results in a malfunction of both the 20L AT and the AAMG.

† D15.51 *KIA*: A KIA result vs a Nimbus' cyclist results in elimination of the Nimbus and all its still inherent weapons.

† D15.52 *K/#*: A K/# result vs a Nimbus' cyclist results in the replacement of the Nimbus counter with a regular half-squad motorcycle.

† D15.6 The AAMG of a Nimbus can be fired by Riders on the Nimbus (with no penalty for Mounted Fire D15.6) or, if riderless, by dismounted Infantry in possession of the Nimbus, in either case, with no penalty for Unqualified use. The Nimbus may be possessed by dismounted Infantry despite having Riders, thus allowing the AT weapon and the AAMG both to be fired in the same fire phase.

† D15.7 Captured use penalties apply to the use by opposing forces of the weapons still inherent to the Nimbus, but not to the vehicle itself.

DUTCH VEHICLE NOTES

During World War Two, the Dutch Army, known as *Koninklijke Landmacht* (KL, Royal Land Forces), served only in the Netherlands; the *Koninklijk Nederlands Indische Leger* (KNIL, Royal Dutch Indies Army), served in the Dutch East Indies (now Indonesia); and the *Korps Marinier* (Marine Corps) served in the Netherlands, as well as in the Dutch East and West Indies. The KNIL was separate from the army in Holland, and often ordered its own equipment.

25. *VCL M1936(b)*: The Dutch had placed an order with Vickers Armstrong for 73 vehicles of the VCL Model B 1935 light tank (Chinese Vehicle Note 1) in 1935. At war's outbreak, fewer than 25 of these tanks had been received and were designated VCL model 36 *vechtwagen* ('fighting vehicle'). The KNIL's *Mobiele Eenheid* ('Mobile Unit'; the only armored Dutch unit in Java) had 2 platoons of 7 vehicles, with 3 vehicles in reserve. The Japanese managed to capture 15 vehicles when the Dutch surrendered and immediately pressed them into service.

† The Target Size TH DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream.

26. *CTLS-4(a)*: In 1940, the KNIL began a major modernization program. With Europe, and the motherland itself, either actively preparing for war or actively fighting it, an alternate source of vehicles had to be found. This left only the U.S. as a procurement source, but most U.S. factories were already committed to the expansion of the American forces or to the newly-created Lend-Lease program. The search for a company with uncommitted capacity led to Marmon-Herrington and, in 1940, the KNIL ordered a total of 600 light

EX: During the Nimbus' MPH it spends 1 1/2 MP to enter W6 and stop and spends another 6 MP (for a total of 7 1/2) for one 2-2-8 crew to dismount. This crew possesses the Nimbus and may fire the AT Gun in Bounding First Fire with a +2 Case C DRM (in addition to the +2 Case B DRM). The 2-2-8 Passenger crew may fire the AAMG with no penalty for Mounted Fire (although with the usual Bounding Fire penalty), but it may not at this point Abandon the Nimbus in order to Remove the MG (since

tanks of various new models just entering production. The first to be produced was the CTLS-4 light tank. It was built in two versions, the difference being which side of the vehicle housed the driver (some sources say this was to cater to European countries whose civilian vehicles featured a right-side driver). Design and production problems delayed the initial order until just after war had broken out in the Pacific. The Japanese invaded the Dutch East Indies in January 1942. In mid-February, the first of twenty-four Marmon-Herrington CTLS-4 light tanks were delivered to the Dutch forces in Java. The tanks arrived without armament, but machine guns similar to the Browning .30 caliber were procured from the Dutch Air Force and used to equip the vehicles. The first seven crews to be trained in the tank were issued vehicles on February 27, the day before the Japanese invaded Java. The KNIL surrendered on March 8, 1942, and the Japanese occupation forces found over a dozen of these vehicles in working order and quickly put them into service.

† The CMG MA may not fire at a target that lies within the port side of the CTLS-4's VCA. In addition, the TCA may not move "across" that area when traversing. See accompanying diagram and example. These restrictions are signified by "Port VCA NA" on the counter.

EX: In the diagram, the CTLS-4 (a) can fire at a target in hex F11 or F10. It cannot fire at a target in E12 or F12. If it wishes to fire at a target in G13 or H13, it must traverse its turret clockwise; i.e., the turret may not traverse across hexside F11-F12.

27. *Pantserwagen M.36 & M.38*: In 1935-36, the Dutch took delivery of 12 Landsverk L180 from Sweden and gave them the designation Pantserwagen Model 36. These vehicles were used to equip *1e Eskadron Pantserwagen* (1EPaw) stationed in s'Hertogenbosch. In 1938, a second squadron (2EPaw) was formed and stationed in Amersfoort. This unit was equipped with 12 Landsverk L182 (also from Sweden and designated Pantserwagen Model 38 by the Dutch Army). Along with this shipment came 2 M.38 command vehicles, one for each squadron. Both the M.36 and M.38 were medium armored cars armed with a Bofors 37mm gun and two Lewis 7.92mm machine-guns, but their armor was thin. The command vehicles only had dummy guns. Early during the German invasion, the 1EPaw operated in Gelderland and on the Grebbe Line. They were later ordered to fall back on Fortress Holland, a naturally defensible redoubt within Holland. The 2EPaw's armored cars were stationed at the airfields of Schiphol (Amsterdam), Ypenburg (The Hague), and Waalhaven (Rotterdam). These M.38s, as well as the M.39s of the 3rd EPaw (see Vehicle Note 28) operated in the province of Zuid Holland (South Holland) where the majority of German airborne operations took place. When the country capitulated, some of its armored cars were destroyed by their crews, although most were captured by the Germans and put to use as police vehicles. The Danish army also bought 2 Landsverk L180 from Sweden but they are not believed to have seen action.

28. *Pantserwagen M.39 "Lynx"*: In 1939, the Dutch formed and equipped the 3EPaw with 12 DAF Type 3 armored cars, given the designation M.39 by the Dutch Army. Built by the *Van Doorne Aanhanwagen Fabriek* (now known as the *Van Doorne Automobielen Fabriek*), the vehicle mounted a Bofors 37mm gun and a 7.92 machine-gun in the turret, as well as two 7.92 machine-guns in the hull. It featured all-wheel drive and had small roller wheels, mounted on the chassis about 18" above the ground, in front of the rear tires to prevent the low-sitting hull from grounding when crossing obstacles. Not all vehicles, though, were fully equipped by the time the Germans invaded.

The Danish Army had purchased 3 DAF M.39s, but none saw action.

29. *Marmon-Herrington III (b) Armored Cars*: The British supplied the Dutch East Indies with the Marmon-Herrington III MFF (British Vehicle Note 48) after the vehicles had finished service with the British army in the Libyan desert. Approximately 50 arrived prior to the Japanese invasion but they did so with no main armament. The KNIL improvised by mounting twin Vickers machine guns in the turrets. The *Depot Vechtswagen* had 10 MH III armored cars assigned to it and they were almost all eliminated on 5 March 1942 in a battle outside Bandoeng.

† Make two To Kill DR on the MG column when using the AP To Kill Table; only one DR (firer's choice) is used.

† Reverse Movement costs this vehicle three times its normal hex entry cost—as signified by "REV x3" on the counter.

H

30. *Jeep(a)*: The KNIL forces had approximately 110 US Willys Jeeps (U.S. Vehicle Note 54) in service when the Japanese invaded Java. They were issued to motorized *eskadrons* of the cavalry in 2 platoons (11 Jeeps each). Each platoon had a Vickers section which consisted of 2 Jeeps mounting Vickers MMG. The MG armed versions were labeled "Blitsbuggys" by the Dutch. In Java, they were found in *depot vechtwagens eskadrons HQ* of the KNIL with 6 Jeeps and in the *Verkennde en beveiligende Afdeling* (Mobile Recon Unit) which had one Jeep platoon assigned to it.

† If armed, the *Jeep* has an Inherent crew and thus a CS# instead of a cs#. The *Jeep's* optional AAMG is a MMG (RF 1.4) and may be Removed (D6.631) as such.

† This vehicle has Low Ground Pressure (D1.41). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle's Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract two (one per crew/HS) from its immediately-subsequent unbogging DR.

COMMON ALLIED MINOR VEHICLES

31. *L5/30 (i) & L3/35 (i) & L6/40 (i) & M13/40 (i)*: Tito's partisans and the Greek army were the main benefactors of captured Italian tanks and tankettes during WWII. Tito's partisans are known to have captured a significant number of L6/40 tankettes (Italian Vehicle Note 6) which were immediately pressed into service during the infant stages of the revolt and formed the first partisan tank brigade. The L3/35 (Italian Vehicle Note 2) was the first tank used operationally by the Greek army during the Greek-Italian war in 1940. During the Kalpaki-Kalama battle, 35 L3/35s were captured intact or recovered by Greek engineers. The Greeks formed an armored squadron with

these tankettes which was part of the M.C.R., or Mechanized Cavalry Regiment. L3/35s also participated in the attack on the city of Argirocastro on 8 December 1940. Later, the surviving L3/35s were incorporated into the 19th Motorised Division and fought the German army in the Doirani area of Macedonia. The L5/30 (Italian Vehicle Note 1) and M13/40 (Italian Vehicle Note 8) also saw service with both Greece and Tito. **L3/35 RF is 1.4** for Greece in 11/40-5/41. **L6/40 RF is 1.4** for Yugoslavia in 42-44. **All other RF are 1.6.**

32. *FT-17M(f) & FT-17C(f)*: Poland acquired 120 FT-17s (French Vehicle Note 1)

along with the production license from France in 1919. Of these, 42 were armed with a MG only, while the other 78 were armed with a 37mm gun. The Poles then started to build their own upgraded version of the FT-17 at the CWS works of Warsaw. 174 were produced before 1936. In 1939 the Polish Army still had 102 operating versions of the FT-17 in service. About half of these were used by armored train units in a scouting role, with the remainder being used in three independent companies, the 111th, 112th, and the 113th *KCL*. Each *KCL* consisted of 15 FT-17s. These companies saw action around the fortress of Brzes in the third week of the Polish Campaign. **RF is 1.2 from 9/39-10/39.**

There were two FT-17Ms in service with the Dutch Army in 1940. **RF is 1.6 in 5/40.**

In the spring of 1941, the Yugoslav *I Bataljon bornih kola* (I Bbk) consisted of a combination of 48 FT-17s and similar French-built tanks. **RF is 1.4 in 4/41.**

At the start of the Italian invasion in 1941, the Greek army had 11 FT-17s acquired in the early 1930s. **RF is 1.6 from 10/40-5/41.**

† Minimum road-MP cost is one MP; i.e., no FT-17 may use the 1/2 MP road rate even if CE—as signified by "Road Rate NA" on the counter.

33. *R-35(f)*: In 1939 the Polish army received a battalion of 49 French R-35 light tanks out of an original order of 100. 45 of these tanks were used to equip the 21st *BCL*, which was only partially trained and was withdrawn into Romania without seeing any combat. The remaining 4 R-35s did see action in an improvised unit designated "*Polkompania J. Jakubowicza*." This unit was formed at Kiwerach on September 14th and included the three Hotchkiss tanks in the Polish arsenal. This group saw action with Group Dubno near the Ukrainian Front against both German and Red Army formations with one R-35 reported lost. **RF is 1.6 from 9/39-10/39.**

The Yugoslav II Bbk was to be equipped with 50 R-35s purchased in February 1940 from France, although it is unknown how many, if any, of these tanks reached Yugoslavia before the fall of France. **RF is 1.4 in 4/41.**

34. *M3A1 Scout Car(a)*: This vehicle (U.S. Vehicle Note 39) was supplied to the *I Tenkovske Brigada* (1st Tank Brigade) of the Yugoslav Partisan army by

the British in 1944. **RF is 1.5 from 7/44-45.**

The Dutch KNIL had placed an order for 400 M3A1 Scout Cars from the U.S. but had only received 25 by the time the Japanese had invaded Java. They were armed with a Browning 12.7mm MG. **RF is 1.4 from 2/42-3/42.**

† Each M3A1 Scout Car (a) starts the scenario with an inherent crew, and also with a 1-2-7 Partisan HS or 2-3-7 Allied Minor HS (depending upon the nationality) as a Passenger that applies to the vehicle's PP capacity (D6.1). This vehicle can retain any unpossessed SW aboard it (D6.4), its crews/Passengers may Remove either of its MG, and Mounted Fire penalties (D6.1) do not apply to its Passenger(s). The MA is Removed as a dm .50-cal. HMG and the other MG is removed as a dm MMG.

† The AAMG FP actually consists of two MG: one .50-cal HMG (MA; 4FP) and one secondary .30-cal MMG (2FP)—as signified by "4MA&[red]2" on the

Vehicle 34

counter. The Inherent crew may fire only the .50-cal MA unless it is malfunctioned or disabled, in which case the Inherent crew may fire the secondary AAMG instead. Otherwise, only a Good Order *Passenger* may use the secondary AAMG (as signified on the counter by printing its FP in *red*). Assuming they are properly manned, the MA AAMG and secondary AAMG may be fired together as a FG or at separate targets (as per D3.5). *The secondary AAMG, when being fired by a Passenger, counts as use of a SW by that Passenger.*

Each AAMG malfunctions and is repaired or disabled independently of the other. If the MA AAMG malfunctions, mark the vehicle with a "MA Malfunction" counter to show that its secondary AAMG is still usable. If the secondary AAMG malfunctions, mark it with an "AAMG Malfunction" counter. Since the ROF applies only to the MA (A9.2), the owner must announce before he fires that he is using the MA if he wishes to possibly retain a multiple ROF. An Armor/Passenger leader may direct the fire of more than one vehicular-mounted/Passenger-fired MG only if those MG are firing together as a FG.

halftracks from France. Of these initial 50, 28 were model P17s and 22 were model 19s (French Vehicle Note 25). The former were used for towing artillery pieces in the 1st Regiment of Motorized Artillery (1PAMot). There were two sections of Motorized artillery in September of 1939: the 2nd Light in the Warsaw Mechanized Brigade, and the 6th Heavy attached to Army Lodz.

Belgium purchased the P14 in the early 1930s to be used for towing heavy artillery guns—the 120mm FRC M31 and 155mm howitzers. The vehicle served in this capacity so well that the Belgians purchased a license to build it themselves. The *CK P17(f)* with a Towing Number of 3 and a BPV of 10 can be used to represent the P14, **RF is 1.5**.

† Prior to setup, and in addition to the normal A2.9 10% Deployment allowance, the Polish/Belgian player may freely Deploy a number of squads sufficient to provide one Passenger HS for each *C-K P19* in his OB—excluding each such vehicle that will set up "towing"-a-gun/carrying-a-crew. These HS may Recombine (and the resulting squads may Deploy) as if they were Carrier HS and these vehicles were Carriers (D6.82).

for the KNIL, which used them on Java. Although dubbed "utility" by the Belgians, this vehicle proved unreliable in service as it could not withstand long distance travel. It was used mainly by the infantry regiments of the first 12 infantry divisions and also by the *Carabiniers Cyclistes*. A few also served with cavalry regiments. Each 47mm ATG company had 12 utility tractors, with another three held in reserve. Those captured by the Germans were used as *ArtillerieSchlepper VA 601(b)*. **RF is 1.3 for the Netherlands in 5/40, 1.1 for Belgium in 5/40.**

36. VCL Utility(b): Belgium ordered 262 of these light tractors from Great Britain in 1935. The Belgian army used this vehicle to tow the 47 FRC ATG (mle 32). Belgium later produced 550 of these tractors under license, including 50 for the KNIL, which used them on Java. Although dubbed "utility" by the Belgians, this vehicle proved unreliable in service as it could not withstand long distance travel. It was used mainly by the infantry regiments of the first 12 infantry divisions and also by the *Carabiniers Cyclistes*. A few also served with cavalry regiments. Each 47mm ATG company had 12 utility tractors, with another three held in reserve. Those captured by the Germans were used as *ArtillerieSchlepper VA 601(b)*. **RF is 1.3 for the Netherlands in 5/40, 1.1 for Belgium in 5/40.**

37. Light Truck & Medium Truck & Heavy Truck: The list of trucks used by the Allied Minor nations in WWII is varied and long. The generalization of all of the various truck types into three categories was done for a variety of reasons, chief among them simplicity. Trucks of other nationalities can be freely used as needed.

ALLIED MINOR MULTI-APPLICABLE VEHICLE NOTES

A. The following apply regardless of the counter's nationality, except as stated otherwise:

- "(a)", "(b)", "(f)", or "(i)" in the piece name stands for "American", "British", "French", or "Italian" respectively, for ESB (D2.5), Hammada Immobilization (F3.31), Sand Bog (F7.31), etc., purposes;

B. 37mm canister has 12FP.

C. May be equipped with a Gyrostabilizer as per D11.

D. If Stunned, this AFV may not regain CE status, may not fire a weapon, and is Recalled as per D5.341; these are signified by "Stun=Recall & CE/FP NA" on the counter.

E. The CMG may be repositioned as a 2-FP AAMG. This can be done only by placing an AA counter on the AFV at the end of any friendly fire phase (not MPh) in which its Inherent crew is CE and could have fired the MG (even if malfunctioned) but did not. This AAMG may fire only at a target that lies within the AFV's TCA—as signified by "AAMG: TCA only" on the counter. The AAMG may be repositioned as the CMG by using these same principles to remove the AA counter. This MG may be Scrounged (D10.5).

F. The CE DRM is +1 vs Indirect Fire, as well as vs Direct Fire that emanates from within the *turret's* rear Target Facing—as signified by "CE: +1 RT" on the counter.

G. Reverse Motion costs this vehicle four times its normal hex-entry cost—as signified on the counter by "REVx4".

H. This vehicle is always CE as signified by "Always CE" on the counter—it may never become BU.

K. Both MA MG are B11. This is signified by "B11" in *red* on the counter (**bold** in the vehicle listing).

L. The MA uses black TH numbers (unless captured), as signified by "Black TH#s" on the counter;

Q. The MA may use neither Bounding (First) Fire nor Motion Fire as signified by "No Bnd (F)F" on the counter.

V. This vehicle was used by the Dutch only in Java in 2/42-3/42 [EXC: if "Ψ" appears, it was used only in the Netherlands in 5/40].

AA. The MA has AA capability as signified by "MA:AA" on the counter.

H

POLISH ORDNANCE NOTES

1. *Granatnik wz. 36* : Fire support in both infantry and cavalry units was provided by wz.30 and wz.36 platoon mortars. These small 46mm mortars were of Polish design and fired a .76kg round. Around 3850 were produced through 1939 and 81 were issued to each infantry division with three per company.

2. *"Ur."* wz. 35 : Often described as one of the most successful anti-tank rifles of its day, the Polish 7.92mm wz. 35 "Ur" was lighter by a wide margin than most foreign counterparts and also pioneered the use of sub-calibre (i.e., APCR) ammunition. The latter aspect was quickly copied by other armies for some ATR and AT guns. Despite the high muzzle velocity, the small calibre and lighter weight of the projectile robbed the ATR of much of its effectiveness. The success of this ATR in 1939 was due as much to the thin armor found on contemporary German and Soviet AFVs as it was to the use of APCR ammunition. 3500 were produced and kept in sealed boxes labeled "Rifles for Uruguay" (hence the "Ur" designation). Although they were not issued until the war actually began, the fact that they functioned just like normal bolt-action rifle greatly simplified training and actual usage. The game piece also represents the British Boys ATR used in limited numbers by the Greeks.

3. *75mm wz. 02/26* : A rechambered version of the Russian Putilov 76.2mm Model 00/02 (see Russian Ordnance Note 13) gun adapted to fire French 75mm ammunition. Nearly 450 were in Polish service in 1939. In spite of its antiquity, it was surprisingly successful against armor—mainly because of the crews. Horse artillery crews were the elite of the Polish cavalry.

4. *100mm wz. 14/19* : A small number of these Italian Skoda guns were purchased in the early 1930s, along with a license to produce them (see Italian Ordnance Note 12). Approximately 900 were in service at the outset of the war.

5. *75mm wz. 97/25* : This counter represents four different models of French 75mm AA guns (see French Ordnance Note 21): the Model 17 mobile towed AA gun, the Model 97 and 97/25 semi-mobile AA guns, and the model 75mm wz. 22/24 gun commonly emplaced in static defense positions. 110 of these various guns were in Polish service. This piece (with a Manhandling # of 8 and RF of 1.6) also represents the 75mm AP wz.36 (*"armata przeciwlotnicza"* or anti-aircraft gun) which was the only Polish artillery piece designed and built in Poland. It entered service in 1936, and although 342 guns had been built by the war's outbreak, only 44 had been delivered to their respective units.

BELGIAN ORDNANCE NOTES

6. *DBT* : Designed by Belgian Denis-Bertrand-Trois (hence the name), the DBT was a small mortar launching a 600g grenade from 130-585 meters. The grenade fuse was non-adjustable, exploding 12 seconds after launch. This often resulted in the grenade rolling around for several seconds after landing, thus allowing the target to take cover.

† Due to the fuse delay, the DBT does not generate an Air Burst (B13.3).

7. *M76A* : Between the two world wars, the Belgian army searched for a replacement to the old short-barreled Schneider 75mm guns and DBT mortars. Low military budgets forced the use of captured German WWI trench mortars. A large stock of 76mm German *Minenwerfers* were still available with an ample supply of ammunition. Called the *Mortier de 7.6cm Allemand (M76A)*, this gun had a small removable wooden wheeled carriage that could be horse-drawn. To fire the mortar indirectly, the wheels were removed and the gun was set on a platform. Direct fire was possible with the wheels in place. This mortar was used against vehicles and tanks as well as personnel. Unloading the mortar from the caisson required approximately 5 minutes and was a strenuous task at best. The gun could be manhandled by six men or dismantled and carried by

Ordnance 14

nine. They were used in the *"batteries d'infanterie"* with 12 guns per battery, each battery having four sections of three guns.

† This weapon may be Pushed or Towed (as if a non-Mortar) in either Limbered or Unlimbered mode, but may only use Direct Fire while Limbered. While Unlimbered, it may only use Indirect Fire (as if a Mortar).

8. *7.6cm FRC* : Another model of WWI German trench mortar pressed into service after major changes were made by the *Fonderie Royale de Canons (FRC)*. The gun was restored in a way to allow it both direct and indirect firing capabilities from the same carriage, a significant enough change to warrant building a completely new version. The new carriage had split trails and two metal wheels, and could be transformed into a trench mortar by simply removing the trails (which gave it a trajectory of 45-80 degrees and a range of 650-2200 meters). A Belgian infantry regiment contained 2 platoons with 2 sections of 2 guns each in the *battalion d'engins* (heavy weapons battalion). 198 were available in May 1940.

† This Gun may also use Indirect Fire, for which purpose its range is "16-55" hexes and its ROF is 3 (if using Direct Fire it has no such minimum range and a ROF of 1). All rules applicable to firing a MTR (including the possibility of Spotted Fire and retaining Multiple ROF) apply to this Gun for Indirect Fire purposes. However, it may not use both Direct and Indirect Fire in the same phase (treating the MPH and DFPh as one). Switching from Direct to Indirect Fire or vice-versa does not cause loss of Acquisition.

9. *C47 FRC M32* : Each infantry division had one company of 12 guns shared by three batteries of 4 guns each. The Model 32 was manufactured by FRC and nicknamed the *"quatre-sept"*, or forty-seven. It was used to equip the T-13 and ACG1 tanks, and was also used in pillbox fortifications. The gun had a two-trail carriage and was transported on wheels that had to be removed when setting the gun into firing position.

10. *C75 TR* : This gun was a licenced version of the German Krupp 75mm M1905 field gun built by FRC. It was the main artillery piece of the Belgian army. 1 battery equalled 3 guns, 3 batteries equalled a group. The C75 TR (TR stands for *"tir rapide"*, or quick shooting) often equipped two groups of an artillery regiment. 396 pieces were in service in 1940, all horse-drawn. (See Japanese Note 12.)

11. *C75 GP* : The *canon de 75 Grande Portée* was a 1918 modification of the standard Belgian C75 TR involving a marriage of the Belgian 75 to the German WWI *10.5cm leFH 16's* field carriage (types I and II are identical for game terms). These guns were used by the Germans as the 75mm FK 233(b) and 234(b). This gun had pneumatic tires for transport, but used standard artillery wheels while firing. In an emergency, the gun could be fired while on transport tires for a short time. Three four-gun batteries formed an artillery group. Most artillery regiments had four groups towed by Latil tractors. This piece also represents the horse-drawn type III used by the cavalry.

12. *Ob 105 GP* : With three 4-gun batteries, this light howitzer equipped the *II/9 Regiment d'Artillerie d'Armée*.

13. *C120 M31* : The *Canon de 120 L Modele 1931* was the most modern artillery piece used by the Belgian army in 1940. It equipped the 4th group of the XIV and XVI Regiments d'Artillerie.

14. *M27 FRC* : Built by the FRC and entered service in 1927, the *Modelé 27* fit on a trailer and, like other mobile 75mm AA guns of its day, was difficult to move and set up.

Ordnance 15

DUTCH ORDNANCE NOTES

15. *Solothurn s/18-1100*: This relatively heavy, but very powerful, anti-tank rifle was usually mounted on a wheeled carriage. Three hundred had been ordered from Switzerland but the Dutch homeland had only 90 on hand (the KNIL in the Dutch East Indies had 70). The Germans captured some of these and gave them to the Italians, Hungarians, and Rumanians.

GREEK ORDNANCE NOTES

16. *Vari 85/24 M*: This Schneider produced 85mm model 1924 howitzer was designed to meet Greek needs for a direct fire, high velocity heavy gun ("vari" is Greek for heavy) with the capability to use the high trajectory fire of a normal field howitzer. 48 were in service in the Greek heavy artillery regiments.

17. *OR 105/19*: This was the companion piece to the 75/19 in divisional artillery regiments. 120 were in service (see French Ordnance Note 12).

18. *3.7cm Bofors AA*: The Greek army had 56 of these guns available in 1940 for AA defense (see Russian Ordnance Note 25).

DANISH ORDNANCE NOTES

19. *Machinecannon 20mm M-35*: The Danes foresaw the use of armor in the upcoming conflict, but were almost powerless to defend against it. A limited pre-war defense budget forced the use of weapons initially designed for one role to serve dual-purpose roles once the war broke out. One such weapon was the Madsen 20mm Autocannon. Initially designed for Denmark's airforce, the Autocannon was converted to use on the sidecar of the Nimbus motorcycle (see Allied Minor Vehicle Note 24) and pressed into both anti-personnel and anti-tank roles.

† The B# for the M-35 is decreased by one to B10 when using IFE as signified by "IFE=B10" on the counter. The M-35 is repaired on a Repair dr of 1 or 2 and removed on a dr of 6 as signified by "R2" and "X6" in the corners of the counter.

YUGOSLAVIAN ORDNANCE NOTES

In total, the Yugoslav artillery park numbered some 7000 guns, of which 4000 could have been termed modern. These included 356 mountain guns, 300 field guns, 732 100mm howitzers, and 44 very heavy guns. Much of this equipment ended up in Italian hands. Tito's Partisans used various captured Italian and German ordnance pieces and from July 1944 were supplied with British 6-pounder AT guns.

20. *3.7cm Infantry Gun*: This piece represents the various WWI-vintage infantry guns in use, including the Skoda 37mm M86, the Krupp 37mm M14, the Hotchkiss 37mm M14, and the Russian 37mm PP obr. 15R (see Russian Ordnance Note 11). Such guns were usually found in heavy weapons battalions of four guns. Other Allied nations used these and similar guns, but not in appreciable numbers.

21. *80mm M28 and M33*: 132 of these Skoda 8.35cm vz 18 guns were in service with territorial defense units. A battery of guns was usually paired with a company of 6-8 HMGs.

22. *100mm M14/19*: This was an old Austro-Hungarian howitzer from Skoda (see Italian Ordnance Note 12). After capture by the Germans, it was known as the *10cm leFH 318(j)*, but most were given to the Italians.

ORDNANCE COMMON TO ALLIED NATIONS

23. *Brandt Medium Mortar*: Various versions of the French 81mm mortar were used in just about every army that wielded infantry support weapons. Bought, sold, and sometimes stolen, it was the staple of the modern infantry company from the 1930s into the 1950s. (See French Ordnance Note 3.)

(Belgium 5/40 RF 1.3)

(Greece 10/40-5/41 RF 1.5)

Norway 81mm bbk: The bbk was issued two per infantry battalion and draught regiment, and saw extensive action on all fronts during the Norway campaign. (4/40-5/40 RF 1.1)

Poland wz. 31: There were approximately 1200 81mm mortars in the Polish arsenal by 1939. Distribution to their allotted infantry units was uneven due to incomplete plans to equip each infantry battalion with 4 pieces. Independent HMG companies had 6 to 9 mortars, while "KOP" battalions and cavalry regiments were issued 2. (9/39-10/39 RF 1.2)

Yugoslavia 81mm M31: 1600 were in service as the standard mortar in independent mortar companies. (4/41 RF 1.1)

24. *37mm Bofors AT*: Along with the German PaK 36, this Swedish-designed weapon was one of the most important and influential anti-tank guns of 1930s and early 1940s. After some tinkering, a simplified version with a sharply sloped gunshield was settled on, and it was bought, licensed, and copied by at least 7 different nations in the 1930s. The British army in Egypt acquired some and used them in North Africa in 1941-42. A variety of mid-war Japanese and Russian anti-tank gun designs suggest that the Swedish Bofors was an integral part of their design. By 1939, Poland had about 1200 wz. 36 in service which were credited with 120-150 tank and 100 armored car kills during the brief campaign. Nearly all were horse drawn, excepting those of the mechanized brigades and motorized anti-tank companies which used PZInz 302T artillery tractors or transported the guns *en-portée* on P-F 621L or Ursus (i.e., Medium) trucks. See French Multi-Applicable Ordnance Note P for the *en-portée* mechanics. (9/39-10/39 RF 1.0)

Denmark acquired some of the early versions and then put the Danish Madsen firm to work manufacturing a licensed-built version designated the *37mm fodfolkskanon M-1937*. (4/40 RF 1.2)

25. *3.7cm Panzerabwehrkanone 36*: The German 3.7cm PaK 35/36 was the most widely distributed anti-tank gun of WWII. Over 20,000 were manufactured during the course of the war. In addition to Germany and the USSR, this gun was bought by Czechoslovakia, Estonia, Finland, Greece (10/40-5/41), Japan, Spain, and Turkey, as well as being the model for versions by the U.S. and the Netherlands (which this piece also represents [5/40], and which equipped its *Pantserwagons* armored cars). This counter also represents the Skoda M38 used by Yugoslavia in companies of 12 guns (4/41). Although the PaK 36 was capable of being carried *en-portée*, the Allied nations appear not to have done so. (See German Ordnance Note 6.)

26. *Bohler M35 47mm*: Manufactured and designed in Austria, the Bohler represented the Netherlands' only larger caliber anti-tank weapon. 1200 had been originally ordered but there were only 370 in the homeland at war's outbreak (5/40 RF 1.2). 30 were in service with the KNIL in Java, only half of which had full supplies of ammunition (2/42-3/42 RF 1.5). The Dutch gun was very similar to the Italian *Cannone da 47/32* (Italian Ordnance Note 5) but some were modified by adding a gunshield and towing eyelet. This piece also represents the Breda ZBM39, of which 120 were in service with Yugoslavia. (4/41 RF 1.4)

27. 65mm wz.06: The Polish army had three batteries of the old Model 06 65mm mountain gun (see French Ordnance Note 9). They served with the 151st-153rd Mountain Gun Batteries. The gun was horse-drawn unless good roads existed for it to be towed upon. (9/39-10/39 RF 1.5)

This gun was the standard light mountain gun in the Yugoslav army (4/41 RF 1.1)

Acquired from France, the Greeks assigned several *Canon de 65 M mle 06* to each infantry regiment. (10/40-5/41 RF 1.4)

Designated the *6.5cm Gebirgsgeschutze Modell 91 System de Bange*, the official war record of the Norwegian army states that as many as 48 65mm mountain guns were on hand, although this outdated gun was most likely pulled from duty prior to the German invasion. (4/40-5/40 RF 1.5)

28. 75mm wz.97: 1374 were in the Polish inventory on September 1, 1939. These were the famous French "soixante-quinze" of WWI (see French Ordnance Note 11) used as towed AT guns. (9/39-10/39 RF 1.0)

In Greece it was called the 75mm "pedinon", and equipped the 1st, 2nd, 3rd, and 4th Field Artillery Regiments. (10/40-5/41 RF 1.3)

This piece (but with no Smoke, BPV 30) also represents the Norwegian *Feltkanon/M01*, Norway's standard light artillery piece. The Ehrhardt firm of Germany produced 139 of these for Norway, which used them in two four-gun batteries per artillery battalion. (RF 1.2)

29. Bofors M34: Designed and manufactured by Bofors, this gun was sold as a mountain artillery piece during the twenties and proved to be a very reliable weapon. The Netherlands bought a significant number for the defense of Indonesia. The gun could be dismantled in 8 parts and transported by mules or towed by four horses. The Japanese captured many of these and used them while ammunition was available. (2/42-3/42 RF 1.2)

For the Belgians, Bofors created a special version (*Canon de 75 modele 34*) that could not be dismantled (and thus could not be Animal-Packed). Licensed and built by Belgian Cockerill, the guns were sited along the German frontier in the Ardennes. These guns equipped the *Chasseurs Ardennes* artillery support group with 2 four-gun batteries. (5/40 RF 1.4)

This counter (a Normal Target, BPV 23) also represents the Norwegian *bergkanon/M11*, nine batteries of which were imported from the Ehrhardt firm to equip mountain units. (RF 1.2 4/40-5/40)

This can also represent (a Normal Target, BPV 21) the Greek 75 "D", the only native-designed gun in the Greek artillery park (the "D" stands for Colonel Dangliu, the Greek designer of this Schneider mountain gun). (10/40-5/41 RF 1.6)

30. 75M 19S: This was the Schneider light mountain gun (see French Ordnance Note 10) which France exported to Poland (9/39-10/39 RF 1.5), Greece (10/40-5/41 RF 1.2), Yugoslavia (4/41 RF 1.4), and Rumania.

Ordnance 31

31. C105 L 13S: The *Canon de 105 L mle 13S* (French Ordnance Note 14) and its derivatives saw action with several Allied armies. Most versions were not suited for vehicular towing. (Belgium 5/40 RF 1.5) (Yugoslavia 4/41 RF 1.4)

This counter also represents the Polish wz.29/34 modification which were distributed to heavy artillery battalions in three-gun batteries (one battery per battalion) and to heavy artillery regiments which had one battalion with 9 guns in 3 batteries. (9/39-10/39 RF 1.4)

32. 120mm wz.09/31: This was the French 10-S Schneider 120mm Model 78/9/31 artillery piece modified with a Russian gun tube (see Russian Ordnance Note 19). Poland had 43 of these in service with the 6th Motorized Heavy Battalion, and nine each in the 46th and 47th Heavy Artillery Battalions. (RF1.6)

33. 155mm Model 17S: The *Canon de 155mm C mle 17S* (French Ordnance Note 16) and its derivatives were used by several Allied armies. Poland had 340 of these howitzers (the 155mm wz.17) in service, and used them in three-gun batteries in heavy artillery battalions regiments. (9/39-10/39)

In Belgium, it was called the *Ob 155* and was towed with CK P14 halftracks, first in the *1st Régiment d'Artillerie Lourde* and later in the *Régiment d'Artillerie d'Armée*—in the I/I RAA in three batteries of four guns. (5/40)

It was the standard heavy howitzer of the Greek army (10/40-5/41), and was the primary heavy artillery piece used by Yugoslavia. (4/41)

34. Mitrailleuse de 13.2 CAJ mle 30: The Hotchkiss mle 13.2 machine gun was the standard AA weapon of several armies before being phased out in favor of the various Bofors models (see French Ordnance Note 18).

This piece represents Yugoslavia's *Zbrajovka* (ZB) machine gun, of which there were 350, used mostly by 12-gun batteries for close AA defense.

† Make two To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. Maximum range for To Hit purposes is 16 hexes. **ERRATA:** This note also applies to French Ordnance Note 18.

(Belgium 5/40 RF 1.5) (Greece 10/40-5/41 RF 1.5) (Yugoslavia 4/41 RF 1.3)

35. 20mm Oerlikon: Until the end of the 1930s, the Dutch Army was equipped with the Vickers and Spandau AAMG to combat aircraft. With growing international tension the interest in AA defense increased and an order for 175 20mm Oerlikon AA guns (see Chinese Ordnance Note 15 and French Ordnance Note 19) was placed with the manufacturing firm in Switzerland, but

only 170 guns were delivered by May 1940. (5/40 RF 1.3)

The Dutch KNIL in Java had 6 of these in Java. (2/42-3/42 RF 1.5)

Greece had 124 of these guns in service found in six-gun batteries or cavalry AA batteries of four. (10/40-5/41 RF 1.4)

This piece also represents the *Breda ZB M34*, of which 120 were in service with Yugoslavia. (4/41 RF 1.4)

36. 40mm Bofors AA: Poland licensed a version (the wz.36) of the Swedish Bofors 40mm auto-cannon (see British Ordnance Note 21) and exported numerous models to France, Spain, the Netherlands, and others, after lightening and simplifying the gun's carriage. Over 300 were on hand at the onset of the war, mostly distributed in four-gun batteries and towed by the C2P artillery tractor. The Bofors was often used in an anti-tank role. (9/39-10/39 RF 1.1)

In Dutch service it was called the 4TLD. In Belgium, FN obtained a license to produce it, where it was known as the c40 Bofors AA. On 10 May 1940, 5 batteries (3 sections of 2 guns each) were serving with the 1st Regiment DCTA and four batteries with the 2nd. Additionally, eight independent batteries were serving with the Territorial Guard AA. (5/40 RF 1.3 for both)

The Norwegian army had some 300 40mm Bofors on hand, which it called the 40mm *maskinkanon/m36*. They were used to defend important targets such as Narvik harbor and the Rjukan power plant. At the latter, at least one (mounted on a truck) was used in a ground role. (4/40 RF 1.2)

ALLIED MINOR MULTI-APPLICABLE ORDNANCE NOTES

A. This weapon may be Animal-Packed (G10).

B. Belgium

C. When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes but the AP Basic To Kill number is still determined using the Caliber Size and Length printed on the unlimbered side.

D. This weapon may not be dismantled.

Da. Denmark

Gr. Greece

Ne. Netherlands

N. Norway

P. Poland

T. As signified by "Tow NA" on the counter, this Gun cannot be towed. However, it may be carried on a vehicle in the same manner as a 76-107mm MTR (C10). It is (un)loaded using normal (un)hooking procedures [EXC: the vehicle need not have a T#; ignore its T# if one is present], and reduces that PP capacity by 8PP while loaded. Section C10 applies otherwise unchanged.

Y. Yugoslavia

J. DELUXE ASL

The greatest thing about *Deluxe ASL* may be that once you know how to play *ASL* you also know how to play *Deluxe ASL*. The rules, for all practical purposes, are identical; the only changes deal with the physical stacking or positioning of counters within the enlarged hexes. In short, *Deluxe ASL* is no more difficult than *ASL*; in fact, it is much more playable due to the many conveniences proffered by the enlarged hex size. In essence, *Deluxe ASL* is simply *ASL* without stacking. There is sufficient room to allow over a dozen counters to be placed in each hex without placing one atop another. This makes the game play much faster because pieces don't have to be constantly shuffled to count FP factors, or moved out of the way to check LOS or the height of buildings. Even systems counters can be laid beside units rather than stacked atop them obscuring their identity. Other informational counters, such as CA markers, are not even needed because CA is readily determined by placement within the hex. *Deluxe ASL* is so much easier to play that we even recommend the use of 1/285th scale miniature figures for those interested in the ultimate panoramic splendor in their gaming. In short, if you enjoy *ASL* we cannot recommend *Deluxe ASL* highly enough. It magnifies the playability and enjoyment of the game even more than it increases the size of the hexes themselves. Be sure to give these new mapboards a try—you'll be amazed how much more fun the game becomes at this scale.

1. MINIATURES

The fine lead alloy 1/285th scale miniature figures of GHQ are the officially licensed *ASL* miniatures and can be purchased by mail direct from GHQ or at your favorite hobby shop. Properly painted, these models can create the breathtaking splendor of countless dioramas in each unfolding game. Indeed, the collection and painting of these models is an intriguing hobby all unto itself. We feel that the combination of GHQ miniatures and *Deluxe ASL* mapboards makes for the ultimate tactical gaming experience. And, as with the transition from *ASL* to *Deluxe ASL*, the miniatures game does not become any more complex—the miniatures merely replace/supplement *ASL* counters.

1.1 INFANTRY: Each GHQ Infantry pack contains enough figures to represent a full company of that nationality in either squad, HS, or crew-sized formations. Each unit stands erect so there is no need to mount them on the counters. In fact, when a side starts a scenario with only one type of unit, 4-6-7 squads for example, we suggest that the miniatures be used without the counters. Only when a unit changes Strength Factors due to Heat of Battle is it necessary to mark them by placing the appropriate counter next to them. Even broken squads can be represented without counters by laying them in a prone position rather than standing them erect.

1.2

1.2 CREWS: Crews are placed on the SW/Gun counter they are serving; if forced to rout without the Gun/SW the miniature is moved while the counter remains behind. In other words, miniatures are used to show possession in the same manner as a counter, except that the miniature is placed on top of the SW/Gun it possesses (which is the inverse of the stacking rules when played solely with counters).

1.3 VEHICLES: Due to the many different rating categories for vehicles it is suggested that the appropriate counter always accompany the vehicle—either beneath or alongside it—until its ratings become second nature.

1.4 TANK TCA: One of the advantages of gaming *Deluxe ASL* with miniatures is that there is no need for the annoying TCA counters, because the TCA of each tank can be readily displayed by rotating the turret to point towards the correct hexspine without moving the vehicle itself.

1.5 SMOKE: To increase the 3-D effect of gaming with miniatures, one can supplement the placement of SMOKE or Flame/Blaze counters with appropriately colored tufts of cotton using the counters only as an informational device if necessary.

1.6 AIRCRAFT: Aircraft can be made to "soar" over your battlefield by mounting GHQ scale aircraft to a supporting base via a thin rigid wire.

2. CONVERTING ASL RULES TO DELUXE ASL

2.1 STACKING: Almost no *ASL* rules are actually changed in *Deluxe ASL*; most are only reworded to account for the absence of stacking in the latter. The only stacking in *Deluxe ASL* is that necessary to show possession; i.e. a MG counter is stacked on a squad to show that the squad possesses it—otherwise they are merely occupying the same Location. Similarly, a Passenger stacks on a vehicle to show that it is on the vehicle, and a leader stacks on a floor level counter or beneath a Sewer counter to show which Location it occupies within its current hex. Otherwise, it is assumed at ground level.

2.11 RANDOM SELECTION: Rather than matching the lightest colored dr to the top unit in a stack (A.9), the lightest dr is now said to affect the leftmost unit of the player in the Location, the darkest dr the rightmost, etc. Be sure to align applicable counters in an obvious left-to-right fashion or specify colors before making a Random Selection DR.

2.12 POSSESSION: Stacking is still necessary to show possession of a Gun/SW (A4.43). Rather than being the bottom counter of a stack, an unpossessed SW/Gun is simply left unattended in the hex—i.e., not part of any stack. A Gun in a stack is possessed by the Infantry unit in that stack regardless of which unit is on top. This allows the player to mark SW which have used their First Fire capability by placing a First Fire counter on them, while stacking the unit which has not yet used its own inherent FP on top of them—a choice which has to be left to memory alone in *ASL* (A7.33).

2.13 FLAME: A Flame which has been Hampered (B25.15) is placed beneath a PIN counter; otherwise a Flame is merely placed elsewhere in the hex for possible conversion to a Blaze during the AFPh.

2.14 WIRE: Units which have successfully moved beneath a Wire counter (B26.4) should be placed in the same hex but not actually beneath the Wire counter. Units which have yet to move beneath the Wire must remain stacked on top of it. Multiple Wire counters may be used (all representing just one Wire counter) to prevent large stacks on a single wire counter if the counter mix permits.

2.15 ENTRENCHMENTS: Units inside an entrenchment are stacked on the entrenchment counter; units not in the entrenchment are placed elsewhere in the hex (B27.1). To avoid stacking, treat all 2S and 3S fox-hole counters as 1S foxholes and allow placement of multiple entrenchment counters in the same hex to accommodate multiple occupying units (counter mix permitting).

2.16 PILLBOX: Units in a pillbox are stacked on top of the pillbox (B30.12); units outside a pillbox are placed elsewhere in the hex. More than one pillbox may set up in the same hex provided each has a different CA.

2.2 PLACEMENT: There is sufficient room in each hex so that the position of a counter in the hex relative to its hexsides can impart information making some information counters unnecessary.

2.21 FIELD OF FIRE: Once a MG/Gun in woods, rubble, or building terrain has fired and thus limited its Field of Fire (A9.21 & C5.11) for the remainder of that phase, it should be placed in the hex so that it actually touches the hexspine that is the base for its CA rather than placing a CA counter. Return all such MG/Guns to the interior of the hex at the end of that phase.

2.22 CA: Guns must still be placed in the hex with their barrels pointing towards a hexspine to define their current CA, but should be placed approximately $\frac{1}{4}$ " away from the hexspine so as not to be confused with Guns having set Fields of Fire.

2.23 RESIDUAL FP: Fire at a unit using Bypass leaves Residual FP only on that particular hexside. The Residual FP counter is left on, but inside, the actual hexside traversed and affects only units moving along that particular hexside or through the hex obstacle without using Bypass.

2.3 CC: Units do not have to be stacked with enemy units to engage in CC (A11), they merely have to occupy the same Location. However, if actually stacked with enemy units, Hand-to-Hand CC rules apply. This is one of the few rules which varies from that of *ASL* and it applies only to Infantry/Cavalry vs Infantry/Cavalry situations.

2.31 HAND-TO-HAND CC: Hand-to-Hand CC can be declared only by the ATTACKER and only if his involved unit(s) has not been Ambushed this turn, but once declared affects all units of both sides as long as that Melee exists in that Location. When Hand-to-Hand CC is declared in a Location, all Infantry/Cavalry in that Location must be stacked together. Any vehicle/PRC in the same Location can attack/defend in the same CC but uses the black Kill Numbers rather than the red ones. Hand-to-Hand CC uses the red Kill Numbers on the CCT. A berserk ATTACKER must declare Hand-to-Hand CC vs an Infantry/Cavalry defender. Hand-to-Hand CC cannot be declared by or vs vehicles.

2.4 SINGLE-STORY HOUSES: Any building depiction not containing a hex center dot or stairwell symbol is considered a level one obstacle to LOS regardless of the height of other building depictions in the same hex.

EX: all contains a level 2½ building obstacle, but any LOS through the smaller outbuilding in all (which does not also cross the main building depiction) has to deal only with a level 1 obstacle.

2.5 BOMBARDMENT: In *Deluxe ASL*, Bombardment rules (C1.81) are altered as follows: the potentially affected area includes all the hexes of any four contiguous *Deluxe ASL* mapboards. The firer makes three dr per board and treats any 6 dr as No Effect.

2.6 AFV CARDS: Another important playability feature of *Deluxe ASL* is the inclusion of AFV cards which aid players in keeping battlefield inventory of the varied weapon systems of each individual AFV in his command. Each card is attractively presented with an enlarged line drawing of the AFV, nationality symbol, and full listing of that particular AFV type's characteristics, including notes and special rules. This device is especially helpful to those who have trouble with the small print or symbology of the counters themselves. AFV cards are not a replacement for the counters, but can be a very handy accessory for their use. One AFV card allows a player to keep track of the armament, ammunition, Schuerzen, and Armor Leaders of up to six vehicles of that type. Each card is designed to provide status tracks for each variable characteristic of the AFV, but only those applicable to that AFV. For instance, only tanks E and F of the PzKpfw III series are allowed to have the optional AAMG as represented on the sample AFV card shown below. Besides being a handy reference for the capabilities of these AFV, use of the AFV cards allows players to dispense with placement of the pertinent status counters on the board where they add to piece density problems and detract from the general appearance of the game—a problem more pronounced in *ASL* than in *Deluxe ASL*. Even mired, bogged, and immobilized status can be shown on the cards by placing the relevant status counter in the appropriate row beyond the Armor Leader box. All of the common AFV of the German and Russian OB are represented by the AFV cards found in the first *Deluxe ASL* Module: *STREETS OF FIRE*. Those wishing to purchase these cards as a separate item may do so by ordering them direct from The Avalon Hill Game Company. Send a stamped, self-addressed envelope and request the current *ASL* Parts Price List.

F	MA	BMG	CMG	AAMG RF 1.3	APCR	Sz			Armor Leader

Card is shown at 62% of actual size

AFV cards must be kept in full view of both players once play begins. However, Armor Leader counters may be left off the AFV Card display until such time as the opposing player has established which vehicle contains an Armor Leader.

DELUXE ASL MICRO ARMOUR PAINTING GUIDE

It used to be that model railroaders were the ones most noted for their search for authenticity and their attention to detail. Nowadays, it's clear that no one tops a wargamer when it comes to checking out the smallest details. Wargamers are continually searching for extra information, always looking for correct data about equipment types, unit compositions—the way things were ACTUALLY done in the particular historical period in which a wargame is to be played.

This concern for authentic detail goes double for people who are wargaming with MICRO ARMOUR. Whether your operation is Barbarossa, Torch or Overlord, ASL gamers not only want their tanks and guns accurate in the casting, but in the combat color schemes too. In fact, wargamers want more than authenticity: they want their AFV to look good. When they put a tank platoon on the table, they want something extra in the way of praise. To help you achieve the best results, here is the method that GHQ has developed over the past two decades to accurately camouflage 1:285 vehicles, and still bring out all the tiny details in the castings. We took a leaf from the Model-Builder's book, and a hint or two from Model Railroading; and put together this system that is relatively simple to do. It will show you how to do it all: from the painting to the blackwashing through to the decals, and weathering.

GETTING THE INFORMATION

First, you have to have an idea of what you want to paint, in terms of colors and patterns. Paint and camouflage schemes can be found in many reference books and hobby magazines. We recommend the high quality publications from Squadron/Signals. Some of these are: *Panzer Colors I*, *Panzer Colors II*, and *Panzer Colors III*. These three books by Bruce Culver cover the German vehicles in detail. Other valuable reference works include: *Armor on the Eastern Front*, by Steven Zaloga, *D-Day to Berlin*, by Terence Wise, *British Tank Markings and Names*, by B. T. White, *U.S. Armor Camouflage & Markings*, by Steven J. Zaloga, and *Blitzkrieg: Armor Camouflage & Markings, 1939-1940*, by Steven Zaloga. To get an authentic camouflage pattern for your unit, you will have to determine which theatre the miniatures are to represent, and which period of the war they are to duplicate. Once this knowledge is in hand, you will be ready to start painting.

A WORD ABOUT COLORS

If you had the chance to hold a military paint chip up to a real tank, the colors would match perfectly. If you then walked several hundred feet away, and held the paint chip up with the tank in the background, you would find that the tank would appear lighter in color than the paint chip. (Trust us, we've done it.) Therefore, the color that you should use to represent new paint should be lighter in hue than the usually dark colors that are generally used as the base coat on an AFV. If you want to show worn, combat veteran vehicles, bleached by the sun, by rain and snow, dusty and battered, the color should be even lighter. Keep this in mind when selecting your paints, particularly if you have to mix paints to get the shade you are looking for.

One other advantage to keeping the base colors lighter than the original paint chips has to do with the light you will be using to game by. Sunlight is much brighter than the artificial light normally found inside. If you paint your vehicles dark, the light will not be enough to illuminate the details of the casting, or of your paint job. For all of these reasons, keep the colors light!

SELECTING PAINTS

Any hobby paint can be used to make good looking Micro Armour. The different types each have advantages and disadvantages, though. The oil-based paints tend to be harder to mix, messier, and are more difficult to clean up brushes, etc. They have the nice feature that you can generally handle the model sooner after painting than the water based paints. The water based acrylics are easier to mix, and cleanup is fast and simple. Unlike the pungent oil based paints, the acrylics have almost no odor. For some people, this is a real plus. The major drawback to the water based paints is that they will "wipe off" for several days after painting if they are not baked on. All of the raised detail areas can quickly become silver if they are handled before the paint is truly dried. No matter which brand of hobby paint you opt for, it is important that you use as little as possible and take care not to glob unneeded color into the fine details on your Micro Armour. The object is to color the vehicle without obliterating the precision sculpture.

PAINTING BY THE NUMBERS (1-10)

1. *Clean each miniature*—remove sprue tabs and mold-flash, if there is any. Next, using ACC or a similar instant setting cement, glue the center of the bottom of the vehicle to the head of a large nail. We use 4 inch long carpenter's nails. This serves as a required handle for picking up and working on the AFV. When using the airbrush, we stick the point of the nail into a large block of styrofoam.
 2. *Do not use a primer or an undercoat if you are painting your Micro Armour with an oil based paint.* Since lots of paint will clog the detail, we recommend only a thin primer coat if you are going to use water-based paints. This primer will help adhere the more fragile acrylics to the metal.
 3. *Choose the lightest of the predominate colors.* Spray or brush it on the AFV, using the lightest coat necessary to cover the entire vehicle. For the best possible effects, use an airbrush. Brush painting will work, but it is much more difficult to control the amount of paint you put on, and the finish will not be as crisp.
 4. *Next, put the miniature in the oven at 200°F for 20 minutes.* This will not melt the miniature as long as you place it on wood or any other non-heat conductive material. This will bake the paint on the miniature. Baking produces a very strong paint-to-metal bond, and takes the place of a primer coat; this works well with all commercially available model paints.
 5. *Remove the miniature from the oven, and apply the next most predominate color.* Use a fine tipped #0000 brush; paint this second color on in a correct pattern.
 6. *Let this paint air-dry.*
 7. *Paint the third color, if any, into its place in the pattern.*
 8. *Let this air-dry.*
 9. *If there is a fourth color in the camouflage pattern, paint onto proper place and let air-dry.*
 10. *Put the AFV back into the oven again, for 20 minutes at 200°F.* This will firmly set all the paints, and complete the basic paint job.
- If you have been working with a Soviet vehicle, or any other single-color AFV, the basic paint job would have been done after step #4. Either way, you'll want to move on to the detailing, and then application of the blackwash.

A WORD ABOUT DETAILING

Detailing is one of the most important things that you can do to maximize the visual effect of your miniature vehicles. It appears painstaking, but all you really need is a little practice—you'll find yourself well rewarded when the job is done.

DETAILING BY THE NUMBERS (11-15)

11. *Using the small brush, paint in the rubber bogies on the sides of the AFV's* using a deep gray or smokey black paint. Be careful to apply paint only to the rims.
12. *Painting the tracks* will help give the camouflaged AFV the finished look. For best results, take the fine brush and carefully paint the tracks a rusty-brown color. Allow this to dry. To highlight the tracks, dry-brush them with steel colored paint. (Dry-brushing: dip the tip of the brush into the paint. Now, wipe almost all of the

Painting Guide

paint off the brush on a tissue. With the "dry-brush", scrape the highlights of the track. Be careful to apply the tiniest amount of paint possible, and that only to the tips of the raised highlights and details.)

13. For the engine deck, mix $\frac{1}{2}$ black paint with $\frac{3}{4}$ thinner; brush this mixture lightly over the gratings. Also, use this mixture to paint in a small oil burn around the vehicle exhaust area.

14. If the vehicle has tow cables, paint them in "steel".

15. If your AFV has turret baskets, they can be highlighted by painting the interior of the basket black, and washing the containing basket with the paint thinner mix.

Obviously, the more detail on the miniature, the more there is to paint, and the better your 1:285 scale AFV will look. So make your detailing count: jerry cans and pioneer gear, spotlights and spotlight covers, spare bogies, anything else that can add some color to the camouflage job will be worth the few seconds it will take. One note here. Jerry cans are general issue items; they're changed so often that they wouldn't get painted in the camouflage scheme on the real vehicles. These can be painted in an olive drab, or new color for your particular army. They will therefore, serve as good contrast points on an otherwise camouflaged AFV model.

PUTTING ON THE BLACKWASH (16-18)

The detailing is important, but THIS is the process that's going to make your careful detailing work really pop out. A good blackwash job will enhance the careful work you've just done about a hundred times. You'll want to mix up two different blackwash solutions (these can be mixed beforehand and kept in jars). The blackwash solutions should be mixed as follows: (a) four parts turpentine (NOT thinner) to one part black paint; and (b) seven parts turpentine to one part black paint.

16. With a $\frac{1}{4}$ " soft brush, brush on (a) the stronger blackwash (4 to 1), into the suspension area and around the exhausts.

17. Brush the (b) solution (the weaker one: 7 to 1), over the remainder of the vehicle's surface. ALWAYS test the solutions on the paint scheme beforehand—you do not want the blackwash to overpower or cover up the paint.

18. NOW—the entire vehicle goes back into the oven, 200°F for 20 minutes. This will "develop" the blackwash: as the turpentine evaporates, the black pigment will bead into detailing and dry there, effectively outlining all of the cast-on details.

Here again, the more detailing there is, the better the vehicle will look when you've finished these steps. Also, on flat, solid-color paint jobs, the paint will take on a bleached appearance as the blackwash dries.

STEPS TO BETTER DECALING (19-23)

Of all the methods we have tried, this is the most effective way to get decals on "tight and right". The results are definitely worth the effort.

19. Use first a clear enamel, like Micro-Gloss; with a small brush dab it onto the spots where the decals will be placed. You have to use the enamel because decals do not stick well to flat paint—use it ONLY where the decals will go. Let the enamel dry thoroughly.

20. Next, a decal positioning fluid (such as blue-label Micro-Set) is spotted on over the gloss enamel. IMPORTANT: The Micro-Set must be moist when the decal is positioned.

21. Put the decal onto the moist Micro-Set; if you work correctly, the Micro-Set will remain moist long enough for you to put on two decals at a time.

22. As the decal is setting, dab it with a decal fixative, like red-label Micro-Sol. This fixative will dissolve the decal right into the Micro-Set underneath; the decals will then contour correctly, and look like part of the paint job.

23. Let all decaling dry thoroughly.

THE LAST STEP (24)

24. Use an airbrush filled with a deglosser, or a spray can (Micro-Flat brand is one example). Spray the entire miniature LIGHTLY. This will give the paint job the correct, characteristic dullness and make the detailing stand out smartly. Step #24 finished the job if you want your AFV to look as if it had just rolled off the production line at the factory. If you want it to appear more realistic, as it would in combat, then you have one more step to accomplish. You will need to use an airbrush to duplicate the wind blown dust from road movement. Set the device to the finest possible spray, and then lightly weather the following areas using a thin yellowish-tan mixture:

- entire suspension system: bogies, treads, tracks, etc.
- at the front and back of the AFV, spray lightly from the bottom towards the top. This simulates road dust swirling up and onto the tank.
- spray the front of the vehicle. Now it will look like it has been eating the dust from the front of the column.
- finally, lay on a distant overall spray to simulate general dust.

For variety, the color you use for dust and weathering could be different from unit to unit, and certainly from theatre to theatre. Light gray, dirty white, rusty tan would all work. Always test the overspray on a sample of the AFV color to make sure that it is what you had in mind. Also, be careful not to spray too much onto your nearly finished AFV!

AERIALS

One final step to bring the Micro Armour to life is the application of aials. These are really beautiful, durable, and worth the effort. You will need a spool of fine weight nylon thread, and a pin-vise with a very fine bit (.00135 or .0015). Simply locate the correct location of the aerial, drill a hole and cement the correct length of thread into it. We use a white glue like Elmers. Trim the aerial to the right height, and paint it black. Command vehicles can easily be spotted if they have several antenna like their real-life counterparts.

That's how you lay a good paint-and-decal job on miniature armored fighting vehicles like MICRO ARMOUR. It seems like a pretty arduous process. But remember this: you are not painting a giant 1:35 scale plastic model. You are painting MICRO ARMOUR. And once you have the techniques down, you can paint up entire battalions at one time, without a lot of trouble.

This technique is oriented to camouflage or painting a dozen or more AFV at a time; the only places where time is carefully spent are on the detail-painting and decaling. With practice, even these steps go quickly.

K

K. Squad Leader Training Manual

INTRODUCTION:

The Squad Leader Training Manual may offer little of interest to veteran players of the game system, since it concentrates on repetitive "hands on" examples of the basic fundamentals of play. While a refresher course would probably help even veteran players, the intent is to take players who are relatively new to *SQUAD LEADER* through a course in basic game principles with a somewhat humorous approach that avoids the "legalese" of the *ASL* rules and uses everyday language. As such, the Training Manual is not a replacement for the *ASL* rules and should not be considered to supersede them in any way. Indeed, the Training Manual deals in generalizations rather than specifics and some of its statements do not hold true in all cases. In the case of conflicts, the *ASL* rules always take precedence over statements in the Training Manual unless the Training Manual refers to "the brass changing the book", which is your cue to realize that an errata change is in the offing. The intent of the Training Manual is solely to give new players a very basic understanding of the game before directing them back to the more detailed rules of *ASL*. To that end, specific parenthetical references to the *ASL* rules such as "(A26.2)" are contained herein should the reader wish more detailed information on the subject being discussed.

However, whether you are veteran or novice, the Training Manual will help only if you take the time to punch out a few counters, place them on the maps referred to, and follow along with the dialogue. In the Training Manual you learn by re-enacting numerous examples. Don't just read it—follow along, moving the pieces as you read—and attempt to understand why the pieces are moving as they are. Get out your LOS thread and check the LOS yourself. Only by adhering to this "hands on" approach will you derive any real benefit from the chapter. Readers should treat ■ as a graphic symbol for pause—indicating a greater passage of time for the characters to enable them to reach a new location or for the reader to deal with a presented exercise. Readers should also come to quickly realize that proper grammatical usage has given way to a usage of quote marks to identify only the statements of the trainees as a means of emphasizing and separating them from the remarks of the Drill Sergeant. This expedient also saved space and allowed us to cover more subjects than our budget would otherwise allow.

The lessons taught here are limited to basic Infantry rules. The Training Manual may or may not be expanded in the future to cover ordnance, vehicles, and more advanced topics. The scenarios of *PARATROOPER* tend to be relatively simple, but not because we expect you to play them based solely on your experiences with the Training Manual. The latter does not cover all the subjects which you'll need to play the game. Given the parameters of brevity and simplicity necessary in dealing with new players (lest they become overwhelmed by the subject matter) and the need to keep the price of the module low, it was decided to forego many subjects we would have liked to cover in more detail. To play *PARATROOPER* you will first have to read and comprehend most of *ASL* chapters A and B, as well as much of chapters C and D if playing a scenario containing vehicles or ordnance. The only sections of chapters A-D completely unnecessary in playing *PARATROOPER* are: Cavalry (A13), Battlefield Integrity (A16), Flamethrowers & Molotov Cocktails (A22), Sunken Road (B4), Elevated Road (B5), Runway (B7), Sewers & Tunnels (B8), Graveyards (B18), Wire (B26), Minefields (B28), Pillbox (B30), OBA (C1), Recoilless Rifles (C12), Gyrostabilizers & Schuerzen (D11), Horse Drawn Transport (D12), AFV Radios (D14), Motorcycles & Bicycles (D15), and DD Tanks & Amphibians (D16).

The primary purpose of *PARATROOPER* is to provide an inexpensive module for those *SQUAD LEADER* players contemplating a switch to *ASL* who have not yet made up their mind. *PARATROOPER* contains all the new updated counters necessary to play the scenarios herein using the *ASL* system. No other materials save *ASL* and boards 1-4 of basic *SQUAD LEADER* are necessary. The limitation of our scenario depictions to these few boards required far more use of terrain change SSR than we like, but was judged a necessary sacrifice to stay within the parameters of an inexpensive module which could be played entirely with the components therein. There is no Chapter K Divider included because it contains information pertinent to Chapter E and will be made available with Chapter

E in *ASL* Module 3. It is hoped that purchasers of *PARATROOPER* will move on to other modules with a greater diversity of boards/counters wherein the richness of detail this game system has to offer can be better served. This is the primary reason for the selection of the Normandy airborne landings as the subject of this module. By limiting the unit types of both sides (especially the paratroopers who are not subject to normal unit Replacement rules), we were able to restrict the counter mix to an absolute minimum of duplication from other modules while still providing all that is necessary for a complete game and supplementing existing counters. Players will find that the counters herein will augment those provided in *BEYOND VALOR* and together constitute a more complete counter mix.

DAY ONE; MARCHING

FALL IN! Line up with your toes touching that white line. You, get rid of that gum! You, suck in that gut! Chin up, shoulders back, eyes straight ahead. Try to look a little like soldiers. Alright—at ease.

Gentlemen, welcome to Camp Avalon Hill. How are you this fine June morning? Fine, I trust. I am your Drill Instructor, Sergeant Stahler. You are all volunteers here for the *ASL* Basic Training course. This course will challenge you; it won't be any game of checkers. We will practice the basic fundamentals of combat on a game board until it becomes second nature. When—and if—you finish you will be able to command Infantry in combat. The best of you will be qualified to go on to Advanced Training where you will learn how to use every Infantry weapon, call in artillery, and even coordinate air support. You will become familiar with every fighting vehicle from a jeep to a Tiger tank. You will learn to cross rivers without paying the toll, sneak beneath city streets via sewers, climb mountains, and jump out of airplanes. But that is in the future. For now, you will learn how to vicariously survive on the gameboards of *ASL* in WWII, and in the process you will learn to lead Infantry, to close with and destroy the enemy. You will become the backbone of the army; you will become Squad Leaders.

Today you will learn how to march. Fall in on the big yellow "I" in your 7-4-7 uniforms in five minutes (freely translated, that means punch out the Sgt. Stahler 8-1 and 7-4-7 squad AA counters and put them in hex B8 on board 1—and prepare to follow along).

■ TEN HUT!

Inasmuch as there are twelve of you clowns, you will be collectively referred to as squad AA and represented by that *Multi-Man Counter* (MMC; A1.12) with the picture of three soldiers. I, on the other hand, being of much more value, am represented by this fine 8-1 marker with my name on it. This is known as a *Single-Man Counter* (SMC; A1.11). If you pass this course—God help us—you too can aspire to such lofty status. In the meantime, note the differences and follow the progress of our respective counters on your copy of board 1. And get used to the abbreviations. We use a lot of them in *ASL* and you better pick up on the jargon fast, because I don't like to repeat myself. If at anytime you don't understand a term I use, look it up in the *ASL* index.

Marching

K

At ease. Unlike your soft, civilian life, the world of a Squad Leader is divided into hexagons. Every hexagon has six hexsides, which separate it from its six adjacent hexagons. Every hexagon also has a white dot or square in the center where I am now standing, and an alphanumeric code consisting of a letter and number, as you can see behind me. We are in hex B8 of board 1, simply referred to as 1B8. By citing the board number and code (otherwise known as a grid coordinate), you can locate any position in any situation. Henceforth we will refer to hexagons as hexes.

YOU! Stop checking your eyelids for holes. You will learn to operate with little sleep, especially at work the day after a tough battle. Pay attention. What hex are we in? "1B8, Drill Sergeant." What are the six hexes adjacent to us? "1A8, 1A9, 1B7, 1B9, 1C8, and 1C9, Drill Sergeant." That's correct, but in the future refrain from including the board number in the coordinate unless we're referring to another board or it's been a long time since we checked our position.

Today you will learn how to march. Units move from hex to adjacent hex, expending *Movement Factors (MF)* as they go. **TEN-HUT! ABOUT FACE!** Forward **MARCH**. Hup, two, three, four. We just entered hex B9, expending one MF. Column Left, **MARCH**. We are now in C10, having expended another MF. Column Left, **MARCH**. We are marching through D9, expending our third MF. You don't have to march in a straight line; in fact, you can leave a hex in any direction, regardless of how you entered it. Column Right, **MARCH**. E10, F10. We are now in F10. Although F10 is only a Half Hex along the edge of the board, it is treated as any other hex. Of course, if you leave the board you vanish, never to be seen again. You will be considered eliminated or Missing in Action which is worse, unless specifically ordered to exit the board (A26.2).

Column Left, **MARCH**. We are now in G10 after expending six MF. Squad, **HALT!** We just passed through six Open Ground hexes, expending one MF in each. That is as many MF as you can expend in one *Movement Phase (MPH)* even while I'm with you unless you Double Time and/or use Road bonus. Each player has only one MPH per Game Turn. "What is a turn, sir?" Don't call me sir, I'm not a *!#&#! officer. I am a Drill Sergeant in Uncle Sam's Army and damn proud of it. You will address me as such in the future, or not talk at all. Is that understood? "Yes, Drill Sergeant." Just as *SQUAD LEADER* terrain is divided into hexes, a Squad Leader's time is divided into Game Turns made up of two Player Turns which are subdivided into phases. One Game Turn is equal to two minutes. At the end of the MPH of your Player Turn, you halt, and any MF that you haven't yet used are lost.

A MMC accompanied by a leader has six MF per MPH. You receive those extra two MF only if you move with a leader as one combined stack throughout the MPH. If the leader is pinned, wounded, eliminated, or otherwise forced to drop out of the stack, those two leader bonus MF are forfeit—although MF already expended cannot be lost. A SMC by himself also has six MF, but a MMC such as you maggots—without a leader—has only four MF (A4.11). Actually, Inexperienced Infantry has only three MF, but they tell me you blockheads are officer material—God help us—so we'll spare you that indignity. In fact, you have the extreme good fortune to be part of our airborne forces and will be represented throughout this training by a 7-4-7 elite squad counter. Try not to disgrace the uniform too much.

See those trees in front of you in hexes G9, H9 and H10? They indicate woods hexes. Naturally, the going is slower through woods. I doubt whether there are any Tarzans among you. The MF cost of a hex represents how long it takes to pass through it. It costs two MF to enter a woods hex, as you will see. Forward, **MARCH**. We just expended two MF to enter H9. Column Right, **MARCH**. We spent one MF to enter I10 for a total of three MF expended so far. Column Left, **MARCH**. We expended two more MF to enter J9; a total of five MF. Column Right, **MARCH**. We expended our sixth MF to enter K10. Squad **HALT!** This MPH we expended all six MF but went only four hexes, because two of those hexes were woods hexes. Left **FACE**. See the building two hexes away in M9? Going through a building is as slow as going through woods; it also costs two MF per hex. Let's start a new turn.

Forward, **MARCH**. L9 costs one MF, M9 costs two more, and N8 costs one MF for a total of four MF expended so far. Column Left, **MARCH!** N7 costs one. Column Right, **MARCH!** O7 also costs one MF, even though we moved along the road. Squad, **HALT!**

You will note that crossing a road or moving along a road is the same as moving through Open Ground. A road doesn't speed you up much if you are on foot. If you spend your entire turn moving along a road you get an extra MF (B3.4). We will now march directly to U4 along the road. Sing out the coordinate of each hex as we enter it. Forward, **MARCH**. "P6, Q7, R6, S6, T5, U5, U4." Squad **HALT!** We just marched seven hexes in one turn, because we stayed on the road the whole turn. How many hexes can a squad move along a road by itself in one turn? "Five, Drill Sergeant." How many hexes can a leader move along a road by himself? "Seven, Drill Sergeant."

Now that we are in U4, observe the buildings. The one on your right in V4 is wooden because it is brown. The gray buildings in front of you in U3 and to your left in T4 are stone. Both building types affect movement in the same way, but the stone buildings offer better protection when fired upon.

Buildings also have different heights. The V4 building has only a ground level because it consists of only one hex and has no stairwell symbol (B23.2)—which is a white square where the center dot should be. The T4 building has both a ground and a first level because it is a multi-hex building without a stairwell symbol (B23.22). However, it has an inherent stairwell in each hex, which you can use to go up or down stairs. Building U3, which has a stairwell symbol, has a ground level, a first level, and a second level (B23.23) in this type of building. You can go up or down stairs only in a hex with a stairwell. You use a level counter to indicate the level you are on by placing it beneath your own counter. The gray side indicates first level, and the yellow side indicates second level. Going up or down stairs costs one MF for each level changed. It still costs two MF to enter a building hex, even if you are staying within the same building. When I refer to a multi-hex building such as T4 or U3, I am naming it by using the coordinate of just one of its component hexes. S5 is part of building T4, but you'll never see it referred to as building S5-T4. It will always be called building S5 or building T4. Even though only one hex is referred to in the name, all contiguous, directly connecting building hexes are part of the same building. Therefore, the terms "building" and "building hex" are quite different. If, to win a scenario, you must control *building hex* U3—you need control only that hex, including all its building levels. However, if you must control *building* U3—you must control hex U3 plus hexes T2, U2, and V2 (and all their building levels) as well. Follow me through building T4.

We enter T4 at the ground level at a cost of two MF. Then we use the inherent staircase to go up to the first level, costing one more MF. Here's that gray Level 1 counter. Moving to S5 costs two more MF (and our recently acquired Level 1 counter tags along beneath us so we don't have to bother with finding a new one), bringing our total expended thus far to five, and the MPH ends when we remove our level 1 counter to go downstairs to the ground level of S5, expending a total of six MF. Of course it would be quicker to go directly from T4 to S5 on the ground level, costing only two MF, but you would miss the beautiful view from the first level.

Now let's head to X5. Sing out the coordinates as you go. Forward **MARCH!** "T5, U6, V6, W6, X5." That took six MF, four for Open Ground, and two to enter X5. The next time we move, we'll use the stairwell to go upstairs. Expend one MF to reach the first level, one more to reach the second level of X5, two MF to move to W5, and two more MF to go to W4 where we again end our MPH. Now for your first exercise. You will proceed on your own from here to 1B2 in as few MF and MPH as possible. Since I have six MF per MPH, I will be waiting for you there. And don't forget to use the correct level counter.

■ **FALL IN!** Those of you who did it in 27 MF and six MPH did well. You remembered to use the stairwell in X3 and the road bonus to move five hexes per MPH for three turns. Fall out for chow; fall in on the big yellow "2" on board 2 in one hour. **DISMISSED.**

■ **TEN HUT!**

Now you're going to get some real exercise. We'll be traversing walls, hedges, and hills. Forward **MARCH!** B7, one MF; B6, two MF. Column Right, **MARCH**. C6, one MF; D5, one MF. Squad **HALT**. To review, how many hexes did we just move? "Four, Drill Sergeant." How many

K

MF did we expend to go those four hexes? "Five, Drill Sergeant." What is the most MF we could expend in one MPh without using a road bonus? "Six, Drill Sergeant." See, you don't have to use all of your MF, but those not used are lost. Next turn . . . see that wall in front of you? It lies along a hexside, between hexes D5 and E5. We are going right over it to E5. Help one another, give your buddy a boost. Now over the next wall to E4. We just spent four MF, one for each hex and one for each wall that we went over. Stop griping, Martin. Sure we could have walked around the wall, but there will be many times when you'll have to go over them, and you have to learn how.

Follow me along the road. Forward, MARCH! Sing out the coordinates. "E3, E2, F1, G2, H1, I2." Column Left, MARCH! "I1." Squad, HALT! Well, whaddayaknow? More walls for us to practice on. Move over the wall to J1 and K2. How many MF did it cost to enter J1? "Two, Drill Sergeant." Wrong! "Seemed like a hundred, Drill Sergeant." Wrong, and this is no time to get tired; you are just beginning. It cost three MF; one for the wall, plus the usual two MF for entering the woods.

Now we will tackle a hill. This hill in front of you has three different levels, each one a shade darker than its next-lower level (B10.1). Each hex is all at one level; the one containing the center dot. Right now we are at ground level. K3 is at level 1, K4 is at level 2, and K5 is at level 3. Moving to a higher level costs double what it would otherwise cost. Move out up the hill. K3 costs two MF, K4 costs two more, and K5 also costs two MF for a total of six MF in this MPh. While you are catching your breath, enjoy the view. You can see a lot from up here, but you can be seen from all those places too. Watch out for the dark brownish-black, serrated hexsides. These are cliffs and run along the hexsides between K5 and the three bordering hexes of L4, L5 and K6. You can't cross cliff hexsides without using climbing techniques (B11.4) that you won't learn in this course. For the time being, you can't climb cliffs at all.

Follow me downhill. Moving downhill is usually like moving on the same elevation; it costs nothing extra. K4, L4, M4. That last hex was tough; it cost four MF: two for the woods doubled to four because we were going uphill. K4 and L4 only cost one MF each because we were going downhill. Let's keep going: M5, two MF; M6, downhill for one MF; M7 downhill to woods for two MF; M8, one MF. That is six MF and ends our MPh. Now let's move directly to J9.

■ How many MF did that last MPh use? "Five, Drill Sergeant." Correct. I brought you down here because I want to show you hex 19. It is unusual because it contains both woods and a building. The cost to enter hexes like this is equal to the cost to enter a woods hex plus the cost to enter a building hex; i.e., four MF (A2.4). Let's do it. Whenever you have multiple terrain types in a hex such as this, the movement cost and TEM of each is cumulative. The main exception is where you find brush and woods in the same hex; the brush is considered just an extension of the wood's undergrowth and therefore the movement cost is the same as entering a woods hex.

Now I have a surprise for you; get the 60mm Mortar in the next room and bring it in here. No . . . put it on top of your counter—not beneath it. Possession of equipment is shown by stacking the equipment on top of the unit possessing it. "Do we get to fire it, Drill Sergeant?" No. You get to carry it, or, in military parlance, to portage it (A4.4). All MMs have an *Inherent Portage Capacity (IPC)* of 3. That means you may carry weapons/supplies worth up to three *Portage Points (PP)* at no cost to your MF allotment. If in any MPh you carry PP that exceed your IPC, your MF allotment for that MPh is decreased by one for each PP by which you exceed your IPC. This mortar and its inherent ammo boxes are worth five PP. So if you carry it out of here without me, how many MF will you have in this MPh? "Two, Drill Sergeant." Right. Your normal MF allotment is four and the mortar exceeds your IPC by two—leaving you with only two MF. If I move with you throughout our MPh, even if encumbered by my own portage, you still get the two MF bonus that a leader provides for a total MF allotment of four. However, as a SMC I can do even more for you. I have an IPC of one which, if I'm not using myself, can be added to any single Infantry unit with which I move in a combined stack (A4.42). So, if I accompany and assist you throughout our MPh, how many MF will you have? "Five, Drill Sergeant." Right. Your normal MF allotment of four, plus my leader bonus of two MF minus one MF for the one PP that is in excess of our combined IPC of four. However, I'm not feeling particularly helpful at the moment, so portage that mortar up the hill to I8 by yourself. I'm staying here.

"We can't carry it that far, Drill Sergeant." Why not? "Entry of a woods hex in a higher elevation costs four MF and we only have two MF while carrying . . . er, I mean portaging, five PP. You'll have to help us." True, you can't portage it normally, but I wasn't planning on your doing it normally or helping you. An Infantry unit with at least one MF left after deducting all excess PP costs may declare a Minimum Move (A4.134), which allows it to move one hex even though it doesn't have the necessary MF to enter the hex normally. Of course, it's a bit strenuous—you will be both CX (A4.51) and pinned (A7.8) when you get there—but that won't prevent you from using another Minimum Move to get back down here in the next MPh. There is no need to rest until you lose the CX counter. Bring it back with you . . . NOW.

■ Welcome back. Wasn't that fun! Take a break.

■ Okay, leave the mortar in the next room for the next class. "What is this CX counter anyway, Drill Sergeant?" Don't worry, I intend to show you soon. Its effects aren't permanent. You have already lost yours during the Game Turn you were on break. But, now I want you to go to hex T6 on your own in as few turns as possible. Remember that you have only four MF by yourselves. I'll be waiting for you there.

■ FALL IN! You should have made it in exactly four MPh, possibly ending turns at K8 or K9, N8 and Q7. You essentially lost a MF in K8 or K9 because you had only one MF remaining before the end of your MPh, and since the next hex in your path (L7 or L8) cost two MF you had to forfeit your fourth MF and start fresh in the next MPh. This lost MF cannot be accumulated for use in a later turn.

Look down at the base of the cliff in U7. The ground down there is littered with shellholes. Shellholes slow down most vehicles, but Infantry on foot has a choice (B2.4). We can either walk around the shellholes for one MF and treat them as Open Ground, or we can use the shellholes as cover and expend two MF. Follow me to T7, calling out the coordinates. "S7, R6, R7, S8, T7." Squad, HALT! That took five MF. Now let's move to U7 expending two MF, and over the wall to U8, for three more MF ending our MPh. Now, over the wall to V8 for three MF, and over the other wall and into the shellholes in V7 for three more MF. All right, you're wearing out my shellholes and my patience. March along the road to U2. "U7—one MF, U6—one MF, V5, V4, V3, U3, U2." Since we avoided the shellholes by calling out a MF expenditure of only one as we reached them, the hex was treated as Open Ground (B2.4), and we even got the road bonus. Had we spent two MF to enter even one of the shellhole road hexes, the road bonus would not have applied.

Now before you is a hedge. Like a wall, it runs along one or more hexsides; this one between T1, U2, U1, and V1. You can distinguish it from a wall by its color.

The cost is the same as a wall. We are going to move to V1 the hard way, via U1. Forward, MARCH! U1 costs three MF, one for the hedge and two for going uphill (B9.4); V1 costs two more MF, one for the hedge and one for the hex. Now follow me to S2. U2, one MF; T1, three MF; S2, one MF. Now go to BB5 on your own in as few MPh as possible. I will wait for you there.

■ It should have taken you three MPh: to X1 along the road, then Y2, Z2 uphill to AA3, and BB3, BB4, then uphill again to BB5. Take a short break and fall in on the big yellow 4 on board 4 in five minutes. DISMISSED.

■ Fall In! Board 4 consists of relatively open, flat countryside. Forward, MARCH! C8, D7, E7, F6. Column Right, MARCH. G7, H7. Squad, HALT! You see grain hexes on three sides of us in hexes G8, I7 and I8.

"May I ask a question, Drill Sergeant?"

Certainly. The only dumb question is the one that isn't asked.

"What kind of crops grow in a grain hex?"

Marching

What a dumb question! It can be anything; corn, wheat, barley, Cheerios. They're all treated the same. Think of it as generic grain fields. Does anyone know the MF cost of a grain hex? One is the cost when the grain is out of season, usually from October to March (B15.6). In April and May the plowed fields slow you down, and from June to September the crops themselves impede movement. Can anyone guess what the movement cost is? "Two MF, Drill Sergeant?"

No, too high.

"1 1/2 MF, Drill Sergeant."

Exactly—except from October through March, when neither the grain nor the plowed fields exist (B15.6). However, since it's June, you must have the full amount of MF to enter a grain hex. If you only have one MF, you have to wait until next turn (or your Advance Phase . . . but we'll get to that much later). Let's march through the grain field. Don't worry about the local farmers; this is government land and it's grown just to be trampled. Your tax dollars at work.

I7, 1 1/2 MF; J6, 1 1/2 MF; K6, 1 1/2 MF; K5, 1 1/2 MF. Squad, HALT! These six MF end our MPh. Now I want you to head to FF5 by yourselves, but not by the quickest route this time. Enter only hexes with a coordinate of 5; for example, L5, M5, N5 is your first MPh. Get moving.

■ It should have taken you eight MPh with a lot of wasted MF along the way. Those who took more or less, try it again. The rest of you, take a short break and fall in on the big '3' on board 3. DISMISSED.

■ Fall IN! Board 3 has only terrain that we have already seen, but before moving on to board 24 where you will see new terrain types, we are going to review what you've learned so far. What hex are we in now? "3B8, Drill Sergeant." How many MF does it take to get to E3, which is the peak of hill 547? "Ten MF, Drill Sergeant." Good. Taking the shortest route in MPh as well as MF, I want you to go to E3, then to I7, and then proceed to the second level of N1. Then go to level 1 of R6, before proceeding to W6, and DD2 at the top of hill 498 where I will meet you. Move out.

■ You should have expended the following MF, and taken the following number of MPh:

B8 to E3: 10 MF, 3 MPh

E3 to I7: 8 MF, 2 MPh

I7 to N1 level 2: 12 MF, 3 MPh

N1 to R6, level 1: 17 MF, 4 MPh (using the road bonus between N4 & Q8)

R6 to W6: 8 MF, 2 MPh

W6 to DD2: 11 MF, 3 MPh

Anyone who got all of those correct has done very well. There may be hope for you yet. Take five and fall in on the big 24 on board 24. DISMISSED.

■ TEN HUT!

At ease. Board 24 has a lot of terrain you haven't seen before, at least not in this course. I suspect that most of you have seen brush, gullies, and orchards, but rarely from a Squad Leader's perspective. Ahead of you in C8 is a valley. We are standing at ground level, or level 0. The bulk of the valley is one level below us, or at level -1. The gully hexes in the valley are at level -2. Behind you, in hexes B9, C10 and D9 is a gully. It is a relatively narrow slit in the ground which is referred to in ASL as a Depression. It is slow going, but usually allows you to move about out of sight of the enemy. The gully is one level below the surrounding terrain. What is the elevation of the gully behind you? "-1, Drill Sergeant." Very good. Now let's do some marching INTO the gully.

K

TEN-HUT! About FACE. Forward, MARCH! Entering INTO C10 costs us two MF. Column Left, MARCH! Staying IN the gully, D9 also costs two MF. Column Left, MARCH! We are descending into the valley IN the gully INTO hex D8 for another two MF. Squad, HALT! That ends our MPh. The cliff to our right prevents us from exiting the gully to E9. Follow me IN the gully. E8 costs two MF. Here again, cliffs block us from E9. There is also a cliff IN our gully hex which prevents us from moving directly to D7 unless we climb. Gully cliffs look somewhat different from hill cliff hexsides, but the effects are the same. Continue IN the gully to E7. There are more cliffs to our left. We can exit E7 along the gully in either direction, but what is our only choice if we want to leave the gully? "E6, Drill Sergeant." What do you think you are—a mountain goat? Guess again. "F7, Drill Sergeant." Nice guess. Ahead of us in F6 is a stone bridge over the gully. We are continuing IN the gully to F6 for two more MF which will end our current MPh. We can leave this gully hex by any adjacent hex, but we cannot move directly to the bridge without climbing. We must first leave the gully and enter the bridge along the road up there.

Follow me IN the gully. G6, two MF; H5, two MF. Squad, HALT! From here we can follow the gully either to the right to I6, or to the left to H4. I6 is a combination gully-woods hex. It costs two MF for the gully plus two more for the woods, for a total of four MF. H4 also costs four MF, since brush costs two MF. To leave a gully and enter a non-gully we have to enter higher ground, which is just like going to a higher level hill hex as far as MF are concerned. How much does it cost to enter I5 from IN H5? "Two MF, Drill Sergeant." Why? "It normally costs one MF since it is Open Ground, but it is doubled since we are going uphill." Outstanding. What is the cost to enter I6 from H5? "Four MF, Drill Sergeant."

IN most Depression hexes such as this, you can move/advance into what is called Crest status (B20.9) by expending two MF (or using your Advance capability). Crest status leaves you clinging to the edge of the Depression in a Depression hex at an elevation one level higher than when IN the Depression itself, and is indicated by placement above a Crest counter. However, you are always considered on one side or the other of the Depression—not both—as indicated by placement of the Crest counter so that the solid portion of the hexside depiction on the counter corresponds with the three hexsides you can directly traverse. A Crest counter must be placed so that the middle of its three hexsides does not align with a Depression hexside. Therefore, here in H5, Crest counters can be placed only on the H5-I5, H5-H6, and H5-G5 hexsides and have no effect whatever on the other hexsides. Back in G6, Crest counters can affect either the G6-G7 & G6-H6 hexsides, or the G6-G5 & G6-F5 hexsides. You can leave Crest status in the Depression across any of these actual Crest hexsides by expending an extra MF (or advancing normally). The only way to traverse one of the other hexsides from Crest status in the same or a different hex is to first return to the bottom of the Depression at a cost of two MF (or your Advance Phase capability). You can also enter Crest status in a Depression hex while entering the hex from a non-Depression hex by expending one less MF than the normal cost to enter that hex (or advancing into it), but the Crest counter must be placed so that the middle of the three hexsides it could conceivably cover coincide with the hexside actually crossed. Let's assume we're in Crest status here along the H5-I5 hexside. How many MF would it cost to move to I5? "Two MF, Drill Sergeant; one to leave Crest status along the Crest hexside and one to enter I5." Good. Since you were already at the same elevation as I5 while in Crest status, there was no need to double the entrance cost of I5 due to entering a higher elevation. How much to enter G6? "Four MF, Drill Sergeant." Why? "Because we have to pay two MF to exit Crest status INTO the -2 level of H5 before entering G6." H6? "Four MF, Drill Sergeant." Outstanding. Remember, Crest status can never be gained in a Depression containing a ford or bridge, nor along a hexside of that Depression which is also a cliff or a Depression hexside (i.e. a hexside through which the Depression is drawn). "Drill Sergeant, is entering Crest status the equivalent of changing Locations in the same hex?" Not quite. Crest status is still considered to be the same Location as the bottom of the Depression because, if a firer has a LOS to both, his fire can affect units both in Crest status and IN the Depression. However, for purposes of leadership and SW Possession, Transfer, and Recovery (only), each Crest counter is treated as a separate Location from the Depression and any other Crest counters therein. Now, let's move on to I6.

K

While we take a short rest IN I6, let's look around. Even though we are IN a gully, we can still see the terrain in ADJACENT hexes. To our right in I7 is a brush hex. It costs the same as woods to move through, but it offers much less protection in terms of stopping a bullet. You can see farther through brush than you can through woods (B12.2).

Follow me as we head through the brush to the road. I7, four MF; H7, one MF; G7, one MF ending our MPh; F6, one MF. Squad, HALT! We are now on the bridge that we were beneath IN the gully. The only way to enter or leave a bridge is across one of the two road hexsides. What are the only two hexes that we can enter from F6? "E6 and G7, Drill Sergeant." Outstanding. Let's keep going across the bridge to E6, one MF; D5, one MF; C5, two MF (remember that we just went uphill, doubling the normal entry cost of the hex); C4, one MF; and C3, one MF—for a total of six MF which ends our MPh. Squad, HALT! Look over to D2. The ground dips and comes back up on the hexside between D2 and D3. The MF cost for such Abrupt Elevation terrain (B10.51) is one MF to go down, plus the usual two MF to go uphill, for a total of three MF. Do it. D2, three MF; E2, one MF; F1, two MF. This ends our MPh since we just expended six MF. Let's continue on through the brush—G1, two MF. Squad, HALT!

Look down into H1. It is a crag hex full of rocks, boulders, and other debris (B17). It offers some protection but it slows you down to the tune of two MF per hex. Follow me into the valley again. H1, two MF; H2, two MF. Squad, HALT! From here we can continue IN the gully to I3 for two MF, or leave the gully by moving to G3 (two MF), or H1 (four MF), but not to I2 because of the cliff hexside. We can move to G2, but that involves going uphill two levels: leaving the gully for two MF plus (B10.51) leaving the valley for two more MF. Instead, we are moving directly to H3 for four MF; two to exit the gully while moving to the level -1 valley plus (B10.51) two more MF to enter the level -2 gully in H3. We will now continue IN the gully to H4 which is a brush-gully hex. How much will it cost to enter INTO H4? "Four MF, Drill Sergeant." Why? "Two MF for the brush and two more for the gully." Outstanding. Let's get moving. H4, four MF; H5, two MF. Squad, HALT! We have been here before. This time let's leave the gully and follow the road. H6, two MF; H7, one MF; I8, one MF; J7, one MF; K7, one MF. Squad, HALT!

To our right is an orchard in L7. This costs one MF to enter, the same as Open Ground, but it offers a little more protection. Beyond it we will take a path through the woods and visit a small pond. "What kind of trees are in an orchard, Drill Sergeant?" Fruit salad, soldier. No, they look pretty young. I guess that makes them ours; infant trees. Forward, MARCH! L7, one MF; M8, one MF. Column Right, MARCH. L8, only one MF since it is a path; K9, one MF. Column Left, MARCH! L9, two MF. Squad, HALT! That is a pond on the hexside between us and M9. Unless you own a paddleboat concession on this pond, you cannot cross it. If you want to go to M9 from L9, you have to go the long way via either L8 or M10.

No swimming today! We'll skirt the pond and head toward town. Follow me up out of the valley to M10, four MF; M9, two MF; continuing directly into another MPh—M8, one MF; M7, one MF; N6, one MF; O7, one MF; P6, one MF; Q7, one MF. Squad, HALT! On your left in Q6 is a lumberyard (B23.211). It is equivalent to a single story wooden building. What is its MF cost? "Two MF, Drill Sergeant." Cross the lumberyard to the road on the other side. Q6, two MF; Q5, two MF; Q4, two MF crossing the hedge. Column Right, and head out along the road: R3, S4, T3. Squad, HALT! On your right is a new type of building. From what we know of buildings, what can you tell me about it?

"It is stone because it is gray, has a stairwell in each hex, and has three levels in each hex." Correct, but it is also a split level building (B23.72). Level 1 in U4 connects to the ground level of V3, and Level 2 in U4 connects with Level 1 in V3. The ground level of U4 doesn't connect with any part of V3 and you cannot move from Level 2 of V3 directly to U4. Let's enter the building. U4, ground level, costs two MF; up to the first level of U4, one MF; over to the ground level of V3, two MF; leave the building and use the path to enter W4, one MF. Follow the path: W5, W6, W7, W8, X8 for a total of six MF. That would have cost 12 MF without the path. A path aids movement through brush just as it does through woods. Follow me through the orchard in X9, one MF; to Y10, one MF.

That concludes our training on board 24 for today. You should now be able to handle any terrain you encounter in *PARATROOPER*, but to be sure we'll practice with a few exercises. How many MF does a squad have

Marching

in one MPh? "Four, Drill Sergeant." Move along the diagonal Hex Grain from Y10 to G1. Keep track of the number of MPh that it takes and the total MF cost. Take off.

■ It should have taken you exactly 32 MF and nine MPh. Now take the same route back to Y10.

■ It should have taken you eight turns and 29 MF. Movement costs between hexes are not always reciprocal. Now move from Y10 to the road intersection at Y2, staying on hex row Y all the way.

■ This was an easy exercise. Who got 12 MF and three MPh? All of you? Outstanding. Maybe there's hope for you yet. Move along the diagonal Hex Grain from Y2 to I10.

■ That should have taken eight MPh and cost 27 MF. If it took you 26 MF you probably forgot to descend a level in U4, because you were at Level 0 when you entered it from ground level of V3 and still had to descend a level to -1 in the valley. You have passed your first test, but it was an easy one. Now, we'll do it again—but like soldiers instead of raw recruits. Report to 1B8.

■ TEN HUT! So far you clowns have barely worked up a sweat. Well, that is about to change. At ease. Has it ever occurred to any of you that if you can move four hexes strolling along by yourselves and six hexes when you pick up the pace due to my encouragement, how much ground you can cover if we actually run? Well, in the military we call that Double Time (A4.5) and you're about to find out all about it first hand. Right FACE. Forward, MARCH! Double TIME. Sing out the total MF expended as we go. C8, one MF; D7, two MF; E7, three MF; Column Right, MARCH! F7, four MF; G8 five MF; H8, six MF; I9, seven MF, Column Left, MARCH! J8, eight MF; Squad, HALT! Ah—an invigorating little jaunt. Now, how many MF do you have in Double Time, Nixon? "Gasp—eight, Drill Sergeant." Correct, but only if accompanied by a leader or you become a SMC yourself. Double Time just increases your normal MF allotment by two, and only if you're not broken, wounded, or CX. Unfortunately, it reduces your IPC by one, but that's no concern to us today. "What is CX, Drill Sergeant?" It is that white counter you've been lugging on your collective backs ever since I declared Double Time. It stands for Counter Exhaustion (A4.51), which, judging from the way you're all wheezing, appears pretty accurate. We'll have to cart that counter with us everywhere we go until we fire in our next Prep Fire Phase (FFPh), or break, or begin to move in our next MPh, or end our next MPh—whichever comes first. Basically, this means that we're prevented from Double Timing during any two consecutive turns so—while we can keep moving—we can catch our breath and you track stars won't have a heart attack. Of course, other arduous tasks, such as advancing into difficult terrain (A4.72) or taking a Minimum Move (A4.134), can also cause CX and prevent Double Timing in the next Game Turn. "Can we CX through more difficult terrain such as brush or woods, Drill Sergeant?" Sure, I'll show you before we're done. Now, how many MF can we expend next MPh? "Only six, Drill Sergeant, because we're still CX."

Don't look so pleased about it, trainee. Being CX can give you a real problem in combat. You'll have to add a +1 Dice Roll Modifier (DRM) to any attack you make and your opponent will qualify for a -1 DRM against you in Close Combat. I doubt whether you'll be smiling then. In general, you want to avoid being CX for a lot of reasons best explained in your advanced training, but there are times when CX status will be necessary. Okay, a turn has passed while we've been talking. Notice your CX counter is gone. Is there any way we can move more than eight MF during our next MPh—short of hauling you out of here in a truck? "No way, Drill Sergeant." Sure there is—if we stick to the road we'll still earn the road MF bonus. I'll prove it to you. Follow me toward V4. Forward, MARCH! Double TIME.

Marching

■ Squad, HALT! Where are we trainee and how many MF did we use? "Gasp, S6, gasp, 9 MF, Drill Sergeant." See? Nothing to it. Okay, take a two-minute break to catch your breath and get rid of this CX counter. What if we were to start marching and had expended MF before I ordered Double Time again? "The Inspector General would have to conduct an investigation into why all of your trainees died in the field." No, wimp! Assume you were no longer CX. "You couldn't do it anyway because Double Time has to be declared at the start of a unit's MPH." That used to be right, but the brass has rewritten the book on this one. Now a unit can declare Double Time anytime during its MPH—but if it waits until after it has expended MF to do so—it gets only a one MF bonus and all the normal CX penalties apply. "Why would anyone ever undergo those CX penalties for just one MF, Drill Sergeant?" I'm glad you asked that. Follow me . . . Route Step—T5, one MF; U6, two MF; V6 three MF; W7, four MF; X6, five MF. RAT-A-TAT-TAT. We're under fire from a *Machine Gun (MG)* in Z6—what should we do? "Declare Double Time, Drill Sergeant." Right. That gives us one extra MF, which is all we need to pay the two MF cost of entry into X5 where we'll be under cover instead of out in the open. All of a sudden being CX ain't so bad, eh? Don't worry, that was simulated fire—well over our heads—but in combat you won't have that luxury. Suffice it to say that you should know how and when to Double Time.

There is another way to get where you're going faster without expending so much energy—although it's more dangerous. Up until now when we've entered building/woods hexes we've done so rather carefully—going from room to room or actually moving through the woods. However, if you declare Bypass Movement (A4.3) when you enter such a hex, you can move *around* the building/woods depiction at a cost of one MF rather than two MF for actually moving *through* the obstacle. This MF cost assumes, of course, the other terrain in that hex along the hexsides in question is Open Ground, with no other applicable costs of entry into that hex. You are able to traverse the hex more quickly because you are skirting the obstacle rather than moving through it. "What's the catch, Drill Sergeant?" Ah yes, there's always a catch isn't there? In fact, there are several of them. You can only use Bypass in buildings/woods hexes and not in all of those, depending on the direction you wish to move and the availability of non-obstructed hexsides in those hexes. For instance, there is no way we can enter X4 with Bypass because it is an Interior Building Hex completely enclosed by building hexsides. We can use Bypass to enter W5 along the W5-W6 hexside because this hexside is not blocked by a building depiction. At this point we will be at the intersection (or vertex) of hexes W5, W6, and V5 at a cost of one MF. Let's do it. From here we can continue on into any of those three hexes at normal MF expenditures, or continue Bypass in W5 along the W5-V5 hexside at no additional cost. The latter will leave us at the W5-V4-V5 vertex from where we can next move into any of these three hexes at normal cost. Let's move to the W5-V4-V5 vertex as part of the same Bypass expenditure . . . how many MF have we used so far in this MPH? "One MF, Drill Sergeant." So, as you can see, whenever you use Bypass you are at a vertex, which limits your next move to the three hexes of that vertex rather than having the more numerous options available to a unit considered at a hex center dot. "Can we continue Bypass in W5 along the W5-V4 hexside, Drill Sergeant?" We could if the W5-W4-V4 vertex were not obstructed by the building (which is a real close call on my mapboard), but it wouldn't be wise anyway. Such continued Bypass to a third contiguous hexside will cost an additional MF. We would have been better off just using normal movement to enter W5 at the same two MF cost. "Can we continue to use Bypass to enter V4 or V5, Drill Sergeant?" Sure, provided that the first hexside Bypassed in those hexes is part of our current vertex. Also, remember that you can never use your last MF for Bypass; i.e., you cannot willingly end your MPH using Bypass. Even if you are forced by enemy fire to end your MPH in Bypass, you are considered to return to the hex center after all Defensive First Fire against you is resolved (A4.32-.33). So, unless we are broken or pinned, we can't end our MPH here at this vertex. If I want to end the MPH here without entering another hex, what must I do? "Voluntarily break, Drill Sergeant?" Been skipping ahead in the manuals, haven't you, Sylvester? No, you can only voluntarily break in the Rout Phase (A10.41), but next time I need a self-inflicted wound I'll keep you in mind. The answer is hardly so devious. "Pay two additional MF to enter the hex we are already in, Drill Sergeant?" Correct—but keep in mind that you are moving—from a vertex to a hex center. Let's go inside W5. Squad, HALT! How many MF did we use in that MPH? "Three MF, Drill Sergeant, but why would we ever want to use three MF to go one hex that we can normally enter for two MF?" Do I have

to run you past another hidden MG? No? Good, because I think some of you soiled your pants the first time. Let's suppose that when we turned that corner to enter the W5-V4-V5 vertex, a previously hidden MG in T4 opened up on us. It fails to hit us, but keeps its *Multiple Rate of Fire (ROF)*. We can't end our MPH while using Bypass so we have to move somewhere. Don't you think it would behoove us to pay the extra two MF to regain the +3 *Terrain Effects Modifier (TEM)* of the stone building here in W5? The unexpected frequently occurs in combat and you've got to learn to deal with it.

And that, boys and girls, is the real danger of Bypass. While using it, you don't get the benefit of the woods/building TEM of the hex you occupy, and you are also usually subject to an automatic -2 DRM for Non-Assault Movement in Open Ground (A4.34) if a firer has a *Line of Sight (LOS)* to you. In short, you are extremely vulnerable to enemy fire while in Bypass. Not only is the fire more lethal but Bypass can increase the opportunities for such fire because the firer has a choice of potential LOS checks to any of the vertices occupied in that hex, or to the hex center dot across any hexside you traversed. While it is true that Bypass can be used to advantage to avoid the LOS of a Known enemy, it is extremely dangerous to use in the proximity of a suspected, hidden enemy. An example is in order. Let's go over to the intersection in W2 and start our next turn from there. An enemy unit and a MG is in Z1. We certainly don't want to fight them from out here in the open so we must move. If we enter X2 normally at a cost of two MF, the MG can fire at us—conceivably twice if it maintains its Multiple ROF. However, if we declare Bypass along the X2-W3 hexside, the MG has no LOS to either vertex we'll traverse (X2-W2-W3 and X2-X3-W3) and cannot fire at us. Suppose, however, that once we declare this Bypass move, a hidden enemy in T4 shows itself to fire on us? We'd be in sad shape because instead of the +3 TEM of the building we'd be subject to a -2 DRM for non-Assault Movement in Open Ground. The moral is that Bypass is a handy way to increase movement capability and can even be used to avoid enemy LOS upon occasion, but is mighty dangerous if you use it where an enemy can see you. Enough lecture. Where are we? "X2, Drill Sergeant." Wrong. "X2-X3-W3, Drill Sergeant." Right. Having used Bypass we are not in a hex but in a vertex of that hex. "But we are also equidistant from the W3 and X3 center dots, Drill Sergeant." True, but every vertex position occupies a portion of one hex—the first hex referred to in its vertex coordinate (A2.2). We can't end our MPH here—let's go inside in X3 (two MF), and up two flights of stairs (two MF), and—oops, Double TIME into W4 (two MF). Put that CX counter on. Squad, HALT!

Where are we, trainee? "W4, second level, Drill Sergeant." Looks familiar doesn't it? This was the starting point of your first exercise. It took you six turns to reach B2 from here. Now that you know how to Double Time and use Bypass you should better that time considerably. I'll see you there.

■ Still six turns, although the last one used only one MF. The distance and MF expenditure (27) were the same, but your ability to Double Time twice got you here sooner. Bypass didn't help you any because the road bonus and a relatively straight route made it unnecessary to leave the road. Had you not started out already CX from the previous MPH you could have used Double Time in the first MPH, which would have gotten you onto the road for Turn 2 and consequently an extra hex traversed due to road bonus. That would have gotten you to B2 in exactly five MPH. As it was, you had to end each MPH in X3 (ground level), R2, M1, F2, and C3. Now that you've seen how to increase MF at the expense of vulnerability, let's see how we can do the opposite—decrease our vulnerability by sacrificing movement. Let's go over to the woods in C3. Assume we want to cross the street into the building in E4, but are afraid of being fired on in Open Ground while out in the street. We can declare a Dash (A4.63), provided we have enough MF to normally traverse the terrain and have not yet expended any MF in this turn. We can Dash from a non-Open Ground hex (such as C3) into the street (D3), and then directly into a non-Open Ground hex (E4) on the other side of the street, where we end our MPH. We give up some of our normal movement capability but get across the street to a position with a good TEM. If fired on while out in the street in D3, those firers who can shoot at us must halve their firepower due to the sudden way in which we cross the street, although the negative DRM for multi-hex movement in an Open Ground hex can still apply.

That's enough for today. Tomorrow, we'll visit the LOS Course in 1Z5. Squad, DISMISSED.

K

LOS

DAY TWO; LOS COURSE

TEN HUT!

At ease. Welcome to LOS Range 1Z5. Today you will learn about LOS (A6). Your LOS determines what you can and cannot see. This is important because it determines what you can and cannot fire at. If you can't see it, you can't fire at it. More importantly, it can't fire at you.

The basic principle of LOS is that you can see it, and it can see you, if there is no obstacle in the way. But there are plenty of things that can be in the way; buildings, woods, hills, etc. Look up the road along the Z Hex Grain. We are in Z5. What other hexes can you see? "Z4, Z3, Z2, and Z1, Drill Sergeant." Right. That's easy. You can see the wooden building in Z1, and fire into it, but you can't see the woods past it, because the building blocks your LOS. Similarly, you can look down the other roads to CC7 and V7, but you can't see beyond them to the center of DD7 or U8.

You can all see the building in Y5; it is in an adjacent hex. What other hexes of that building can you see? Obviously, you can't see X2, X3, X4, W4, or W5, but how about Y3, Y4, and X5? This is where the white dots in the center of each hex take center stage. To determine if there is a LOS between two hexes, stretch a thread between their respective center dots. If the thread crosses an obstacle depiction with the obstacle visible on both sides of the thread, that LOS is blocked. An obstacle in either of the hexes in question doesn't count (unless tracing fire to/from vertices of the same hex). Only obstacles between the respective firing and target hexes block LOS. Now you see that you have a LOS to X5 and Y4, but the building in Y4 blocks LOS to Y3. Only the actual depiction of a building/woods blocks LOS, not its entire hex.

You can see Z6. What other hexes of that building can you see also? "Y7 and AA7, Drill Sergeant." Why can't you see Z7? "The building in Z6 blocks LOS, Drill Sergeant." Good. Can you see BB7? "No, Drill Sergeant." Right. The building in AA7 blocks the LOS. Can you see CC8? "Yes, Drill Sergeant." Right again, even though the LOS passes through AA7 it doesn't pass through the building itself. Can you see AA3? "I'm not sure, Drill Sergeant." This is a close one. The LOS barely cuts the corner of the building in AA4, but because the building is not visible on both sides of the thread the LOS is not blocked (A6.1). You can't see Y2, but Y1 is in clear view. Can you see FF5? Come on, don't take all day! Any LOS along an Alternate Hex Grain is easy—you just sight along the hexspines. You better learn to recognize the easy ones because in combat you can't afford to be wrong—the thread stays in your pocket until the fire is irrevocably declared. "Yes, Drill Sergeant."

Let's go into a building. Enter Y8. It has a white square instead of a hex center dot, which makes it a stairwell hex. How high is this building? "Two levels, although the building is a 2½ level obstacle, Drill Sergeant." Why? "Because it has a stairwell, Drill Sergeant." What level are we on? "Ground Level, Drill Sergeant." What other levels does the building have? First and Second, Drill Sergeant." Good. You were paying attention yesterday. Looking up the stairwell, you have LOS only to the level directly above, the first level in our case. You can't see a unit on level 2 of our hex, because level 1 blocks LOS. You can see hexes Y7 and Z7, because they are adjacent, but only the ground level. Levels 1 and 2 in those hexes are out of your LOS. You can't see Z6 and AA7 at all, because they are blocked by the intervening rooms of Y7 and Z7. Looking out of the building, you can see X7 but not beyond it along this Hex Grain and at this elevation. You can see through the X7 hex—to W5 for instance, because your LOS does not cross the building depiction.

Now go up the steps to level 1. Yes, climb onto that gray level 1 counter (B23.421)—it helps you visualize where you are. You can now see both up and down the stairwell to all levels in this hex—other than the rooftop, which doesn't concern us at this stage of your training. You can also see level 1 of hexes Y7 and Z7, but not the ground or second levels of those hexes. You still can't see Z6 or AA7 at all, but you can now see past X7! When you or your target are higher than ground level, the height of obstacles becomes important. Small, one hex buildings that only have a ground level (B23.21) are one-level obstacles. This means that they block all ground level LOS, but units on level 1 or above can see past them to Locations that are also at level 1 or above.

You can see past the obstacle in X7 to the first level of hexes T4, S5, Q6, and even N3 among others. You can't see past S5 at this level, because that is a larger, two story house (B23.22). Multi-hex buildings without stairwells, which have both a ground and first level, are 1½ levels high. You have to be at level 2 or higher to see past them. They block both ground level and level 1 LOS. Move up the stairs to level 2. Jump onto that yellow level 2 counter.

Now you have an excellent view. You can see not only past X7, but you can also see past S5 to the second level of Q4. You can't see past Q4 because that is part of a multi-story building (B23.23). A building with one or more printed stairwells has a ground level, first level, and a second level, and it is 2½ levels high. You must be higher than second level—on a third level hill, for example—to see past it.

Since we are at level 2, we can see past level 1/level 1½ obstacles to the ground level. The obstacle still blocks our LOS to the ground-level hex right behind it. Think of it as a one-hex shadow behind a one-level obstacle. A hex in the shadow of an obstacle is called a Blind Hex (A6.4). Looking past X7, we cannot see W7 since it is directly behind X7. We can see V6, U6, T5 and both levels of S5. We can't see R4, because that is a Blind Hex due to the building in S5.

One thing about shadows; they get longer as the distance to the obstacle increases. Put another way, the farther away an obstacle is, the longer shadow it has, and the more Blind Hexes it creates. To be exact, an Obstacle has one more Blind Hex for every five hexes between the viewer and the obstacle (A6.41). How far away is S5 from us? "Six hexes, Drill Sergeant." How many multiples of five hexes is that? Between one and two, Drill Sergeant." Right, but in this case you discard fractions. It is one full multiple of five hexes, and it extends the shadow by how many hexes? "One, Drill Sergeant." That gives it two Blind Hexes. Can you see the ground level of Q4? "No, Drill Sergeant." What about the first level of Q4? "No, Drill Sergeant." Wrong. A one level obstacle, or a 1½ level obstacle in this case, never blocks LOS between a second level hex and a first level hex.

Let's look out another window. Can you see DD10? "Yes, Drill Sergeant." CC10? "Yes, Drill Sergeant." BB9? "No, Drill Sergeant." Why not? "It's in the Blind Hex formed by the 1½ level building in AA9." Outstanding. Let's go back to our previous window and look toward U8. Can you see past it to S8? "Yes, Drill Sergeant." Right. U8 is a 1½-level obstacle four hexes away and therefore creates only a one-hex shadow. Can you see Q8? "Yes, Drill Sergeant." Q8 is "behind" building hex R7 but because our LOS does not cross that building obstacle—it casts no shadow for us. Can you see O8? "No, Drill Sergeant, it's blocked by the building in P7 and P8." Correct. How about M8? "I'm not sure, Drill Sergeant." You can't see M8 because the building in O8, which is ten hexes away, casts three Blind Hexes. M8 is blocked by the building in O8, even though you can't see the ground level of O8 because it is blocked by the building in P7/P8. Can you see K8? "Yes, Drill Sergeant." How many Blind Hexes does it create behind it? "Three, Drill Sergeant." Why can't you see E8? "It is blocked by the woods in I8, which is 16 hexes away, and creates four Blind Hexes." Back downstairs and into the truck. We're due at LOS Course 4FF5 in 20 minutes.

TEN HUT.

At ease. We are at the intersection of three roads. One leads off the board, another is lined with hedges and leads to a wooden building, and the third runs toward a stone building. You can see the wooden building in Y9 as

well as all the road hexes leading to it. Can you see beyond Y9 to X9? "No, Drill Sergeant." Right. The building blocks LOS. Similarly, you can't see beyond X1 to W1.

Hedges and walls have exactly the same effect on LOS, but they are different than woods and buildings because they are half-level obstacles (A6.21). Hedges and walls only block LOS between hexes on the same level as the hedge or wall, and then only if neither the target nor the firing hex is adjacent to the hedge or wall. For example, you can see past the hedge on the FF5-FF6 hexside all the way to FF10, and anyone in those hexes can see you too. You can also see along the EE6-FF6 hexside to EE7, DD8, and CC10. You can see to DD5 because the DD5-EE6 hedge forms a hexside of DD5. However, hedges block your LOS to CC5 and CC6, because they are neither part of your hex nor the hexes that you are trying to see. Can you see DD7? "No, Drill Sergeant, it's blocked by the EE6-EE7 hedge hexside." Correct. You should also keep in mind that units in Crest status or in an entrenchment cannot see past a wall/hedge hexside in their hex and at their elevation to a same level target (B9.21).

Now head down the road and cross the hedge to Z7. Look toward BB10. Can you see it? "Yes, Drill Sergeant." No, you only think you see it. The hedge on the AA8-AA9 hexside blocks LOS. All walls and hedges are considered to extend to the very end of their hexsides (B9.1). The LOS touches the end of the hexside, because it runs through the vertex where hexes Z8, AA8 and AA9 meet. This is enough to block LOS.

On the other hand, you can sight along a hexside such as Y7-Y8 to see X7 and beyond (B9.2). You can even see DD7 from here, because the AA7-AA8 hexside is adjacent to your hex, and the CC7-CC8 hexside is adjacent to DD7. If you fired at DD7, the target would get a TEM of +1 because of the CC7-CC8 hedge. If it fired at you, you would get a TEM of +1 because of the AA7-AA8 hexside. The same is true if you fired at—or were fired at from—X7, due to the Y7-Y8 hexsides.

Can you see CC8? "Yes, Drill Sergeant." BB8? "Yes, Drill Sergeant." AA9? "Yes, Drill Sergeant." Would a target in AA9 get the hedge TEM? "Yes, Drill Sergeant." Right, for the same reason that you are prevented from seeing BB10, the LOS clips the end of the hexside. Can you see BB9? "No, Drill Sergeant." DD9? "No, Drill Sergeant." EE7? "No, Drill Sergeant." Okay, you chowderheads are getting the hang of hedges.

Now, at the risk of confusing you, I'm going to touch upon how hedges differ from bodge. Bodge is a tall hedge grown atop an earthen mound and replaces hedges/walls when specified by SSR. Bodge is a level 1 obstacle—not a half-level obstacle—and has a TEM of +2—not +1 like a hedge. You cannot see down the length of a bodge hexside as you can with a hedge and you must have Wall Advantage to fire through it to a non-adjacent hex. It costs two extra MF to cross a bodge hexside—not just the one extra MF of a hedge. Perhaps most importantly, a unit in a bodge hex which can't be seen by an unbroken enemy except through a bodge hexside can grow a "?" counter at the end of its Player Turn. If you find yourself in a bodge scenario, I'd advise getting acquainted with B9.5 real quick.

Let's check out the grain field now. While it Hinders your fire, you can still see through grain hexes. You can see V7, T7 and R7. What is the DRM for firing at a unit in R7? "+4, Drill Sergeant." Right, +1 for the woods and +3 for the three grain hexes. Even though that's a lot of Hindrance, you can still see R7. The maximum allowable Hindrance DRM for any one shot is +5; beyond that, the target is considered out of your LOS (B.10).

Now head to the biggest building on this board—P6. Board 4 is very flat. In fact, this building contains the only Location above ground level on board 4. Before we go upstairs, let's look around from the ground level. What other buildings can you see from here? "P8, CC6, S2 and P1, Drill Sergeant." Right. You have to look through grain to see most of them. What blocks the buildings that you cannot see? "Woods, Drill Sergeant." Can you see O9? "No, Drill Sergeant; the wall blocks the LOS." Can you see Q2? "Yes, Drill Sergeant." Q1? "No, Drill Sergeant, the Q2-Q3 hedge blocks the LOS." Can you see R1? "No, Drill Sergeant." Can you see CC7? "Yes, Drill Sergeant." DD7? "No, Drill Sergeant."

Now climb the inherent stairs (B23.22) to the first level of P6. Hop onto that gray Level 1 counter. From up here, you still can't see past the woods which are Level 1 obstacles. How high do you have to be to see over woods? "Level 2, Drill Sergeant." Correct. Woods and buildings still block your

LOS, but you can easily see over grain, walls and hedges. Grain offers no Hindrance to your view from up here. For example, you can now fire at P1 or Y6 with no Hindrance DRM. You can see right over the grain. "But Drill Sergeant, we're only a 7-4-7 and Y6 is nine hexes away. We can't even use Long Range Fire against it." Very good, Cantatore, but I was speaking generally—hoping that someday you might be entrusted with a MG. Besides, you can still see it—even if you can't hit it with your FP.

Can you see O9? "Yes, Drill Sergeant." Right—and there is no TEM or Hindrance for fire into O9 from here. What about O8? "We can see it, Drill Sergeant." Of course you can, but it still gets the wall TEM of +2. Can you see Q2? "Yes, Drill Sergeant." Q1? "Yes, Drill Sergeant." R1? "Yes, Drill Sergeant." And CC7 and DD7 too. You can see much more from up here, but you can be seen from many more places too. When you have an elevation advantage you are more dangerous to your enemy, but you are also a better target yourself. Whatever you can see, can see you too. Fall in on the hilltop on 2M5 in ten minutes. Squad, DISMISSED.

■ TEN HUT!

At ease. Here on 2M5 we are on a third-level hill hex. From here we can see all the other third-level hill hexes on board 2. An obstacle has to be higher than a particular level to block LOS between that level's hexes. Below us are woods in M4. Woods are a one-level obstacle, so woods on level 2 hexes are level 3 obstacles. From 2M5, you can't see past these woods to a lower level hex. Other level 3 hexes also block LOS to lower levels. From 2M5, you can't see O6 or any other hexes in that direction because of the plateau effect of N5—another third-level hex. Similarly, you can't see M3, M2, or M1 because of the third-level woods in M4. Of course, you can see both M4 and N5 with no problem.

You can see directly downhill to lower hexes. You can see all the level-two hexes from N4 to R2. You can see L4, K4, J3 and the woods in I3. You can also see ground-level hexes J2 and I2 among others. Hills have a much gentler slope than buildings and woodlines, and so don't create Blind Hexes unless they are five or more hexes away (B10.23). However, elevation advantage over an obstacle can reduce the number of Blind Hexes by one for each level of elevation advantage that is more than the one level needed to see over the obstacle in the first place (A6.42). In the case of non-Cliff Crest Line obstacles (B10.11), Blind Hexes can be eliminated altogether by sufficient elevation advantage—but with other obstacles a minimum shadow of one Blind Hex is always left, regardless of the amount of elevation advantage.

For example, you can see K6 and K8, but the J8 and K9 Crest Lines are five hexes away and create one Blind Hex. However, we are on level 3 and the obstacles are only level 1 Crest Lines, so our extra elevation advantage negates the Blind Hex and we can see J9 after all. Now look at the level 2 hill hex F7. Since it is seven hexes away, it has a Blind Hex for every elevation drop behind it. It is only one level below us so we don't negate any Blind Hexes by elevation advantage. E8 is one hex behind F7 and one level lower which takes it out of our LOS. D8 is two hexes behind F7 and two hexes lower, so it too is in the shadow of F7; if we could see it, it would create just one Blind Hex since it is nine hexes away but we have a two-level elevation advantage over it. C9 is beyond the shadow of F7, and we could see it if there were no woods obstacle in D8. C9 is also ten hexes away, which extends its shadow to three hexes, but our elevation advantage reduces the shadow to two so we still can't see B9 or A10.

Woods on a level 1 hill become level 2 obstacles—even that portion of the woods depiction which may be growing on what appears to be a ground level portion of the hill hex (B10.1). Being on level 3, we can still see over them, but they create a Blind Hex nonetheless. You can see M6 and M7, but the woods in M7 cast a shadow. You cannot see M8 because it is one hex behind the woods and one level below the elevation of the woods; and M9 is not visible because it is two hexes behind the woods and two levels below the elevation of the woods (A6.43). The ground level building in M9 still has its one hex shadow, so you can't see M10, either. Unlike shadows cast by hills, woods/buildings never lose their one-hex shadow regardless of your elevation advantage.

K

Can you see the woods in I3? "Yes, Drill Sergeant." Right. We established that earlier. Can you see H2? "No, Drill Sergeant." G2? "No, Drill Sergeant." F1? "Yes, Drill Sergeant." Good. It is two levels below the woods in I3, but it is three hexes behind it. Can you see E1? "Yes, Drill Sergeant." Let's try a different direction. Can you see J6? "Yes, Drill Sergeant." I7? "No, Drill Sergeant." H7? "No, Drill Sergeant." Right—and even if there were no woods in I7, the woods in J6 would block LOS to H7 because H7 is at ground level and the woods in H7 are only a level 1 obstacle (A6.43). Can you see G8? "No, Drill Sergeant." Wake up! Yes you can! G8 is level 1, and is two hexes beyond I7—but only one level below the obstacle so I7 doesn't block it either. G8 is in plain view as you will doubtless find out the day someone shoots you from there. Can you see F8? "Yes, Drill Sergeant." E9? "Yes, Drill Sergeant." Good. You remembered our extra elevation advantage over F8, which negates the Crest Line's Blind Hex. D9? "No, Drill Sergeant." C10? "Yes, Drill Sergeant." Outstanding. The distance to E9 and our extra elevation advantage over E9 cancel each other out, so it has only a one-hex shadow.

Now look along the N4-R2 Hex Grain. You can see the second level hexes from N4 to R2. R2 ends in a cliff which has a LOS shadow as if it were a building. There is a two-level drop from the cliff to S2, and R2 is five hexes away, so the cliff has a three hex shadow. Can you see S2? "No, Drill Sergeant." T1? "No, Drill Sergeant." U1? "No, Drill Sergeant." Wrong. Two out of three isn't good enough in combat. U1 is level 1, which reduces the shadow to it by one hex. Looking at it another way, U1 is one level below the obstacle, R2, and three hexes away. The distance of the obstacle from the viewer—five hexes—increases the shadow by one hex; in addition, there is a one-hex shadow due to the net elevation change of one level between R2 and U1. Thus the shadow of R2 is two hexes in length—but U1 is three hexes from the obstacle, which makes it visible to you. Of course, if a cliff is part of your hexside, it doesn't block your LOS to a lower Location; you can see right over the cliffs on the M5/L4 and the M5/L5 hexsides.

To practice LOS techniques, you are going to repeat the same exercise from a number of different vantage points. From a particular hex, look along the Hex Grain in all six directions and list the hexes that are in your LOS. To start with, go to J4 and look around. What do you see? I'll give you five minutes to write it down.

■ In the six directions you should have seen: J3, J2, J1; K4, L3, P1, Q1, R0; K5, J5, J6, J8, J9; I5, H5, G6, F6, E7, D7, A9; I4, H3, G3, F2, D1. Anybody have any problems?

"Why can't we see O2, Drill Sergeant?" O2 is at level 0 and is two hexes behind the level 2 woods obstacle in M3. You are at level 3 so you don't have any extra elevation advantage to reduce the woods' shadow.

"Why can we see A9, Drill Sergeant?" C8 is seven hexes away from us—increasing its shadow by one, but it is also two levels below us—decreasing its shadow by one.

"Why can't we see E2, Drill Sergeant?" Even though we have a two-level elevation advantage over the woods in F2, woods—like buildings and cliffs—always create at least one Blind Hex, which in this case is E2.

Now, what can you see along the Hex Grains from Q6?

■ From Q6 you can see: Q5, Q4, Q3, Q2, Q1; R5, S5, U4, W3, X2, Y2, Z1; R6, S7, V8, Z10; Q7, Q8, Q9, Q10; P6, O7, N7, M8, L8; P5, O5. Any questions?

"Why can we see Q3? Doesn't the woods block LOS?" The woods are a level 2 obstacle, but Q3 is at level 2 also. The woods must be higher than Q3 to block LOS. Blind Hexes can only exist if we are at least as high as an obstacle that is itself higher than the hex we are looking at.

"Why can we see Q1, Drill Sergeant?" The only obstacle in question is the hill Crest Line in Q2 which has no shadow since it is within four hexes of us. Crest Lines, unlike other obstacles, can have their shadow reduced to 0 by elevation advantage.

"Why can we see W3, Drill Sergeant?" W3 is only one level below U4, but two hexes away. "How about Y2, Drill Sergeant?" X2 is five or more hexes away. Doesn't it create a Blind Hex?" The Crest Line in X2 has one Blind Hex because of distance away from us, but we have a two-level elevation advantage over it which reduces its shadow back to 0. Similarly, our extra elevation advantage cancels X9's being a Blind Hex due to distance, so we are able to see Z10.

Now try the view from U4. It is only a level 2 hex, but see what you can see along the Hex Grains.

■ You should have seen: U3, U2, U1; V3, W3, X2, Y2, Z1; V4, W5, Y6, Z6, CC8; U5, U7, U8, U9; T4, S5, R5, Q6; T3, S3, R2. Any questions?

"Doesn't the wall block LOS to U9, Drill Sergeant?" No, a wall blocks LOS traced on the same level only. If you are above the wall, it has no effect on LOS. Now try Y6 and check out the LOS along all Hex Grains.

■ From here you can see: Y5, Y4; Z5, AA5; Z6, CC8; Y7; X6, W7, U8, T8, P10; X5, W5, U4, R2. Any questions?

"Why can't we see Q10, Drill Sergeant?" The woods in S9 creates two Blind Hexes because it is six hexes away and we only have a one-level elevation advantage. Push on to F7 and repeat the exercise.

■ You should see: F6, F5, F4, F3; G7, H6, J5, K5; G8, H8, L10; F8, F9, F10; E8, D8, A10; E7, D6, C6, B5, A5. No questions? Outstanding. Let's try a couple from ground level. Go to O10 and repeat the exercise.

■ You are able to see: O9, O8, O5; P9, Q9, R8; P10; N10; N9, M9. When looking uphill, you can see only the first hex of each level above you; O9, O8 and O5 in this case. One more time, go to C6 and repeat the exercise.

■ From here you are able to see: C5, C4; D5, E5, G4, H3; D6, E7, F7; C7; B6; B5, A5. The D5-E5 wall blocks LOS to F4, but not to hill hexes G4 and H3. E7 and F7 would not be in LOS if you are of the opinion that your LOS crosses the building obstacle in D6. I'm not, but these things have been known to vary slightly from one board to another. For our final LOS session, fall in at the stone building in 24Z9 after chow. Squad, DISMISSED.

■ TEN HUT!

At ease. Around you we have mostly familiar terrain. Can you see BB9? "Yes, Drill Sergeant." DD10? "No, Drill Sergeant." DD9? "Yes, Drill Sergeant." What? "No, Drill Sergeant." That's better. The end of the wall blocks LOS. In training you get a second chance; in actual combat you might not.

Looking in the other direction you see an orchard in X9. It Hinders LOS in the same manner as grain except that it Hinders any LOS traced through the orchard hex—even a LOS traced along the orchard's hexside. The LOS does not have to be drawn through the orchard symbol depiction to be affected; the entire hex is considered composed of orchard, including the hexsides. You can see through the orchard to W10, V9, V10, U10, and T9 with a Hindrance of +1. You can see past the grain field to another orchard that is in BB6. What is the total Hindrance of fire into BB6? "+2, Drill Sergeant." Right. Into BB5 or CC6? "+3, Drill Sergeant." Right. The orchard adds its Hindrance to the Hindrance from the grain. How about CC5? "+4, Drill Sergeant." DD3? "+5, Drill Sergeant." DD2 or EE3? "+6, Drill Sergeant." No, you don't have LOS to those hexes. You can't have a Hindrance DRM of more than +5 (B.10). You can't see beyond CC3 DD3 EE4 because the combined Hindrance finally builds up so that it blocks LOS.

Now move to the wooden building in Y9. The brush acts exactly like grain. It only Hinders LOS drawn through the brush depiction itself. You can see right through the brush to V7 and W7, but with a Hindrance of +2 in each case. You can also see U8, but with a Hindrance of +3, +2 for brush and +1 for the orchard.

"Drill Sergeant, the LOS cuts through three hexes that contain brush: X8, W8, and W9. Shouldn't there be a Hindrance of +3 for brush?" The brass has changed the wording of A6.7 so that the maximum Hindrance, excluding SMOKE/AFV/wrecks, can never exceed the range to the farthest Hindrance—even if it crosses extra Hindrance hexes. The LOS crosses hexes that contain Brush at a distance equivalent to a range of only two, not three, so the maximum Hindrance of the brush is +2, not +3. Now let's move out to Q4 to study more effects of orchards on LOS.

LOS

■ Look at the orchard in O3. Even though you can see past the tree trunks to other hexes on ground level, the leafy crowns of the trees in June block LOS to and from higher hexes as if the orchard were a woods hex (B14.2). In fact, an orchard is a lot like a woods hex without the undergrowth. Thus, you cannot see past the orchard in O3 to N2.

On the other side of the hedge you see a lumberyard in Q5. For LOS purposes the lumberyard is exactly like a single story building. Can you see the lumberyard in Q6? "No, Drill Sergeant." Can you see R5? "Yes, Drill Sergeant." P5? "Yes, Drill Sergeant." Good.

Let's go to M8. The path through the woods in L8 allows us to move easily through the woods, but it doesn't do anything for vision. Can you see L8? "Yes, Drill Sergeant." Can you see K9? "No, Drill Sergeant." What types of terrain do not affect LOS, Collier? "Paths, roads, shellholes, Open Ground and Water Obstacles, Drill Sergeant." Good anticipation; the pond doesn't block LOS at all. You can see directly from L8 to M10, and from M9 to L9, right over the water. Now assume that an enemy unit is in O10 using Bypass along the O10-O9 hexside. Is there a Hindrance DRM to your fire at vertex O10-N9-O9? "Yes, Drill Sergeant; +2" Wrong! A unit is always at the higher elevation when Bypassing an obstacle that is at the higher elevation of a Crest Line in its hex (A4.34). Therefore, your attack has no Hindrance DRM.

Gullies don't block LOS but they're hard to see INTO because they're so narrow. To see INTO a gully, your distance in hexes from the gully must be no greater than your elevation above the bottom of the gully (A6.3). I'll show you what I mean. Go to H7. You are now two hexes away from the nearest gully. The bottom of the gully is at level -2, but here in the valley our own elevation is -1, so our elevation above the gully bottom is only one. How far from a gully must we be to see INTO that gully? "One hex, Drill Sergeant." Right. Move to H6. Now you can see INTO the gully in hexes G6, H5 and I6. What's more, you can see along the gully if you can see INTO it, as long as your LOS doesn't leave the gully symbol itself (inclusive of the dark green background; B19.2). You can see not only H5, but H4 and H3 as well, but not H2. You can't see J5 either, because the woods in I6 block your LOS. Units in Crest status (B20.9) are considered a level above the gully and therefore can be seen as if they were at normal Open Ground level. One more question: is there a Hindrance DRM for firing into H3? "No, Drill Sergeant—because we're at a higher level than a unit IN the gully." Right. The Brass have declared that if the firer and target are at different elevations, an intervening gully-brush hex presents no Hindrance. If the unit in H3 were in Crest status, then the H4 brush would Hinder our fire at it.

Now enter the gully in H5. What can we see? The six adjacent hexes, as well as H3 and F6. LOS to H3 has a Hindrance of +1 due to the brush in H4, and in F6 you can see both the bridge and the gully below it. "But Drill Sergeant, my LOS to H3 doesn't actually cross any brush depiction—it lies entirely within the gully symbol. Why should the brush Hinder my LOS?" Observant cuss, aren't you Ellberger? The brass has declared that whenever brush or woods are depicted on both sides of a gully depiction in a gully hex they are considered part of that gully depiction.

Move along the gully to H3. This is one of the rare places where you cannot see INTO an adjacent hex. H2 is out of your LOS because it is also in a gully and that gully isn't directly connected to our gully hex through a shared Depression hexside. From here you can see F2, G2, I2 and J2 because they are two levels above us and only two hexes away. What other hexes can you see from here? "G3, G4, H4, H5, H6, I3 and I4, Drill Sergeant." Right—but remember that if we were in Crest status here, we'd be at level -1 and our LOS ability would change considerably.

Move back along the gully to F6. You cannot see anything on top of the bridge; the bridge blocks LOS between units on and below it (B6.2). What hexes can you see? "The six adjacent ones, H5, I5 and D7, Drill Sergeant." Very good. Now move to E7. The cliff along one side of the gully allows you to see adjacent hexes on top of the cliff, but nothing beyond it—regardless of height (B11.21). You can see E6, D6 and D7, but not C6. If the cliff weren't there, you would be able to see C6 since it is two levels higher and only two hexes away.

Now move back up the gully to D9. Even though we can see hexes D6 through D3, our LOS passes through the crags in D7. A crag Hinders LOS that passes through any portion of its hex, in the same manner as orchards (B.6). However, crags are not an obstacle or Hindrance to LOS from a higher level. LOS traced to D6 has a Hindrance of +1, for example, but the LOS traced to D2 has no Hindrance at all. Let's go to K3 for another look at crags.

From K3 you can see I4 with a Hindrance of +1. Can you see H4? "Only the Crest status level, Drill Sergeant, since it is a gully." Can you see the woods in G5? "Yes, Drill Sergeant." With what Hindrance? "+2, Drill Sergeant." Good. What about J4? "We can see it with a Hindrance of +1 due to the crag, Drill Sergeant." Outstanding. You can see G3 with a Hindrance of +1. A cliff hexside never blocks LOS sighted along it (B11.2), so we can see past the J2/J3 hexside, but the crag hexside is sufficient to Hinder LOS into G3.

You're ready for the last LOS exercises. Start in the gully in C10. As before, list what you can see in each of the Hex Grain directions.

■ You should have seen the five adjacent hexes plus E9 and A9. A fellow with a magnifying glass and a picky demeanor might make a case that the LOS to D9 crosses light green prior to reaching the D9 hex center dot and therefore E9 is not in LOS. A good lawyer might win this case after a few appeals, but this sort of situation comes under the heading of House Rules (or even a LOS die roll; A6.1). In my games, I expect LOS to be more clearly blocked and assume that it isn't otherwise. Players should come to an understanding over just how picky they'll be before these problems develop. Now try from the woods in G5.

■ You were able to see: G4, G3, G2; H4, I4, J3, K3, L2; H5, I6; G6, G7, G8, G9, G10; F5, E6, D6, C7, B7, A8; F4. Try it again from K7, and remember it is June.

■ You should have seen: K6; L6, M6; L7, M8, N8, O9; K8; J7, I8, H8, G9, F9; J6.

"Why couldn't we see P9, Drill Sergeant?" An orchard in season is a one-level obstacle to LOS from a higher level. You can see through the orchard to O9 which is on the same level as K7 and the orchard, but P9 is a level higher, so the orchard blocks LOS between K7 and P9. Now see what you can view from the woods in F2 above the valley.

■ You should have seen: F1, F0; G2, I1, J0; G3, H3, I4, J4, P7; F3, F4, F9, F10; E3, C4, B4, A5; E2, D1, C1, and B0. I hope you remembered that you could see over the woods in the valley to the ground level terrain on the other side of the valley.

Let's review LOS from a building. See what you can see from the first level of S7. Remember that the first level of a building in a valley at level -1 is at level 0.

You should have seen: S6, S5 (both levels); T6 (first level); T7, U8, V8, W9; S8, S10; R7, Q8, P8, M10; R6, Q6, M4 (first level). Any questions?

"Why can't we see S2, Drill Sergeant?" S5 is a 1½-level building, which gives it a net height of level ½. You are at level 0 so S5 blocks your LOS to anything below level 1. S2 is at level 0 so it is blocked by S5. For the same reason you can't see past M4 to J2. One last exercise: what can you see along the Hex Grains from the second level of V3, the highest point on board 24?

■ From V3 you saw: V2, V1, V0; W3, X2, Y2, Z1, BB0; W4, Y5, Z5, AA6, EE8, FF8, GG9; V4; S5 (first level), O7, N7, L8, I10, H10; U3, T2, S2, R1, Q1, P0.

"Why can't we see DD7, Drill Sergeant?" The orchard in season, when seen from above, is a one-level obstacle, like a woods hex. It normally has a one-hex shadow, but since it is six hexes away it obscures two hexes. DD7 is two hexes behind it and therefore you can't see it.

"Is that why we can't see V10, Drill Sergeant?" Exactly. "Drill Sergeant, why can't we see U4? After all, it is in the adjacent hex?" Actually, you can see the rooftop, but the second level is obscured by the roof. You can't see through a roof without X-ray vision and although there may be several Clark Kents among you, I don't see any Superman!

"Why can't we see the bottom level of S5 since we can see the first level?" U4 has a two-level drop to the ground in T4, so it has two Blind Hexes at ground level. The ground level of S5 is one of them, but the first level is only one level below the obstacle and there is only one Blind Hex at that level, so you can see the first level of S5.

"Why can't we see the first level of R5?" Building S5 blocks LOS to everything in R5 but the rooftop, and you can't see through the roof to the first level inside the building. Any more questions?

Good. I hope none of you leave with the impression that you can only see along Hex Grains. Tomorrow you will put your LOS knowledge to work at the Rifle Ranges where you will qualify with your weapons. Report to 4C7 at 0600 with your IFT in hand. Squad DISMISSED.

K

DAY THREE; RIFLE RANGE

TEN HUT!

At ease. Previously we just took walks through the countryside, but combat is more than a Sunday School picnic. Today we start to get serious. We will learn how to use our weapons. The Firing Range runs from 4C7 to the woods in M2.

To fire at a target, load your rifle, remove the safety, hold the stock firmly against your shoulder, and aim at your target. Position the target squarely within your sights, take a deep breath, let it out halfway, and squeeze the dice before you roll them. Roll one white die and one colored die, and add the resulting numbers on the two dice together to obtain a *Dice Roll (DR)*. The lower the DR, the more damage you are likely to inflict on your target.

Before you fire, carefully select your target. You can fire at any Location that you can see, within your weapon's range. Infantry Small Arms fire into a Location affects all occupants of that Location except those to which a LOF is blocked such as being entrenched behind a wall (B9.21) or non-Crest units IN a Depression (B20.92) (unless it is Defensive First Fire, which affects only moving units), even if the Location contains both friendly and enemy units (A7.4). However, you can fire at only one Location each time that you fire, unless you have a MG or an underlined range factor which qualifies you for Spraying Fire (A7.34, A9.5).

Next, determine the amount of *firepower (FP)* that you are using against your target. This depends on your inherent FP, the range to the target, and several other factors. Now you will learn what those numbers on your uniform mean. The first number is your FP. The second number is your Normal Range. In your case, your FP is seven and your Normal Range is four hexes. If you fire at a target in an adjacent hex, your FP is doubled due to Point Blank Fire. How much FP would you have against a target in D6? "14, Drill Sergeant." Right. You use your normal FP beyond Point Blank range and up to your Normal Range. At which hexes in our Firing Range do you have seven FP? "E6, F5 and G5, Drill Sergeant."

You can fire beyond your Normal Range up to double your range. Which is the farthest hex at which you can fire? "K3, Drill Sergeant." How far away is K3? "Eight hexes, Drill Sergeant." Beyond your Normal Range, your FP is halved. How much FP would you have if you fired at K3? "3½, Drill Sergeant." How much FP would you have against L2? "I don't know, Drill Sergeant." You have no FP against L2 since that is more than double your Normal Range, you ninny!

Once you have determined your total FP, use that number to locate the proper column to use on the *Infantry Fire Table (IFT)*. You have all been issued an IFT in your *ASL* rulebook; you should have it with you now and at any time you are in danger of engaging in combat. Look along the "DR/FP" row until you find the highest bold number not higher than your available FP. This is the column of the IFT you use for your attack. In your case, you would use the 12 column for Point Blank Fire, the 6 column at Normal Range, and the 2 column at Long Range.

"But our FP factors are all higher than that, Drill Sergeant." You still use the next-lower column if you haven't got at least as much FP as that listed at the top of the column (A7.3), blockhead. For example, you use the 8 column for 11 FP even though 11 is closer to 12 than it is to 8.

Next roll two dice and sum the numbers to get a total DR between 2 and 12.

Rifle Range

Cross-index this DR with the correct FP column on the IFT to determine the result. If the result is "-", you wasted good ammunition. Your target is unaffected aside from maybe wondering what you were shooting at. A "PTC" is a bit better (A7.305); each unit in the target Location must take a *Pin Task Check (PTC)*. Now they at least know what you were firing at. Your opponent makes a DR for each affected unit. If the DR exceeds the morale of the unit, it is pinned. The men in the pinned unit are sufficiently discouraged to keep their heads down. This halves their FP and disadvantages them in other ways.

"What is a unit's morale, Drill Sergeant?"

Morale is the third number on your uniform. Your morale is 7. European/American squads usually have Good Order Morale of 6, 7, or 8. A leader's morale is his first number. My morale is 8. Leaders have morale ranging from 6 to 10.

As I was saying, if a unit rolls higher than its morale during a PTC, it is pinned. If it rolls its morale or less, it is unaffected by your fire. For example, if you took a PTC, you would be pinned if you rolled 8 to 12, and okay if you rolled 2 to 7. I would be pinned if I rolled 9 to 12, and ok if I rolled 2 through 8. Major Eastwood, who is a 10-3 leader, would be pinned only if he rolled an 11 or 12.

The next-better result is a *Normal Morale Check (NMC; A7.303)*. This is similar to a PTC. Each unit in the target Location must take a *Morale Check (MC)*. However, there is more at risk. If the unit rolls higher than its morale, it breaks and is flipped over to its broken side. When a unit is broken, it cannot fire or move normally; all it can do is rout away or wait until it rallies. If the unit rolls exactly equal to its morale, it is pinned (A7.8) just as if it failed a PTC, but it is not broken. Thus, the unit is unaffected only if it rolls less than its morale. If it rolls a 12, it has taken a Casualty MC (A10.31) and suffers Casualty Reduction. Casualty Reduction wounds a SMC (perhaps mortally), eliminates a crew or *Half Squad (HS)*, and Reduces a squad to a HS.

1MC, 2MC, 3MC, and 4MC are variations on the NMC result. A MC must be taken for each affected unit in the target Location, but the specified number is added to the DR. For example, if you score a 2MC on a target Location, each affected unit in that Location must add two to its Morale Check DR. However, a Casualty MC occurs only if the Original DR—before all modification—is 12.

More devastating than a MC is a K result (A7.302). There are four possible K results: K/1, K/2, K/3, and K/4. At least one of the target units, chosen randomly, suffers Casualty Reduction (A7.302); all the remaining target units take a MC, adding the number following the "K/" to the DR. So, if you get a K/1 on the target, at least one unit is Reduced, and all target units—including any HS created by Casualty Reduction—must take a 1MC.

Worse yet is a KIA which stands for Killed In Action (A7.301). Each KIA is preceded by a number, which is the number of units in the target Location that are removed from the mapboard via cardboard body bags. The exact units are chosen randomly if there are more target units than the KIA number. All other target units are broken; no MC is necessary. Scoring a KIA result is like hitting the jackpot on a slot machine.

You are now going to use the Firing Range. You will be firing strictly on your own with no leadership benefit from me. All fire will be considered Prep Fire, and when you resolve it you will be marked with an orange-on-white Prep Fire counter (A.12). The Prep Fire counter signifies that you have already fired and will not be allowed to fire or move until it is removed at the end of the Advancing Fire Phase. A simulated German First Line squad, a 4-6-7, is your target. There it is now in K3 where you can fire at it at Long Range since it is eight hexes away. How many FP factors do you have? "3½, Drill Sergeant." Right. Roll the dice and use the 2 column of the IFT. And for God's sake, keep that weapon pointed down range. The first trainee to hit my counter with an accidental DR will need a boot extractor before he can sit down.

Your first DR is a 7. You missed, try again. DR 6: a PTC. What is a PTC? "Pin Task Check, Drill Sergeant." How does that effect the target squad? "If it rolls 8 through 12, it is pinned. If it rolls 7 or less, it is okay." Your next attack DR is a 4. What happens?

"The squad must take a 1MC, Drill Sergeant." What does it need to pass the 1MC? "It needs a 6 or less, Drill Sergeant." And what happens if it rolls a 6? "It is pinned, Drill Sergeant." What if it rolls a 12 for its

K

Rifle Range

MC? "It is Reduced to a HS and broken, Drill Sergeant." Right. The HS it is Reduced to is determined by the squad's Class, which is in the upper right corner of its counter. For instance, the 4-6-7 squad would Reduce to a 2-4-7, a First Line HS, which is broken.

Bulls-eye! You've rolled a 2 for a K/1 result. What happens to the target squad? "It is Reduced to a 2-4-7 HS, Drill Sergeant." And then what? "The HS must take a MC, Drill Sergeant." Does it add anything to this MC? "Yes." Yes, what? "Yes, Drill Sergeant." No, blockhead, what does it add to its MC DR? "I don't know, Drill Sergeant." It adds the number following the "K/", which is 1 in this case. Remember it. Your opponent may not be so co-operative. That 2 DR would have been subject to Cowering in combat, but here on the Firing Range we'll forget that for the time being.

We have another simulated target: a 4-4-7 Second Line German squad in E6, two hexes away. What is the column that you use on the IFT? "The 6 column, Drill Sergeant." Why the 6 column? "The target is at Normal Range and we have seven FP at Normal Range, Drill Sergeant."

Your first shot is a 9 which is a miss. You are shooting high . . . adjust your dice. Your next shot is an 8. What is the effect on the target squad? "It must take a PTC, Drill Sergeant. If it rolls greater than its morale, it is pinned." What DR does it need to pass its PTC? "7 or less, Drill Sergeant." Outstanding.

It passed its PTC. Your next DR is a 4. What happens? "The target must take a 2MC, Drill Sergeant." What if the target rolls an Original 6? "It adds the 2 of the 2MC to get an 8, which is greater than its morale, and it breaks, Drill Sergeant." A DR of 3. What happens to your target? "It suffers a K/2 result. It is Reduced to a HS which must take a 2MC." Which HS is the 4-4-7 Reduced to? "A 2-3-7, Drill Sergeant." What DR does the HS need to stay unbroken? "Five or less, Drill Sergeant." What happens if the HS rolls a 5? It is pinned, Drill Sergeant." What if it rolls a 12? "It is Reduced, Drill Sergeant." Reduced to what? "Nothing; it is eliminated."

Okay . . . we have a simulated 4-6-7 squad target in D6. All of you should be able to hit it at this range. What column do you use when firing at D6? "12, Drill Sergeant." What DR results in a miss? "11 & 12, Drill Sergeant." Your first DR is a 10. What happens? "The squad takes a PTC, Drill Sergeant. It must roll its morale or less to avoid being pinned."

Now I want you to fire at the simulated Conscript 4-3-6 squad target at every range from eight to one hex. Keep firing until you eliminate it. And then fire at it again at the next closer range, until you eliminate it again. Remember that if it breaks it then uses its broken side morale, which is 5 for this unit. A broken squad that breaks again is Reduced to a HS. A broken HS that breaks buys the farm. What HS does this squad get Reduced to? "A 2-3-6, Drill Sergeant." Lock and load one magazine. Keep your weapons pointed down range. Commence Fire.

■ You should have noticed that targets usually last a long time at Long Range, but tend to melt away rapidly under Point Blank Fire. However, nothing is guaranteed. Some of you may have dispatched the Long Range target faster than the Point Blank one. You have been firing only at targets in the open so far, but in actual combat your opponent will seldom be so gracious. Most terrain offers some protection in the form of modifiers added to the IFT DR. For example, if the target is in woods, you must add +1 to the DR of your attack. This is called a TEM. It offers troops in the woods more protection than they would get in Open Ground. For example, if your target is in E5, a woods hex, and you attack it with your normal FP of 6, you would miss on an Original DR of 8 or more. A PTC result would occur on an Original DR of 7, and so on. What Original DR would be required to obtain a NMC? "Six, Drill Sergeant." Right, because 6 plus 1 for the woods TEM is 7, and a 7 DR on the 6 column of the IFT yields a NMC. What would result in a 1MC? "4 or 5, Drill Sergeant." Right. What would you get with an Original 2 DR? "K/2, Drill Sergeant." Then how could you get a KIA? "Attack with more FP, Drill Sergeant." Exactly.

It's time to learn more about how terrain protects targets from fire attacks. Load onto that truck—we're going to another range at 24N6.

24

■ Fall In. Around us you see woods in O6, a wooden building in N7, and a stone building in M6. The woods affords some protection since it has a +1 TEM. A wooden building is better because it has a +2 TEM. A stone building is the best with a +3 TEM. As an exercise, we have a simulated German First Line 4-6-7 squad target in each of those three hexes. Fire at each of them, one at a time, taking turns, until you eliminate all three. Remember that you have 14 FP with Point Blank Fire, the target squad has a morale of 7 when broken, and it Reduces to a 2-4-7 HS with a broken Morale Level of 6. Fire when ready.

■ You should have noticed that the squad in the stone building is a lot tougher to break than the one in the woods. You may have also noticed that being in good terrain doesn't guarantee anything; it only makes it tougher for the attacker to hit you—not impossible. You may have actually broken the target in the stone building before the one in the woods.

"Drill Sergeant, we have been firing at the targets from the open. If we were in the same building, would the target still get the same TEM?"

Yes, even if both you and the target were in the same Location of the same building or firing up or down stairs. The TEM for buildings and woods are the same regardless of the terrain that the firing unit occupies except for Factories (B23.741) which you won't encounter anytime soon.

Let's move to Q7. You see a lumberyard in Q6. This is treated exactly the same as a single story wooden building for TEM and LOS purposes. There is also a hill in hexes P7 and Q8. It is not really a hill, we are actually in a valley, but everything is relative so it is just like a hill as far as we are concerned. Having a Height Advantage (B10.31) gives you some protection—a TEM of +1 to be exact—but it applies only if you receive no other beneficial TEM and is never applicable to units in Crest status. For example, a target in Q8 gets a TEM of +1 for being uphill from you, but a target in P7 gets only a TEM of +1, even though it is both in woods and uphill from us. It can choose one method of protection or the other, but not both.

Hedges and walls also provide protection. Let's move to Q4. There is a wall between you and the wooden building in Q3, and hedges between us and the buildings (or lumberyard) in P4, Q5 and R4. A hedge has a TEM of +1 if you are firing across it, and a wall has a TEM of +2. However, a target can only use either the hexside TEM or the TEM of its hex—not both (B9.31). If you fire at a target in Q3, it can use either its wall TEM or its building TEM, which are both +2. If you fire at a target in R4, it has a choice of a hedge TEM of +1 or a stone building TEM of +3. You're all thinking that its obvious which TEM the target would choose, but it's not always that obvious.

Sometimes it is wise for a defender to choose a lower hexside TEM to retain his Wall Advantage (B9.32). When units from opposing sides are in adjacent hexes separated by a hedge or wall, they cannot both use the same wall or hedge for protection; they would be practically on top of each other. Wall Advantage, which also applies to hedges, belongs to whoever was there first. A Wall Advantage counter is used to mark the unit(s) with Wall Advantage whenever enemy units become adjacent with a wall or hedge between them. Suppose that there is an opposing squad in Q3 and we move to Q4. The enemy could claim Wall Advantage, and consequently we would get no TEM for the wall. If the enemy moved away first, we could claim the Wall Advantage if a new enemy unit entered Q3.

You can also lose the Wall Advantage by using the TEM of something else in your hex (B9.31). For example, suppose that an enemy unit in R4 held Wall Advantage over us, which denies us the use of the +1 TEM for the hedge. If we fired at it and it chose to use the +3 TEM of the building instead of the +1 TEM of the hedge to resolve that attack, it would immediately lose the Wall Advantage to us.

Similarly, suppose that a German unit in Q3 had the Wall Advantage over us when some other GIs fired at them from P3. If the German chose to use the TEM of the building, they would lose the Wall Advantage to us. If they wanted to retain the Wall Advantage, they would be considered in Open Ground with a 0 TEM while resolving that attack. Claiming or

K

forfeiting Wall Advantage never has any effect on LOS. For example, the German in Q3 could still be fired on from Q2 even though they were claiming Wall Advantage against fire from Q4. In all of these cases the Germans would have to declare the applicable TEM against the fire before it is actually resolved.

You can also qualify for a hexside TEM if the fire passes through the length of a hexside (B9.3). For example, if we were to fire at a target in R2, it would get a TEM of +2 for the wall between Q3 and R3. Wall Advantage does not apply to this situation; it only applies if two enemy units are adjacent on both sides of a wall or hedge. So in this case each unit would receive the beneficial TEM when fired upon by the other.

There is a lot of terrain that gives no protection to units therein but does Hinder fire that passes through. . . I can see that a lot of you chowderheads haven't got the slightest idea of what I'm talking about. I'll show you what I mean. Move to the wooden building in Y9.

■ Looking around us you see a lot of different terrain types. Y10 is a road hex. Does it give you any cover? "No, Drill Sergeant." Right. It is just like Open Ground. You can also fire right through a road hex with no problem, just like Open Ground. Z9 contains a stone building. What protection does it give you? "A stone building has a TEM of +3, Drill Sergeant." Buildings stop bullets very effectively, so that an enemy unit on the other side of a building—in AA10 for example—cannot be affected by your fire at all. Similarly, woods stop all fire through them, even though they only give units in them a TEM of +1. Can you fire at a unit in Y7? "No, Drill Sergeant." Why not? "The woods block fire, Drill Sergeant."

There is grain in Z8, brush in X8, and orchard in X9. They all have a TEM of 0, giving no protection to targets therein against your fire, but they all Hinder fire through these hexes at targets beyond them. The Hindrance in each case is a +1 DRM added to your IFT DR for each Hindrance hex that your fire passes through on its way to the target (A6.7). You don't count any Hindrance in your own hex or in the target's hex—just the hexes in between except for SMOKE.

So far we have come across two types of DRM. What are they? "TEM and Hindrance modifiers, Drill Sergeant." From your position in Y9, what is the DRM of a target in Z8? "Zero, Drill Sergeant." In AA8? "+1, Drill Sergeant." BB7? "+2, Drill Sergeant." CC7? "+3, Drill Sergeant." Wrong. It is only +2, one for the Hindrance in Z8 and another for the Hindrance in AA8. BB7 is Open Ground and has no Hindrance at all. In fact, every hex along the road from BB7 to GG5 only has a total DRM of +2.

What is the DRM of a target in X9? "Zero, Drill Sergeant." Good. What about W10? "+1, Drill Sergeant." V10? "+1, Drill Sergeant." No, you forgot the TEM of the woods. A target in V10 has a TEM of +1 for the woods and a Hindrance of +1 due to the orchard in X9 for a total DRM of +2. I'll give you another chance. X8? "Zero, Drill Sergeant." W8? "+1, Drill Sergeant." V7? "+3, Drill Sergeant." Why +3? "+1 for the woods and +2 for Hindrance due to the brush in X8 and W8, Drill Sergeant." Right. The path has no effect on fire. Like a road, it affects movement but not fire. Now move to M9.

■ You can see across the water to L9. The pond has no effect on fire. What is the total DRM if you fire into L9? "+1, Drill Sergeant." Right. How about N8? "Zero, Drill Sergeant." O8? "+1, Drill Sergeant." P7? "+3, Drill Sergeant." Nope. Hindrances only apply if you are firing through them, not over them. When you fire at a higher level, such as up to P7, you fire over the grain fields in N8 and O8. The DRM equals only the TEM of the woods, or the TEM for Height Advantage. What is the DRM of a target in O10? "+2, Drill Sergeant." Right. Only the TEM of the wooden building applies. Suppose the target in O10 fired at us? What DRM would we have? "+1, Drill Sergeant." Right. Only woods TEM applies.

Let's move on to L8. We've been here before. You can see along the pond hexside to M10. What is the DRM for a target in M10? "+1, Drill Sergeant." What about a target in L4? "+2, Drill Sergeant." How do you figure that? "+1 for the Hindrance of the orchard in L7 and +1 for the hedge." Outstanding. Now let's go to G7.

Look at the bridge adjacent to us in F6. Firing at a target with your LOS traced along the road, the bridge is treated as Open Ground. What DRM would we have if we fired at a target on the bridge? "Zero, Drill Sergeant." Past the bridge in E6

Rifle Range

or D5? "Zero, Drill Sergeant." In C5? "+1, Drill Sergeant, for Height Advantage." Gullies also have no effect on firing except that it's hard to see a unit in a gully. You can fire right into the gully in G6 because we are ADJACENT to it. The target is as vulnerable as if it were in Open Ground. What DRM would it have? "Zero, Drill Sergeant." Right. Let's assume our next target is in Crest status. Crest status bestows a +2 TEM (the same as entrenchments) to any Direct Fire from a position that does not have a LOS INTO the Depression, or that is not traced through one of the protective Crest hexsides. What if the target were in Crest status on the G6-G7 hexside? "Zero, Drill Sergeant, because we are ADJACENT and therefore have a LOS INTO the Depression." Good. What if we were in G8 instead? "+2, Drill Sergeant, because we no longer have a LOS INTO G6." What if the Crest target was centered on hexside G6-G5? "Zero, Drill Sergeant, because our LOS does not cross a Crest hexside." Outstanding. That's enough on Crest status. How about a target on the other side of the gully in the woods in G5? "+1, Drill Sergeant." Good. Only the woods affects your fire—not the gully. You can also fire into the gully, below the bridge in F6, with a DRM of zero (B6.2).

Now move to the woods in F7. From here, fire against a target on the bridge would be partially blocked by the sides of the bridge depiction. The target would have a TEM of +1, which it wouldn't have for fire along the road from G7 or E6. Also, the bridge can Hinder fire that is not traced along the road, as if the bridge were grain or brush. What is the DRM of a target in F6? "+1, Drill Sergeant." F5? "+1, Drill Sergeant." F4? "+3, Drill Sergeant." Good. Why? "TEM of +1 for the woods, Hindrance of +1 for the bridge, and a Hindrance of +1 for the brush." Outstanding.

Let's move onto the bridge, which we have to do via G7. Remember? A unit below us in the gully is safe from our fire since we can't see it and vice versa. We can fire INTO the gully in G6 or E7 with a 0 DRM. If targets IN the gully fired back at us, we would get a DRM of +1, from either Height Advantage (B10.31) or the bridge. Exit the bridge via E6 and go through the brush and into the woods in G5.

From here we can see down INTO the gully in H4, H5 and G6. What DRM would targets IN any of those hexes have? "Zero, Drill Sergeant." Right. What about a target in I4? "Zero, Drill Sergeant." No. Even though a unit in H4 is IN the gully, the brush in the hex is both IN the gully and at its Crest status level (B19.21). Since we are in a valley, the brush exists both at level -1 and -2 in H4. It thus Hinders our fire through H4 and the target in I4 would have a DRM of +1 due to the Hindrance caused by the brush.

From our position, J3 has both a TEM of +1 for fire into the crag hex and a Hindrance of +1 for fire traced through the brush hex. If we fire at a target in J3, what DRM would it have? "+2, Drill Sergeant." Right—+1 for the brush Hindrance and +1 for the Crag TEM. How about K3? "+2, Drill Sergeant." L2? "+3, Drill Sergeant." Outstanding.

Suppose you fire at a target in J2. What DRM would it have? "+3, Drill Sergeant." Right. The gully doesn't affect your fire, and the brush Hindrance doesn't apply since the target is above us on level 0. The cliff hexside doesn't affect fire except that the uphill unit gets Height Advantage. What would be the DRM if you fired at a unit in I2? "+1, Drill Sergeant, for Height Advantage." Good. What if that unit fired back at you? "We'd have a DRM of +1, Drill Sergeant." Right. The cliff doesn't affect Small Arms fire at all from the top of the cliff.

Fall out for chow and assemble at 3X3. DISMISSED.

■ FALL IN! Let's review some of the lessons from this morning. What are the two types of DRM encountered thus far? "TEM and Hindrance, Drill Sergeant." What causes TEM? "Terrain in the target hex, Drill Sergeant." What causes Hindrance? "Terrain between the firer and the target, Drill Sergeant." What are the three ranges at which you can fire? "Long Range, Normal Range, and Point Blank Fire, Drill Sergeant." What are their respective effects on your FP? "Halved, normal, and doubled, Drill Sergeant." There is yet another range category which we have not yet discussed. It is called *Triple Point Blank Fire* (TPBF; A7.21) and results in tripled FP against targets in the same Location as the firer. It is rather rare—who can tell me why? "Drill Sergeant, I thought you weren't allowed

Rifle Range

to enter a Location containing an enemy unit in the MPh, and if you don't enter such a Location until the *Advance Phase (APh)* you would be in Melee before you could actually fire on the IFT." You've seen combat in the old game, haven't you? Well, you're right for the most part. However, there are occasions where certain units can enter an enemy-occupied Location in the MPh, and when it occurs the DEFENDER has no choice; he must use triple FP against the entering units (A8.312). If the DEFENDING unit has already used its First Fire capability, it must use Subsequent First Fire which would still be tripled (A8.3) against the moving enemy in its hex, but would then also be halved for using Subsequent First Fire. Briefly, Subsequent First Fire allows a DEFENDING unit that has already fired and is marked by a First Fire counter, to fire again at a moving target with half its FP—provided it selects a target which is within its Normal Range and no farther away than the closest Known enemy unit. If the defending unit has already used Subsequent First Fire, it must instead use *Final Protective Fire (FPF)* against the moving unit. FPF is the equivalent of Subsequent First Fire except that it can only be used against ADJACENT or same-hex moving units, and its resolution DR also serves as a NMC against the firer after resolving fire against the target. A unit using FPF is being pressed to the breaking point—and may do more damage to itself than to the enemy. "Drill Sergeant, can the ATTACKER ever use TPBF?" Yes, sort of. If he is not broken by the DEFENDER's TPBF First Fire/Subsequent First Fire/FPF, he can return fire with TPBF but it is always halved for taking place in the *Advancing Fire Phase (AFPh)*—but that's another lesson.

Shellholes are no Hindrance to fire, but they do have a TEM of +1 for units in the shellholes. If units are moving quickly through a shellhole hex paying only one MF and not entering the shellholes, they are treated as being in Open Ground. What is the DRM of a target in X2? "+1, Drill Sergeant." X1? "+1, Drill Sergeant." Y3? "+1, Drill Sergeant." Z2? "+1, Drill Sergeant." Y2? "+1, Drill Sergeant." What? "Zero, Drill Sergeant." That's better—now give me fifty!

There are a number of other factors that affect fire in addition to range and terrain. One is pinning. How does a unit become pinned? "By failing a PTC, Drill Sergeant, or by passing a MC by rolling exactly equal to the unit's morale." Outstanding. Being pinned is not a disaster, but it can lead to one. Among other things, it halves your FP. This is in addition to halving for other factors such as Long Range.

PIN
Half FP
for Move
No Adv

Suppose that you are under fire and become pinned. You are marked with a Pin counter. What would your basic FP be? "3½, Drill Sergeant." What FP would you have at Long Range? "1¼, Drill Sergeant." With Point Blank Fire? "7, Drill Sergeant." "What good are the fractions, Drill Sergeant? Why don't we just drop fractions?" Suppose that you're combining FP with a pinned 3-3-7 HS at Long Range. The HS would have three FP, halved to 1½ for being pinned, and halved again to ¾ for Long Range Fire. That, added to the 1¼ of the squad, equals 2½ FP and allows you to use the 2 column of the IFT. If you dropped fractions, you would only be able to use the 1 FP column.

What other effect that we've learned about can reduce FP? "Well, if you Double Time us up that hill again I'll scarcely be able to hold my rifle—let alone aim it, Drill Sergeant." Right. CX (A4.51) adds a +1 DRM to the attack of all units it affects for as long as they tote the CX marker around. It doesn't reduce your FP, but it certainly reduces its effect. Pinning, concealment, Covering, Hindrance, CX, and the TEM that we have encountered so far all reduce the effectiveness of FP. We'll talk about concealment (A12) and covering (A7.9) later.

Leadership is an important factor that increases the effectiveness of your FP. You have seen how a leader can speed up a squad's movement. A leader can also make a unit's attack more effective as I'll now explain.

The first number on a leader's counter is his morale. The second number is his leadership, which can be used as a DRM for attacks. Not all leaders benefit an attack. Normally, leadership DRM range from +1 to -3. A zero-DRM leader does not modify an attack but is still useful in directing attacks to avoid covering. A leadership DRM of -1, -2, or -3 improves an attack that the leader directs. A leader with a leadership DRM of +1 can actually lessen an attack's effectiveness, but can still prevent covering.

To affect an attack, the leader must be in the same Location (i.e., generally speaking, the same hex and the same level within that hex) as the unit it is going to direct. A leader can direct the fire of all units in its Location, but only if they all fire together at the same target. Using the leader to direct an attack is optional (even a 6+1 leader; A10.72), just as the act

of firing is optional. Make no mistake about it however, a leader directing an attack is assumed to be firing for all rules purposes. If the leader directs the attack, his leadership is added as a DRM to the attack DR, and he is restricted in his other activities as if he had fired.

I am an 8-1 leader. If I direct your fire by pointing out targets in the hex and politely encouraging you to use your weapons, your fire is more effective and you subtract one from your attack DR. This can neutralize the effect of woods or hedges, reduce the protection of a building, and make Open Ground even more dangerous. However, I can't do this if I am pinned or broken (A7.831, A10.7).

F ?
7 morale

Connerski! How much FP do you have against that target in X1? "What target, Drill Sergeant? All I see is woods." That's right, but any terrain capable of concealing an enemy (i.e., Concealment Terrain; A12.12) can be a target if it is in your LOS. Suppose that woods hex contains hidden enemy units (A12.3)—are you going to wait for them to shoot you to see if they are there? If you have reason to suspect the presence of enemy units in a Location, you can fire at it with halved FP in an attempt to reveal them. If your halved FP attack results in a PTC result or better on the IFT, any hidden/concealed units therein are revealed. "But how do we know when and where to suspect a concealed enemy?" Usually, they do you a favor by wearing a "?" counter, which means they may or may not be there (A12.11). But hidden units could be in any Concealment Terrain if so allowed by *Scenario Special Rule (SSR)* or during a night action (E1.2). That's a thing that no Squad Leader knows for certain, but the best ones develop a sixth sense about. Now . . . how many FP factors can you exert on X1? "3½ with a +1 TEM which is negated by your leadership, Drill Sergeant."

Another consideration for determining FP is Covering (A7.9). As hard as it is to believe that any of you stalwart lads would freeze under fire, the fact remains that statistics tell us that it happens to a majority of troops under fire. Covering occurs whenever the Original—that is, face-value—IFT DR results in Doubles, unless the attack is directed by a leader. There are a number of other exceptions which you'll learn later but for the time being just remember that whenever you Cover your FP column on the IFT is reduced to the next column on the left—unless you're Inexperienced in which case you lose two columns on the IFT. So, if you Cover, what will your FP be reduced to in an otherwise normal attack? "4, Drill Sergeant." More importantly, the Brass has decreed that any unit that cowers, as well as all of its SW, is automatically marked with a Prep Fire or Final Fire counter as applicable. This means that cowering also results in loss of Multiple Rate of Fire and Subsequent First Fire.

Up until now, everything you've learned about DRM and FP has been applicable to all fire conducted on the IFT, regardless of phase. However, there are three fire phases in each Player Turn and each of them has rules applicable only to that phase. Those phases are the *Prep Fire Phase (PFPh)*, *Defensive Fire Phase (DFPh)* including both First Fire (which actually occurs during the opponent's MPh) and Final Fire, and the *AFPh*. One of the basic rules to remember is that all fire occurring in the *AFPh* is halved—even if the firer has done nothing else in that Game Turn (A7.24). The only exception to this is if the ATTACKER declares Opportunity Fire (A7.25) in the *PFPh*, which allows him to fire in the *AFPh* at full strength but not at all in the *PFPh* nor may he move in the MPh.

However, units with an underlined FP factor—such as you—are equipped with automatic or semi-automatic weapons which allow you to use Assault Fire (A7.36) within Normal Range. A unit using Assault Fire in the *AFPh* may, after all other modifications, add one to its FP and round fractions up. So your FP in the *AFPh* is 5 (7 divided by 2 = 3½ + 1 = 4½ (Fractions Rounded Up) = 5).

FIRST FIRE
FFPh

FINAL FIRE
FFMO

Two of the most important DRM (FFNAM & FFMO) deal with the target's movement status and therefore apply only during First Fire (A4.6). A unit that fires during First Fire (A8.1) is marked with a purple-on-white First Fire counter until the *DFPh* is over. Should that unit fire again during First Fire by using Subsequent First Fire, the First Fire counter is flipped over to its Final Fire side. First Fire affects only moving units (A8.1); therefore those DRM—as well as the First Fire attacks themselves—do not apply to non-moving units in the same target Location at the moment of attack. The other portion of the *DFPh* occurs after the opponent's MPh has ended and is referred to as Final Fire. The advantage of waiting to use Final Fire is that the attack can affect all the enemy occupants of the target Location—not just moving units. A unit that has already used First Fire, as signified

K

by the First Fire counter on top of it, cannot use Final Fire except against adjacent or same-hex targets, and even then has its FP halved (prior to Point Blank Fire doubling/tripling). A unit that is already marked with a Final Fire counter cannot fire at all in Final Fire, except as FPF which is dangerous to both the firer (A8.31) and target. And remember, FPF can be made mandatory by an enemy able to enter the DEFENDER's Location during the MPH. A unit that fires in any capacity during Final Fire is marked with a Final Fire counter which remains until the end of the DFPh.

First Fire Non-Assault Movement (FFNAM) is a -1 DRM applicable to each moving unit during its MPH unless it has declared the use of Assault Movement for that move. Assault Movement is a declared one-hex move that requires less than a unit's full, non-CX, MF allotment. Any other form of movement assumes some form of prolonged erect posture which makes a better target.

First Fire Movement in the Open (FFMO) is a -1 DRM applicable during its MPH to each moving unit that enters an Open Ground hex and cannot claim some form of protective TEM or LOS Hindrance DRM. So, as you can see, multi-hex movement into an Open Ground hex could be subject to a combined -2 FFNAM/FFMO DRM which is sure to ruin your day. Perhaps now you better understand the dangers of Bypass.

This probably leaves you with the impression that any attack with a FFNAM/FFMO DRM is the best possible. Usually true, but not always. Let's move to M7 and assume you are now a 3-3-7 HS with no leadership. Assume that an enemy unit has just moved from N4 to O5 without using Assault Movement. Because we have a clear LOS from M7 to the entire hexside crossed by that moving unit we can declare a Snap Shot (A8.15). Snap shots are conducted with half FP, and no FFMO/FFNAM DRM apply to them, but neither does the TEM of the hex moved into. A regular attack on O5, using the -1 FFNAM DRM on the 2 FP column with a DR of 5, would result in No Effect due to the +3 TEM of the building. However, the same DR on a Snap Shot attack using the 1 FP column results in a PTC because there are no applicable DRM. There are a few exceptions to the rule about terrain in the target hex not applying to a Snap Shot. SMOKE in the target hex is applicable to a Snap Shot, as is the TEM of a wall or hedge of the target hex crossed by the fire on the way to the target hexside. For example, a unit in O6 entering P5 would be subject to a Snap Shot from M7 with a +2 DRM for the wall. However, just crossing a wall/hedge hexside does not add that TEM to the Snap Shot. For example, a unit entering P6 from P7 would not be subject to a TEM for a Snap Shot from M7. There is also the matter of whether you should withhold your First Fire altogether, ignoring the temptation of those negative DRM, so as to be able to fire with full FP in Final Fire against all the enemy occupants of a target Location rather than against just moving units which seldom move together in groups. But the answer to that question always depends on the situation, and requires far more intuitive skill gained from combat experience than we can hope to instill here.

Back on the truck. We'll test what you've learned on the Combat Walk-Through Course. Assemble on the road in 24Y1. Squad DISMISSED.

24

■ TEN HUT!

At ease. This course is very simple because you will do all the firing—nobody will be shooting at you—unless one of you points his weapon at me. We will proceed down this road one hex at a time. I will call out our present position, fire phase, your Original DR, and the Location of a simulated target which has just popped up. You will respond by instantly calling out your total FP against that target, any applicable DRM, and the result of that fire. I will be directing your fire unless stated otherwise. There will be a total of 21 targets. You can make Expert with a score of 19 or more, Sharpshooter with 17 or 18, and Marksman with 15 or 16. If you miss more than six targets, you have failed to qualify and will be dropped back to the next cycle for retraining. Keep your IFT at the ready. (Those of you at home should cover the answerline—overprinted in gray—with a bookmark until you're ready to answer.) Any questions? Good, let's begin.

Y2, PFPh, DR: 2, I'm pinned. Target: Z1.

"14 FP, +2, 3MC"

Rifle Range

Nervous, aren't you? You'd better be ... because you butchered that shot. Your FP is 14 due to PBF, but I'm pinned so I don't direct your attack which, with an Original DR of 2, means that you Cowered (Doubles) leaving you with only 8 FP (down one column from 12). Your total DRM is only +1 for the Woods TEM—you can't claim Height Advantage in addition to another beneficial DRM. The result is a K/2—better than you had assumed. Try again—and this time I won't be pinned.

X2, First Fire, DR: 12. Target is moving into X2 without using Assault Movement.

"21 FP, -3, 1MC"

Good! You recognized TPBF plus the application of both FFMO and FFNAM plus my leadership DRM. What else can you tell me about what just happened? "Well, we better hope the target failed that 1MC, because we sure failed our NMC caused by the FPF and have now either broken or suffered Casualty Reduction due to that Casualty MC—depending on whether a Random Selection dr picks you/us as the Casualty Reduction." Wrong! Had it been a FPF situation, your FP would have been halved after tripling, resulting in only 10½ FP. We were not marked with a Final Fire counter so our attack was not subject to FPF penalties. Had it been, your analysis would have been correct except that with only 10½ FP, the result to the enemy would have only been a PTC.

W2, AFPh, DR: 7. Target: U1.

"5 FP, 0, PTC"

Correct on all counts. FP is halved due to AFPh Fire but increased to five by Assault Fire, and a +1 Height Advantage DRM applies which is nullified by my leadership DRM.

V2, PFPh, DR: 9. Target: Q4.

"3½ FP, -1, -"

Correct. Long Range Fire is halved and my -1 leadership DRM applies.

U3, Final Fire, DR: 5. Target S4 has entered using Assault Movement.

"7 FP, -1, 2MC"

Outstanding. You didn't fall for the bait. FFMO does not apply because this is Final Fire—not First Fire. Only my leadership DRM applies.

T3, AFPh, DR: 9. Target is concealed in S3.

"5 FP, +1, -"

Good. Your FP is halved twice by AFPh Fire and Concealment, but is then doubled for PBF before adding one FP and rounding fractions up for Assault Fire. The +2 DRM for the wooden building more than counteracts my -1 leadership DRM.

S4, PFPh, DR: 5. Target: Q3.

"7 FP, +1, 1MC"

Right again. The DEFENDER cannot have both the wall and building TEM, and my leadership DRM negates only part of the +2 TEM.

R3, First Fire, DR: 3. Target is Dashing into P2 from P4.

"3½ FP, -3, 2KIA"

Wrong. Your FP is halved alright against a Dashing unit, but the Wall hexspine Q4-Q3 still adds a +2 DRM to your fire (B9.32) and cancels any FFMO DRM because the target is no longer considered in Open Ground (A4.61). The +2 TEM of the wall negates my -1 leadership DRM and the -1 FFNAM DRM, for a total DRM of 0 resulting in a 1MC on the 2 FP column. Alternatively, you could have made a Snap Shot at the P3-P4 hexside, which would have resulted in a 1 FP attack—due to being halved once for the Snap Shot and again for the Dash—and a -1 DRM for my leadership. This too would have resulted in a 1MC.

Q4, AFPh, DR: 5. Target is U4, first level.

"5 FP, +2, PTC"

Good. AFPh Fire and Assault Fire yield five FP, and the +3 TEM of the stone building is partially negated by my leadership. "Drill Sergeant, since this is the AFPh and Pin markers are removed at the end of the Player Turn before the DEFENDER can fire again anyway, is there any reason for him to actually take a PTC or can it be ignored?" Sometimes it can be ignored, but not if there is a possibility of that PTC causing a Sniper or Booby Trap attack, nor if there is a chance that the ATTACKER will wish to advance into the hex for CC during that Player Turn.

P3, PFPh, DR: 5. Target is concealed in L2.

"3½ FP, +1, PTC"

Rifle Range

Good. You added the +1 orchard Hindrance DRM to the +1 woods TEM and deducted my leadership. What special significance does the result of your attack have regardless of the outcome of the PTC? "The target loses its concealment, Drill Sergeant."

O4, First Fire, DR: 3. Target is moving into O5 from P4 without using Assault Movement.

"7 FP, -1, 1K1A"

Outstanding. You could have said: "14 FP, +1, 3MC" but you correctly chose a superior form of attack—the Snap Shot. You'll make Expert with that kind of shooting.

N4, PFPh, DR: 5. Target: O10.

"3½ FP, +1, PTC"

Good. You remembered that terrain Hindrance does not apply to a different-level target. Later you will learn about SMOKE Hindrance (A24.4), which is a different matter altogether.

N5, First Fire, DR: 5. Target is squad Bypassing P5 from O5 to P5-O6-P6.

"7 FP, -3 DRM, 1K1A"

Good. A Bypassing target in an otherwise Open Ground hex always offers a -2 DRM for FFMO/FFNAM. Although firing at a vertex that includes O5, you correctly concluded that you weren't eligible for PBF because the target was actually in P5. Had the target been Bypassing at M5-M6-L5 instead, the +1 TEM of the hedge would have been applicable because you would have been firing down that hexspine.

N6, First Fire, DR: 9. Target is squad Bypassing M5 from L4 to M5-M6-L5.

"7 FP, -1 DRM, PTC"

Wrong! You have no attack. You can't see the target because your LOS to the only vertices transited is blocked by the M6 building, while a LOS to the M5 hex center doesn't cross a hexside Bypassed by the unit. You should've waited for the unit to continue its move before firing. Now you've wasted your opportunity. If it's any consolation, you did have the DRM correct for fire against a unit Bypassing a hedge hexside through another hedge hexside (-1 for FFNAM, +1 for the hedge, -1 for my leadership).

M7, AFPh, DR: 7. We are CX and the target is K8.

"5 FP, +2, -"

Good. The CX +1 DRM cancels out my leadership of -1, leaving only the +1 for the orchard Hindrance and the +1 woods TEM. From here on, I won't be directing your fire.

L6, PFPh, DR: 3. Target: R6.

"No attack, Drill Sergeant."

Why? "The hedge at P6-Q6-Q7 vertex blocks my LOS (B9.1), Drill Sergeant."

K7, Final Fire, DR: 5. Target: E6.

"3½ FP, +2 DRM, -"

Good. A +2 DRM applies for Hindrance of the brush in J6 and I7—even though J6 is technically a woods hex—because the LOS crosses the brush depiction and not the woods depiction. Similarly, there is no Hindrance DRM for the bridge because the LOS does not cross the bridge depiction.

J7, AFPh, DR: 5. Target: E6

"1½ FP, +2 DRM, -"

Correct. Although you lost the Hindrance DRM for the brush in J6, you gained one for the bridge because your LOS now does cross the bridge depiction. Your FP is halved twice—once for the AFPh and again for Long Range Fire—and Assault Fire is not applicable at Long Range.

I8, PFPh, DR: 5. Target: E6.

"7 FP, 0 DRM, 1MC"

Outstanding. Long Range Fire no longer applies nor does the bridge Hindrance DRM because your LOS is now traced solely through the road depiction.

I9, First Fire, DR: 7. Target is a MMC entering Crest status in E8 from IN E7.

"7 FP, +1 DRM, PTC"

K

Perfect. You recognized that the +2 TEM of Crest status must apply, because only hexsides E6-F7 and E6-F8 can accommodate Crest status due to the cliffs and Depression hexsides of the other four. You also realized that the -1 DRM for FFNAM must apply because the MMC had to expend four MF to enter Crest status from E7 (two MF to enter the E8 gully, and two more to achieve Crest status), making Assault Movement impossible. It is interesting to note that, were the cliffs not present, your target could have moved into Crest status along hexside E8-D7, you could have applied the FFMO -1 DRM as well because the entrenched TEM would not have been applicable—thereby making E8 an Open Ground hex. The Final DRM in that case would have been -2 (FFMO & FFNAM) rather than +1.

I10, PFPh, DR: 2. Target: G10.

"7 FP, +1, K/2"

Wrong. The +1 DRM for Height Advantage applies, but your FP is reduced to the next column to the left due to Covering. Remember, I am not directing your fire any more. The correct answer is: 4 FP, +1, 2MC.

Those of you who have qualified with your weapons will learn how to close with and destroy the enemy in Close Combat tomorrow. Report to 3AA7 at 0600. Those of you who missed seven or more targets and failed to qualify, return to the LOS Course for remedial training.

DAY FOUR; CLOSE COMBAT

■ TEN HUT!

At ease. Today you will learn to use bayonets, hand grenades, entrenching tools, rocks, and even teeth if necessary to defeat the enemy at close range. We're not talking Point Blank Fire here, or even TPBF. You are literally on top of your enemy—so close that you can smell him—which judging from the lot of you might be quite a few yards away.

First you have to get into the enemy's hex. Can you do this normally in the MPh? "No, Drill Sergeant." That's right; during normal movement (A4.14) you may not enter an enemy-occupied hex. What you have to do is use the MPh to move adjacent to the enemy, survive his fire, and then use the APH (A4.7) to enter the enemy hex. After that comes the *Close Combat Phase (CCPh)* wherein you resolve things for keeps. No breaking here—you either kill your enemy or you don't. This fighting may continue to the next turn, in which case you and your enemy remain in Melee. In Melee you are too occupied with each other to affect anything else on the battlefield, too closely engaged even to move away. You again attempt to resolve the fight in the next CCPh. A Melee can continue indefinitely, but it often ends real fast.

After all normal movement and firing, broken units have a chance to get away in the *Rout Phase (RtPh)*. Then comes the APH, in which most unbroken, unpinning ATTACKER Infantry units get to move one hex. If they are adjacent to an enemy unit, this one hex advance can be into the enemy unit's Location, causing *Close Combat (CC)*. "Drill Sergeant, does the advance have to be into an enemy unit's hex?" No. It can be to any adjacent, Accessible hex. It can even be into a Location occupied by both friendly and enemy units already in Melee. However, it cannot occur if you are so encumbered by PP that you have no MF remaining, now that the Brass have amended A4.7.

There are other restrictions too. Broken units cannot advance, nor can CX units if the normal MF cost of such entry is four or more MF or all of a unit's non-Double Time MF allotment—whichever is less. Other units advancing into such terrain become CX in the process (A4.72). Units

K

already in Melee are stuck there, barring Withdrawal (A11.2) or Infiltration (A11.22). Units cannot advance where they can't move in the first place. For example, you can't advance across a cliff—at least not without climbing it in the MPh (B11.432).

We are now in 3N4. We can advance to any of the six adjacent hexes. Advance to the wooden building in M5. During the MPh this would cost two MF and you could continue on if you had more MF remaining. In the APH you must stop here. You can't even continue upstairs. Suppose we start our next APH here. Where can we advance? "The six adjacent hexes, Drill Sergeant." Right, but you can also advance upstairs to the first level of M5, or you can stay where you are.

Go to the first level of M2. Where can you advance from here? "The ground floor of M2, the second level of M2, the first level of N1, or the first level of N2, Drill Sergeant." Outstanding. You'll notice that when we go up or down stairs this gray slab beneath us called a level 1 counter will disappear, but if we go to an adjacent hex of the same building at this elevation it will go with us. Modern technology—ain't it wonderful? Be thankful you don't have to cart it around on your backs. Now go to the building in V3—but on your bellies—using only the APH. Let me know how many turns it takes.

■ I see that you all made it. Ten turns is a long time to spend crawling isn't it? That's often the length of an entire game. The APH helps you get where you're going safely, but you can't rely only on it. It's much too slow.

Normally you don't pay much attention to movement costs during the APH, but they do become relevant when you advance into Difficult Terrain (A4.72). Difficult Terrain means that it costs four or more MF to advance into a hex, or all of your MF if your MF allotment is less than four—which it can be if you are carrying a lot of equipment or are inexperienced. Here is an example. What is the MF cost of W3 from our position in V3? "One MF, Drill Sergeant." V4? "Two MF, Drill Sergeant." W4? "Four MF, Drill Sergeant." Which is the Difficult Terrain? "W4, Drill Sergeant." Right. You can't advance into Difficult Terrain at all if you are already CX. If you are not CX, advancing into Difficult Terrain makes you CX, just as if you had Double Timed during the MPh. If you advance to W4, you become CX. Suppose that you were already CX here in V3. You could still advance to W3, V2, U3, U4 and even V4, but not to W4. Now go get the 60mm mortar that's in the next room. Okay—how many MF do you have available while lugging this mortar around? "Two MF, Drill Sergeant—if you won't assist us." Right—on both counts. So what are your APH capabilities now? "Unchanged, Drill Sergeant, except that now V4 also becomes Difficult Terrain." Good.

For today's training, I have arranged for some of the trainees from B Company to act as a German 4-6-8 squad. They're waiting in V4. To engage in CC, use the APH to enter V4—but leave the mortar here. You won't need it—no *Support Weapon (SW)* can be used in CC. It's okay, the Brass has ruled that a SW can be dropped in the APH/CCPh (A4.43). I'll stay behind. Next, resolve the CC during the CCPh. In CC, you ignore your range and morale. Only FP counts. In this case, your FP is 7 and your opponent's FP is 4. To resolve your CC attack, compare your FP with your opponent's as a ratio, and then reduce it to one of the odds on the *Close Combat Table (CCT)*. 7-4 reduces to 3½-2, which is closest to the 3-2 odds listed on the CCT. If between two odds columns, always use the lower one. Beneath the correct odds, you will find the Kill Number for that CC. Use only the black number, which for a 3-2 attack is a 6. Then roll two dice. If you roll more than the Kill Number, there is no effect to your target. If you roll below the number, the target is eliminated. If you roll exactly equal to the Kill Number, the target suffers Casualty Reduction as if it received a K result on the IFT, but without any MC. CC is simpler than firing at a target, and usually more decisive.

Most combat is simultaneous, so regardless of your effect on the target it usually gets to attack you also—completely unaffected by your attack against it. Only after both attacks are resolved are the casualties actually taken. So even if you eliminate the enemy, he still has a chance to eliminate you.

The German 4-6-8 attacks you. What are his odds? "4-7, Drill Sergeant." Right. What column does this reduce to? "2-3½, Drill Sergeant." I don't see any such column on the CCT. Which columns is this between? "1-2 and 1-1, Drill Sergeant." Which column does the enemy use? "The lower column, Drill Sergeant." Which is? "1-2, Drill Sergeant." Finally. What

is the Kill Number? "4, Drill Sergeant." What DR does he need to eliminate you? "2 or 3, Drill Sergeant." To miss you? "5 through 12, Drill Sergeant." And if he rolls exactly 4? "We are Reduced to a 3-3-7 HS, Drill Sergeant."

Suppose you both survive CC. You are now in Melee (A11.15), and a red Melee counter is placed on the Location. This means that neither of you may move, fire, advance, or do anything else until the next CCPh. No Infantry may move into the Melee hex normally, since it is occupied by a Known enemy unit. Both sides may fire into it, but that fire (unless it is a Sniper) affects everyone in the Location, friendly and enemy. Since the German squad has a higher morale, the German player may decide to fire into the Location in hopes that you'll break while his own squad remains unbroken. Of course, the opposite can happen, but the odds do favor the German. Suppose he doesn't fire into the Location but instead moves another 4-6-8 to V5. In his APH, that 4-6-8 advances into the Melee. Things look a lot worse for you now. You have three choices. You may attack one of the enemy squads at 3-2 as before. You may attack both of them together at 7-8—that is, 1-2. Or, you may withdraw from Melee (A11.2), but this is risky because you won't get to attack any of the enemy units while they not only get to attack you but may do so with a -2 DRM.

Suppose the German attacks you with both squads; a total FP of 8. That gives them 8-7 odds (1-1). What would they need to get 3-2 odds? "10½, Drill Sergeant." Right—but with eight they only have 1-1. So what is their Kill Number? "5, Drill Sergeant." It is more dangerous than it was against only one squad, but your chance of making it through another Player Turn is still very good.

We know what the odds are if you choose to attack only one enemy squad. Regardless of what you do to your target, the other squad is unaffected. If you attack both enemy squads together, what is your Kill Number? "4, Drill Sergeant." That is a lot worse than a Kill Number of 6, but if you get less than 4 you kill both enemy squads. Of course, if you roll more than 4, both enemy squads are unaffected. If you roll exactly equal to the Kill Number, at least one enemy squad chosen by Random Selection is Reduced to a HS but, unlike a K result on the IFT, no MC are involved.

If you decide to withdraw from Melee, the enemy subtracts two from their CC attack DR against you. In that case, an Original DR of 2-6 eliminates you and a 7 DR Reduces you to a HS. However, if you are not eliminated, you get to escape from the Location. You are placed in an adjacent, Accessible Location of your choice—provided it does not contain an enemy unit. To be Accessible, it must be a Location that you could reach in an APH, so you could not withdraw over a cliff or to a higher or lower level of an adjacent building hex.

Being brave men, you decide to stay and fight it out, and again no units take any losses. Fortunately for you, I am going to advance into the Location during your next APH to save your worthless butts. Normally a leader has no FP but, in CC only, all leaders have a FP of one. A leader can be grouped with any unit, in which case he attacks and defends with that unit, or if he opts to attack alone he must defend alone. If grouped, his leadership applies to any CC attack made by that unit and his FP increases the FP of that unit by one. If he attacks alone, his leadership does not apply at all. If he is grouped with another unit he cannot be attacked alone, but adds his FP to that of the unit he is grouped with in defense. If alone, he is fair game and can be attacked alone and defends with only his own FP of one.

Suppose I attack alone. The Germans could attack me with one squad at 4-1 (Kill Number 9), or use both squads to attack at 8-1 (Kill Number 11). Being rational, I am sticking with you guys and directing your attack. The best the Germans can do against us now is 8-8 (1-1), since I add my one FP to your seven. And now to get 3-2 they need a combined FP of 12.

We can attack one of the enemy squads at 8-4 (2-1) with a -1 DRM due to my leadership. Now you can eliminate an enemy squad with an Original DR of 7 or less, and Reduce it with an Original 8 DR. The Germans decide at this point to withdraw one squad with the other squad staying behind to cover the withdrawal. There is a -2 DRM against the withdrawing unit, but the covering squad adds a +1 DRM, so the net Withdrawal DRM is -1 prior to application of my leadership. Each covering unit gives a withdrawing unit a +1 DRM. What options do we have? We can withdraw too, but we won't. We can attack the withdrawing squad, the covering squad, or both. If we attack the covering squad, the odds are again 8-4 (2-1), with a -1 DRM for leadership.

CC

If we attack the withdrawing squad, the odds are still 2-1, but it has a DRM of -1 for leadership, -2 for withdrawing, and +1 for one covering unit. This amounts to a total DRM of -2. The squad is Reduced on an Original DR of 8 and eliminated by an Original DR of 8 or less. We can alternatively attack both squads at 8-8 (1-1). There is still a -1 DRM (for leadership) against the covering squad, and a -2 net DRM against the withdrawing squad (my leadership -1 DRM negates the +1 DRM for the covering squad). The Kill Number is 5. Because of the DRM, an Original DR of 5 or less eliminates both squads, 6 eliminates the withdrawing squad and Reduces the covering squad, 7 Reduces the withdrawing squad only, and 8 or more has no effect. Being good guys we'll have a happy ending; we roll a 5 and eliminate them both. This ends the Melee and we are free to move/fire normally in the next Player Turn.

"Drill Sergeant, can a unit withdraw from CC immediately?" If it advances into a Melee already in progress, it may attempt a withdrawal on the same turn. However, on the first turn of CC in a Location, neither side may withdraw. They must survive at least one turn of CC and wait until a Melee marker is placed on the Location before they may withdraw. It is withdrawal from Melee, not from CC.

Suppose that two 6-6-6 squads are in CC with two German 4-6-7 squads. How many ways can the Americans make their attacks? "Three ways, Drill Sergeant. Both can attack one German squad, both can attack both German squads, each 6-6-6 can attack one 4-6-7." Good. The Germans have the same options, but worse odds.

"Drill Sergeant, what happens to broken units in CC?" Let's see. Suppose we are in Melee with a 4-6-8. The German player fires into the hex hoping to break us, but he breaks his own squad instead. Broken squads are required to attempt to withdraw from Melee (A11.16). They also have a DRM of -2 for being broken. That unfortunate squad must withdraw with a -2 DRM for being broken, -2 for withdrawing, and a -1 for my leadership. Our Kill Number is 7 since we still have 2-1 odds against it, but with all those DRM an Original DR of 12 Reduces it to a HS and 11 or less eliminates it.

Let's take a different case. Suppose you're part of a force of three 7-4-7 squads in Melee with a 4-6-8. The German fires into the Location, but this time you break. You must withdraw, but you have two squads covering you. Your DRM are -2 for being broken, -2 for withdrawing, and +2 for two covering units. This is a net DRM of -2. The German would attack you at 1-2. His Kill Number is 4, so you are Reduced on an Original DR of 6 and eliminated on an Original DR of 5 or less. Of course, there's a good chance that the German player will ignore you and concentrate his attack on the unbroken squads who by not withdrawing still pose a very real threat to him at 14-4 (3-1) odds.

It is also possible to be pinned during CC. This can occur due to fire into the Location while in Melee, or due to an advance into CC against a pinned enemy unit. You are in V4 and a pinned enemy 4-6-7 is in V5. You advance into its Location and thereby cause CC. Its attack FP is halved, but this doesn't apply to attacks against it. You still attack at 7-4 (3-2), but the FP of the 4-6-7 is halved when it attacks you so it attacks you at 2-7 (1-4) on the CCT. Its Kill Number is only 3, not 4, which it would have been if not pinned. A unit that becomes pinned in Melee cannot withdraw, just as it can't move or advance.

Another condition that affects CC is CX. Tired units do not perform well in CC, either in attack or on defense. There is a -1 DRM to a CC attack against a CX unit, and an attack that includes a CX unit has a +1 DRM. To further show how this works, assume you're in W4 while a German 4-6-7 advances from V3 and another one advances from V4. The squad from V3 becomes CX due to its advance uphill into the woods, which is an advance into Difficult Terrain. The non-CX squad attacking alone has odds of 4-7 (1-2) with a Kill Number of 4. Both squads attacking together have odds of 8-7 (1-1), with a Kill Number of 5. The DRM for CX applies, and consequently the attack has the same chance of success if the CX squad were not involved. In this case, the German player would probably be better advised to find another use for his squad from V3. The two squads cannot attack separately because all units attacking the same target have their FP added together (A11.12).

You can attack either the non-CX squad at 7-4 (3-2), or you can make the same attack against the CX squad but with a -1 DRM. If you attack both squads together, the -1 DRM only applies to the CX squad. Your odds would be 7-8 (1-2) and you would eliminate both squads with an

K

Original DR of 3 or less, eliminate the CX squad and Reduce the non-CX squad with an Original DR of 4. Reduce the CX squad with an Original DR of 5, and leave them both unaffected with an Original DR of 6 or more.

When advancing into CC, it is possible to creep up on your enemy and catch him unaware. It is also possible to blunder into a trap. Both situations are referred to as an Ambush (A11.4). Ambush can only occur when entering an enemy Location during the APH to cause CC, not when entering a Location that already has a Melee in progress. It can only occur in woods or in buildings (or lumberyards), or if at least one unit on either side is concealed. Units that are concealed are placed under a "?" counter. This means that the opponent cannot examine a stack to see its contents. Such units are considered unknown to enemy units on the mapboard. A stack can have both concealed and unconcealed units in the same Location. In this case, only the concealed units are placed under the "?" counter.

Determining if an Ambush occurs is easy. If an Ambush is possible, each player makes a *die roll* (dr), trying to roll lower than his opponent. If your Final dr—that is, after all modification—is at least three less than your opponent's final dr, you have Ambush advantage. However, there are modifiers to the Ambush dr. Conditions that make it easier for you to be ambushed include having units that are CX, pinned, or broken; add +1 to your dr for each condition that applies to one or more of your involved units. If you have one or more concealed units, you have a better chance because a concealed unit earns a -2 dr to the Ambush dr. Unless a leader is by himself, his leadership also modifies the Ambush dr.

Units can also be defined as being Stealthy or Lax. Stealthy troops are good at slipping silently through woods, or from room to room. If you have any stealthy units involved, you subtract one from your dr. On the other hand, Lax troops are not as adept at silent movement. They may be sleepy from partying all night, or they may still be partying, or they may just be inexperienced. If you have a Lax unit involved, add +1 to your Ambush dr.

Let's check out the Ambush determination process. Move to the woods in AA7. There is an adjacent German 4-6-7 in AA8. It is your APH so you advance into AA8 to initiate CC. Since AA8 is woods, Ambush can occur. Both players make a dr. There are no modifiers, so both sides have an equal chance of ambushing or being ambushed; approximately one in six. Now suppose you have an 8-1 leader such as myself with you. I modify the dr by -1 and thereby considerably improve your chances of both ambushing the Germans and avoiding being ambushed. It is not necessary to know the exact percentages—common sense will tell you who has the advantage and the dr will decide the matter.

Now suppose you're concealed and stealthy, still with an 8-1 leader, and there are three German 4-6-7 squads in AA8, but one is broken, one is pinned, and one is CX—and they all are Lax. What modifiers do you have? "-4, Drill Sergeant." How do you figure that? "-2 for concealment, -1 for Stealth and -1 for leadership, Drill Sergeant." Very good. How about the Germans? "They have an Ambush modifier of +4, Drill Sergeant. Their dr is modified by +1 for each condition: broken, pinned, CX, and Lax." Outstanding. What is our worst possible Final dr? "Two, Drill Sergeant." And the German's best possible Final dr? "Five, Drill Sergeant." So in this case we automatically Ambush the Germans regardless of the respective dr.

"Drill Sergeant, what good is an Ambush?" Plenty. We, as the ambushing force, can immediately withdraw from CC before it starts (A11.41) to any Accessible Location not occupied by the enemy. "Drill Sergeant, could we withdraw even if pinned?" No. Ambush withdrawal is just like withdrawal from Melee except that it occurs before combat is resolved in the Location. In fact, some ambushing units may withdraw while others stay to fight it out. Another advantage is that the ambushing force makes its attacks first and the enemy is allowed to attack back only with the survivors. This is an obvious exception to the normal resolution of simultaneous CC, and is referred to as Sequential CC. In this case, we wish to attack just one squad—the one that is CX—at 2-1 (actually 8-4). We get a -1 DRM due to Ambush which, with the DRM for leadership and for a CX target, gives us a -3 DRM. The squad is eliminated on an Original DR of 9 or less, and Reduced on an Original 10 DR. The CC DR is a 7 so the CX squad is eliminated. Now the Germans can only attack back with the pinned squad, which attacks at half strength and with a DRM of +1 because it was ambushed. Like CX, Ambush works both ways. The attack is 2-8 (1-4). With the +1 DRM for being Ambushed, it needs to roll an Original 2 to cause casualties. It misses.

K

At the end of the first turn of CC, the ambushing force has another chance for a free withdrawal from CC. We can use this to go back from where we came or to "withdraw" to the other side of the enemy to penetrate their lines. If the ambushers do not withdraw, the survivors are in Melee normally and there are no further Ambush advantages, nor is Ambush status resolved again for this Location in the next CCPh.

Remember that I said we were concealed. You normally lose concealment when you attack in CC, but if you Ambush you can conceivably retain the concealment of your attacking units. If your attack eliminates all the enemy units it attacks—not necessarily all the enemy units in the Location—your attackers remain concealed. If you're ambushed despite your concealment, you immediately lose that concealment. If there is no Ambush, you must decide before CC attacks are declared whether you are going to keep your concealment or attack; you can't do both. If you decide to attack, you immediately lose your concealment. Let's try another example.

This time two 6-6-6 squads, both concealed, advance into AA8 which contains only a single 4-6-7. The U.S. Ambush dr modifier is -2 for concealment even though two units are concealed. It takes just one concealed unit to earn the dr, but additional concealed units earn no further DRM. This is true of the other modifiers too. You choose to have just one 6-6-6 attack; so that the other one who remains is concealed, you can only attack at 6-4 (3-2) with the unconcealed squad. The Germans can attack the unconcealed squad at 4-6 (1-2), the concealed squad at 2-6 (1-4), or both at 2-2 (1-6). Its attack is halved if it attacks one or more concealed units even if there are unconcealed targets as well (A11.19).

"Drill Sergeant, why would a unit want to remain concealed in CC if to do so it has to forfeit its ability to attack?" Lots of reasons—most of them involving survival. The most likely benefit though, is that a concealed unit does not enter Melee, and thus can leave the CC Location in its next MPh/APh or fire in a fire phase—including TPBF against all other occupants of its own Location.

Back to Ambush. Suppose you're in the AA7 woods and three German 6-5-8 squads with a 9-2 leader advance into your hex. It looks grim, but luck is with you. Despite their -2 dr for leadership, you Ambush them. This is a good opportunity to withdraw from Ambush prior to combat, perhaps to AA8.

Now let's try some Ambush exercises. A U.S. 9-2 leader and two CX 6-6-6 squads in Y7 advance into the Y8 building, which contains a German 9-1 leader and three Lax 4-6-7 squads. What are the U.S. dr for the Ambush dr? "-1, Drill Sergeant." For the Germans? "Zero, Drill Sergeant." Right. The leadership cancels out the Lax dr. Notice that an Ambush can occur even though the U.S. troops advanced from Open Ground. It is only the terrain in the CC hex that counts.

A U.S. 8-0 leader and 6-6-6 squad in EE10 advance into DD9, which contains a concealed German squad. An Ambush can occur even though the hex contains neither woods nor buildings because there is a concealed unit involved. What are the modifiers to the Ambush dr? "Zero for the U.S. and -2 for the Germans, Drill Sergeant." Correct. One last example and we'll call it a day.

A stealthy 6-6-6 in BB7 advances into CC8 against a Lax 4-6-7 German squad. What are the Ambush dr? "-1 for the U.S. and +1 for the Germans, Drill Sergeant." That would be correct except that no Ambush can take place in Open Ground when neither side is concealed. We can't quit on such a stupid mistake. We'll stay out here until you get it right, so here's another one. And give me fifty while you're thinking about it!

A concealed 6-6-6 in AA7 advances into AA8, which has three 4-6-7 squads, one of which is stealthy but broken, one pinned, and one inexperienced and CX. What is the Ambush dr for the U.S. player? "-2, Drill Sergeant." For the Germans? "+3, Drill Sergeant. The dr for being broken negates that for being stealthy, the pinned squad gives a +1, Inexperienced troops are always Lax which is another +1, and CX gives another +1." Good. Report to hex 3U3 tomorrow at 0600 for Morale Indoctrination. Squad, DISMISSED.

Morale

DAY FIVE; MORALE INDOCTRINATION

TEN HUT!

At ease. In combat you have to know how to take it as well as dish it out. You have learned to fire at targets; now you will learn how to be the target. This includes taking MC, routing broken units, and rallying them to fight again.

You learned about MC earlier. Let's review what you know. How do you get a MC? "As a result of enemy fire, Drill Sergeant." Is it good to get a MC? "No, Drill Sergeant." Can you get a MC as a result of fire from... friendly units? "Yes, Drill Sergeant, if they happen to fire into a Mele we are in." What adds to a MC DR? "The severity of the MC, Drill Sergeant." Very good. What are the possible results of a MC? "You can pass it and be okay, you can fail it and become broken, or you can pass it but become pinned, Drill Sergeant." What if you roll an Original 12 during a MC? "You are Reduced by a Casualty MC, Drill Sergeant." Outstanding.

If there are numerous units taking a MC in a Location, they must each take it one at a time with their own DR. If there are leaders in the Location, they check their morale first, in order from the highest-morale leader to the lowest. For example, with just you maggots and myself here, I would take my MC first. If I passed the MC, I would help you clowns with yours. In a NMC, I break if I roll 9 or more. If I roll 7 or less, I add a -1 to your MC DR so that you break on an Original DR of 9 or more, become pinned on an 8, and are still okay on an Original DR of 7 or less. I cannot use my leadership to help my own MC—only yours. If I roll an 8 on my own MC, I am pinned and my leadership is instantly nullified even though I am not broken. Consequently, I cannot assist you in your MC (A7.831).

Now let's invite a couple of other leaders, an 8-0 and a 7-0, to join us for a MC. I take my MC first, but I cannot help the 8-0 leader since we have the same morale. A leader cannot help another leader who has the same or better morale (A10.22). I can help the 7-0 with his MC, but not the 8-0. The leadership of only one leader may be used. If there were a 9-2 leader in the hex with us, he could apply his leadership to all of us and you would use his -2 leadership instead of my -1. I can apply my leadership to another leader only if he has lower morale, but to any friendly MMC, even if it has the same or higher morale.

If you are in the same Location as a leader, and the leader breaks, it shakes you up. I can just imagine how disturbed you would be if your beloved Sgt. Stahler lost his nerve. After taking any MC caused by the same attack that broke me, you must take a *Leader Loss Task Check (LLTC)*, which is just like a PTC. If you roll more than your Morale Level with two dice, you are pinned. You are unaffected if your DR is equal to or less than your morale. However, there is a catch: you reverse the smitten leader's leadership and add it to the DR. Therefore, if I break, you have to take a PTC and add +1 to the DR. You skip this check if the broken leader has the same or lesser morale than you, or if you are already broken or pinned—even if it could result in a Sniper (A14.1) or Booby Trap attack (B28.9).

If the leader is eliminated instead of just broken, you must take a MC—not merely a PTC. Again, you only take this MC if the leader has higher morale than you. For example, if an 8-1 leader or an 8-0 leader is eliminated, you must take a MC; a 1MC in my case, just a NMC in the case of the 8-0 leader. If the 7-0 leader is eliminated, you do not take a MC, because your morale is the same or higher than his. If you're already broken at the time of my elimination, you don't have to take a MC. Who can tell me why? "Because we hate your guts, Drill Sergeant." No, wise mouth, because your broken Morale Level is an 8, which is equal to my own. Now, give me a hundred!

Morale

"Drill Sergeant, what if a leader in our Location is pinned?" That doesn't force you to take any check, it just negates his leadership—even for the same attack that pinned him and will next affect you. "Drill Sergeant, does terrain affect MC or PTC?" No, other than modifying the IFT DR that caused the MC or PTC in the first place. I take that back. TEM are applied as negative DRM to the NMC DR caused by White Phosphorous (A24.31), but the Germans rarely have any of that stuff so they are the ones who have to worry about being on the receiving end.

However, there is more to breaking than just being flipped over to your broken side. That's bad enough, but there are more serious consequences to failing a MC. You've already learned about Casualty MC on an Original DR of 12 (A10.31), and the Reduction of broken units that fail a MC (A10.31). However, there's another possible consequence of breaking for unbroken, non-crew units called Replacement (A19.13). Whenever an unbroken Personnel unit fails a MC by an amount greater than its *Experience Level Rating* (ELR; A19.1), that unit is Replaced by a broken unit of the same size but lesser quality. ELR is a number from 0 to 5 which is inherently assigned to all units of a given side in a scenario. The Replacement unit must be of a poorer Class and can contain no FP, Range, Morale, or leadership factor(s) greater than those of the unit it is Replacing. Therefore, if an unbroken German Elite 4-6-8 squad with an ELR of 4 fails a MC by five or more, it is Replaced with a broken First Line 4-6-7. If my ELR is 5, and I fail a MC by 6 or more, I would be Replaced with a broken 8-0 leader counter. Squads with an underlined Morale Factor (A1.23)—such as yourselves—are considered to always have an ELR of 5, and if subject to Replacement, are Replaced with two broken HS of the same Class. So, if you have to take a 2MC and roll an 11 or more (after any applicable leadership modification), you'd be Replaced by two broken Elite 3-3-7 HS—not by a broken 5-4-6 squad. If an unbroken HS with an underlined Morale becomes subject to Replacement, it becomes broken and Disrupted instead. Any questions?

"Drill Sergeant, why aren't broken units affected by Replacement?" Broken units that fail a MC are already subject to Casualty Reduction—any further penalty beyond that permanent effect would be too harsh. "Drill Sergeant, what is Disrupted?" Disruption is a special form of broken status which usually occurs to a unit that has failed a MC by more than its ELR but is unable to suffer Replacement—usually because it is already the poorest quality Class of unit of its size and type. It can also occur to a HS with an underlined Morale Level which fails a MC by more than its ELR (A19.12), and due to a variety of lesser special cases we won't discuss here. The main effects of being Disrupted are that the unit cannot Self-Rally while so affected, and its ability to rout is limited to any RtPh in which it is in a Blaze Location, or Water obstacle, or in Open Ground within the LOS and Normal Range of an enemy unit or ADJACENT to an enemy vehicle—although if ADJACENT to or in the same Location with an enemy Infantry/Cavalry unit the Disrupted unit must surrender to it rather than rout away. A Disrupted unit cannot use Low Crawl, does not prevent enemy movement into or through its Location and remains Disrupted until rallied or captured.

Now you know how to become broken. Frankly, I never thought this group would have any problem learning that—you're natural "broken" material if I ever saw any. Nevertheless, being broken is a bummer. Leaders lose their leadership. Broken units are more easily destroyed, since they are Reduced if they fail another MC. They cannot move normally, and cannot advance, fire, or attack in CC. There are just four things that broken units can do: rout, rally, surrender, or die.

Routing occurs after all fire in a turn, but before units advance. In general, broken units must get away from the enemy and seek shelter. Routing is similar to moving since units expend MF while routing. A broken unit must carry any SW it possesses up to its IPC—all others are abandoned (A10.4). Only broken units can rout although an unbroken, unpinned leader in the same Location with a broken unit may voluntarily rout with that unit (A10.711). Most unbroken units can break voluntarily and rout (A10.41). "Drill Sergeant, why would a unit want to break?" There are circumstances that call for it. Suppose you're in a burning building and about to be burnt to a crisp, or pinned, alone, and ADJACENT to all the enemy squads in the known world. It might make sense to voluntarily break and rout out of Dodge, rather than wait for the inevitable.

The idea of routing is generally to get back to woods or buildings where the chance of rallying is increased (A10.61)—preferably out of enemy LOS and fire. Broken units are generally forced to rout if ADJACENT to a Known, unbroken, armed enemy unit unless they are held in Melee

K

(A11.16). Broken units in Melee cannot rout in the RtPh, although they are forced to withdraw from Melee during the CCPh. A broken unit in Open Ground in the LOS and Normal Range of a Known, unbroken, armed enemy unit is also generally forced to rout. Being in Open Ground (A10.531) includes being on a hill, on a road, on a bridge, or in a gully—provided there is no Hindrance to the enemy's LOS, nor any TEM (including Height Advantage; A10.531). The enemy unit in question cannot be pinned, CX, broken, or in Melee, and it must have some FP, which excludes non-heroic leaders without SW. You cannot rout toward a Known enemy broken unit or a non-heroic leader without a SW but they don't cause you to have to rout in the first place. Or putting it another way, a broken unit (or a non-heroic leader without a functioning weapon) has no Normal Range, and therefore cannot by itself force a broken enemy unit to rout, nor can it Interdict that broken unit, even if that broken unit is ADJACENT to it.

"Drill Sergeant, what is a Known unit?" A unit is Known if it isn't hidden/concealed and is in your LOS.

Now, assume we're broken in 3U3 and DM (which I'll explain in a minute), and there's a German 4-6-7 squad in the neighborhood. From which hexes could it force us to rout away? What about V3? "Yes, Drill Sergeant." Right. It is ADJACENT to us and we are caught in the open—although if it was concealed/hidden and wished to remain that way it would not affect us. How about T3? "Yes, Drill Sergeant." Right. Even if we had the Wall Advantage, we would still have to rout because the enemy is ADJACENT to us. U4? "Yes, Drill Sergeant." S3? "No, Drill Sergeant." Good. We would have the TEM from the wall protecting us, which makes U3 Non-Open Ground from S3. R1? "Yes, Drill Sergeant." U1? "No, Drill Sergeant." Right, since the grain Hinder LOS and we get a TEM from the hedge. X1? "Yes, Drill Sergeant." W4? "No, Drill Sergeant." Right—we're not even in the LOS of the enemy. BB1? "Yes, Drill Sergeant." Wrong. BB1 is seven hexes away and the Normal Range of a 4-6-7 squad is only six hexes—although if it had a MG we'd need our routing shoes.

You may be able to rout at your option, even if not required to, but only if you're under the effects of *Desperation Morale* (DM). If you're DM, but not ADJACENT to an enemy nor in the open within Normal Range and LOS of a Known enemy unit, you can either stay where you are or rout toward safer cover. There are a number of reasons for remaining in place, the most common being that there is no safe route by which to rout out of your current position. More often than not, you'll want to rout to a position out of enemy LOS where you can hope to avoid DM status in future Player Turns.

Units become DM when they first break, whether due to enemy fire or voluntarily breaking. They also become DM when they are already broken and are subsequently fired at (A10.62), or when a Known enemy unit becomes ADJACENT to them, or if they start a RtPh in Open Ground in the LOS and Normal Range of a Known enemy unit according to the Brass. DM makes it much harder to rally, but allows a unit to rout. It is removed during the Rally Phase (RPh) unless ADJACENT to a Known enemy unit. DM status can otherwise be voluntarily kept beyond the RPh only if not presently occupying a building/woods/pillbox/trench Location, so that the unit can continue to rout to one in the next RtPh.

All routing units have six MF which cannot be increased by any condition. In addition to paying normal movement costs for entering terrain, routing is governed by a number of additional rules that only apply to routing units.

1. Routing units may not enter a hex ADJACENT to a Known enemy unit unless they are in the process of leaving that Known enemy unit's Location (A10.51). They may not end their rout ADJACENT to a Known unbroken, armed enemy unit. For example, if there were an unbroken, unconcealed enemy 4-6-7 in U4, we could not rout to T3 or V3. On the other hand, if there were 4-6-7 squads in V3 and S4, we could rout to T3 since the unit in S4 was not Known to us. However, once we got there, we couldn't stop because the enemy unit would now be Known. We would have to keep routing, and S3 and T4 are out of the question because they are both ADJACENT to the enemy unit in S4. Any other hex would be subject to Interdiction, thereby making it subject to surrender to the enemy unit in S4 (A20.21). However, if that enemy unit rejects that surrender and eliminates us instead, No Quarter (A20.3) would be invoked and A20.21 would not apply for the rest of the scenario. For the sake of simplicity, we'll consider No Quarter to be in effect for the rest of our training.

K

2. Routing units may not rout toward a Known enemy unit. This means they may not rout to a hex that decreases their range to such an enemy. For example, if a Known enemy unit were in Z1, five hexes away, we could not rout to V3 which is only four hexes from the enemy even though it is out of LOS of Z1. That same unit, even if broken/Disrupted/unarmed, would also prevent us from routing to V2. However, were it the only enemy unit in LOS, it could not force us to rout because it has no Normal Range while broken or unarmed.

3. Routing units must rout to the nearest building/woods hex—even if using Low Crawl—unless there is no such hex you could legally rout to within six MF (A10.51). "Nearest" is determined by the number of MF it takes to get there. Aside from the extra MF cost to exit an entrenchment that the unit is already in, the extra voluntary cost of entering entrenchments/shellholes (to avoid Interdiction) or leaving wire is not counted in determining whether a building/woods hex is within six MF or is the closest such cover (A10.531). However, if there were an enemy unit in U2, we'd have to rout to V3 at a cost of two MF, rather than T3 which costs three MF because of the wall. In determining the nearest building or woods hex, you may disregard hexes that are the same distance from a Known enemy unit as your currently occupied hex—even if there are no other building/woods hexes within six MF. For example, if there is an enemy unit in X1, you may rout to V3 since that is also three hexes from the enemy, but you may alternatively rout to T1, S3, T3, or T4—all of which are three MF away and farther away from the enemy than V3. You may also disregard other hexes/Locations of the building that you began the RtPh in.

4. Upon reaching a building/woods hex, a routing unit must stop unless either ADJACENT to a Known enemy unit, or able to continue directly into other woods/building hexes only. Assuming the enemy unit in X1, you could rout to T3 and then continue to S3 or T4. You couldn't continue to S4, because that is not a building/woods hex. You must stop in S3 or T4, because you have used five MF and the one remaining MF is not enough to continue to another building/woods hex, although you have the option to go up to the first level of S3. Routing units cannot use Bypass.

5. If you rout through Open Ground in the Normal Range of a Known enemy unit, you can be Interdicted. Interdiction cannot occur in a Location where a positive TEM applies, nor if Hindrance to that Location from the Interdictor's Location will result. The Interdictor cannot be CX, pinned, broken, or in Melee (A10.532). If you are Interdicted, you take a NMC. If you roll less than your Morale Level, you are okay and can continue routing. If you roll exactly equal to your Morale Level, you are pinned and must stop your rout in the Interdiction Location. If you roll higher than your Morale Level, you suffer Casualty Reduction, but any remaining HS may continue routing. An unbroken, friendly leader in your Location can usually add his leadership factor to your DR. "Drill Sergeant, can a unit Interdict you more than once? If more than one unit Interdicts you, do you have to take a NMC for each one?" Yes to the first question, no to the second. Interdiction is resolved per hexes traversed in LOS of an Interdictor, not by number of units capable of Interdicting in such a hex. One unit can Interdict any number of hexes and any number of routing units in each hex, but a routing unit takes only one NMC in each Interdicted hex, regardless of the number of enemy units Interdicting it in that hex (A10.532).

6. To avoid Interdiction, a non-Disrupted routing unit may use Low Crawl (A10.52). This means a rout of only one hex, but is free of Interdiction in that hex. You may not Low Crawl ADJACENT to an enemy unit if you are in the process of leaving that unit's Location.

7. If required to rout and you cannot do so legally, you are eliminated for Failure to Rout—or you might surrender instead. Surrender usually occurs when broken Infantry is forced to rout due to being ADJACENT to Known, Good Order, armed enemy Personnel, but cannot do so without resorting to Low Crawl or being subject to Interdiction (see A20.21 for the exceptions).

Suppose two unconcealed enemy units capable of Interdicting are in T2 and U4. Where is the only hex that you can rout to from our position in 3U3? "V2, Drill Sergeant." Right, but that is Open Ground. What are your choices? "Low Crawl to V2 or be Interdicted in V2, Drill Sergeant." Good. If you Low Crawl, you end your RtPh in V2, broken, DM, but alive—even if only temporarily. If you rout and are not pinned by Interdiction in V2, you have three options. You can rout to V1, X1, or X3, since they are all an additional three MF away. If you rout to V1, you risk no further Interdiction and since you have two MF left, you can rout on to U1, V0, or W1. If you rout to W1 or X1, you'll suffer Interdiction

again in W2 from U4, and you can continue only to X0. If you make it to X3—after being Interdicted again in W3 by the unit in T2—you must stop, since the only building/woods hex adjacent to you is W4. Continuing the rout into W4 would be routing toward the enemy unit in U4, which is not allowed even though that enemy unit is currently out of your LOS. You still remember the enemy's Location from the start of your RtPh. "Drill Sergeant, if continuing the rout from X3 to W4 is not allowed, then why were we able to continue our rout from V1 to U1? Don't both constitute a move toward a Known enemy at the start of the RtPh?" No. When we were routing to U1 from V1, both hexes were two hexes away from the Known enemy at T2—we didn't move closer. Routing from X3 to W4, on the other hand, decreases the range to the enemy in U4 from three hexes to two.

Suppose there are unconcealed enemy units in T2 and W4 instead. You must rout to V3 from U3, since that is the closest building/woods hex and W4 is not in your LOS. When you get there however, you must continue your rout because you discover the unit in W4. You must still rout toward a woods/building hex within six MF of your original position at the start of the RtPh—even though you have only four MF remaining. You cannot rout to W3 or V4 because they are ADJACENT to W4. You also cannot rout to U3 because of the enemy unit in T2. Your options are limited to V2 or U4. You cannot use Low Crawl because you have already routed one hex. If you had chosen Low Crawl originally, you could have gone only one hex in the RtPh—which would have been V3 where you would have been eliminated for Failure to Rout (A10.5). In U4 the stone walls protect you from Interdiction from both T2 and W4, so that is the better choice for continuing your rout with your third MF. You must finish your rout in T4 with the expenditure of your fourth and fifth MF. You cannot rout to V1 via V3-V2 because that would require an expenditure of six MF. Clearly, T4 is the closest available woods/building hex which you can rout to—although in a round-about way. Had no other woods/building hex been within six MF of your original position (U3), you would have been free of the requirement to move toward the nearest woods/building hex once you reached V3.

Things could be worse. If there are enemy units in T3, V1, and W4, you must rout to V3 from U3 as before, but once there you cannot rout anywhere without being ADJACENT to a Known enemy unit. You are therefore eliminated or captured for Failure to Rout. Remember: once you've chosen to Low Crawl, you cannot change your mind and opt to rout out of a Location that you've just discovered is ADJACENT to a Known, unbroken, armed enemy unit. It's too late—you're a goner.

Now let's suppose the only enemy unit is in T2. You can rout to V3 and continue to W4 which uses all six MF. Then the enemy moves unconcealed 4-6-7 squads into X3, V3, Y6, and S5 in his MPh. Your only rout now is to W8. You can rout to W5 despite moving closer to Y6, because Y6 is not in your LOS until you reach W5. You can then rout along the ridge to W7 and then into the woods at W8 because you're not moving closer to Y6. You're also protected from Interdiction by Height Advantage. You can't rout to U6 or U7 because they're closer to S5 which comes into your LOS when you enter W5. If there's another unconcealed enemy unit in W9, you cannot continue routing because you're out of MF, so you'd be eliminated or captured for ending your RtPh ADJACENT to a Known enemy unit. On the other hand however, you could have chosen to simply Low Crawl to W5, thus ending your RtPh there.

Let's go to the ground floor of M2 for some more examples. Suppose there's an unconcealed enemy unit in L1. You are required to rout because you are ADJACENT to it. You have a lot of options though. You can rout up the stairs to the first or second level of M2, or you can go to N1 or N2, or using the stairs, get to any level of those hexes. You can also rout out of the building altogether because that's the building that you started the RtPh in. Since, if you leave the building, you must still rout to the woods/building nearest your original position, you must rout to N0, L4, or O1. Those three hexes are all four MF away, while M5 is five MF and P1 and P2 are each six MF away.

Suppose that enemy unit is in M1 instead. You cannot rout to L1 or to the ground floor of N1, as both are ADJACENT to the enemy unit. You can rout up the stairs and to the first or second level of N1 since those levels are not directly connected (i.e., ADJACENT) to M1. You can alternatively rout to either of the two upper levels of M2, or to any level of N2. If you choose to disregard this building, you can rout to L4 which is the closest building/woods hex. Since it is four MF away, you can use the remaining MF to rout to M5, or upstairs to level 1 of L4. If neither

Morale

K

the grain nor plowed fields are in effect (B15.6), you can instead rout to K1, J1, or J2, since they are four MF away also and no closer to the enemy unit.

Let's assume that you rout to the first level of M2. The enemy moves to the ground level of M2, and more unconcealed enemy units move to the ground level of N1 and N2. You can still rout up the stairs to the second level of M2 since that Location is not ADJACENT to the ground floor, or to either of the upper levels of N1 or N2 since there is no stairwell in either of those hexes and consequently they are not ADJACENT to the ground floor. Wherever you rout, you'd better rally fast because you're in real trouble. It won't be long before you run out of places to rout to, or succumb to a Mopping Up operation (A12.153). The advent of the Mopping Up rule in ASL makes routing to upper building levels much less effective; consequently, you should generally avoid climbing stairs when you're broken if you have any other alternative.

Take a break for chow and fall in on the bridge at 24F6. Squad, DISMISSED.

■ TEN HUT!

At ease. To stay in practice, we're going to practice more routing before we learn how to rally. Suppose we're broken and there is an enemy 4-6-7 in D5. We have to rout, but since we're on a bridge, we can only move to E6 or G7 (B6.4). We can't rout to E6, because that's toward the enemy unit, so we must rout to G7. We can Low Crawl there and stop, or risk Interdiction and continue to the woods in F7. We'll do the latter, and will assume that we all passed our Interdiction NMC—a big assumption for you bozos.

Now an unconcealed enemy unit moves ADJACENT to us in F8 and the enemy in D5 vanishes. We become DM and must rout. It would be safe to rout INTO the gully in E7 or F6 to get out of the enemy's LOS and avoid Interdiction, but we must rout to the nearest woods or building, which in this case is I6, unfortunately. "Drill Sergeant, we can get to F4 in six MF if we go via G7, F6, E6 and E5. I6 is also six MF away, so don't we have a choice?" Just checking to see if you were awake, and apparently you were only half asleep. Yes, F4 would be a possible choice—except that there is a closer building/woods hex than either F4 or I6. We can reach J8 in five MF without ever shortening the range to the enemy unit. Fortunately, No Quarter is still in effect so we are not subject to surrender and can rout to J8 or Low Crawl to G7.

Let's try another example. You are broken IN F6 beneath the bridge, and the enemy is IN E7. You must rout. You cannot be Interdicted in G6, even though the gully is Open Ground, because there is no LOS between E7 and G6. You could also rout directly to the brush in F5 on your way to the woods in either F4 or G5. You could not be Interdicted in F5 because the brush is not Open Ground and in any case is out of the LOS of the enemy IN E7.

You rout to G5 but our persistent enemy moves to F4 and is aided by another unconcealed enemy unit which moves to H6. You now have but one choice—you must rout to H4. Since you can't reach a woods/building hex with your six MF (A10.51), you can either stop in H4 or continue routing to H3, I4, or I5. You don't have to go to I4 or I5 in order to get to J4. Although J4 is the closest available building/woods hex it is more than six MF away and therefore does not have to be the goal of the rout. You choose H3. The enemy units move to G4 and I4 in their next RPh, so in your RPh you rout to H2. The enemy in T4 then moves INTO H3, but now you don't have to rout because you're not in its LOS, even though adjacent. The enemy unit in G4 disappears, but another unconcealed enemy unit appears adjacent to you in I2, forcing you to rout because it has a LOS INTO the H2 gully and you're in Open Ground. You must rout toward the woods in F4, which is the closest building/woods hex (five MF). You can enter G3 even though it is ADJACENT to the enemy in H3 because they are not Known to you until you enter G3. You don't Low Crawl because it would leave you ADJACENT to an enemy unit at the end of the RPh. Therefore, you rout to F4, subject to Interdiction from I2 in both G3 and F3.

Suppose you're broken in H1 with unconcealed enemy units in G1 and I2. You can still rout to H2. It is not ADJACENT to I2 in the sense that a unit cannot move or advance directly from I2 to H2 because of the cliff.

You can stop there via Low Crawl. Any continued Rout would risk Interdiction in H2 and elsewhere.

Let's check out the view from AA7 while still broken. An unconcealed enemy unit appears in Z6 and forces you to rout. The closest hexes you can rout to are the building in DD5 and the woods in CC9, both of which are 4½ MF away. Y8, Y9, Z9, and DD8 are all five MF away. DD5 is your best choice because you can rout to DD5 via the orchard in BB6 and the grain in CC6 without fear of Interdiction, because those hexes are not Open Ground. So you go to DD5. Now two more enemy units show up at DD4 and BB5. You can rout through DD6 to DD8 or FF7 without Interdiction because the unit in BB5 has its LOS Hindered by the grain in CC6, making DD6 safe even though it is Open Ground, and the unit in Z6 is Hindered by the orchard in BB6. You could instead go to FF7, GG7, or GG4 which are also five MF away, but each route would be subject to interdiction in EE6 from DD4.

Okay, I guess you guys have enough experience at being broken. Let's see if we can teach you how to rally.

Rally is the most common way that broken units return to Good Order. Leaders and crews can rally themselves, as is signified by the box that encloses their broken Morale Level. A unit attempting to rally itself is always referred to as making a Self-Rally attempt, which is distinctly different from a normal rally attempt. A Self-Rally attempt always incurs a +1 DRM penalty. Both rally and Self-Rally require the rolling of two dice. If the sum of the DR after modification is equal to or less than your broken Morale Level, you have rallied. If you roll an Original 2 Rally DR, Heat of Battle (A15.1) occurs (unless Self-Rallying, in which case Leader Creation is possible; A18.11) but we won't get into that now. If you roll greater than your broken Morale Level, you just remain broken unless you roll an Original 12. An Original 12 DR eliminates a crew or HS, Reduces a squad to a HS, and wounds a leader—just like rolling 12 on a MC (A10.64). There are several modifiers to the Rally DR. If you are under DM, a +4 DRM applies. A rally attempt in a woods/building/pillbox/trench Location receives a -1 DRM. "Drill Sergeant, what about lumberyards?" They are like wooden buildings for just about all purposes except rally (B23.211), so you don't get a terrain DRM for attempting to rally in a lumberyard.

I am now going to attempt Self-Rally. I am in woods and under DM. What Original DR do I need to Self-Rally? "4, Drill Sergeant." Correct. My broken Morale Level is 8 but I am subject to a +4 DRM (+1 [Self-Rally] -1 [terrain] +4 [DM] = +4). A leader's leadership DRM never applies to himself. My Original Self-Rally DR is a 7 so I don't rally, but the DM is removed at the end of the RPh if I'm not ADJACENT to a Known enemy unit.

You, as a squad/HS, may not attempt to Self-Rally unless you do so during your own Player Turn as the first MMC rally attempt of that Player Turn (A18.11). In addition, you cannot be Disrupted or in the same Location with a Good Order leader. If this Self-Rally attempt results in an Original 2 DR, you may also attempt Leader Creation (A18.11), but that's another story altogether. Otherwise, you can only rally with the assistance of a Good Order leader in the same Location. Since I am still broken and our commander has seen fit not to waste his once-per-Game Turn Self-Rally attempt on you, you too will remain broken but will lose your DM status at the end of the RPh if not ADJACENT to a Known enemy unit.

It is the next RPh and we are no longer DM, so I need an Original 8 Rally DR to Self-Rally. My Self-Rally DR is again a 7 and I rally. Now that I'm unbroken I can help you rally in this same RPh. Your broken Morale Level is 8, but the addition of the -1 terrain drm for being in woods and my -1 leadership drm will enable you to rally on an Original DR of 10 or less. Regardless of favorable DRM, if you roll an Original 12 you'll suffer Casualty Reduction.

Let's assume we're in EE8 and DM. It is harder to rally here since the brush doesn't qualify for the terrain drm. I need an Original 3 or less to Self-Rally. However, if I succeed, you'll need only an Original 5 or less due to my leadership DRM and the absence of any Self-Rally. I fail my Self-Rally attempt so we all remain broken. You think that's funny, Mishcon? We'll see how funny it is when you clean out the latrines tonight! We are subsequently fired on again so we start the next RPh with DM, but a Good Order 9-2 leader has joined us. The 9-2 assists me so I am no longer penalized by a Self-Rally attempt, and I also get the benefit of the -2 leadership drm, so I now need an Original 6 or less DR to rally.

K

Regardless of how I do, the 9-2 can also try to rally you. You now need a 6 or less also. If we fail to rally, we will still have the choice of retaining our DM so we can rout to a building/woods hex, or we can remove it—hoping to rally where we are. Usually, it is wise to remove the DM status. If we can avoid DM status before the next RPh, we will need only an Original 10 or less DR to rally thanks to the 9-2 leader.

I hope you can see how important leaders are. It's very common for units to break during combat and leaders are the most likely way of rallying them. Now let's try to put together the whole break-rout-rally cycle.

We are in W9. Three German 4-6-7 squads are in V7. They fire at us with 12 FP and a TEM/Hindrance DRM of +2. They roll an Original 6, which becomes an 8 after the DRM. This results in a 1MC which I pass and you fail . . . naturally. You are now a DM broken squad. You can remain in W9 since it is not Open Ground and no enemy units are ADJACENT, but you rout to a safer Location. I decide to accompany you on your rout. We must rout to the nearest woods/building hex which is Y9, U9, V10, or X10—all of which are three MF away. We rout to Y9 via X9, and continue to Z9 where we stop after using five of our six MF. In the following RPh I attempt to rally you. The total DRM is +2 (+4 [DM] -1 [terrain] -1 [leadership] = +2) so you need to roll an Original 6 or less to rally. You don't . . . of course.

Those same three German squads have moved to X9 where in their AFPh they fire at us again. They use the 6 column of the IFT with a +3 DRM for the stone building. They roll an Original 3 which becomes a 6 on the IFT and results in a 1MC. We all break in two separate DR, and you are Reduced to a 3-3-7 HS for failing a MC while already broken. Although we don't have to rout since we are neither ADJACENT to the enemy nor in open Ground, we can rout to, among other places, Z10 or Y8 which are the closest woods/building hexes, but they are the same distance from the enemy as we are so we may disregard them. Although Z10 is closer to us (2 MF) than Y8 (3½ MF), we can still choose to go to Y8 simply because Z10 is no farther from the enemy. Dismissing the closest building/woods hex for being no farther from the enemy does not disqualify other hexes from consideration that are also no farther from the enemy. Z7 is closer (3¼ MF) than CC9 (4¼ MF), so we choose to rout to Z7. We can rout no farther because we would have to leave woods/building terrain without directly entering other such terrain.

Since I am broken and DM, I need an Original DR of 4 or less to Self-Rally. I don't make it and therefore you don't get a chance to rally. Nor do we rally following our Player Turn. The enemy meanwhile moves to Y7 and Z8 where they automatically DM us again, and were it not for No Quarter would have again subjected us to surrender. So, we rout to the nearest woods—AA6—chancing Interdiction in AA7. We pass our respective separate Interdiction NMC but fail to rally. The enemy moves up to Z5 and AA7, forcing us to rout again. We rout to the building in DD5 via BB5 and CC5, avoiding Interdiction because Grain is not Open Ground.

I rally, but you don't, and the enemy moves up to CC5 and DD6—forcing you to rout again since these No Quarter Huns aren't taking prisoners. I opt to accompany you via Voluntary Rout (A10.711). Our choices are to rout to GG4, risking Interdiction in EE5 and FF4, or to Low Crawl to EE5. We go for the woods and risk Interdiction. Since I am no longer broken and am accompanying you in the RPh voluntarily, I no longer have my own Interdiction NMC—instead being subject to the result of yours as if I were broken, except that I can aid you with my leadership. The Interdiction NMC DR for EE5 is an Original 7 which is reduced to a 6 by my leadership. So far so good. We continue into FF4 where the Original Interdiction DR is a 8. My leadership DRM saves us from Casualty Reduction, but the Final NMC DR of 7 still pins us in FF4. We may rout no farther in this RPh and will doubtless be easy targets in the enemy's next fire phase. Rather than contemplate that dreary ending, let's call it a day.

Tomorrow, assemble in the street at 304 for Camouflage training. Squad DISMISSED.

Concealment

DAY SIX; CONCEALMENT

■ TEN HUT!

At ease. This afternoon you will learn how to conceal yourselves from the enemy, what the benefits of concealment are, and how you lose that concealment. First, let's get out of the road where everyone can see us. Enter the building in O5. Is there any enemy in sight? No? Good. We can become concealed, and mark the occasion by placing that cardboard concealment “?” marker on our collective heads.

“Drill Sergeant, doesn't this make us more conspicuous?” It's not as good as being hidden, but if you can't be hidden it's certainly better than nothing. I don't want any one belly aching about how heavy their “?” are. Carry them on top of you whenever you can; they're for your own good since they give you an edge in combat and help keep you alive.

You can gain concealment at the beginning of a game, before entry into a game as reinforcements, or at the end of your Player Turn. We will concentrate on gaining concealment during combat; in other words, at the end of your Player Turn.

To gain concealment you must be in Good Order, which basically means that you aren't broken or locked in Melee. A broken unit usually has some yelling, wailing, or flopping around like a chicken with its head cut off—in short, without proper battlefield discipline. It can't hide from anybody. If you are in Melee with an enemy, you're likely to be making too much noise to be concealed.

It helps to be in Concealment Terrain to gain concealment (A12.12). This includes buildings, rubble, woods, grain, brush, marsh, and orchards. It also includes being behind a bocage hexside, but only when all unbroken enemy units with a LOS to you trace that LOS through the bocage. If you are in Concealment Terrain and out of the LOS of all unbroken enemy units, you automatically become concealed at the end of your turn. If an enemy unit has a LOS to you, you cannot become concealed since you can be seen. Even one Good Order SMC in LOS is enough to deny you concealment. You can gain concealment if you are in the LOS of any number of enemy units as long as they are all broken; if just one of them is unbroken, you cannot become concealed.

If you are not in Concealment Terrain, you automatically gain concealment at the end of your Player Turn if you are out of the LOS of all unbroken enemy units, and there are no unbroken enemy units within 16 hexes of you (whether they are in your LOS or not).

There are two cases in which you must make a dr (A12.122) if you wish to gain concealment. If you are in Concealment Terrain in the LOS of unbroken enemy units, but all of them are more than 16 hexes away, you can attempt to become concealed. If you are in non-Concealment Terrain, out of the LOS of all unbroken enemy units, but within 16 hexes of at least one unbroken enemy unit, you can attempt to become concealed. Both cases depend on making a concealment dr of 5 or less. That sounds easy, but there are modifiers to the dr. The first dr depends on the size of the unit trying to hide. A leader adds +1, a HS +2, and a squad adds +3. With this dr I would have to roll an Original 4 or less to become concealed, but you would have to roll an Original 2 or less. A leader can use his leadership to help other units become concealed, but not himself. For example, if I am helping you, pointing out places where you can hide, you can become concealed with an Original dr of 3 or less. You are also helped by terrain. You subtract the TEM and the Hindrance of your terrain from the dr. There are also drms for being Lax or Stealthy but we'll ignore those for now.

What would you subtract from the dr if you are in a wooden building? “Two, Drill Sergeant.” In woods? “One, Drill Sergeant.” In an orchard? “One, Drill Sergeant.” In a crag? “One, Drill Sergeant.” No, a crag has both a TEM of one and a Hindrance of one. Try again. “Two, Drill Sergeant.” Good. This modifier depends only on terrain in the hex itself. Walls, Height Advantage, and other hexside only TEM (i.e., LOS-dependent TEM) have no effect on this dr.

Concealment

As an exercise, take a close look at the following tactical situation at the end of a German's Player Turn. Which units automatically gain a "?", which units must make a dr, what is the highest Original dr that they can roll and still become concealed, and which units cannot become concealed?

Here is the situation: U.S. Good Order squads in 3K7, M2 (ground level), M3, M10, P6, and a broken squad in S5. The German units are as follows: G6: 7-0 leader & HS; H5: squad; J1: HS; N1 first level: squad; Q4: 9-1 leader & squad; R5 ground level: squad; R6: HS; S6: squad; T5: 8-0 leader & HS; U2: squad; W4: squad; AA7: HS; BB5: broken squad; DD9: 8-1 leader & HS; EE10: squad; EE6: HS; FF5: 9-2 leader & squad; FF9: squad; GG5: squad. Take ten minutes, look at the situation, and write down your answers. "Drill Sergeant, this is pretty complicated—couldn't you draw us a picture?" No, trainee—I ain't no artist and this isn't an Art Appreciation class. This is "hands-on" training—which means YOU place markers on a map and figure it out. I didn't ask you to do it from memory! The pretty pictures are in the ASL rulebook—we're not interested in making this easy for you. If you're going to learn—you'll have to get out the pieces and check LOS yourself. Now do it!

■ The units that can roll for concealment (and their necessary Original dr) are listed below. Mark them with a CX counter temporarily to symbolize that their concealment gain is dependent on a successful dr. A successful dr will conceal the following units: the 7-0 in G6 (5 or less), the HS in G6 (4 or less), the squad in H5 (3 or less), the leader in Q4 (4 or less), the squad in Q4 (3 or less), the squad in S6 (2 or less), the leader in T5 (4 or less), the HS in T5 (3 or less), the HS in EE6 (3 or less), the 9-2 in FF5 (4 or less), and the squad in FF5 (4 or less).

The units that cannot gain concealment are: the HS in J1 (LOS of M3), the HS in R6 (LOS of P6), the squad in W4 (LOS of K7), the squad in BB5 (broken), the squad in EE10 (LOS of K7 and not in Concealment Terrain), and all the U.S. units (not their Player Turn). All the other units gain "?" automatically.

Even though the units in FF5 are out of LOS of all enemy units, they are in non-Concealment Terrain within exactly 16 hexes of the unbroken enemy unit in P6, and must make a Concealment dr. GG5 is 17 hexes away so the unit there becomes concealed without a dr. The units in Q4 are in open terrain regardless of the hedge and must roll for concealment.

Now that you know how to gain a "?", you need to know what good it does you. First, it keeps the enemy from knowing exactly what is under the "?". You can look under your "?" to see what you have, but you may not peek under an enemy "?". I might also mention that you cannot inspect an enemy stack unless you have a Good Order unit with a LOS to it (A12.16). "Drill Sergeant, can you have both concealed and unconcealed units in the same hex?" Yes. In that case, put the unconcealed units on top, with the concealed units on the bottom and the "?" in between.

A second big advantage of being concealed is that it makes enemy fire less effective. In fact, FP against a concealed unit is reduced to half strength. This is in addition to all other forms of halving fire penalties. What if a pinned unit fires at Long Range at a concealed unit? How much is its FP reduced? "It is divided by eight, Drill Sergeant." Right. How is it reduced against a non-concealed unit? "Quartered, Drill Sergeant." Good. Concealment also helps you gain Ambush status when you first enter CC, and can help you bag routing units who head toward you as they move to the closest woods/building hex not "knowing" you're there until you reveal yourself (A10.533). Concealment has many advantages, but we'll concentrate on its FP effects for the moment.

"Drill Sergeant, if a concealed unit is stacked with an unconcealed unit, how is FP affected?" The concealed unit has the FP halved against it, while the unconcealed unit doesn't. This means that the attack would be resolved on different columns on the IFT, but with the same DR. For example, suppose that there are two enemy squads in the woods in P5, one concealed and one not. Since we are in O5, you use Point Blank Fire. You have 14 FP against the unconcealed squad and seven FP against the concealed squad. My leadership negates the effect of the woods. If you roll a 9, the unconcealed squad must take a NMC, while the concealed squad is unaffected.

You see how useful concealment is to have, and you know how to get it. Concealment is easy to lose (A12.14), however. A unit loses concealment if it becomes broken or Reduced, regardless of the proximity of enemy units. If a unit is within LOS of a Good Order enemy unit, regardless of range, it loses its concealment if it is attacked and suffers a PTC or worse.

K

The unit must be in Good Order to make you lose concealment once you have it; it needs only to be unbroken to prevent you from gaining concealment in the first place. A Good Order unit is one that is neither broken, berserk, captured, nor in Melee.

If a Good Order enemy unit is within 16 hexes of you, and also has a LOS to you, there are many more ways to lose concealment. If you fire a weapon, you lose concealment. This includes your inherent FP or SW. If you are a leader, you lose your concealment if you try to rally a unit. You lose concealment if you attack in CC, barring a successful Ambush (A11.4). You also lose concealment if you enter an Open Ground hex or use non-Assault Movement. To keep your concealment while moving, you have to move real slow. At least one unit in your Location loses concealment if an enemy unit attempts to enter your Location (A12.15). Remember, you must be within 16 hexes of a Good Order enemy unit that has a LOS to you to lose concealment due to these actions.

Let's test your knowledge of concealment. Suppose there is an enemy Good Order unit in 3M5. You are still in O5, concealed. If the enemy squad fires at you and gets no effect, do you retain your concealment? "Yes, Drill Sergeant." What if the attack results in a PTC which you pass? "Yes, Drill Sergeant." Wrong. You do lose your concealment to a PTC—whether you pass it or not. Suppose that you fire at the only Good Order enemy unit in your LOS and break or eliminate it? Do you lose your concealment? "Yes, Drill Sergeant." Right—because the enemy unit was in Good Order when you fired at it. However, if that unit was already broken when you fired at it you wouldn't have lost your concealment.

Suppose that the enemy squad is in Good Order but you are broken. I am concealed but I try to rally you. Do I lose my concealment? "Yes, Drill Sergeant." Right. See what a leader has to give up for his men? You there, go fetch me a drink of water. Now, suppose that both you and the enemy squad are concealed. You move into the road in N5. Do you lose your concealment? "Yes, Drill Sergeant." Does the enemy squad, since you moved ADJACENT to it? "No, Drill Sergeant." Right, but it must be momentarily revealed to make you lose your concealment (A12.14). Suppose it doesn't fire at you, and chooses to remain concealed. You attempt to enter its Location in M5. Does it lose its concealment? "Yes, Drill Sergeant." Right, and what happens to you? "We stay in N5 and end our movement, Drill Sergeant." Sort of . . . actually you entered M5 and the MF you paid to do so are still expended—but in N5 where they make you subject to new Defensive First Fire/Residual FP (A8.2). Now suppose that instead of one squad, there are three squads and a leader in M5, all concealed. If you tried to enter M5, who loses concealment? "One unit or more, chosen by Random Selection, Drill Sergeant." Outstanding.

This is the sort of training you would receive in Advanced Infantry Training, but I'm sure you can already see how rules we've learned earlier, such as Assault Movement, fit into the later training. In truth, we could continue this training for many weeks and I'm sure you'd all be better Squad Leaders for it—even you veterans of the earlier version. But I can see you're all ripe for a taste of battle. Rumor has it that you'll be leaving England immediately as part of the big invasion of Europe. I know I've been hard on you men, but I'm sure you realize it's been for your own good. You came to me whimpering about rules that were too long and too hard, and you're leaving as men with a solid foundation in combat theory at the squad level. With this basic understanding of the system under your belts, return to your ASL rulebook for the more definitive data that you will need to become viable battlefield squad leaders. Pay particular attention to Residual FP (A8.2), Machine Guns (A9), Snipers (A14), and Mortars (C9). We didn't really touch upon them in your brief stay here and you're sure to encounter them soon. One last bit of advice; roll low.

K. Squad Leader Training Manual

INTRODUCTION AND ASSUMPTIONS:

This is a continuation of Chapter K, originally presented in PARATROOPER, and is written assuming the reader has access to boards 1-4 and 24. Reference is also made to the Chapter H notes for the U.S., which are available in YANKS.

As with the six days of training presented in the first installation of Chapter K, readers should treat ■ as a graphic symbol for pause—indicating a greater passage of time for the characters to enable them to reach a new location or for the reader to deal with a presented exercise. Readers should also realize that proper grammatical usage has given way to a usage of quotation marks to identify only the statements of the trainees as a means of emphasizing and separating them from the remarks of the Drill Sergeant. As always, the lessons taught here are limited to basic situations and should not be considered exhaustive.

DAY SEVEN:

LIGHT MORTARS AND BASIC ORDNANCE

■ TEN HUT!

At ease. As you men no doubt recall, my name is Sergeant Stahler and I am your Drill Instructor. Today we are going to learn about mortars. By now you chowderheads have had some experience with SW and fired a machine gun or two. Mortars are a lot like machine guns, but can also be very different. We're going to look at some of those differences now. Meet me inside the building at 219.

FALL IN. Let me reintroduce you to the M2 60mm mortar. You all probably remember this beauty from Day One, when we got to lug it up and down 218. Remember what a bad time you had carrying a 5PP SW? "Yeah, but it would have been easier if you'd lent us an extra PP Drill Sergeant." Aw, Lyman, was it too heavy for you? "Well, not so heavy as much as just awkward, Drill Sergeant." That's right, but the lesson was one you won't forget now, was it? There's another trick we could have done. Here, take the mortar, push on that tab, and twist the barrel...see? A mortar can be *dismantled (dm)* (A9.8), the same way most other heavy SW can be dm'ed. You can't fire a dismantled mortar, but it's easier to carry. We replace the M2 MTR counter with an M2 dm MTR counter. This indicates that it isn't ready to be fired. Do you notice any other difference on this counter? "The PP is down to 3, instead of 5, Drill Sergeant." Very good. Light mortars, like this M2, can be dm to halve their PP—fractions rounded up, of course. Larger mortars between 76 and 82mm also can be dm'ed—this makes them into a 1/2" counter that you can carry just like any other SW. If you pass around the pieces and ammo boxes, then a squad like you can carry this one at normal speed, even without any help from a leader. Which is exactly what you're going to do now. Meet me at 2E2, and be there within five minutes.

A dm weapon can be assembled either during your PPh or your DFPh. But you can only dismantle a mortar during these phases if you haven't shot it. Assembly takes some time, and counts as if you've used a SW during that phase. Assembling or dm'ing a mortar counts as using a SW, so you guys could fire your inherent FP during the phase—unless you assemble two mortars, or assemble a mortar and fire another SW.

Your commander also has a choice before a battle—if he wants you to enter a

combat area with any of your eligible weapons dm, he can. But if the scenario card specifies a weapon is dm, then it must enter dm.

■ Large mortars are easier to get into awkward places than most Guns. Unlike other Guns, you can take a large mortar (if dm) into a Crag (B17.4), Graveyard (B18.43), or Entrenchment (B27.1), re-

assemble it, and fire from there. You can also take a dm mortar onto the roof of a building, assemble it, and fire it from up there (B23.85), if you're fighting in an area that has roof access. You aren't allowed to fire any mortar from inside a building at all (B23.423), including huts for you grunts that will be heading to the Pacific. Of course, you could fire any mortar from a lumberyard (B23.211) or rubble—even if that rubble was formerly the upper level of a building.

■ Okay, here in 2E2, let's assemble our mortar. Replace the dm counter with the original M2 MTR counter. And now let's look at the counter. What information do you see? "It's back up to 5 PP, Drill Sergeant." Good eye. "It's 60mm, and only fires HE." Close—it isn't allowed to fire AP. "Are the numbers in brackets its range?" Yes, a mortar is an Indirect Fire weapon (C.1) that has a minimum and maximum range. The last number in the brackets is its maximum range, and the first number is its minimum range. "It has a Multiple ROF of 3." That's something to remember—mortars often have high rates of fire. Even if they aren't very accurate or deadly, they can get lucky eventually just because they keep firing and firing. A mortar can even change targets on subsequent ROF shots. Anything else? "What's the asterisk next to the caliber mean, Sarge?" That means our mortar has a short barrel length and suffers To Hit penalties for firing at longer ranges (C4.11; the Brass have indicated that the rules about barrel length apply to certain SW, including mortars).

Anything else? Has anyone tried turning the counter over yet? Besides the usual information on breaking and repairing a SW, there's two special notes for the M2. First, it can fire Illuminating Round (IR) ammo, and this might save you some enchanted evening. Second, the M2 mortar can fire WP in any battle taking place in 1945 (or, as an early Christmas present, the U.S. gets WP in December 1944 if you are in any of the *Kampfgruppe Peiper* battles [KGP SSR 16]). I'll describe WP in more detail when we talk about special ammunition.

Is that it? "Yes, Drill Sergeant." NO! IT IS NOT! Always, ALWAYS read up on any weapon or vehicle you're going to take out in the field—even if it's just a SW. If you'd checked Chapter H about this weapon, you'd also see that you can exchange three M2 60mm mortars for a 4 FP Offboard Artillery module, complete with a radio or field phone. This gets into rules we'll discuss some other day, but it's important for a commander to remember he has options. And that you should always read your operator's manual.

Finally, and most importantly, the M2 mortar is a 1/2" counter, so it is a SW and not a Gun, even if it is considered ordnance because it uses the To Hit (TH) table. This means that your commander thinks any infantry is qualified to fire this thing, Heaven help us. Almost all 1/2" SW do not require a specially trained crew to fire it at full effectiveness—except for American RCL and all 37* INF weapons, plus the Japanese always require a trained crew to fire a MMG, HMG, or ATR at full effectiveness (G1.611). The fact that we have a SW instead of a Gun says we don't have a CA when we set up or fire our mortar—this is light enough that we can turn and fire it in any direction with no penalty (A9.21).

Like a MG, a squad can fire a mortar and still use its inherent FP. Unlike a MG, though, you cannot add your inherent FP to the results of a mortar's attack (A7.351), even if you fire at the same target. Since mortars are SW, a squad can fire two mortars (or one mortar and another SW) instead of using its inherent FP. Likewise, a half-squad can fire a mortar instead of using its inherent FP. If you've got a lot of leaders and heroes with nothing better to

K

do, two SMC can team up to fire a mortar at full effect. And one SMC can fire a mortar alone, but he loses any chance for Multiple ROF (C9.2). If you moved the mortar this turn, you can't fire your mortar during the AFPh, either (A4.41), and that includes just changing Location within a hex. If you moved into a Location and Recovered a mortar during your MPH, you COULD fire it during the AFPh so long as you didn't move the mortar, but without ROF.

Mortars, like all weapons, are subject to breakdown. No, Fago, that is not the same as dismantling it; it means it doesn't work any more. Most mortars have an inherent B12 (and so do not have a Breakdown Number (B#) printed on the counter), meaning that they malfunction on an Original To Hit DR of 12. When that happens, the mortar is inverted and cannot fire again until it is repaired, although if you had hit with an Original 12 (unlikely, but possible) that attack would still be resolved.

Look on the back of the counter again. What do you see besides the Special Ammo information? Petersen? "Uh, an R1 in the upper left and an X6 in the lower right." What else? Anyone see a big white X? Sometimes the obvious gets overlooked. The white X means you can't fire the mortar till you repair it. The R1 means you can repair it during the RPh with a Repair dr (no DRM apply) of 1, while the X6 means a Repair dr of 6 eliminates the mortar. This is true for all SW mortars and most 5/8" mortars also—indeed, for most weapons in general. Some rare 5/8" mortars (like some other Guns) don't have a white X on the back. Any guesses what that means? "It won't malfunction, Drill Sergeant?" You should be so lucky, Repetti. No, it means those Guns must be unlimbered to fire at full effectiveness (C10.2) and you use a special Malfunction counter when they break. Maybe some of you will go on to Advanced Ordnance training one day where they go into material like this. You guys sure aren't ready for it yet, though. Enough chatter. Let's try this baby out.

■ Standing at 2E2, and looking due east, how far can you see? "Hex 2Q2, Drill Sergeant." That's right. How far away is that? "12 hexes, Drill Sergeant." Good—and within easy range of our mortar. We'll put a simulated German 4-6-7 squad on top of the hill in 2Q2. For their sake, we'll let them set up in a foxhole. Set the range of your mortar to 480 meters, and let's fire off a round during the PFPh.

PHOOP!

Unlike firing your inherent FP or a MG, firing a mortar is a two step process. We have to roll To Hit (TH) the target, and then roll to determine how effective the hit was on the IFT. First we look at the C3 To Hit Table. Under TARGET TYPE/RANGE, we look under the 7-12 column, and cross reference that with the Area (Mortar, SMOKE) Target Type. You should get a 7. "Why is the seven red, Drill Sergeant? I thought in 1944 the Americans got black TH numbers." Normally that's true. But mortars are Indirect Fire weapons, and always use Area Target Type for the TH charts (C3.33). For Area Target Types, everybody gets a red number.

Next, read down through C4 GUN & AMMO BASIC TO HIT NUMBER MODIFICATIONS, and see what modifiers apply at this range. We have a * Gun (no modifier until your range is 13 or more hexes). Otherwise, no modifiers apply so our Modified TH Number is 7. In comparison, the German light mortar is 50mm, and right away we see an advantage the American mortar has over its German counterpart—at ranges greater than 12 hexes, the smaller caliber of the German mortar suffers an additional reduction in its Modified TH Number.

Now read through the C5 Firer-Based DRM Table. Before you start, notice the "dagger" footnote reference says some of these cases do not apply to Area Target Types. That's us and our mortar. Let's go through the checklist, skipping the daggered modifiers:

- **Case A:** Firer outside CA—doesn't apply, because light mortars don't care about CA.
- **Case B:** Fire in AFPh—we're not doing that just now.
- **Case D:** Pinned Firer/Spotter—we're not pinned.

- **Case F:** Intensive Fire—not an option for SW like our Light mortar (C5.6), but could be for mortars on a 5/8" counter.
- **Case H:** Captured/Non-qualified Infantry—by the time we're done here, you'll be qualified to use an M2. This would apply only if we're using another nationality's mortar or a larger mortar on a 5/8" counter.
- **Case I:** Buttoned Up AFV—certainly not a squad out on a sunny summer day.

• **Other:** None apply. We'll talk about Spotted Fire later.

Total DRM for Firer-Based Hit Determination: +0

Okay, we're doing well. For all the modifiers that we can control, we have suffered no bad ones. Now we look at the C6 Target-based DRM Table, and see what the defender has done to avoid our fire:

- **Case J:** Moving/Motion Vehicle or Dashing Infantry—our target certainly isn't Dashing, nor a vehicle.
- **Case J1-J2:** Defensive First Fire vs Moving Vehicle—not shooting at a moving vehicle that just came into sight.
- **Case J3-J4:** FFFAM/FFMO—our target isn't moving for our benefit, either.
- **Case K:** vs Concealed Target or Area Fire—doesn't apply. For us this only applies if we have a concealed target. Area Fire (C.4) is NOT the same thing as Area Target Type (C3.33); just because we're using the Area Target Type doesn't mean we must use Area Fire.
- **Case M:** Bore Sighted Location—doesn't apply to us. We'll talk about Bore Sighting later.
- **Case N:** Acquired Target—this is our first shot, so it doesn't apply yet.
- **Case O:** Target using Hazardous Movement—doesn't apply.
- **Case P:** Target Size Modifier—infantry doesn't have a Target Size.
- **Case Q:** TEM—Note that TEM doesn't apply here. Don't smile too much though because we apply the TEM to the IFT results if and when we do score a hit.
- **Case R:** LOS Hindrance—no hindrance between here and there.
- **Other:** None apply.

Total DRM for Target-Based Hit Determination: +0

There's one other thing to notice. The C6 table has a triangle (Δ) in the upper right hand corner, and C5 table does not. That means I can apply my Leader Modifier to your Firer-Based Hit Determination chances on the TH DR, and any defending leader cannot modify our roll. I'll throw in my -1 modifier now. So what do you need? "A 7 base to hit, +0 Firer Based DRM, +0 Target Based DRM, -1 DRM for Leadership. We need to roll an 8 or less, Drill Sergeant." That's right. And don't look so disappointed that it's only an eight—just try it. Roll the dice.

What did you roll? "A nine. We missed." Wait. Get in the habit of checking your dice. What did you roll on the colored die? "It's a three, so we keep our ROF." Right, and you get another bonus besides a second shot. You also get an Acquisition counter. Choose a 5/8" Acquisition counter out of your boxes—they look like a gun sight. We use 5/8" Acquisition to mark Area Target Type Acquisition, and 1/2" markers for Acquisition using Infantry or Vehicular Target Types. If you have many weapons putting many Acquisition counters on the table, you can choose an Acquisition counter that has the same Identity (A, B, C, and so on) as the weapon that it applies to. You might also choose one color of Acquisition counters to represent M2 mortars, if lots of different Ordnance are acquiring targets.

Now put the Acquisition counter, with the "-1" side up, on top of our target hex. If you remember Case N from the Target-Based Hit Determination, you see the -1 DRM applies to your now-acquired target. Presumably you have an idea of where your previous shot landed, and future shots can be corrected onto your target. So for your second shot, you get this new modifier. What do you need to hit now? "We needed an 8 last time, and the only change to the DRM is the -1 Acquisition. So now we need a 9?" See? It just keeps getting better. Roll the dice.

"We rolled a 5, but the colored die is a 4." Okay, you lost ROF for this turn, but you scored a hit on the target. Before we figure the hit results, flip your Area Acquisition over to the "-2" side for future shots. That's as good a DRM as you can get from Target Acquisition, and now next turn you'll need a

K

10 to hit. Not too shabby.

But now that we've gotten a hit, we need to figure out what sort of damage we've done to the target. Pull out the IFT, and look across the FP row. Each FP is followed by a slash and number, and the one we're interested in is the 8/60 column. This means our 60mm mortar has the equivalent FP as an 8 attack—almost. Because we're using Area Target Type, the FP for our mortar is halved to a 4. Does our target get any terrain modifiers in 2Q2? "+2 for the foxhole?" Yep. "+1 for Height Advantage?" No, HA never applies if you already have any positive modifier terrain bonus. And if you read B10.31 carefully, it says HA applies to "... any unit receiving Direct Fire..." and we are using Indirect Fire. Also, I can't offer you any Leadership Modifier because I can only apply it to your TH calculation (A7.531)—can't use me twice. Here's a quick opportunity to look at what might be shooting back at us someday. A German 50mm mortar would be on the 6/50 column, then halved to the 2 column. Not exactly as effective as our American mortar. "Weren't these originally designed in France, Drill Sergeant?" Get back to work, Ferraro.

Having finally scored a hit on our target, we resolve the damage on the IFT. Roll the dice. "We got a 7, +2 for TEM makes it a Final 9 on the 4 FP column. No effect." Well, not exciting. Most light mortar shots aren't though. And remember, unless that German squad does something, we get "To Hit" it on a 10 or less now that its hex is acquired, and with our Multiple ROF it can't count on a turn going by without us hitting for some effect.

Let's go to the German's turn, and assume the squad has been gracious enough to stay put in its foxhole. Fire again during our DFPh. What do you need to hit now? "Only DRM that's changed is the Acquisition, so now we need a 10." Outstanding. Roll the dice. "A five, and this time the colored die is 1." Good. Now roll on IFT column 4 with a +2 DRM. "Rolled a 4, +2 makes it a NMC." Excellent. Let's say the German squad rolls an 8 and breaks. Now you get to fire again with your ROF. "Still need a 10. We roll a 2!"

Good shot. Not only is a 2 a hit, but you've scored a *Critical Hit (CH)* (C3.7). Now we'll make the squad regret staying in that foxhole. For mortars, the benefits to a CH are all modifiers to the IFT resolution. Instead of halving our FP (it was 8 halved to 4), we now double the FP (8 doubled to 16). Also, any TEM is now a minus to the DRM instead of a plus. So now the foxhole gives the defender a -2 TEM instead of the usual +2.

If we had gotten bonuses for FFNAM/FFMO (Case J3 and J4), they would stay negative (C3.71). An Airburst would also stay negative, but we'll talk about those later. If there had been multiple targets in the hex, a Critical Hit would only affect one of them (C3.74)—chosen by Random Selection. Everybody else in the hex, barring any ties on the Random Selection, would be hit with halved FP (8 halved to 4) and normal TEM.

Rolling a 2 TH is considered a CH only if you could have hit your target had you rolled a 3 or better—if you needed to roll a 2 or less just to hit, then you need to roll a subsequent dr. If the subsequent dr is a 1, you do indeed score a CH. Otherwise, on a dr of 2-6, you just score a normal hit (2-3 if you needed less than 2 to hit).

So now we roll on the IFT in the 16 column, with a -2 DRM for the reversed TEM of being in a foxhole. Roll away. "We got an 8—with double fours." You're worried about Cowering? Don't. Ordnance rolls on the IFT are immune to Cowering (A7.9). Your 8 minus 2 for terrain results in a 2MC. Jerry rolls another 8; the squad misses its morale check and reduces to a broken half-squad. Here we see the true lethality of a high ROF. It can cause multiple morale checks before your opponent gets to rout away. Useful to keep in mind, especially if you get the chance to fire at a single target with multiple mortars.

As if the Critical Hit wasn't enough, we still have ROF. Roll again. "A 3!" This mortar is smoking! The only bad thing about having a great day with ROF is that it can draw some unwanted attention. All this rolling To Hit and rolling on the IFT could lead to some enemy Sniper attacks. But don't let me rain on this parade—figure your shot. "We have a 4 column +2 DRM on the

IFT, and roll a 4. Goes to 6, a NMC." Okay. Jerry rolls 9. Not his day for morale checks. His half-squad is Casualty Reduced, and is removed from play. We still have our ROF, but now we're out of targets to fire at, so we'll save ammo and let the phase end.

■ There are a couple of lessons to always remember when you're firing a mortar. A mortar's Area Acquisition is based on the hex you've targeted. If the enemy leaves the target hex, you can't track him. Instead, you keep your acquisition on the hex he just left. You can even use the Area Target Type to acquire a hex that has no enemy in it, and thereby acquire a hex you think the enemy might be headed for—or maybe the hex could have hidden enemy units stashed away. The only thing you need to worry about is enemy Snipers and Malfunctioning the mortar.

If you fire the mortar at another hex, you lose the Area Acquisition you had before on the first hex and start gaining acquisition on the new target hex. A word of warning—and another difference between mortars and MG—if you fire your inherent FP at anyone, *even the same target you fired your mortar at*, you lose your Target Acquisition (C6.5). The choice is yours—keep shooting your mortar with its increased accuracy, or blast them with your tommyguns. If you really want to use your inherent FP, use it in your friendly fire phase *before* you ever fire your mortar. That way, you get to shoot and gain acquisition, at least for that turn. Next turn, you could fire your mortar with its new acquisition, then think about firing your inherent FP. Of course, if you fire your FP without a leader, there is the danger that you could Cower. And if you *do* Cower, you and all your SW will be marked with a Final Fire counter (A7.9), and you will lose your chance to fire your mortar.

This would be a good time to mention *Bore Sighting* (C6.4), which you might remember seeing in Case M on the Target-Based Hit Determination modifiers. If your current scenario makes you the Scenario Defender (check your Index!), you can Bore Sight your Mortars (plus lots of other weapons). You write down the mortar, its possessing unit, and the hex it is Bore Sighted on. The target hex must be within a range of 16 hexes. So long as you don't move the mortar to a different hex or give it to some other unit, you can keep your Bore Sighted hex in your sights and get a -2 DRM on your TH roll—even if you fire your inherent FP or the mortar at a target in a Location other than your Bore Sighted one. Bore Sighting cannot be combined with Acquisition, though. Think of it as a pre-acquired target hex—with a little more versatility.

Board 2 is a little claustrophobic for people trying to see far and shoot farther. Let's dm the M2, clean it, fall out for chow, and assemble at 24C3 in an hour. DISMISSED!

■ TEN HUT!

At ease. You probably remember some of the interesting terrain we have here on board 24 from earlier in your training. This afternoon we're going to study some of the more unusual tactics and terrain conditions that can affect a mortar's performance. Assemble the mortar.

Say we have seen a German squad armed with a HMG at level 2 of 24V3. Thinks it's the cat's pajamas up there, in that stone building with a commanding view over most of the battlefield. But out here, we're outside of its weapon range unless it has a leader to direct its fire (A9.4). And the squad's within ours. Let's take a shot at that unit.

PHOOP!

Check the C3 table. Range? "Twenty hexes, Drill Sergeant." That gives us a base of 8 to hit. Table C4 tells us that firing a * Gun will give us a -1 right off the bat, so the Modified TH Number goes down to 7.

K

Run through the C5 DRM, and tell me what applies. "Nothing, Drill Sergeant?" Right. What does table C6 give us? "We can see over the building in 24N3, right?" Right. C6 gives us no DRM, either.

So what's our chance TH? "Modified base DR of 7, +0 DRM for C5, +0 DRM for C6, and a -1 DRM from your leadership." Yeah, I'll help you with this shot. You need to roll 8 or less. Throw the dice. "We got a 5, colored die is 1." Now let's see what effect we have on these Krauts. Check the IFT, and add +3 for the stone building. "A 4 FP +3, and we roll a 6, goes to 9. No effect." But I see you marking the target hex with your -1 Acquisition counter, and loading for another shot because you maintained ROF. Very good.

Roll again, and call out your DRM. "Modified base DR of 7, +0 DRM for C5, -1 DRM for C6 with our Acquisition, -1 DRM for your leadership. We need to roll a 9 or less." Right. "We roll a 9, colored die is 3." And the results? "Roll on the 4 column of the IFT, +3 for stone, we roll a 3, goes to 6. Jerry takes a NMC." Excellent. Say he rolls and stands firm. Take your next shot. "Modified base DR of 7, +0 for C5, -2 for our Acquisition on C6, -1 DRM for leadership. We need a 10 or less. We roll a 6, colored die is 5. No more ROF." And what do you do after you hit? "Roll a 4 on the IFT, goes to 7. PTC for Jerry." The squad rolls, and is pinned. End of your PFP, unless you want to fire your inherent FP at something and lose your Acquisition. "No way, Drill Sergeant!" Good choice.

Just to make things more interesting, let's say that on the German's turn, two Concealed squads move into the building at 24V3—one on Level 0, one on Level 1. Now it's our DFP, and we shoot again. Can we hit the new units? Anyone? Okay, it's an interesting situation. You're probably concerned about losing your Acquisition by changing targets. That won't happen because Area Acquisition covers the entire hex. Anything else? "We can see where the Concealed squad moved into Level 1, but can we even see Level 0 over there Drill Sergeant?" Well, no you can't, at least from here. It's hidden behind Level 1 of the building in hex 24N3. But that doesn't matter with our mortar. Remember, we're firing at the *hex* and not a specific *Location* in that hex. Potentially, we can affect everyone and everything in that hex by using Area Target Type, whether they are friend or foe (C3.33).

Two things will modify our shot. The new Concealed squads will be harder to hit, and they will certainly get better cover from all those floors of stone building over their heads. But we can still affect them with the same dice rolls that affect the HMG squad up on Level 2.

We start with the same TH DRM for the squad on Level 2. What other TH DRM apply to the squad at Level 1? "Case K, vs Concealed Target?" Bingo. He now has a +2 TH DRM. We roll To Hit the hex only once, and apply the appropriate modifiers to each target in the hex. We may hit the guys on Level 2 and miss the guys on Level 1. Because the guys on Level 0 are out of our LOS, we only hit them if we hit the hardest target we can see. In other words, if we score a hit on the guys in Level 1, we hit everyone. Fire when ready, and for now keep track only of the modifiers for the HMG unit.

"Modified base DR of 7, +0 DRM for C5, -2 DRM for our Acquisition on 24V3, -1 DRM for leadership. We need a 10 or less. We roll a 6, colored die is 5. We have no ROF." Okay, so the squad upstairs gets hit. How about the Level 1 boys? "Our roll of 6, +2 for Case K, but -2 for Acquisition and -1 for leadership is also a hit." And because we hit the squad at Level 1 (our hardest target), we also hit the unseen squad at Level 0. Now for the effect. "We roll a 3 on the IFT, +3 for the stone building gives us a NMC against the Level 2 Germans." Jerry rolls 4, and stands firm. Okay, now let's see what the effect is on the guys on Level 1. Even though they were Concealed, we don't halve the firepower of our indirect fire. Our penalty was already paid when we figured them to be harder to hit (A12.13). But because they are on a lower floor of a building, they get an additional +1 IFT DRM per floor above them (B23.32), even if that higher level has been Rubbled (B24.3). That modifies your IFT DR to a 7—a PTC. That's enough to strip away their concealment. Surprise, Jerry. He rolls, and the squad is pinned to boot. Now the last squad, the one at Level 0. What happens to it? "Our IFT DR is modified by +3 for stone building, and another +2 for the two floors above it. The Final IFT DR is 8. No effect." That's right.

Had we scored a CH on our TH roll, we wouldn't get the bonus of reversing the TEM from positive to negative for everyone. We would use Random Selection to pick who got the CH thrashing (C3.74). And it's scary for people in stone buildings: the 16 column with a -3 on the IFT for the stone building. Everyone else in the hex would be hit on the IFT under the 4 column, as usual, figured with normal TEM bonuses added to our IFT DR. "Uh, Drill Sergeant, would the guys on level 1 of the building get a -4? Er, -3 for the stone building, and another -1 for having a floor above them?" No, the floor bonus does not apply to a CH, but good thinking.

■ End of the PFP, and let's look at the Germans' situation. They're in good cover, but our mortar has -2 Acquisition. Last turn we were lucky with our IFT DR. The HMG squad took a NMC, and the concealed squad took a PTC, lost its concealment, and ended up pinned. Our mortar is outside their range without a leader, and they can't even return fire. If you were the Germans, would you stay in that position? That, of course, depends on how the rest of the battle is going. But we've succeeded in making them think twice about what looked to be the strongest position on the board. And we're only one squad.

Now let's look at our situation. What do you think? "I think we've got them against the ropes, Drill Sergeant!" Yeah, yeah. And what else? "Well, we are sitting out here in the middle of open terrain. What if the Germans come after us?" Exactly. So far, we've looked at mortars as long-range fire support. That's ideal sometimes, but if you've ever waded through a couple of the ASL boards, you probably realize that long range shots are a luxury. Let's explore what happens if we're in a little closer to the action. First dm the mortar, and let's march over to 24O8. I've got some new tactics to show you.

■ Fall in! Okay, let's get that mortar reassembled. We're going to once again put a simulated German squad armed with a HMG in level 2 of building 24V3. We can't see him here, because of the hill to our east. I'm going to Deploy you boys into two HS (A1.31). Count off by two's, all ones will join our Assistant Squad Leader in IIS Able, the rest of you will gather around the mortar in HS Baker. Now we'll wait out the turn until we gain Concealment for being out of LOS (A12.12).

Next turn already? Somebody wake up McGrath. Okay, HS Baker still possesses the mortar and can stay here. HS Able, come with me. We are going to Assault Move up this hill, into the trees in 24P7. By using Assault movement into concealment terrain, we get to keep our "?" marker. Now look at our target in 24V3. That HMG suddenly looks a lot more dangerous, doesn't it? But we're still at Long Range for a German First Line squad, and we're concealed and in some cover. Not too tempting a target, we hope.

We are going to use our position here to act as Spotters for the mortar adjacent to us (C9.3). From here, so long as we remain adjacent to the mortar, we can call down correcting fire information. Note that we merely need to be adjacent (within 1 hex) and not necessarily ADJACENT (within LOS and advance movement range). So we could be up a cliff or on the third level of a building or even out of LOS, for all the HS we're Spotting for cares. Because we're Spotting for them, they can fire the mortar and be immune from any return fire. And so long as you boys only call out correcting information, Spotting is not a Concealment Loss activity (Case C on the Concealment Loss/Gain table). And if we had been lucky enough to set up HIP, Spotting wouldn't give you away, either. A nice combination, don't you think? Now you boys stay here, and I'm going down to coach the mortar team. "Uh, Drill Sergeant? Don't you think you'd better help us spot?" Nah. Spotting is something I can't help you with (Δ), and if you do need to Rout away from that HMG, I'll be just one hex away, along your most logical Rout path. You stay put. I'm heading back to 24O8.

Howdy boys. Point that mortar where you think 24V3 is, and make sure you're aiming higher than HS Able. Okay, now that you Baker boys are firing the mortar, you lose any inherent FP. You'd also lose your "?" when you fire if any other Germans could see us, but we don't really care because the only ones we know about are out of our LOS. Another thing to know—your ROF will drop by one because you're losing some of your reloading speed using a Spotter and watching for correction signals from HS Able. Now that we've declared HS Able to be our spotters, we can't use someone else as a

spotter until HS Able is killed, captured, or broken. So if they are pinned, our Spotted Fire suffers from C5 Case D—Pinned Frier/Spotter. Let's wait for our DFPh and fire.

PHOOP!

And what do you need to hit? "Range is 8 hexes, we have a base chance of 7. C5 Case Other says Spotted fire is a +2 DRM. C6 gives us no DRM, and we have no Acquisition from this new Location. We need a 5 TH." Close, but you missed one. The Brass says that while I can't help HS Able with its spotting, I can still use my Leadership DRM to help you guys fire your spotted mortar. So you'll need a 6 TH. What do you roll? "A 7, colored die is a 2. We missed but have ROF." And we just gained our -1 for Target Acquisition, because HS Able is signaling us from above that our shot hooked a little.

We shoot again. What do we need to hit? "A 7, counting DRM for Acquisition, leadership, and Spotted Fire." And do you hit? "We roll a 4, colored die is 3. No ROF because it's reduced one for Spotted Fire." Good. Remember to flip the Acquisition counter to -2. Now roll for your effect. "We roll 10 on the IFT, +3 for the stone building, and have no effect." Sorry to hear that.

■ Okay, let's hold our fire a moment. HS Able is signaling that the Germans are finally bugging out of that building. This Spotted Fire might be a luxury we can't afford anymore. Let's get that mortar up with HS Able. No, don't dm it, just pick it up. Let me help. Take a quick check. It's a 5PP mortar, as a HS you can carry 3PP and I can help for one more. Together we have 5 MF. It'll cost 4 to get up the hill, so we can still Assault Move. Go! Go! Go!

HS Able, we're going to Recombine into our full squad. By moving the mortar, we've lost any acquisition we had on hex 24V3. Have you seen the Germans? "No, Drill Sergeant, we lost them when they came down out of the building." Stay sharp, now it's their MPH, and we might get a shot. There! See them? They're moving in the trees over at 24V7! Far enough from us to be at Long Range for our FP, but we've got our mortar. Let 'em have it!

What do we need to hit? "Range is 6 hexes, we have a base TH of 7. No more Spotted Fire, so C5 gives us +0. C6 gives us J3 FFNAM for -1, and Case R LOS Hindrance for the Orchard in 24V8 gives us +1, total +0 DRM. Your leadership modifier is another -1 DRM. We need an 8 to hit." Roll. "We got a 6, colored die is a 2. We hit and got ROF." Place your Acquisition counter.

Now on the IFT we have a new special case. The Germans are in woods, and that gives this Indirect Fire an Air Burst (B13.3) effect. The shrapnel of our shells is made even more vicious detonating on the tree tops and spreading down. Instead of the Germans getting a +1 TEM, they get a -1 for being in woods. This modifier is cumulative with any other terrain, so even if they were in a foxhole, their TEM of +2 would also get a -1 for the woods, for a net TEM of +1. But these boys are just standing there, thinking trees are good cover. What are your results? "We roll a 7, TEM of -1 gives us a 6, which scores a NMC." Excellent. The Germans roll and break. They spent 2 MF in our LOS, so as long as we have ROF we can fire once more. Next shot.

"We have a base 7, C5 gives us +0, C6 gives us -1 for Acquisition, +1 for LOS Hindrance, -1 for FFNAM, Leadership DRM -1, for a total DRM of -2. We need a 9 to hit. We roll a 10, and miss." That's all right. At least we've got that squad on the run. Two more things to know about an Airburst. First, any residual fire left in a woods hex by a mortar is increased by one IFT column. Second, a CH in woods still gets the -1 DRM to the IFT DR (C3.71) for Airbursts—it isn't reversed to a positive value. The Brass says the +1 Direct Fire woods TEM is *not* considered for an Indirect Fire CH, but other TEM (e.g., entrenchment) would be. So, a CH against a foxhole in a woods hex would use -2 TEM for the foxhole, plus -1 TEM for the Airburst, for a total -3 DRM.

With our mortar's ROF exhausted, we could now sacrifice our Acquisition and use our inherent FP before the Germans rout away. And now that the heat of the moment is passed, I realize that we could have attacked the Germans with our inherent FP *before* we fired the mortar, and that way we wouldn't

have interfered with our acquisition. "Unless we didn't have you with us, and we Cowered, right Drill Sergeant?" Exactly, although I couldn't direct both your inherent FP and your mortar attack. I can't do everything, you know. When we're up against real German squads, I hope we'll keep our heads and not let them get off so easy.

Now we'll check out where the Germans went. Let's wait until our turn, and then move over to those woods in hex 24W5.

■ Look around. I see another simulated German squad in hex 24BB4, behind that hedge. What do we need to hit? "Range is 5 hexes, we have a base of 7. C5 is +0, C6 is +0, Leadership Modifier is -1. We need an 8." And roll. "We roll a 7, colored die is 4. Hit with no ROF." Right.

Now hedges and walls don't offer the same protection against Indirect Fire as they do against Direct Fire. Their protective TEM is reduced by one (B9.34). This decreased protection also applies to Bocage. So the hedge that the Germans are hiding behind is a +0 TEM. This still would negate any chance at FFMO, because our LOS to the Germans crosses the hedge depiction. What do you do to the German? "We roll an 8 on the IFT, +0 TEM for the hedge vs Indirect fire, for a result of No Effect." Close, though.

Any target hex that has a hedge or wall depiction gets the reduced TEM even if our LOS didn't cross the depiction. "Excuse me, Drill Sergeant? What?" Look at hex 24AA10. Say there was a German squad in there, and we were set up in 24CC10. What TEM would he get? "Wall TEM is +2, reduced to +1 vs Indirect Fire, Drill Sergeant." Right. Now, leave the German squad there, and let's say we're set up in hex 24Y10. He *still* gets a +1 TEM for the wall (B9.34). Not all of our Indirect Fire shots land exactly where we'd like them to land, and he still gets a little protection for being near the wall—even if he's on our side of it. "But Drill Sergeant, if we saw him move there, would we still get a -1 FFMO DRM to our To Hit DR?" Sure, that hasn't changed. So long as our LOS doesn't cross the depiction on the hex-side, we see him as if he's in the open. He just gets a little TEM when we resolve our Indirect Fire. "Drill Sergeant, would he get a modifier for two walls? He's adjacent to two hexsides that are wall depictions." Repetti, do you have any lawyers in your family? Well, nice try, but no. The rules say that you can only apply one wall TEM in this way.

■ Let's stop shooting at our simulated squad over there, and take a moment to look in some of our specially marked ammo boxes. This is our standard issue of Special Ammunition (C8). As I told you before, in addition to HE rounds, the M2 mortar can fire IR (C8.7, E1.93). Plus, depending on the date, sometimes it can also fire White Phosphorous (WP) (A24.3, C8.6).

IR are only useful for night scenarios, and I'm not going to teach you about fighting at night just yet. But some rules apply only to mortars firing IR, and we'll mention those. First, you must make a Usage dr of 4 or less before you actually can fire IR. Then to fire IR, you must make a TH roll. Not that you're going to hit anything, but you might malfunction your weapon or draw Sniper fire. Firing IR consumes all your ROF for that turn, and counts as a Gunflash. Placement of the IR...well, that starts getting into night specific rules, and I think I'll just encourage you boys to read E1.932 and E1.922 before you find yourselves manning a mortar some dark night.

Your WP Special Ammunition is another issue. Let's explore this ammo round carefully. First, note that the Index defines SMOKE as both Smoke and WP. WP is the U.S. player's version of SMOKE for this mortar. "Drill Sergeant, why would we want to waste time firing SMOKE when we could be blasting the enemy with HE?" Because a well placed SMOKE round can provide a Hindrance for your opponent's LOS to a hex you're concerned about crossing. SMOKE negates FFMO if your troops are moving behind it. We can even use WP offensively.

In any scenario set in 1945 (or December 1944 in any of the *Kampfgruppe Peiper* scenarios [KGP SSR 16]), the M2 mortar has a WP Depletion Number (C8.9) of 7. If you want to fire WP, announce that you're firing it, and roll TH. You compare your TH roll with the Depletion Number on the back of

K

your mortar counter. If your roll is less than the number, you fired successfully. If you roll higher than the Depletion Number, you don't have any WP to fire and are considered to have not even fired yet—unless you malfunction the mortar. If you roll exactly your Depletion Number, you get off your last round of WP and can no longer try to fire it from this mortar—at least in this scenario. This requires your commander to do some record keeping to track who's still able to fire WP. You can't fire SMOKE in rain, heavy winds, Mud, or Deep Snow, and it does not have any effect in a Fog Location.

"Drill Sergeant, what happens if you miss with a SMOKE round? Where does it go?" Notice on C4 you get a +2 to your TH number if you're firing SMOKE within 12 hexes. It's pretty tough to miss when firing SMOKE. You'll probably roll higher than your Depletion Number before you ever miss with a SMOKE round. But just in case you find a way to miss, it's assumed to have landed where it is ineffective, and therefore not put into play. Maybe in somebody's rain barrel.

SMOKE must be fired before anything else fires in the PFPh and DFPh. As soon as you fire any other type of ammo during your PFPh/DFPh, you can't fire any more SMOKE. In addition, WP can be fired at the start of a friendly fire phase before any other fire. Of course this doesn't include a squad using Smoke Grenades (A24.1) since that happens during the MPH.

A couple of interesting things to notice about SMOKE. Firing from a mortar is the only way a commander can hope for multiple SMOKE clouds from one weapon, since using the Area Target Type consumes a non-mortar's ROF (C3.33). If you maintain your ROF without depleting your Special Ammo, you can keep firing SMOKE. Smoke has to be fired in the PFPh or DFPh, but WP can be fired during any friendly fire phase. If it's other than the beginning of the PFPh, however, the WP is placed onboard as a white dispersed WP counter (A24.31). If you keep up your ROF, you can also switch from WP to HE rounds. Just remember that the first HE round fired ends any opportunity to fire more SMOKE this phase.

When WP hits, you place a WP counter on that hex; it's a +2 Hindrance cloud that rises 4 levels above the hex's ground Level. SMOKE always lands on the ground level of a hex, no matter who you were shooting at in that hex—even if the ground level is out of your LOS. Note that there are three different WP counters: a white WP counter with a +2 Hindrance, a white Dispersed WP counter with a +1 Hindrance, and a gray Dispersed WP counter with a +1 Hindrance. You place a white WP counter in your target hex after you score a hit. On your next PFPh, you flip the White WP counter over to the Dispersed WP side or remove it if already Dispersed. If there's a Mild Breeze blowing, the Brass says your WP remains a Level 4 Hindrance ('91 Annual) and during the AFPh it Drifts (A24.61), creating a row of two (or only one from a white dispersed WP counter) gray Dispersed WP counters that flow downwind from your original White WP counter.

If you're standing in a Location that's been hit with SMOKE, your view of the world is affected more than the world's view of you, and your IFT DR and TH modifiers add +1 (A24.8). And that's only one reason to think about shooting your opponent with WP. WP is also a major irritant. Anybody in a hex hit by WP (but never a hex into which WP has Drifted) must take a NMC (A24.31) unless safe inside a BU CT AFV. Leadership benefits and TEM—even Air Bursts—apply to this NMC, so chances of a result may be small. But a NMC will strip any concealment that the target had, which can be useful. This NMC will also DM an already broken target. Plus, you can score a CH with WP like any Area Target Type shot (or if you're throwing WP grenades and the affected squad rolls a 6 on the colored die during his NMC). Unlike a regular CH, for a WP CH any TEM applies as a positive DRM to the NMC. Finally, WP is so volatile that it may cause fires in Dry or Very Dry EC (A24.32).

■ Okay, heads up. Hear that? "Sounds like trucks coming, Drill Sergeant. From the east." Yeah, we're going to try firing our mortar at some vehicles. Because vehicles are so mobile, it can be hard to keep them Acquired since Area Acquisition doesn't track targets into new hexes. Unless, of course, the vehicle starts doing some cross-country driving and spends some quality time in each hex. During our opponent's MPH, we can only fire at a unit as many

times in one Location as it spent MF/MP in that Location (C6.17).

Here comes our target. There's something coming around those woods, we'll likely see it in 24BB7. Yep, it's an Opel Blitz truck, with its *Vehicle Covered Arc (VCA)* (D3.11) pointing due west. It just spent 1/2 a MP pulling into view. What do you need TH? "Range is 5 hexes, we have a base 7 to hit. C5 gives us +0."

C6 gives us some new cases:

Case J: vs Moving Vehicle +2.

Case J2: Defensive First Fire vs Moving Vehicle ≤ 1 MP in our LOS +2.

Case P: Target Size +0.

Total: +4

Ouch. Throw in my Leader Modifier for -1, and what do you need to hit? "7, C5 +0, C6 +4, Leader DRM -1, we need a 4 or less." And roll. "We roll an 8, colored die is 3. Missed, but maintain ROF." Okay. And we can't shoot at the truck during its MPH until it either enters another Location or spends another MP (A8.1).

Opel Blitz opts to keep moving into hex 24AA7. We can either fire at the truck or keep our -1 Acquisition on hex 24BB7. "Are we going to get more targets coming down this road, Drill Sergeant?" That's not the point—we're here to shoot this truck. What do you need TH? "Range is 4 hexes, base 7 TH. C5 gives us +0." And for C6, Case J still applies (+2). Even though the truck has entered a new Location, it's still only spent 1 MP in our LOS, so J2 still applies (+2). Total is +4. "Base 7, C5 +0, C6 +4, Leader DRM -1, we need a 4 TH." And your roll? "Seven, colored die is 3. Missed and kept ROF again." All right. In the real world, we might have considered letting our mortar sit this one out and just shot that truck with our inherent FP. But we're here to learn about mortars, so keep dropping shells in the tube.

Opel Blitz spends 1/2 a MP, and moves into 24Z6. We've seen it spend 1 1/2 MP. Case J still applies, but now instead of J2 we get to use J1 (+1) since the truck has been moving in our LOS for more than 1 MP and less than or equal to 3 MP. So we now need a 5 TH. Roll. "8 again, colored die is 2. Missed, but maintain ROF." Right now, if the truck moved into 24Y6 it would be closer than the minimum range of our mortar and we couldn't fire at it anymore. Fortunately, its driver's in training too, and it stays on the road.

That Opel Blitz now spends another 1 MP in hex 24Z6 to change VCA to the Y6-Z5 hexspine. It's spent 2 1/2 MP in our LOS. What do you need to hit? "Base 7, C5 is +0, C6 has Case J (+2), J1 still applies (+1), and Case N gives us -1 for Acquisition. Total is +2. Leader modifier is -1. We need a 6 to hit." Excellent. Fire away. "We roll a 5, colored die is a 1, maintain ROF." Very good.

Unarmored vehicles are hit on the ★ row of the IFT (A7.308, C1.55), and our DR would be modified by any applicable TEM. Our 60mm mortar gives us the 8FP column, halved for area target type is the 4FP column. The ★ row says "5". If we roll less than 5 we destroy the truck and flip it to its Wrecked side, and any PRC onboard could roll for Survival (D5.6). If we roll half what we need to hit (FRD, so if we roll a 2), the truck becomes a Burning Wreck and nobody survives. If we roll exactly a 5, then the truck is Immobilized. Greater than a 5, and we have no effect on the truck. If, and only if, we don't destroy the truck, then any PRC onboard would suffer a General Collateral Attack. In this case, they would use the original IFT DR number we came up with on the 4FP column.

What do you roll? "We roll a 9. No effect." And no effect on any vulnerable PRC, either. It's okay, we still have ROF.

The Opel Blitz spends 1/2 MP and moves to hex 24Z5. Total MP spent in our LOS is 3. Your chance 'To Hit? "Base 7, C5 is +0, C6 Case J is +2, Case J1 is +1, Leader Modifier is -1. We need a 5 to hit." And do you? "We roll a 5, colored die is 4. Hit with no more ROF." And to kill? "We roll a 4!" All right. The truck is flipped to its Wreck side, any passengers have to roll a *Passenger/Rider Survival (cs)* (D5.6) of 6 or less to escape the carnage. Seeing how

K

we've already figured the damage on the vehicle, surviving passengers would not be further affected by a General Collateral Attack (D5.6) since the attack eliminated the truck. Nice shooting, boys. That was something like five shots in a row. Had the truck kept moving, it would have spent more than 3 MP in our LOS, and we finally would have lost that J1 modifier to our TH DR. And if you wanted to, you could now blast away with your inherent FP at any PRC that survived the hit.

■ Next turn, now let's see what comes around the bend. Something is driving this way. And there's our target—a tank driving along the road, due east, and now entering 24BB7, *Buttoned Up* (BU) (D5.2) with its VCA pointing at the AA7-AA8 hexspine. So far, we've seen it spend 1 MP in our LOS, so

Case J2 would apply.

First, let's take a quick gander at the tank. It's a German Mark II. It's driving BU, so it'll be spending a full MP per hex it enters. That means we will lose our Case J1 and J2 modifiers much sooner than we did with the truck. Note that the white dot on the vehicle's Front Armor Factor means the vehicle is a Small Target (D1.74), and that its front and side armor are both 1.

The tank spends 1 MP and enters 24AA7. It's already spent two MP in our LOS, so Case J2 no longer applies. Fire when ready.

"Range is 4 hexes, base TH is 7. C5 gives us +0. C6 gives us Case J for a Moving Vehicle (+2), Case J1 for it spending less than or equal to 3 MP in our LOS (+1). Case P Target Size is Small (+1), for a total of +4. Leader Modifier is -1. We need a 4 to hit." And roll. "We get a 7, colored die is 3. Missed, but retain ROF." Okay.

The tank spends 1 MP to change its CA to the Z6-AA6 hexspine, so now it's spent 3 MP in our LOS. We can fire again. "Base TH is 7. C5 is still 0. C6 gives us Case J (+2), Case J1 (+1), Case N Acquired Target (-1), and Case P (+1), for a total of +3. Leader Modifier is -1. We need 5 to hit." And? "We roll a 6, colored die is 5. Miss with no ROF." We're done for this DFPh. We just gotta watch it drive now. The tank moves on to 24Z6, so it's spent more than 3 MP in our LOS. It spends another MP to change CA to hexspine Z5-AA6, spends 3 MP to move into hex 24Z5 with the wreck of the truck, and a MP to Stop.

During our Prep Fire Phase, we can shoot at the tank again. And this time, it isn't moving. What do you need? "Range of 3 hexes is a base of 7, C5 is 0, C6 is only Case P (+1), and +1 modifier for the Hindrance of the wreck." No. A wreck is only a Hindrance if LOS goes *through* the hex, not just into or out of the hex (D9.4). And wreck TEM only applies to Infantry (D9.3). Go on. "So C6 is a total of +1. Leader Modifier is -1. So we need a 7 TH."

And your roll? "We roll a 9, colored die is 3, we miss and maintain ROF." Keep shooting. "Next shot gets an additional -1 for Acquisition, so we need an 8 to hit. We roll a 7, colored die is 5. We hit with no ROF." Outstanding. But now that we're shooting at an AFV, we have something new to check. The colored die not only tells us ROF, but also tells us the Hit Location against a Vehicle.

Hit location on an AFV is figured by what you rolled on your TH DR. If the white die is greater than the colored die on your DR, you've hit the turret. Otherwise you hit the hull (C3.9). You can remember this because it's the same color scheme as the suggested House Rule for Random Selection (A.9) where the highest die declares which target is hit. The rules suggest the lightest hue (our white die) hits the top unit (the turret), and darker hue hits the lower unit in a stack (the hull). There's an exception for Location of a Hit if you get a CH vs a HD target, but nobody is ever HD against Indirect Fire (D4.2). So remember—roll the dice, check ROF, check Hit Location.

Note that our colored die was greater than or equal to the white die. That means we scored a hull hit. Remember to check now, before you rattle your dice around and forget. Next, we gotta roll on the IFT to see what damage we do to that tank (C1.55). The possibilities are:

- a KIA destroys the vehicle and allows for *Crew Survival* (CS) (D5.6, D6.9);
- a Final DR half or less of what is needed for a K/# results in a burning wreck (B25.14) and no CS (D5.6); and

- either a K/# or 1 greater than a K/# result is an automatic Shock or Immobilization, depending on whether we hit, respectively, the turret or hull (C3.9).

As usual, TEM (but not Airbursts vs BU CT AFV) modify our DR on the IFT. Seeing how we're firing Indirect Fire, the tank can't ever claim HD or HA against us. But if the tank was behind a wall, it would get the reduced TEM (C1.52) instead of HD status. Also, we get the following DRM for its armor (C1.55):

- If all AF are ≤ 4 we get -1 on the IFT.
- If the vehicle is OT we get a -1.
- If all AF are ≥ 8 we get a +1 (and we better say our prayers).

"What happens if we either Shock or Immobilize the tank. Drill Sergeant?" Immobilization (D8.1) means the crew must pass a TC to avoid abandoning the vehicle (D5.5) and the tank can't change Locations anymore. Shock (C7.4) means the tank is out of commission for the rest of the Player Turn, with a 2/3 chance of being out of commission for the *next* Player Turn, and, if so, 50/50 odds of being eliminated altogether, with no chance of Crew Survival, come the Player Turn after that.

In summary, we can roll really low and make the tank a burning wreck, or roll moderately low and turn the tank to a wreck. Or we might Shock or Immobilize the tank. Or have no effect. So. What sort of modifiers do we have to our DR? "We get -1 for the tank having all AF ≤ 4 , and no TEM since it is in the open." Right. And what do you roll? "A nine, modified to an 8. No effect." Well, a mortar shooting at a tank is often a crap shoot. Against this light tank, we needed to roll a 4 or less for any effect.

■ Okay, it's the tank's turn again. It looks like it's going *Crew Exposed* (CE) (D5.3) for some reason—either it wants to take advantage of the Road Movement Rate, or its commander is a little reckless! And it's spending a MP to Start (D2.12). Let's do that tank the courtesy of firing at it before it scoots out of our sight.

What do we need? "Range is 3 hexes, base TH is 7. C5 is +0. C6 gives us Case J (+2), Case N (-2), and Case P (+1), for a total DRM of +1. Leader Modifier is -1. We need a 7 TH." Er, not quite. A vehicle that just Started is not a Moving Target according to the fine print in D2.12 and C.8. So Case J doesn't apply until the tank moves into a new hex. You need a 9 TH. Roll. "We get a 5, colored die is 3, so we hit the tank and maintain ROF." Good.

And guess what? We have a new case to look at. This time, we're hitting the tank with its Crew Exposed. This means we can roll to damage the tank *and* damage the tank commander and any hypothetical passengers or riders. Just as if there were personnel in the same hex as the tank, we resolve this as a General Collateral Attack (A.14B) because we are firing at the hex with Area Target Type, except that you only affect PRC if you hit the tank. We roll the dice once on the IFT, look at the results vs the tank, then use the *same* DR to resolve an attack against the exposed crew. The crew receives a +2 modifier for cover from the tank, called a CE DRM (D5.31). This is instead of the hex's TEM, except you would count Air Bursts.

In addition to figuring the wreck/Shock/Immobilized effects on a tank, we also check the effects on the crew. If the crew fails a MC, the tank is Stunned (D5.34). This forces the tank to BU and Stop, and not fire for the remainder of that turn. The crew is also cursed with a +1 Stun counter for the rest of the scenario, which affects any vehicle crew's TH, MC, TC, IFT, CC, and Over-run DR. Bad day for the treadheads.

If the crew suffers a KIA or Casualty Reduction, the tank is Recalled with a +1 STUN counter (D5.341), and must BU and Stop like before. When it starts again, it must try to exit the map off a Friendly Board Edge as quickly as possible by spending the least amount of MP it can. It could stop only long enough to unload passengers. "But Drill Sergeant, wouldn't the KIA result also wipe out the tank?" Usually Dunn, but not always. Remember the crew checks with the +2 CE DRM instead of whatever TEM the tank had—a heavily armored tank in rubble would get a +4 DRM while the crew gets only a +2.

K

So what do you roll for results after that hull hit we scored? "On the 4 FP column, we roll a 3!" Great! But don't forget your -1 for the tank having all AF less than or equal to 4, so your modified DR is a 2. First the tank—that's an automatic Immobilization for it. The Collateral Damage rule (A.14) says we affect the crew subsequent to all results of the attack against the vehicle. So next the crew takes an immediate Immobilization TC (D5.5) to see whether it bails out. The Germans pass, so they stay in the tank. Now we check for the Collateral Damage on the exposed crew. A DR of 3, +2 for CE DRM, is a 5, or IMC. The Germans roll a 9, or "nein!" in this case, and fail their morale check. They are Stunned.

You still have ROF. "Still need a 9 TH, and we roll a 10. No ROF." That's okay, we know the tank isn't doing anything for at least a Player Turn or so.

Well, we've seen how to shoot a lightly armored tank. What would be different if it had been a King Tiger? "Instead of the -1 DRM for all armor being less than or equal to 4, we would have had a +1 because all armor would have been greater than or equal to 8." "But the tank would have been easier to hit in the first place, because it is a Very Large target." Okay, so we would hit it because it's hard to miss. But before we needed to roll a 4 or less on the IFT to even affect the light tank, and against this monster we'd need a 2. And we could try for a Collateral Attack if it was driving around CE. Not great odds, but a light mortar still has the option if you're desperate.

■ I want to take a moment here to talk about Open Topped (OT) AFV. For the most part we treat them exactly like any other AFV, except for the -1 modifier for IFT damage that the chart in C1.55 gives us. But if we were fortunate enough to catch an OT AFV in the woods, where it would suffer Air Bursts (D5.311), its crew would be Vulnerable and get no protection from the vehicle, not even the CE DRM and not even if BU. The crew would take a hit just like Infantry, and would suffer any results from KIA down to PTC. And if they failed a morale check, they'd rout from the vehicle, just like us foot soldiers. Furthermore, such an AFV is treated as unarmored vs our mortar, with our attack against it, but not its crew, treated as if the AFV were a truck—but with no Air Burst TEM.

■ There's one more target type I'd like to mention—Guns. Barring unusual circumstances, a Gun, including a mortar on a 5/8" counter, that is still where it originally set up at the beginning of a scenario is Emplaced (C11.2) with a +2 TEM. Even if a Gun loses its emplacement because it is moved during a scenario, it may still provide some protection for the crew. AT and INF Guns are built with Gunshields (C11.5), which normally offer their crew a +2 DRM through their covered arc. Against Indirect Fire, though, a Gunshield offers only a +1 DRM. Mix that with Airbursts, and a Gun might suddenly regret setting up in Woods.

All mortars can be destroyed like any other SW—either deliberately during any PTPH/DFPH (A9.73), or by IFT (A9.74), OVR (A9.74), and CC (A11.13) results. A mortar on a 5/8" counter, like all Guns, is automatically destroyed and its crew eliminated by any CH (C3.71).

And one last thing. Before you run off and start using Captured mortars from the enemy, there are two things to remember. First, your X#/B# is decreased by two and the original B# is now an X# (A.11). Second, you reduce your ROF by one (A21.12), and add +2 to your TH DR (Case H). These same penalties apply if I ever catch you dogfaces trying to use a 5/8" mortar that should be manned by a trained Crew. And if you have the audacity to try to use a Captured 5/8" mortar, you suffer *both* the penalties. I don't want to stand around you when you're trying that.

■ Well, boys, that's your indoctrination on light mortars and basic Ordnance principles. This lesson doesn't cover every last rule, though. Terrain often has special cases for Indirect Fire, Ordnance, or mortars, and I recommend you look up anything you're unsure of. We've also broached a lot of the rules that are the backbone to understanding Ordnance in Chapter C. There are some more rules you need to master before trying out some of the larger mortars on 5/8" counters. But those rules apply to all other Guns, too, so only the few of you that go on to Advanced Ordnance Training need to concern yourselves with that knowledge. If you master the situations we've talked about here, you'll open up a whole new collection of scenarios that you can participate in.

ADVANCED SEQUENCE OF PLAY (rev.)

As listed in the Advanced Sequence of Play (ASOP), each phase is usually broken down into three main parts (the START, DURING, and END) and several discrete Steps. In each Step Number (e.g., "1.11A"), the player(s) involved is specified as A (ATTACKER), D (DEFENDER), or B (Both). The ASOP lists the official order of actions, even for those whose order is not given elsewhere (e.g., as per Steps 3.21A-3.22A, units that start the MPh berserk must move before non-bersek units); however, inconsequential violations of sequence should be tolerated in

the spirit of good sportsmanship. Should the order of actions given in the body of the rules conflict with the ASOP, the latter takes precedence. All activities in the same Step may be conducted in any order unless stated otherwise. Certain mutually exclusive actions may be listed in the same Step despite the fact that they cannot be conducted by the same unit—and many restrictions normally applicable to the listed actions are left unmentioned; in both cases, the normal rules pertaining to such actions still apply.

† Sniper Attacks/Cheeks are possible during this phase (A14.1; A14.4; E1.72; E1.76; G12.603; G14.261; RB SSR CG8).

1. RALLY PHASE

Only one action (attempt) allowed per unit per RPh [EXC: repairing > one SW/Gun (A9.72); leader rallying > one unit (A10.7)].

1.1 START OF RPh:

1.11A Roll for any provisional (SSR) reinforcements (including Air Support; E7.2). Set up, off-board, all forces due to enter in this Player Turn (A2.51-52 [DD tanks, D16.8; Cloaking, E1.41; Gliders, E8.1; Parachutes, E9.1-11; LC, G1.664/G14.23]).

1.12A Check for Wind Change (B25.65 [Blazing building collapse, B25.66; NVR change, E1.12; Civilian Interrogation, E2.4; Fog level, E3.312; Rain/Falling-Snow intensity, E3.51-53.71; Dust, F11.76-77; Heavy Surf, G13.448; if DYO note also G16.2 footnotes]). During Gusts (B25.651), remove Vehicle Dust (F11.74) and Dispersed SMOKE, then flip remaining SMOKE counters to their Dispersed side [EXC to both: SMOKE in cave; G11.8].

1.13B May Recombine Good Order HS if Good Order leader present, and/or Unarmed/Guard/Finn/Carrier HS without leader (A1.32). May place/remove Animal-Pack counter(s) in initial RPh of Game Turn (G10.3) [Pack-TI; G10.11]. May (un)load Animal-Pack Gun(s) if halfway through (Un)packing Period (G10.31).

1.14B May attempt to Recover SW/Gun(s) in same Location (A4.44; G.5) [Ski-use dr; E4.21].

1.2 DURING RPh:

1.21A May (attempt to) Deploy Good Order squad(s) if Good Order leader present, and/or Unarmed/Guard/s/Finn(s)/Carrier-HS/U.S.M.C.-7-6-8(s) without leader (A1.31; G17.11). Infantry MMC may attempt to Scrounge abandoned vehicle(s) or non-burning wreck(s) (D10.5); place Scrounged and TI markers.

1.22B May attempt to repair SW/Gun(s)/vehicular-armament (A9.72; A13.33; D3.7). May Transfer SW/Gun(s)/Prisoner(s) (A4.431; A13.33; A20.5; D6.31) [Ski-use dr; E4.21].

1.23B May attempt to Rally broken unit(s) (A10.6); those with Commissar-(A25.222)/Japanese-leader-(G1.41) which fail to Rally are Replaced or eliminated. First ATTACKER MMC Rally attempt (or first two; RB SSR CG17) may be Self-Rally/Field-Promotion (A10.63; A18.11).

1.24A Determine final Drop Point for each Para Wing, then place all Sticks (i.e., Parachutes; E9.12) onboard in Aerial Locations.

1.3 END OF RPh:

1.31B Roll for Shocked/UK AFV recuperation (C7.42); remove or flip marker/AFV as appropriate. May/must remove DM markers from eligible broken units (A10.62).

2. PREP FIRE PHASE†

2.1 START OF PFPPh:

2.11A Remove his Dispersed SMOKE (checking for any Napalm terrain-Blaze/weapon-destruction; G17.41); then flip his SMOKE counters to their Dispersed side (A24.4). Leader(s)/MMC/CE-AFV may attempt to fire Starshell(s) (E1.91-921). Check for Vehicle Dust removal (F11.77).

2.12A May fire ordnance-SMOKE-(C8.5-51)/MTR-IR-(E1.91; E1.93-932), after designating Spotter (C9.3) if necessary; resolve ensuing WP NMC. May fire MOL-Projector(s) (O10.2). Check for ensuing Flame(s) (A24.32; O10.44). Place Prep Fire or Gunflash counter(s) as required.

2.13A May attempt Radio Contact (C1.2; G.7) if necessary (C1.63; E12.77). If successful may (must, for FFE/C; C1.34) attempt (Sighting TC [E7.61] and) Battery Access (C1.21; G14.63); if successful may place AR (C1.3) and either SR (C1.3-31) or Pre-Reg. FFE/IR (C1.731/E1.931), or must place rocket AR and FFE (C1.9) or remove or replace FFE/C (C1.34-343; G14.671).

2.14A May (must, for a Creeping Barrage FFE) Correct/Convert or Cancel SR/FFE (C1.33-337; C1.35-4; E12.73-74; E12.76; E12.771) [EXC: rocket Correction is NA; C1.9].

2.15A May place OBA SMOKE-(C1.71; E12.51)/IR-(E1.91; E1.93-932), resolving ensuing WP NMC (C1.71; C3.76; G14.65) and checking for ensuing Flame(s) (A24.32). Then resolve HE FFE (C1.5; C1.52-56; G14.65), checking for shellhole/Flame/rubble creation (B2.1/B6.331/B25.13/B24.11/G13.71), wire/roadblock/pillbox removal (B26.52/B29.5/B30.92/G14.56), minefield/panji removal/reduction (B28.62/G9.72/G14.56), and sangar/trip-flare elimination (F8.41/G.8B). Check for Column Disbandment (E11.533) and Reverse Slopes (G14.66-661).

2.2 DURING PFPPh:

2.21A Infantry MMC may become TI and; Mop Up (A12.153) [Casualties; A12.154], or attempt to entrench (A25.21; B27.11; F.1B; G3.5; G13.82), placing Labor counter if unsuccessful. Infantry may make Kindling Attempt(s) (B25.11; MMC requires leader who passes NTC); place Prep Fire counter on each unit involved.

2.22A May designate Spotter(s) for MTR(s) that had no original Spotter (C9.3). May fire non-Aerial, non-TI Good-Order-unit(s)/manned-and-functioning-weapon(s) [Heavy AA fire; E7.52], placing Prep Fire or Gunflash counter(s) as required; both sides resolve attacks. Infantry/Cavalry may declare Opportunity Fire; place Bounding Fire counter(s) (A7.25). Leader (MMC/CE-AFV, if a Starshell/IR has been fired in no previous Player Turn) may attempt to fire Starshell (E1.921). May destroy/malfunction/dismantle/reassemble SW/Gun(s) (A9.73; A9.8).

2.23A May (un)limber Gun(s) (C10.21); it and crew become TI if unlimbering).

2.3 END OF PFPPh:

2.31A May change CA of Gun(s) presently able to fire without using Intensive Fire (C3.22). May designate/cancel AA mode of weapon(s) that can/dotes) thusly change CA (E7.5).

3. MOVEMENT PHASE†

The MPh Sequence of Play is expressed separately in terms of the MPh and of each moving unit's (or stack's) MPh; i.e., each moving unit has a START, DURING and END to its MPh within the overall context of the MPh—usually followed by the START of another unit's (or stack's) MPh. However, the MPh of all units that start the MPh berserk must be completed before any non-bersek unit may start its MPh, and the MPh of all non-bersek units that start the MPh on the ground (i.e., non-Aerial) must be completed before any Glider/Parachute may start its MPh.

3.1 START OF THE MPh:

3.11A May designate new mortar Spotter for one eliminated or not in Good Order (C9.3).

3.12D Leader(s)/MMC/CE-AFV may attempt to fire Starshell(s) (E1.91-921).

3.13A Place all Gliders, blue-side up (i.e., in Aerial Locations), onboard in their ILH (E8.2).

3.2 START OF ITS MPh:

3.21A Prepare to move any currently berserk unit/stack required to charge (A15.43); then go to Step 3.31A [EXC: if no such berserk unit can charge, go to Step 3.22A].

3.22A Prepare to move any Good-Order/Mobile ground unit/stack [EXC: pinned Infantry; A7.8] not marked with a Prep/Bounding Fire or TI counter (A4.1; D2.1). May drop possession of SW/Gun(s) (A4.43). Best leader may make Freedom of Movement dr if Scenario Defender (E1.21). Make Movement (E1.53-531)/Straying-(E1.53; G2.22; G3.21; G13.83) DR if necessary. Infantry may declare Double Time for two extra MF (A4.5; place CX counter); or Assault Movement (A4.61). Dash (A4.63). Sewer entry (B8.4) or Climbing (B11.41). Infantry/Cavalry may declare Human Wave (A13.62/A25.23/G18.61)—Banrai Charge if Japanese Infantry; G1.5), or Swimming (E6), movement. Dare-Death Infantry may declare berserk status (G18.6). Cavalry (or Wagon) may declare Gallop for 8 (or 4) extra MF unless Cavalry/Horse (or Wagon) is CX (A13.36 or D12.4). Remove vehicle's Motion counter if it will expend MP/ME. Check for Column-(E11.52)/Convoy-(E11.2)/Platoon (D14.2) movement status. Onboard radioless AFV that will use non-Platoon movement takes NTC (D14.23) unless Recalled. Flail tank declares TB creation attempt in minefield hex it will enter (B28.7). Boat/Non-Aground-LC in Heavy Surf makes

any required (un)Beaching DR (G13.442/G13.4423). Crew abandons or enters vehicle (D5.41-42). Lastly, go to Step 3.32A [EXC: if no ground unit can/wishes to declare/conduct any Step 3.32A action, go to Step 3.23A if an Aerial Glider/Parachute exists or to Step 3.5 otherwise].

3.23A Prepare to conduct Glider/Parachute movement: go to Step 3.37D [EXC: if no Aerial Glider exists, go to Step 3.34A].

3.3 DURING ITS MPh:

3.31A Berserk unit charges if so required (A15.43-431; A15.45; G13.491); then go to Step 3.35D.

3.32A May move that non-TI Good-Order/Mobile (or must charge with that voluntarily berserk Dare-Death) ground unit/stack after making any required Sewer dr (B8.41) or Mechanical Reliability (D2.51 [Stall]), Bog Removal (D8.3; G12.211-212) and/or Movement/Straying (E1.53-531; G2.22; G3.21; G13.83) DR. May conduct Infantry OVR (A4.15-152). Infantry may declare Double Time for one extra MF (A4.5; place CX counter), and/or make Manhandling DR (C10.3; E5.2). Pushing unit and Gun/Boat become TI—place Labor counter if unsuccessful. Infantry may place (A23.3) or Set DC (A23.7; roll USF). Personnel (etc., for LC; G12.12) may mount/dismount horse (A13.31) or vehicle (D6.4-5; D12.2; D15.41; G12.4-45; G13.443). Personnel may attempt SW/Gun Recovery (A4.44) [Ski-use dr; E4.21] and/or drop possession of SW/Gun(s)/Prisoner(s) (A4.43; A20.53). May declare attempt to Clear rubble (B24.71), wire (B24.73), mines (B24.74), Set DC (B24.75), roadblock (B24.76), Path (G2.7), Panji Covered-hexide (G9.71), or non-Factory Debris (O1.5). unit becomes TI. May attempt to Clear Flame (B24.72; unit becomes TI—place Labor counter if unsuccessful). May hook up Gun (C10.11); it, Personnel and vehicle become TI. May unhook Gun (C10.12; it and Infantry become TI). May attempt to place SMOKE Grenades (A24.1; F.10) or use Smoke Dispenser (D13); resolve ensuing WP NMC (A24.31) and check for ensuing Flame (A24.32). Japanese Infantry squad/HS within 8 MF and in LOS of enemy AFV may attempt to create T-H Hero (G1.421 [DC Hero; G1.424]). Cavalry may declare Gallop (for 4 extra MF) unless Horse is CX (A13.36), and may declare Charge while ≥ 3 hexes from and in LOS of target (A13.6; resolve in target Location). Make Bog DR as required (D8.2-23). Recalled vehicle must attempt to exit (D5.341; G14.232 [EXC: G14.33]). Vehicle may use Bounding First Fire (C5.3; C8.6; D3.7; D7.1; E7.51-512; G12.5). Vehicle may declare Wreck Removal (D10.42), attempt ESB-(D2.5)/HD-Maneuver-(D4.22), and/or place or remove CE counter (D5.33). May conduct Armored Assault (D9.31). Wagon/Motorcycle resolves any required Wreck Check dr (D12.4/D15.46). Units using Impulse movement expend MF/MP in their Impulse before receiving First Fire. Check for "??" loss (A12.14-15; A12.23; A12.33; A12.41-42) and Column Disbandment (E11.531). Infantry resolves any required Lost dr (B8.41), Falling DR (B11.4) or Swimming TC/MC (E6.1/E6.21/E6.5). Place appropriate Climb counter for Infantry that successfully ascends or descends (B11.41). Resolve Panji MC (G9.41). May don/remove Skis (E4.2). Check for creation of Vehicle Dust (F11.74-741). DD tank may drop screens (D16.11). May (un)Beach Boat/LC (E5.23/G12.3). LC might run Aground (G12.21; G13.446). Check for Swamping (G13.4222) and/or Heavy-Surf Swamping/Immobilization/(un)Beaching/Broaching (G13.44-4423). Infantry/Cavalry Wading in Heavy Surf become CX (G13.447). Lastly, go to Step 3.35D.

3.33A Aerial Glider takes Evasive Action if necessary (E8.21); then go to Step 3.37D.

3.34A All Aerial Parachutes drift (E9.2); then go to Step 3.38D [EXC: if no Aerial Parachute exists, go to Step 3.5].

3.35D During Steps 3.31/3.32 resolve, vs moving ground unit/stack (only), each Residual FP (A8.22; A9.22), FFE (A24.31; C1.51-53; C1.55-56; C1.72; C1.9; G12.5; G14.65-661) and/or minefield (B28.41-412; B28.42-52; B28.531; G14.53) attack as it occurs. Leader(s) (MMC/CE-AFV, if a Starshell/IR has been fired in no previous Player Turn) may attempt to fire Starshell(s) (E1.921). Check for Column-Disbandment-(E11.532)/trip-flare-activation-(G.8). Lastly, go to Step 3.36D.

3.36D During Steps 3.31/3.32, may conduct First-Fire-(A8.1)/Subsequent-First-Fire-(A8.3)/FPF-(A8.31) vs moving ground unit/stack [Snap Shot, A8.15; Fire Lane, A9.22; Thrown DC, A23.6; Reaction Fire, D7.2; Sighting TC and FB/DB Ground Support, E7.3-4/G17.4-42]. Place Residual FP (A8.2; A9.22; G11.821). First/Final/Intensive/No Fire or Gunflash counter(s) as required. Place MOL-Projector Smoke and check for any ensuing Flame (O10.44-45). Japanese squad/HS in CC Reaction Fire position may attempt to create T-H Hero (G1.421). DEFENDER vehicle may attempt Motion-(D2.401)/Smoke-Dispenser-use-(D13.2). ATTACKER may conduct Light AA fire (E7.51) vs attacking FB/DB, placing AA/Prep-/Bounding-Fire or Gunflash counter(s) as required (E7.5). Check for Column Disbandment (E11.532). Lastly, go to Step 3.41A.

3.37D May conduct Light AA First/Subsequent-First Fire vs Aerial Glider (E7.51-512, E8.21-211), placing AA/First-/Final-Fire/Gunflash counter(s) as required; then go to Step 3.33A (or to Step 3.42A if no Light AA fire occurred).

3.38D May conduct First/Subsequent-First Fire vs all Aerial Parachutes (Small-Arms/Light-AA only; E9.3-33; E7.5-5121), placing AA/First-/Final-Fire/Gunflash counter(s) as required; then go to Step 3.43A.

3.4 END OF ITS MPh:

3.41A Non-Bypassing Good Order Infantry/Cavalry may Search (A12.152; G.8; G.8C; G1.63) [Casualties; A12.154], becomes TI—Defensive-First/Subsequent-First/EPF allowed. Broken Infantry in Bypass enter that obstacle (A4.32). Sewer unit/stack makes emergence dr (B8.42). Unarmed unit(s) may attempt to Scrounge Small Arms (A20.552; G17.14). Place Motion counter on qualifying vehicle(s) (D2.4; F.11) or expend Stop MP. Place CC counter if necessary. Lastly, go to Step 3.21A.

3.42A Glider lands (E8.211 [Landing DR, E8.22; Crash dr, E8.23]); then go to Step 3.23A.

3.43A All non-German 1/4 Parachutes move one hex; all Parachutes then land, and all 1/2 Parachutes are flipped over (E9.4; [NMC/NTC, E9.42]); then go to Step 3.5.

3.5 END OF THE MPh:

3.51A Each vehicle unable to leave, and each Glider/Parachute that landed in, terrain Blaze Location is eliminated (B25.4; E8.232; E9.421). Resolve Wreck Removal (D10.42). Air-Dropped pre-1942 German MMC may attempt to locate arms canisters (E9.7).

3.52A Berserk unit(s) with no Known enemy in LOS return(s) to Good Order (A15.46).

3.53B Remove all Residual FP (A8.2; A9.22) and 1/2 SMOKE (A24.11 [EXC: G11.85]) counters.

4. DEFENSIVE FIRE PHASE†

4.1 START OF DFPh:

4.11D May fire ordnance Dispersed-SMOKE-(C8.5/MTR-IR-(E1.91; E1.93-932). Resolve ensuing WP NMC. May fire MOL-Projector(s) (O10.2). Check for ensuing Flame(s) (A24.32; O10.44). Place Final/Intensive/No Fire or Gunflash counter(s) as required.

4.12D May attempt Radio Contact (C1.2; G.7) if necessary (C1.63; E12.77). If successful may (must, for FFE/C; C1.34) attempt (Sighting TC [E7.61] and) Battery Access (C1.21; G14.63); if successful may place AR (C1.3) and either SR (C1.3-31) or Pre-Reg. FFE/IR (C1.731/E1.931), or must place rocket AR and FFE (C1.9) or remove or replace FFE/C (C1.34-343; G14.671).

4.13D May (must, for Creeping Barrage recorded as "FFE:1"; E12.734) Correct/Convert or Cancel SR/FFE (C1.33-337; C1.35-4; E12.74; E12.771) [EXC: any such action of Creeping Barrage recorded as "FFE:1" is NA; rocket Correction is NA (C1.9)].

4.14D May place OBA Dispersed-SMOKE-(C1.71; E12.51)/IR-(E1.91; E1.93-932), resolving ensuing WP NMC (C1.71; C3.76; G14.65) and checking for ensuing Flame(s) (A24.32). Then resolve HE FFE (C1.5; C1.52-56; G14.65), checking for shellhole/Flame/rubble creation (B2.1/B6.331/B25.13/B24.11/G13.71), wire/roadblock/pillbox removal (B26.52/B29.5/B30.92/G14.56), minefield/panji removal/reduction (B28.62/G9.72/G14.56), and sangar/trip-flare elimination (F8.41/G.8B). Check for Column Disbandment (E11.533) and Reverse Slopes (G14.66-661).

4.2 DURING DFPh:

4.21D May designate Spotter(s) for MTR(s) that had no original Spotter (C9.3). May fire unit(s) *not* marked with First or Final Fire counter (Heavy AA fire; E7.52), and/or any marked with First Fire counter (as Final Fire at adjacent/same-hex target; A8.4), placing AA/Final-Intensive-/No-Fire or Gunflash counter(s) as required; both sides resolve such attacks. Leader(s) (MMC-/CE-AFV, if a Starshell/IR has been fired in *no* previous Player Turn) may attempt to fire Starshell(s) (E1.921). May conduct FB/DB Sighting TC (E7.3) and Ground Support (E7.4; G17.4-42); ATTACKER may conduct Light AA fire (E7.51-.512), placing AA/Prep-/Bounding- Fire (E7.5) or Gunflash counter(s) as required. May attempt to Clear Flame(s) (B24.72-.721; unit becomes TI—place Labor counter if unsuccessful). Check for Column Disbandment (E11.533). May destroy/malfunction/dismantle/reassemble SW/Gun(s) (A9.73; A9.8).

4.22D May (un)limber Gun(s) (C10.21; it and crew become TI if unlimbering).

4.3 END OF DFPh:

4.31D May change CA of Gun(s) presently able to fire without using Intensive Fire (C3.22). May designate/cancel AA mode of weapon(s) that can(dot)s thusly change CA (E7.5).

4.32D In daytime scenario, remove all First and Final Fire counters (A3.4; E1.8).

5. ADVANCING FIRE PHASE†

5.1 START of AFPh:

5.11B During Mild Breeze, place Drifting (i.e., gray) Dispersed SMOKE downwind of each Blaze, and of each white SMOKE, counter that has none (A24.61) [EXC: NA in cave; G11.851].

5.12A May fire ordnance Dispersed WP (C8.6); resolve ensuing NMC (A24.31) and check for ensuing Flame (A24.32).

5.13A During Gusts (B25.651), remove Dispersed SMOKE, then flip remaining SMOKE counters to Dispersed side [EXC to both: NA in cave; G11.8].

5.2 DURING AFPh:

5.21A Place all Glider contents [EXC: vehicle/Gun and its PRC/crew] onboard (E8.4).

5.22A All unbroken ground (or sewer; B8.43) units/weapons not marked with Prep/Bounding/Intensive/No Fire or TI counter may fire, using halved FP for non-ordnance [EXC: DC; Non-Motion FT; Opportunity Fire (A7.25)]; qualified squad(s) may use Assault Fire (A7.36); ordnance uses TH Case(s) B/C [EXC: Case B NA for Opportunity Fire; C5.2]. May (un)limber Gun(s) (C10.21); it and crew become TI if unlimbering. Resolve Placed DC attack(s) (A23.4; C7.346).

5.23A Each berserk unit that eliminated all Known enemy units (at least one) in its Location with halved TPBF returns to Good Order (A15.46).

5.3 END of AFPh:

5.31B Resolve Blaze Spread (B25.6; B25.651) every Player Turn *after* initial appearance.

5.32B Resolve Flame-to-Blaze Spread for each unflamed Flame (B25.15-.151).

5.33B Remove all Prep Fire, Intensive Fire, No Fire and Bounding Fire counters. If night scenario, also remove all First Fire, Final Fire and Gunflash counters (E1.8).

6. ROUT PHASE

ATTACKER first, then DEFENDER (A3.6).

6.1 START of RPh:

6.11B Unit(s) may Voluntarily Break (A10.41). Place DM counter on each non-DM unit/stack that must rout (A10.62).

6.12B Disrupted unit(s) in/ADJACENT-to enemy Infantry/Cavalry Location (might) Surrender (A19.12) [Interrogation; E2.1].

6.2 DURING RPh:

6.21B Conduct all routs (A10.5-.52; A19.12; E1.54; G14.41); leader(s) may accompany routing unit(s) (A10.711). Routing unit(s) may not/remove Skis (E4.2). Broken Infantry in/ADJACENT-to Known enemy Infantry/Cavalry might Surrender (A20.21/A20.3) [Interrogation; E2.1]. Check for Failure-to-Rout elimination (A10.5; A20.21). Resolve Interdiction-(A10.53)/Panji-(G9.41) MC [EXC: if using Low Crawl], and check for trip-flare activation (G.8); as enemy unit/stack routs. Resolve, vs routing unit/stack only, each FFE-(C1.51-.53 [C1.71-.72; C1.9; E12.5; G14.65-.661]/minfield-(B28.41-.413) attack as it occurs. Check for Column Disbandment (E11.532).

6.3 END of RPh:

6.31B Eliminate all Infantry unable to leave terrain Blaze Location(s) (B25.4).

7. ADVANCE PHASE

7.1 START of APh:

7.11A May Transfer SW/Gun(s)/Prisoner(s) (A4.431; A20.5) [Ski-use dr; E4.21].

7.12A Japanese Infantry squad/HS ADJACENT to enemy AFV may attempt to create T-H Hero (G1.421).

7.13A Boat/Non-Aground-LC in Heavy Surf makes any required (un)Beaching DR (G13.442-/G13.4423).

7.2 DURING APh:

7.21A Good Order Infantry not pinned or TI may advance (A4.7 [PAATC, A11.6; vs Difficult Terrain = CX/Panji-MC, A4.72/G9.41]). Climbing unit(s) may exchange Climb counter for CX counter if at proper level (B11.432). May not/remove Skis (E4.2). May place/remove CE counter(s) (D5.33). Sewer unit(s) may emerge (if allowed; B8.42) or advance into CC with adjacent sewer unit(s) (B8.44). Check for trip-flare activation (G.8).

7.22A Boat(s)/Amphibian(s)/Swimmer(s) might drift in Moderate/Heavy Current (B21.121-/E5.23/E6.2); check for OCEAN drift in Heavy Surf (G13.444) [EXC to all: Pier; G13.734].

7.23D Boat(s)/Amphibian(s)/Swimmer(s) might drift in Heavy Current (B21.121/E5.23/E6.2) [EXC: Pier; G13.734].

7.24A May (un)Beach Boat(s) (E5.23). Boat/Non-Aground-LC in Heavy Surf makes any required (un)Beaching DR (G13.442/G13.4423).

7.25B During Steps 7.21-.24 resolve, vs advancing/drifted unit/stack (only), each FFE-(C1.51-.53 [C1.71-.72; C1.9; E12.5; G14.65-.661]/minfield-(B28.41-.412; G14.53) attack as it occurs. Check for Column Disbandment (E11.532).

7.26A All $\frac{1}{8}$ Parachutes onboard are removed and replaced by their contents (E9.6).

8. CLOSE COMBAT PHASE

Perform all Steps listed under "... LOCATION'S CCPh" in any one CC/Melee Location first, then in the next such Location, etc.

8.1 START of LOCATION'S CCPh:

8.11B Place onboard beneath a "?" all hidden items, then reveal Strength Factors of all concealed units (eliminating Dummies) (A11.19).

8.12B Resolve Ambush if *advance* into CC (not Melee) was into woods/building/jungle/bamboo/kunai (A11.4; G.6) and/or by/with "?" (automatic ATTACKER Ambush for Street Fighting; A11.8) [night Ambush dr; E1.77].

8.13D Japanese Infantry squad/HS in same Location with enemy AFV may attempt to create T-H Hero (G1.421).

8.14B Check for Sequential CC if vehicle(s)/Ambush/Prisoner(s) involved (A11.3); Prisoner(s) of broken Guard(s) may declare escape attempt(s) (A20.55). Infantry may declare attempt to capture escorted Abandoned vehicle(s) (A21.2).

8.15B May (must, if non-Disrupted/non-Guard broken Infantry; A11.16) declare Withdrawal(s) from *Melee* (ATTACKER first; A11.2), dropping possession of any SW/Gun(s) that would prevent Withdrawal (A4.43).

8.16B Declare each SMC's solo status or pair it with another SMC or MMC (A11.14)—ATTACKER first (A11.12).

8.2 DURING LOCATION'S CCPh:

8.21B Declare first/next sequential CC attack (A11.3-.34)—or, ATTACKER first (A11.12; G13.495), all simultaneous CC attacks if no sequential CC exists. Declare if Hand-to-Hand (G1.64; G18.62; J2.31; SSR *RB11*) and/or Capture attempt (A11.52; A20.22). Reveal (A12.31) all units declared to be making/directing a CC attack (A11.19).

8.22B '44-'45 German(s), or Japanese T-H Hero(es), may make ATMM dr (C13.7; G1.4231).

8.23B Japanese Personnel may attempt/commit Hara-Kiri (G1.641) vs CC Capture attempt.

8.24B Resolve that sequential CC attack, or all simultaneous CC attacks if no sequential CC exists. Successfully withdrawing unit(s) enter(s) *Advanced Location(s)* (A11.21-.22); resolve, vs Withdrawing unit/stack (only), each FFE-(C1.51-.53 [C1.71-.72; C1.9; E12.5; G14.65-.661]/minfield-(B28.41-.412) attack as it occurs, and check for Column-Disbandment-(E11.533)/trip-flare-activation-(G.8)/Panji-MC-(G9.41). Berserk unit(s) that eliminated all Known enemy units (at least one) in Location return(s) to Good Order (A15.46). Lastly, go to Step 8.21B if further sequential CC can be declared.

8.25B May Interrogate new Prisoner(s) (E2.1; G1.621; G18.71).

8.3 END of LOCATION'S CCPh:

8.31B Automatic capture of unescorted abandoned vehicle(s) (A11.7). Flip/remove CC, or retain/remove Melee counter as appropriate. Dare-Death Infantry remain berserk only if in Melee (G18.6).

8.4 END of CCPh:

8.41B Declare and resolve (sequentially; ATTACKER first) all Aerial Combat (E7.22-.226).

8.42B Resolve all non-Flame Clearance attempts (B24.7; B28.7; G2.7; G9.71; O1.5); place Labor counter if unsuccessful (B24.8). Eliminate all Recovered tunnel entrances (B8.61).

8.43B Remove all TI [EXC: Ammo Replenishment (E10.3); Animal-Pack (G10.11)] and Pin counters. Flip each Stun counter to its +1 side (D5.34) [EXC: cumulative Stuns (G12.111; G14.33)]. Check for Ammo Replenishment (E10.3).

8.44A Place a "?" on his qualifying non-concealed, Good Order unit(s) or stack(s) (A12.12-.122; E1.32; E3.712; F11.601; G1.63; *RB* SSR CG15).

8.45B If night, remove all Starshells (E1.923) and IR (E1.933), and all Acquisition not Illuminated by Blaze/Flame (E1.74).

PRE-GAME SEQUENCE

Follow in the order given. Not all will apply to every scenario. Items pertinent only to a DYO scenario are indented. Should the order of actions given in the body of the rules conflict with this Sequence, the latter takes precedence *except* in the case of a CG Refit Phase.

- Determine who will play each side.
- Set up mapboard(s), and overlay(s) if any [EXC: if a DYO scenario, do not set up OCEAN overlays yet; G13.91].
- Agree upon which (if any) optional/house rules will be in effect (A16, B10.211, C13.311, E1-E2, E4-E12, F.11, footnote A18/C5/C9, Incremental IFT, etc.).
 - Determine Weather (E3 Temperate, F11.2 Arid, G16.2 Tropical, or O11.618 *RB*, Chart).
- Ascertain Stream/River depth (B20.4/B21.122) and River current (B21.121); see also B16.6 (G16.2, if DYO).
 - Check to see if a Reef exists (G13.91).
 - Determine Beach Slope (G13.92), if applicable.
 - Determine Beach Width (G13.93), if applicable.
 - Check for purchase-restrictions/BPV-alterations (G1.66-.664; G11.99; G12.9; G14.261-.262; G14.6; G14.69; G14.74; G15.3; G17.15-.152; G18.8-.831).
 - Make DYO purchases (H1) [E1.23/E1.76/E3.712/E3.741/E4.1/E5.1/E7.1/E7.6/E8.11/E9.1-/E10.11/E10.6/E12.7/F.7/F.7B/F.8-.8B/F8.2/G.8D/G1.66-.664/G9.13/G11.99/G12.9/G14.261-.262/G14.58/G14.69/G14.74/G15.3/G17.15-.152/G18.8-.831].
 - Calculate Battlefield Integrity Base (A16.1; G14.24).
- Choose Commissar(s) if/as allowed (A25.22; G18.31; O11.6206).
- Ascertain the special limitations/capabilities of all units and Guns (see National Capabilities Chart and pertinent Vehicle/Ordnance Listing/Notes).
- Assign armor leaders (D3.41).
 - Set up all OCEAN overlays (G13.95).
- Check for the presence of all other terrain changes/conditions, and implement if/as required.
- Assemble all OBA Draw Piles (C1.211; G14.63).
- Record all Pre-Registered hexes (C1.73; E12.71). Offboard Observer hexes (C1.63) [EXC: Aerial (E7.61); Shipboard (G14.68)], Barrage Blast-Area hexes (E12.2), and Aiming Hexes (E12.71).
- Record the Drop Point of each paratrooper Wing (E9.12).
 - Determine Time of Day (F11.2), if applicable.
 - Determine Base NVR and Cloud Cover if applicable (E1.11; see also E1.15/E3.5/E3.71).
 - Determine EC (B25.5, F11.4, G16.3, or O11.618; see also E3.3, E3.4, E3.6, E3.713, E3.72, E3.73, E3.74, and/or F11.6111).
- First side (or the side "defending the beach"; G13.95) commences setup.
- ‡ Deploy squad(s) if/as allowed (A2.9; A5.5; A25.2; A25.61; A25.7; G14.311; G17.11; G18.2).
- ‡ Ascertain setup limitations (A2.9 [Offboard: A2.51; dm SW, A9.8]; Half-Hexes, A2.3; Stacking, A5.1, G2.2, G3.1; "?", A12.12; Crest, B20.91; HD, D4.221; Guns, B23.93, B30.111, C2.7; Motion, A2.52, D2.4; Seaborne Assaults, G14.21, G14.23; Reserves, O11.6194b; see also the rules for specific Fortification types).
- ‡ Employ HIP if/as allowed (A12.3) [HS Equiv., A5.5; Fortifications, A12.33, E1.16, G.2; Emplaced Guns, A12.34, G3.4; Mines, B28.1 [Daisy Chain, B28.531, G1.613; Half-Hexes, A2.3; as Beach Obstacles, G14.501]; Field Phones, C1.23; Scenario Defender, E1.2; Trip Flares (G.8); Japanese, G1.631-.32 [T-H Hero, G1.422; A-T Set DC, G1.6121]; CCSS, G11.32-.321].
- Scenario Defender records all allowed Bore Sighting (C6.41-.42) [EXC: NA in *RB*; SSR CG5].
- ‡ Attempt any HD Maneuver(s) (D4.22-.221).
- ‡ Note special DD-tank/amphibian setup abilities (D16.8).
- Scenario Defender places No Move counters (E1.21).
- ‡ Scenario Attacker employs Cloaking (E1.4-.411) [EXC: either/both side(s) in *RB*; O11.6194b].
- ‡ Record Dare-Death squads if Chinese side (G18.6).
- First side (or the side "defending the beach"; G13.95) completes setup.
- Scenario Attacker makes one Recon dr if allowed (E1.23).
 - Make all allowed DYO UDT dr (G13.96; G14.561).
 - Determine Tide (see G13.97), if applicable.
 - Determine Surf (G13.98; see also G13.448), if applicable.
- Second side commences setup (also repeat all steps above marked with "‡").
- Second side completes setup.
- Record all allowed NOBA Ocean hexes (G14.62).
- Make all allowed *non-DYO* UDT dr (G14.561).
 - Determine Wind Force (B25.63, F11.5, G16.4 [see also G13.448], or O11.6241) and Direction (B25.64).
 - Determine Fog Level (E3.31) and Density (E3.311), if applicable.
 - Determine Dust Density (F11.701; F11.77), if applicable.
- As determined by LOS/range, reveal hidden Fortifications (A12.33) [EXC: E1.16; G.2], then place "?" if/as allowed (A12.12).
- Set up Sniper counters (DEFENDER first) (A14.2; *RB* SSR CG8).
- Conduct all allowed Bombardments (C1.8-.823 or G14.7-.73).
- Scenario Attacker determines Creeping-Barrage Timing (E12.72) if applicable, then conducts (E12.72-.74) all "pre-Game Turns" if/as required.
- Begin RPh of initial Player Turn.

O

O. RED BARRICADES

ORDER OF PRESENTATION:

- | | |
|----------------------------------|---------------------------|
| 1. Debris | 7. Culvert |
| 2. Railway Embankment | 8. Gully Entrance Hexside |
| 3. Printed Rubble | 9. Storage Tanks |
| 4. Single-Hex Two-Story Building | 10. MOL-Projector |
| 5. RB Factories | 11. RB Campaign Games |
| 6. RB Cellars | |

[Rules O.1-O.8 are clarifications of Chapter A-D rules. As such, they apply to the rest of the ASL system as well as to RB.]

O.1 ROAD-NEGATING TERRAIN (B3.4; B24.121): Infantry may not claim the extra-MF road bonus during a MPH in which they expend extra MF to derive the protection of shellholes/woods—nor may they claim it if they choose the non-Open-Ground cover of an orchard in preference to the Open Ground of a road. A road covered by rubble/debris is treated as non-existent [EXC: for Street Fighting (A11.8) purposes; if Cleared (B24.71)]. Therefore, Dash (A4.63), road bonus (B3.4) and the ½-MP road rate are not allowed in a road hex covered by rubble or debris except via TB.

O.2 SEWERS & FORTIFIED BUILDINGS (B8.44 & B23.922): A unit may not exit a sewer to enter a Fortified Building Location if it could not enter that Location from outside the sewer. A sewer Location may never be Overstacked.

O.2A TUNNELS & FORTIFIED BUILDINGS (B8.61 & B23.922): Only a unit of the side that constructed a tunnel may use that tunnel to enter a Fortified Building Location and may do so even if that Location is enemy-occupied.

O.2B WALL ADVANTAGE & FORTIFIED BUILDINGS (B9.32 & B23.93): A Gun in a Fortified Building (or Pillbox) Location may never claim Wall Advantage. Its manning Infantry could claim it only by first dropping possession of the Gun. Such a Gun can, however, have a LOS to non-adjacent same-level Locations over the wall hexside(s).

O.3 GULLIES & RUBBLE (B19. & B24.2): A combination gully-rubble hex is a LOS obstacle at both its Crest and Depression levels [EXC: rubble bridge; B6.331], but only to same-level LOS. A unit IN such a hex must expend four MF to enter Crest status in that hex (B20.91). A Crest unit in such a hex always receives rubble TEM—not entrenchment benefits. All other Crest rules apply unchanged.

O.3A GULLIES & SHELLHOLES (B19. & B2.4): Shellholes occur only IN a Depression—not at its Crest level. The MF cost to enter a gully-shellhole Location is as per B19.4.

EX: A squad IN CC3 may move INTO the BB3 gully-shellhole Location at a cost of two MF, or three MF if also using the shellhole TEM. It may continue movement into AA3 at a cost of two MF (Open Ground) or three MF (if using the shellhole TEM).

O.4 FACTORY MOVEMENT (B23.742): A vehicle that changes its VCA in any Factory Location is subject to Bog. A vehicle that becomes Immobile in a Vehicular-Sized Entrance (5.2; B23.742) does not negate Entrance benefits. Any unit may use the Open Ground entrance benefits of a Vehicular-Sized-Entrance—but only when entering it from outside that Factory and not if that Entrance is Roofless (see 5.42). Such use of OG entrance benefits does not negate that hex's Factory TEM.

O.4A FACTORY TEM/HINDRANCE (B23.741): Normal building TEM (usually +3) applies to Indirect Fire vs a non-Rooftop Factory Location (unless Roofless; 5.45). The extra +1 TEM for a Fortified Factory Location does not apply vs Indirect Fire. For Sniper Target Selection (A14.21) a unit in a stone Factory is considered to have a +3 TEM (+2 TEM if wooden). Factory Hindrance is a half-level LOS Hindrance. See also 5.41.

O.4B FACTORY ROOFTOP ACCESS POINTS (B23.742 & B23.8): Aside from Scaling (B23.424), a Factory Rooftop can be reached from ground level only via a non-rubbed, non-roofless (5.4) Factory Rooftop Access Point; i.e., a printed stairwell or a Location of the Factory that contains a road hexside.¹ A Factory that contains neither of these Rooftop Access Points must have at least one such Point designated by SSR if its Rooftop is to be usable.² The ground and Rooftop levels of a Factory Rooftop Access Point hex are ADJACENT (see the entry for "Squad K" in the EX at the top of page O4); intermediate vertical levels do not exist [EXC: for MF-expenditure, LOF and Residual-FP purposes; see O.4C]. Infantry expend two MF (for a 1½-level Factory) or three MF (for a 2½-level Factory) to ascend to the Rooftop or vice-versa.

O.4C ATTACK EFFECTS (B23.8): Infantry changing levels via a Factory Rooftop Access Point may be attacked at ground level (if descending) and/or Rooftop level (if ascending) in the normal manner. However, they may also be attacked at the first-level (and/or second-level if a 2½-level Factory) "quasi-Location" of that hex by a unit that has a LOS to that quasi-Location. Such a quasi-Location is not considered Open Ground, but such an attack vs it receives no TEM [EXC: non-Fortified building TEM applies if firing from outside the Factory] and neither Factory nor debris Hindrance DRM. The target is assumed to expend one MF per level changed; if pinned or broken while at that quasi-Location it reverts to the level it was attempting to leave (and may be attacked by any Residual FP at that level as it re-enters it). The Residual FP left by an attack vs such a quasi-Location remains at that level (place the Residual FP counter on the appropriate Level counter) to attack each unit subsequently entering that level in that hex during the same MPH.

A unit at rooftop level in a Factory Rooftop Access Point hex being attacked by a same-hex ground-level unit receives the Height Advantage +1 TEM (B23.81), while the ground-level unit receives Factory TEM (and no additional TEM for a Fortified Building Location) if attacked by that Rooftop unit. Both units may use PBF (since they are ADJACENT; A7.21).

O.5 ROOFTOPS (B23.82): A Rooftop Location is Concealment Terrain only for setup purposes. Once the first RPH has been completed B23.82 comes into effect. A Rooftop Location is not considered a building Location for rout and Victory Condition purposes. A Gun may never be Emplaced (C11.2) on a Rooftop.

O.6 RUBBLE & SEWERS (B24.4): Entrance/exit of a sewer through a rubbled Manhole Location is allowed if the Manhole is in a road hex that can be crossed (not just entered) along the road via a full TB.

O.7 ARMORED CUPOLA (D9.5): Since it is treated as an Immobile tank, CC vs an armored cupola requires the use of PAATC and CCV in the normal manner. An armored cupola set up directly behind a wall/hedge is always assumed to have Wall Advantage over those hexsides (even if set up after an enemy unit that is ADJACENT to it across such a hexside(s)) unless it is Abandoned or its Inherent crew is stunned/shocked. If an armored cupola is set up using HIP, it is revealed when an enemy unit enters its Location (or attempts to claim Wall Advantage while ADJACENT to it). If this occurs in the APH, the entering unit must immediately take a PAATC (if normally required to do so), failure of which Pins it in the armored cupola's Location. An Armored Cupola may also be placed in shellhole or debris terrain. An armored cupola, if considered a Dug-In tank, can become a burning wreck.

O.8 ENTRENCHMENTS (B27.): A trench (including an A-T Ditch) may not occupy the same Location as a foxhole.

1. DEBRIS

1.1 Debris³ (EX: hex K3) is Inherent Terrain (B.6) [EXC: if in a Factory; 5.41] and also Concealment Terrain (A12.12). It has a +1 TEM and is a Half-level LOS Hindrance (both of which are cumulative with Factory TEM/Hindrance [EXC: see 5.41]). Debris may not be Kindled, nor may a Blaze spread to it; however, debris in a Roofless Factory Hex (EX: S13) can catch Fire along with the building Location (which may still be Kindled in the normal manner [EXC: Gutted; 5.51]). Debris may not be created during play.

1.2 MF/MP: Infantry must expend one MF+COT to enter a debris Location. The only vehicle type that may enter debris is a fully-tracked AFV, which does so by expending ¼ (FRU) of its MP allotment and taking a Bog Check with a +1 DRM (and an additional +1 Bog DRM for entry of a Factory Location if applicable) [EXC to all: if Bypassing a Factory debris Location; 5.42]. Dash (A4.63), road bonus (B3.4) and the ½-MP road rate are NA in a road hex covered by debris except via a TB (O.1).

1.3 FORTIFICATIONS: A Fortification may exist in a debris Location unless other terrain/Fortification(s) therein prohibit it.

EX: Debris hex K3 may contain Wire/Mines/Entrenchments/Pillbox. Debris-road hex D15 may

1.3

contain Wire/Roadblock/Pillbox/non-hidden Mines. Interior Factory debris hex R12 may contain no Fortifications—but could be designated as a Fortified Building Location.

1.4 RUBBLE: Rubble created in, or falling (B24.12) into, any debris Location turns it into a Rubble (not debris) Location.

1.5 CLEARANCE: Debris may be Cleared [EXC: Factory debris; 5.41] as if the Location were Fallen rubble (3.2; B24.71). However, debris may not be totally Cleared from a hex contrary to the last sentence of B24.71.

1.6 MANHOLES: A printed/inherent Manhole in a debris Location is usable.

1.7 AERIAL: There is a +1 DRM to a Sighting TC vs a unit in debris [EXC: if in a Roofless Factory Hex; 5.47].

1.8 CA CHANGE: The Case A TH DRM (C5.11) is not doubled for being in debris [EXC: if also in a Factory Location; 5.41].

2. RAILWAY EMBANKMENT

2.1 EFFECTS: A Railway Embankment⁴ (EX: hexesides E2-F1 and E2-E3) represents slightly elevated railroad tracks. Each hexside (including vertices) crossed by the gray and black railway depiction—but not the depiction itself (i.e., not the artwork)—is treated exactly like a wall for all purposes [EXC: all types of units may cross it at a cost of one MF/MP plus COT with no Bog DR required due to crossing the Railway Embankment hexside].

EX: Across hexside D2-E3, a unit in D2 has LOS to the ground level of hexes F2, F3, F4, E3, and E4.

2.2 ROADBLOCK: A roadblock may not be placed along a Railway Embankment hexside.

2.3 STRAYING: A unit/stack that wishes to "follow" a railway embankment by moving in hexes having contiguous railway embankment hexsides is exempt from making a Movement DR in the same manner as if on/ADJACENT-to a road, path, etc. (E1.531).

3. PRINTED RUBBLE

3.1 The *RB* map depicts numerous printed rubble Locations (EX: hex R42 contains printed stone rubble; hex R43 contains printed wooden rubble), all of which are treated exactly as if a corresponding rubble counter were in that Location [EXC: 3.2]. Ignore small portions of the artwork extending across a hexside into an adjacent non-rubble Location; the presence of these fragments serves only to reinforce the fact that, as Inherent Terrain, rubble blocks all same-level LOS traced along the rubble hexside.

3.2 CLEARANCE: For Clearance purposes (B24.71), the only printed rubble that is considered Fallen is that which lies in a road or gully Location. Furthermore, the last sentence of B24.71 is negated for all *RB* scenarios.

3.3 CELLARS: Printed rubble Locations never have a *RB* Cellar Location "beneath" them (6.6).

4. SINGLE-HEX TWO-STORY BUILDING

4.1 A building with a large white center dot (EX: hex I6) is a 1½ level LOS obstacle with both a ground- and first-level Location and an Inherent stairwell. Like a Single Story House (B23.21) it has no Rooftop Location. In all other respects it is a normal building.

5. RED BARRICADES FACTORIES

5.1 Each building on the *RB* map that has ≥ one road entering it is a Factory. No others are Factories. Normal Factory rules apply to all *RB* Factories except as amended below.

EX: Building O40 is a Factory due to having a road enter it in hex O41. Building L27 is a Factory due to having roads enter it in hexes M27 and M29.

5.2 VEHICULAR-SIZED ENTRANCE: A non-rubbled *RB* Factory Location that has a road entering it (EX: hex M29) is considered a Vehicular-Sized Entrance (B23.742; see also O.4-4C).

O

5.3 FACTORY INTERIOR WALLS: A thick black bar covering a hexside (EX: K12-L13) or partial hexside (EX: J13-K13) in the interior of some RB Factories represents a massive interior wall similar to the black-bar hexside of a Rowhouse (B23.71). It is considered to extend from the Base Level of the Location to the underside of the roof (even if the roof itself does not exist).

EX: The Factory Interior Walls of a 1½-level Factory are 1½ levels high, even where no roof exists.

5.31 LOS: The black-bar depiction, as well as the hexside itself (inclusive of vertices) lying *within* the building depiction, represents the Factory Interior Wall and blocks all LOS along/through it unless the viewing/viewed unit is at a level $\geq$ the top of that Interior Factory Wall [EXC: Breach, 5.33; if Rubbled, 5.34]. In a Roofless Factory one or more hexes directly "behind" such a black bar can also be Blind Hexes to higher-level LOS.

EX: See the illustration at the top of page O4. At ground level, LOS from K15 to L16 and from L15 to K17 is blocked by the black bar along the L15-K16 hexside. However, ground-level LOS from J18 to K20 does exist since the black bar does not cover the J18-J19-K19 vertex. See entries for "Squad A", "Squad C" and "Squad F" in the this EX.

5.311 FACTORY NVR: In a Night scenario, a (non-Sewer/non-rooftop) unit in a Factory tracing its LOS completely within that Factory building's depiction always has its NVR to *roofed* Locations of that building limited to the first roofed Location its LOS enters [EXC: as altered by Illumination/lower-NVR].

5.32 MOVEMENT: A ground-level unit may move/rout/advance/Withdraw-from-Melee across a Factory Interior Wall only via "bypass" (as per B23.71) along an *exterior* vertex (i.e., one "outside" the Factory building depiction) or via a Breach (5.33).

EX: See the illustration at the top of page O4. Squad J in hex K19 may directly enter J18 only by using Bypass along the J18-J19-K19 vertex or via a Breach in hexside J18-K19.

5.33 BREACH: A Factory Interior Wall, even if part of a Fortified Building Location, may be Breached by a DC as per B23.711, or by any AFV using the mechanics of B9.541.

5.331 EFFECTS: Once a Factory Interior Wall hexside has been Breached, that hexside's effects remain unchanged except as follows:

- units may move/rout/advance/Withdraw-from-Melee, and same-level (only) LOS may be drawn, across it as if it were a wall (exclusive of its vertices, whose status remains unchanged by the Breach);
- the *Inherent* FP (only) of a unit/FG firing through such a Breached hexside is halved as Area Fire if the total US# of the unit(s) currently firing is ≥ 3 ;
- only one Gun (whether vehicular or not) per Location may fire through such a Breached hexside per Game Turn;
- such a Breached hexside may be crossed only if the total US# of all units that have crossed it during the current phase, plus the US# of the unit currently wishing to cross it, is ≤ 5 .

EX: See the illustration at the top of page O4. Assume hexside L15-K16 has been Breached. Squad C has a LOS through the Breach to hexes K16 only (its LOS to J16 is blocked since it goes outside the Factory building depiction in hex K16). If hexside K17-J17 were also Breached, squad C could fire at a unit at ground level (only) in J17 with 8 FP (4 $\times$ ½ [unit with a US# ≥ 3 firing Inherent FP through a Breach] + 6 [SW FP through a Breach is not penalized by Area Fire]=8) with a +1 (Factory) TEM and a +3 Factory debris Hindrance.

5.34 RUBBLE: Rubble has no effect on a Factory Interior Wall black bar unless both hexes sharing the hexside are rubbled, in which case the Factory Interior Wall ceases to exist along that hexside.

5.4 ROOFLESS FACTORY HEX: A Roofless Factory Hex (EX: hex S13) represents a portion of the Factory in which the roof has collapsed. It is depicted on the RB map by the presence of a dark gray "floor" covered by debris and, aside from not having a roof, is considered a building in all respects. A unit may never gain Rooftop status in a Roofless Factory Hex.

5.41 FACTORY DEBRIS: All non-rubbled Roofless Factory Hexes contain debris (1.). Factory debris is not Inherent Terrain (i.e., it exists only *within the building depiction*), and may not be Cleared. Only *building* (not Factory debris) TEM applies to a Direct Fire attack whose LOS is *not* traced *entirely* within the Factory (see the entry for "Squad J" in the EX at the top of page O4. Indirect Fire, and Direct Fire whose LOS is traced *entirely* within the Factory to a Roofless Factory Hex is subject to both Factory TEM (+1) and Factory debris TEM (+1). Moreover, LOS (and Indirect Fire) that incurs the +1 Factory Hindrance of a Roofless Factory Hex also incurs that hex's +1 debris Hindrance, for a total of +2 per-hex LOS Hindrance (an EXC to the last sentence of A6.7). See the entry for "Squad E" in the EX at the top of page O4.

EX: See the illustration at the top of page O4. Squad M has a LOS to the ground level of K20 with no Factory debris Hindrance (since the Factory debris in L19 does not exist outside the building). Squad J, if fired on by squad L, would receive the +3 Building TEM (i.e., no TEM for Factory debris). Squad H, if fired on by squad C, would receive a +6 DRM (+2 for the Factory and debris Hindrances in L16, +2 for the Factory and debris Hindrances in K17, and +2 for the Factory and debris TEM of K18). If squad H fires its Small Arms at squad C, the latter receives a +5 DRM (+2 for the Factory and debris Hindrances in K17, +2 for the Factory and debris Hindrances in L16, and +1 for the Factory TEM of L15). Squad H, if fired on by squad D, would receive only a +2 DRM (for the Factory and debris TEM of K18).

5.42 MF/MP COSTS: A unit entering a Roofless Factory (i.e., a Factory debris) Hex expends MF/MP as per 1.2, unless entering via Bypass in which case the Factory debris does not affect its movement.

5.43 ROOFTOP LOS: Since it lacks a roof, a unit in a Roofless Factory is more vulnerable to fire from above (and vice-versa). For game purposes, the dark jagged artwork delineating the interior edge of the roof acts like a hill Crest Line (B10.2); however, LOS may be traced directly *along* such a hexside (even if also an Interior Factory Wall hexside) just as if tracing it *along* a cliff hexside (B11.2).³ The Rooftop artwork extending into a Roofless Factory Hex never itself blocks LOS. Barring other LOS Obstacles, a unit on or higher than a Factory roof has no LOS into *roofed* ground-level Factory Locations past the first such Location its LOS enters. See the entries for "Squad D" and "Squad F" in the EX at the top of page O4.

EX: A unit on the second level of hex O18 has a LOS to the ground level of Factory hexes O15, O16, and O17 (since all are hexes of a level-1½ Factory). If firing at the ground level of O15 it incurs the +1 Factory TEM of that target hex; if firing at O16 it incurs a +2 Factory debris TEM; if firing at O17 it incurs the +3 stone-building TEM. The unit has no LOS to the ground level of O14 since a higher-level unit has a LOS only into the first *roofed* ground-level Factory Location its LOS enters.

EX: The following serve to further illustrate various LOS possibilities in a partially Roofless Factory.

Squad A has a LOS only to squad C. It has no LOS to squads E and H due to Interior Factory Wall vertex L15-M15-M16.

Squad B has a LOS to all other rooftop squads only. It has no LOS to squad O since that unit is $\frac{1}{2}$ level lower than squad B nor to any units in the depicted Roofless Factory Hexes since the interior roof edge acts like a hill Crest Line for LOS purposes.

Squad C has a LOS only to squads A, E, G and H. It has no LOS to squad N due to Interior Factory Wall hexside L18-K19.

Squad D has a LOS to all other rooftop squads as well as to squads E and H. It can see squad H since the rooftop depiction overlapping into Roofless Factory Hex L16 does not block LOS (5.43).

Squad E has a LOS to squads C, D, F, G, H, I and N. It has no LOS to squad K due to intervening Factory debris Hindrance (5.41).

Squad F has a LOS to all other rooftop squads as well as to squads E, G, H and M. Squads G and M are in its LOS since squad F has a LOS into the first roofed ground-level Location of another hex its LOS enters in that Factory. Its LOS to squad H is clear since the viewing unit is at a level $\geq$ the top of the Interior Factory Wall hexside it is viewing along (5.31).

Squad G has a LOS to squads C, E, F, H, I, J, K, M and N.

Squad H has a LOS to squads C, D, E, F, G, I and M. Squad I could Spot for squad H's mortar (5.45).

Squad I has a LOS to all squads *except* squads A and C. It has no LOS to squad A as a higher level unit can only see into the first roofed ground-level Location of that Factory its LOS enters.

Squad J has a LOS to squads G, I, K, L, M, N and O. Squad J, if fired on by squad L, would receive a +3 building TEM (no debris TEM applies; 5.41) or a +4 applies if squad J's Location were Fortified (B23.9).

Squad K has a LOS to squads I, J, L, M, N and O. It has a LOS to squad N since the ground and rooftop levels of a Factory Rooftop Access Point are ADJACENT (O.4B); squad N, if fired on by squad K at PBF would receive the HA +1 TEM (O.4C).

Squad L has a LOS only to squads I, J, K, N and O.

Squad M has a LOS to squads F, G, H, I, J, K, N and O. If fired on by squad N, squad M's TEM would be +3 since the LOS is not traced entirely within the Factory building depiction (B23.741).

Squad N has a LOS to all other rooftop squads as well as to squads E, G, J, K, L, M and O.

Squad O has a LOS to squads I, J, K, L, M and N. It has no LOS to rooftop squads B, D, and F as they are $\frac{1}{2}$ -level higher than squad O. If Factory L17 were only a $1\frac{1}{2}$ -level Factory (i.e., it had no printed stairwell) squad O would then have a LOS to all rooftop squads of the L18 Factory as well as to squads C, E and G.

into a roofed hex of that Factory). Such Drifting SMOKE rises from the Level/Roof counter it is placed on to the same height as that of its Original SMOKE source.

EX: The wind is blowing to the northeast. The Original (level two) smoke source in R12 (in a level $1\frac{1}{2}$ Factory) Drifts into S12 (at rooftop level). Since all Drifting SMOKE from an Original SMOKE source in a Roofless Factory Hex is at $>$ ground level, the squads at ground level in the illustration have unhindered LOS to each other. If squad R were to fire at a rooftop-level unit in S12 the smoke Hindrance would be +4 (+2 for the first-level smoke in T11 and +2 for the rooftop-level smoke in the target hex; A24.8 would not apply since the in-hex smoke is not in the firer's Location). Were the R12 Factory $2\frac{1}{2}$ levels high, level-two smoke in the Factory would not Drift because the $2\frac{1}{2}$ -level S12 Factory is higher than the level-two smoke, thereby preventing its Drift. However, if the smoke in R12 was a level-four terrain Blaze (emanating from burning rubble or a Burning Wreck) then the Drifting smoke in S12 would be placed on a Level Two counter.

5.44 EC & WEATHER: All effects of EC and Weather apply in a Roofless Factory Hex despite the latter's being a building. However, of these effects, only Fog/Mist [EXC: Mist due to Rain or Falling Snow; E3.52, E3.711] can ever apply in the *roofed* hexes of such a Factory.

5.441 WIND & SMOKE: "No Wind" is always in effect in a Roofless Factory Hex from ground level to that Factory's highest full-level elevation. An Original SMOKE source in a Roofless Factory Hex *does* Drift if there is a Mild Breeze, but only at $\geq$ that Factory's *full-level* height equivalent. Such Drifting SMOKE is placed on a Level counter corresponding to the height of the Factory (e.g., on a Level One counter if Drifting in/from a $1\frac{1}{2}$ -level Factory, or on a Level Two counter if Drifting in/from a $2\frac{1}{2}$ -level Factory) in each hex it Drifts into [EXC: it is placed on a Roof counter if Drifting

5.45 INDIRECT FIRE: Indirect Fire is allowed from a Roofless Factory Hex, but AA fire vs Aerial units is not. A rooftop unit with LOS to an adjacent ground-level unit in a Roofless Factory Hex may Spot for that unit (see the entry for "Squad H" in the EX at the top of this page). Indirect Fire vs a unit in a Roofless Factory Hex—even one that is Fortified—receives a +2 TEM (+1 for Factory and +1 for debris).

5.46 RUBBLE: A Roofless Factory Hex can still be rubbled (see also 5.34).

5.47 AERIAL: The Sighting TC (E7.3) DRM vs a unit in a Roofless Factory Hex is always +2—not +3. Aerial fire vs a unit in a Roofless Factory Hex—even one that is Fortified—receives a +2 TEM (+1 for Factory and +1 for debris).

5.48 NVR/ILLUMINATION: In a night scenario NVR applies in the normal manner in all Roofless Factory Hexes [EXC: LOS to *roofed* Factory Locations; 5.43]. Starshells/IR can illuminate a Roofless Factory Hex. A Starshell may be fired from an Interior Roofless Factory Hex.

O

5.5 GUTTED FACTORY: A Gutted Factory represents a building that has been burnt-out from previous fighting. Hence such a building is never created *during* a scenario; it only appears as per SSR or during the RePh of a *RB* Campaign Game and should be marked by placing a Gutted counter in any hex of that Factory. All exterior and Interior Factory walls still exist normally unless rubble (5.34).

5.51 KINDLING: A Gutted Factory Location may *never* catch Fire in any way (i.e., it is not Burnable Terrain) [EXC: if rubble].

5.52 ROOFLESS: Each hex of a Gutted Factory is a Roofless Factory Hex, but its Obstacle (and Hindrance; 0.4A and 1.1) height remains the same [EXC: if rubble].

5.6 GUNS: All categories (C2.2) of Guns may set up in a *RB* Factory. A Gun may enter/exit a *RB* Factory via a Vehicular-Sized Entrance (using the Entrance's movement benefits) or via another non-Interior hex of that Factory [EXC: B23.93]. However, entry/exit via a non-Vehicular Sized Entrance is allowed only if being Pushed, in which case both normal building-entry Infantry MF costs and that Factory hex's TEM apply as Manhandling DRM, even if exiting that Factory.

6. RB CELLARS

6.1 All multi-hex, non-Factory buildings depicted on the *RB* map contain beneath their ground-level Location (i.e., at building level -1) a *RB* Cellar level (beneath which is that hex's sewer level, if any).⁶ A *RB* Cellar Location is considered the equivalent of another non-rooftop building Location in that hex (even for falling rubble [B24.12] and Victory Condition purposes) except as specified otherwise. The *RB* Cellar level is ignored when determining the Base Level of a building hex.

6.11 FORTIFIED: A *RB* Cellar Location is always considered to be a Fortified Building Location with a TEM of +4 [EXC: +3 if wooden]. All Fortified Building rules apply except as stated otherwise. A *RB* Cellar Location can be Breached (B23.9221) only across a hexside that is common to an ADJACENT *RB* Cellar Location.

6.2 ENTRY: Only Infantry/SW may set-up-in/enter a *RB* Cellar, and their presence therein is indicated by placing them *beneath* a Cellar counter. Infantry may enter/exit the *RB* Cellar level only via a Stairwell, Manhole, or a "connecting" Trench or Tunnel, and only as per B23.922 [EXC: see 0.2A and SSR RB6]. Infantry already in a *RB* Cellar may directly enter an adjacent *RB* Cellar Location only if the two hexes involved share a building hexside, as determined by the building's depiction [EXC: if Rowhouse].

EX: The C25 *RB* Cellar Location is ADJACENT only to the B25 *RB* Cellar Location and the C25 ground-level building Location. It is not ADJACENT to the *RB* Cellar Locations of B24 and C24, as hex C25 does not share a building hexside with either.

6.21 All Trench "connections" (SSR RB6), Manholes, and Tunnel entrances/exits "open into" the *RB* Cellar level if it exists in that hex [EXC: if the ground level above the *RB* Cellar has been Rubbled; 6.6]; otherwise, Sewer/Tunnel (B8.) and Trench (B27.5) rules are unchanged [EXC: a tunnel's entrance and exit Locations may be at different levels].

EX: See the 6.2 illustration. The squad in the D24 trench may directly enter the C25 (or C24) *RB* Cellar Location at a cost of two MF (see also SSR RB6). The only other Locations from which the C25 *RB* Cellar Location may be entered are the two Locations ADJACENT to it (see the 6.2 EX) or via Sewer movement (since C25 is a Manhole Location) or a connecting tunnel.

6.3 LOS: Infantry in a *RB* Cellar tracing LOS *outside* of their building's depiction to a non-ADJACENT Location do so as if entrenched at ground level (B9.21), and trace LOS to an ADJACENT Location in the normal manner (B23.25; B8.2). There is no LOS between adjacent *RB* Cellar Locations across a Rowhouse black bar hexside [EXC: if Breached; B23.711]. A unit in a *RB* Cellar Location may never claim Wall Advantage.

EX: See the 6.2 illustration. The squad in the C25 *RB* Cellar has a LOS to the ADJACENT *RB* Cellar Location in B25 (despite the actual LOS going outside the building depiction). However, squad B does not have a LOS to hex D23 (due to wall hexside C24-D24), since it traces LOS *outside* of its building depiction to a non-ADJACENT Location as if entrenched at ground level.

6.4 FIRE EFFECTS: The *Inherent* FP of a unit/FG in a *RB* Cellar is halved as Area Fire if the LOF leaves their building's depiction and is *not* traced to an ADJACENT *RB* Cellar Location, and the US# of the unit(s) *currently* using such Inherent FP is ≥ 3 . (A leader directing fire from an *RB* Cellar Location does not add his US# for this calculation.) Otherwise, a *RB* Cellar has no effect on the use of SW/Inherent-FP other than those normally caused by being fired in a building. A DC in a *RB* Cellar may be Thrown only into an ADJACENT Location.

6.5 BLAZE SPREAD: A Blaze may spread from (or to) a *RB* Cellar Location only to (or from) an ADJACENT Location.

6.6 RUBBLE: A *RB* Cellar Location can be rubbled like any other building Location. If a *RB* Cellar Location is rubbled, it and *all* other building Locations in that hex cease to exist and the appropriate Rubble counter is placed at ground level in that hex. All occupants, weapons, Tunnel-entrances/exits and Manholes in that hex are eliminated, as is its Fortified Building status (if any), and an AFV can no longer fall into it (6.62; B24.4). If the ground level Location above a *RB* Cellar is rubbled, the appropriate Rubble counter is placed at ground level on top of a Cellar counter. The *RB* Cellar Location beneath such still exists, but all LOS out of that Location across a non-building hexside is blocked. Trenches no longer "connect" to a *RB* Cellar Location if the ground level Location above it has been rubbled, though a tunnel entrance/exit and Manhole are unaffected.

EX: The ground and first level Locations of M6 have been rubbled as signified by a stone rubble counter on a Cellar counter in that hex. Movement and LOS from *RB* Cellar Locations L5 to M6 (and vice-versa) are still possible. However, if the rubble counter were placed in the hex not atop a Cellar counter (thus signifying that *all* building Locations in that hex are rubbled at ground level), the *RB* Cellar Location in that hex would cease to exist. Movement at *RB*-Cellar-level directly from L5 to N5 (and vice-versa) via M6 would not be possible without first ascending to ground level in L5 and N5.

6.61 STAIRWELL: A stairwell between the *RB* Cellar level and ground level is affected in the normal manner if that ground-level Location is rubbled (B24.4).

6.62 COLLAPSE: The B23.41 cellar rules apply unchanged to a *RB* Cellar. [EXC: An AFV falls into an *RB* Cellar if the Original colored dr of the Bog Check is ≥ 4 . If the crew of such an AFV survives, it may automatically attempt to Scrounge the AFV and the crew is then placed in the *RB* Cellar Location instead of at ground level. In all cases the AFV is eliminated and leaves no wreck. Each Infantry unit in such a *RB* Cellar Location must take an immediate NMC; if it fails this NMC a dr (Δ) must then be made for each SW it possesses: a 6 eliminates that SW and a 4-5 result malfunctions it.] The removal of an AFV for falling into a cellar in a single hex building does not create a *RB* Cellar Location in that hex.

6.7 ENCIRCLEMENT: The principles of A7.72 (Upper Level Encirclement) do not apply to *RB* Cellar Locations; i.e., a unit in a *RB* Cellar is not Encircled merely by having no exit to ground level.⁷

7. CULVERT

7.1 The Culvert in hexes D38 and E39 represents a subterranean gully* and as such is Open Ground. On the *RB* map it exists only at level 0 and is indicated by the thick black, dashed lines representing the underground passage. A unit IN a Culvert is placed beneath a Culvert counter and has a LOS only to ADJACENT gully/Culvert Locations. Overstacking may never occur IN a Culvert. All rules pertaining to subterranean units/Locations apply unchanged (e.g., E1.923).

7.2 ENTRY: Infantry enter a Culvert as if entering INTO a gully but may do so only from IN an ADJACENT gully or Culvert Location. No Vehicle/Cavalry/Horse/mounted-Cycle may enter INTO a Culvert. Cycles may be portaged INTO a Culvert but may never be mounted IN such. Only INF/AT Guns that are small targets (C2.271) and MTRs may be set-up-IN/Manhandled-INTO a Culvert.

7.3 INDIRECT FIRE: A Mortar may not fire from IN a Culvert, nor does Indirect Fire affect units IN one.

7.4 CREST: Crest status may not be gained in a Culvert hex, nor may it be gained along a gully-Culvert hexside (hexsides C39-D38 and E39-F39).

7.5 SNIPERS: A unit IN a Culvert is considered a non-target (A14.22) vs Sniper attacks.

7.6 MINES: Non-HIP A-P mines may be setup IN a Culvert but may be eliminated as per non-HIP A-T mines on a paved road Location (B28.53). No other Fortification [EXC: Roadblock; SSR RB5] may be setup IN a Culvert.

8. GULLY ENTRANCE HEXSIDE

8.1 A hex containing a small portion of dark green gully artwork (EX: hex DD2) along one of its hexsides (EX: hexside CC3-DD2) is not a gully hex, but that hexside is a gully hexside. When a unit IN a gully hex crosses such a hexside to a non-gully hex (or vice versa), it is not changing elevation.

9. STORAGE TANKS

9.1 Any obviously round structure (EX: hexes GG28 and DD29) represents a Storage Tank⁹, which is a 1½-level obstacle with no Rooftop Location and is Concealment Terrain with a +1 TEM. However, while its Location is Encircled (A7.7) this TEM is reduced to 0 and it is not considered Concealment Terrain. It is *not* a building for any purpose, nor can it catch Fire in any way.

9.2 ENTRY: Infantry pay one MF to enter a Storage Tank hex. Vehicular

entry is possible only via VBM. A Gun may neither set up in nor enter, nor may a dm 76-82mm mortar be assembled in, such a hex. The structure itself may *never* be entered/Scaled/Climbed by any unit.

10. MOL-PROJECTOR

10.1 The MOL-Projector¹⁰ is a crewed, 2PP Russian LATW ordnance-SW with its own To Hit Table printed on the back of the counter. This TH Table is used vs both armored and unarmored targets in the same manner as a BAZ except as noted otherwise below.

10.2 USAGE: Only a Russian crew, or two Russian SMC (as per C12.21), may use a MOL-Projector with neither Captured-nor non-qualified use (A21.13) penalties. A Russian non-heroic leader may use one *with* non-qualified-use penalties. A Russian hero may use one as per A15.23. A MOL-Projector is not a SCW, has no "back-blast" and does not fire HEAT; hence C13.8-9 do not apply to its use, and it may be fired from a building/Pillbox/Rooftop. Like ordnance unable to use the Area Target Type (C13.1), a MOL-Projector must predesignate its target before firing. Moreover, in the PFP and DFP it must fire before the first weapon firing other than SMOKE in that phase (since it places smoke when it achieves a hit; 10.45); however, this restriction does not apply to firing in the enemy MPh. Leadership DRM do not apply to a MOL-Projector's TH DR. A MOL-Projector may not fire at a target that lies at a different elevation than the firer if the elevation difference between them exceeds the range, nor may it be fired by PRC (though it may be carried as a Passenger/Rider on a vehicle). It may not use Bore Sighting, Target Acquisition, Intensive or Sustained Fire, nor may it attempt Deliberate Immobilization.

10.3 CH: A MOL-Projector achieves a CH on an Original 2 TH DR (C3.7). See also 10.4-43.

10.4 EFFECTS: The effects of a hit by a MOL-Projector are similar to those of a MOL attack. However, unlike the latter, a MOL-Projector attack is an ordnance attack and hence is never accompanied by a Small Arms attack.

10.41 vs AFV: An AFV hit by a MOL-Projector is affected exactly as if hit by a MOL (A22.612). However, the *only* possible modifications to the MOL-Projector attack's Basic TK number are: +1 for hitting an OT AFV; +1 for a rear Target Facing hit; and doubling due to a CH. A hit also causes a 4-FP Specific Collateral Attack vs an AFV's Vulnerable PRC.

10.42 vs UNARMORED VEHICLE: An unarmored vehicle hit (or Partially Armored Vehicle hit in an unarmored Aspect; C3.9) by a MOL-Projector is attacked on the ★ Vehicle Line of the IFT using a Kill number of 9. A CH doubles this Kill number to 18.

10.43 vs INFANTRY/GUN: An Infantry-target/non-vehicular-Gun hit by a MOL-Projector is affected exactly as if hit by a 4-FP HE attack. A CH causes an 8-FP attack with applicable reversed TEM (or, vs the Gun, eliminates it and its manning Infantry).

10.44 vs TERRAIN: A MOL-Projector hit can cause a Flame in Burnable Terrain as per A22.6111, but uses the colored dr of the TH DR. (An Original 6 dr has no adverse effect—but see 10.5.)

10.45 SMOKE: A MOL-Projector hit creates a *white* Dispersed Smoke counter as per C8.52.

10.5 MALFUNCTION: A MOL-Projector malfunctions on an Original TH DR of 11. As signified by "X12" printed in red on the counter, an Original TH DR of 12 eliminates the MOL-Projector and creates a Flame in its Location if there is Burnable Terrain therein. Both the X# and B# are lowered by the appropriate amount if Inexperienced/Captured/non-qualified, etc., use applies.

10.6 MOL CAPABILITY: Both MOL-Projector and MOL capability (A22.6) may be used in the same scenario. However, both cannot be used in the same attack because, as ordnance, a MOL-Projector may not participate in a FG.

O

11.31

11. RED BARRICADES CAMPAIGN GAMES

11.1 INTRODUCTION: The *Red Barricades* Campaign Games offer two or more players a series of interrelated scenarios pertaining to the bloody struggle of mid-October to mid-November 1942 for the *Barricade* ordnance factory and surrounding terrain. Using this system, a variable number of scenarios are played, each simulating a microcosm of the actual battle occurring on those days of the campaign.¹¹

11.11 BETWEEN SCENARIOS: Between Campaign Game (CG) scenarios, players make use of a special CG phase called the Refit Phase (RePh), wherein each side takes stock of what has happened and prepares for further combat in the next CG scenario. In the RePh, Reinforcement Groups (RG) in the form of infantry companies, AFV platoons, OBA modules, and gun batteries—to name a few—may be selected by the players and purchased through the expenditure of Campaign Purchase Points (CPP). Players will soon find that the last-ditch, suicidal charge so often employed in a standard scenario may be needlessly costly to their chance of victory in the overall campaign.

11.12 CASUALTIES: Casualties suffered in a CG-scenario/its-subsequent-RePh must be placed in their respective "Casualties" box on the Chapter O divider (11.15), since their Casualty VP (A26.2) total is used both to determine a DRM for the CPP Replenishment Table (11.616) and for all CG non-Initial-Scenario Victory Conditions. The Casualty VP value of a unit unable to be removed (e.g., wrecked AFV) should be noted on scrap paper. (Alternatively, a player must keep a running tally of all Casualty VP suffered by his side during the CG scenario and its subsequent RePh in the "Casualty VP Tally Box" on the CG Roster; 11.14.)

11.13 TEAM PLAY: The three CG herein (11.51-.53) are easily adapted—indeed, recommended—for team play, with each player commanding either certain unit types (EX: one player commands all the armor and Guns, another the non-Gun-crew Infantry, of one side), or a mapsheet sector (EX: one player commands the forces on/north-of hexes numbered 20). If desired, an overall commander may determine which RG his subordinate players will receive, assigning each to the one who requires it most.

11.14 CG ROSTER & RG PURCHASE RECORD: The enclosed printed copies of the *RB* "CG Roster" and "RG Purchase Record" should be photocopied and used by CG players to record important CG information. See RePh steps 11.617-.619 and 11.622 for information on updating the CG Roster; see 11.6197 for specifics on the RG Purchase Record.

11.15 CHAPTER O DIVIDER: The Chapter O divider provides spaces for keeping each side's Eliminated units, Reinforcements available to enter (one boxed area should be used per RG) and Retained units for the next scenario. As reinforcements (and even Retained units) for each side can be kept secret, it is suggested that players make two photocopies of this divider so that each side has one on which to keep its forces out of sight of the opposing side (photocopies of the reduced-size *RB* map on the back of the divider will also be necessary for RePh step 11.6066). During the RePh the divider can be used to place purchased fortification counters in the "Fortification Counters" box until they are positioned on the map. Wounded leaders and Captured and malfunctioned Weapons may also be separated until resolved in their respective phases.

11.2 DEFINITIONS & ABBREVIATIONS: The following glossary explains abbreviations and important terms used frequently in the *RB* Campaign Game system.

CG: Campaign Game

CG Day: One day of a CG (whether a scenario is played or not); e.g., 17 October is the first CG Day of CG I (11.51), 18 October is its second CG Day, etc. Each CG Day (except for the first in each CG) begins upon the passage of RePh step 11.6121 ("New CG Day").

CG Roster: The sheet used to record information for each CG Day. One line is filled out for each CG Day. Players are urged to photocopy the facsimile provided herein.

Coy (company): A CG Infantry RG organization type.

CPP (Campaign Purchase Points): Used to buy RG in RePh step 11.619.

Depleted: A RG not received at Full Strength.

Eliminated: Units/Equipment "Eliminated" in a CG are removed from that side's OB.

Equipment: Any SW/Gun/Vehicle/Daisy-Chain that can be part of a side's OB. Any counter that can be Portaged/driven/Manhandled about on the map.

Escape: The process by which a unit attempts to leave an Isolated Area (11.6063).

FPP (Fortification Purchase Points): Used to purchase Fortifications in RePh step 11.621.

Front Line Location: Each Location that belongs to a(n) (Alternate) Hex Grain of a Perimeter marked in RePh step 11.605. Each Front Line Location is part of a "loop" of adjacent Front Line Locations.

Full Strength: An Infantry-Company/AFV-Platoon RG received *in toto*.

Idle Day: A CG Day in which both sides have picked an Idle chit (no CG scenario is played).

Initial Scenario: The first scenario of a CG (see 11.51-.53). A CG's Initial Scenario gives each side's setup/entry restrictions, Initial Scenario Victory Conditions, starting OB (including certain predetermined RG and a pool of CPP to spend on additional RG), and the SSR applicable only to that Initial Scenario.

Isolated Area: A group of adjacent Isolated Locations.

Isolated Location: A Location that lies within the Perimeter Area of both sides.

No Man's Land: Locations that are either outside both Perimeter Areas or part of a type A (i.e., unoccupied) Isolated Area (11.606).

OB (Order of Battle): All the units, Equipment and Fortifications of a side that are eligible to participate in the next CG scenario. Includes all Retained units and Equipment, plus all RG purchased since the last CG scenario.

Perimeter: All of the (Alternate) Hex Grains formed by the placement of the Perimeter markers enclosing a section(s) of the map. Although the (Alternate) Hex Grains marked out in RePh step 11.605 might produce $\geq$ one Perimeter "loop" (i.e., one [or more] "main loops" and one [or more] Pockets), there is still only one Perimeter per side.

Perimeter Area: All hexes enclosed by, and including, a side's Front Line Locations (11.605).

Pltn (platoon): A CG Infantry or AFV RG organization type.

Pocket: An Isolated section of the Perimeter Area created in RePh step 11.6056-.6058. A Pocket may never include any map edge hex.

RePh (Refit Phase): The series of steps performed between CG scenarios. All Chapter O rules beginning with "11.6" are *RB* CG RePh rules/steps.

Retained: All units/Equipment in a side's OB that are available for on-map/off-map setup in the next CG scenario; i.e., all that remain available from the last CG scenario, all RG purchased since the last CG scenario but prior to the current CG Day, and all RG purchased on the current CG Day and specifically allowed to set up on-map. Retained units/Equipment (important: see 11.6134 for FT/DC) should be kept in the "Retained" box on the Chapter O divider (11.15) when not on-map.

RB: Red Barricades ASL module.

RG (Reinforcement Group): Usually a number of units/Equipment purchased, as a group, for use in the CG as additions to a side's OB. Also includes FPP, MOL capability, SAN increase, OBA, Pre-Registration, Offboard Observer and Observation Plane capability.

RG Purchase Record: The sheet used to record the units-in/information-for each CG RG type. One line is filled out for each RG purchased. Players are urged to photocopy the one provided herein.

Shore Hex: A level-0 land hex adjacent to a Water Obstacle hex on the *RB* map.

Stone Location: Each stone-building [EXC: rooftops and Sewers] and stone-rubble Location on the *RB* map. These Locations are used in all campaign scenario and game Victory Conditions (11.651-.53; 11.6235). On the *RB* map there are 570 total Stone Locations (which can be broken down further as follows: 171 Factory, 134 non-Factory ground level, 109 first level, 13 second level, 98 *RB*-Cellar level, and 45 rubble). Of course, this total can change during a CG due to rubble.

Strategic Location: Each building Location [EXC: Sewer/Rooftop], rubble, Pill-box, Entrenchment, non-Water-Obstacle map-edge hex, and Shore Hex is a Strategic Location (11.6052). See also 11.6052-.6054.¹²

Strength: An Infantry Coy or AFV Pltn is received either at Full or Depleted Strength.

Weapon: Any SW/Gun/Vehicular-armament/Daisy-Chain using the IFT/TH table(s) to cause damage to the opponent.

11.3 THE CG SCENARIOS: The parameters of the Initial Scenario for each CG are given in 11.51-.53. Additional scenarios for that CG (and the Victory Conditions for each) are generated in a special between-CG-scenario sequence called the Refit Phase (RePh); 11.6. The CG continues until the specific CG Victory Conditions are fulfilled by one side or the completion of the last CG Day of that CG, whichever comes first. The "start lines" (or, Front Line Locations, to use the game term) in a CG scenario are determined by Locations Controlled by both sides at the end of the last-completed CG scenario.

11.31 CG BALANCE PROVISIONS: Should each player wish to play the same side (A26.5) the following Balance is used:

✱ Each German Personnel counter possessing a FT/DC is Fanatic.

★ Each Russian *elite* Infantry unit in a Fortified Building Location is Fanatic.

11.32

11.32 CG SCENARIO BALANCE PROVISIONS: The following CG-scenario Balance provision may come into effect automatically, depending on the opposing sides' win/loss record:¹³

- Provided $\geq$ three CG scenarios have been completed, a side that has won $\leq$ one-third of those scenarios receives a -1 DRM to all of its CPP Replenishment DR (11.616) and RG-Strength DR (11.6201-.6204), or
- Provided $\geq$ four CG scenarios have been completed, a side that has won $\leq$ one-fourth of those scenarios receives a -2 DRM to all of its CPP Replenishment DR (11.616) and RG-Strength DR (11.6201-.6204).

11.4 CAMPAIGN GAME SPECIAL RULES: All RB CG SSR below apply in all CG scenarios.

CG1. MAP: The entire RB map is used in all CG scenarios.

CG2. RB SSR: All RB# SSR (see the flip-side of Scenario RB6) are in effect except as amended below.

CG3. WEATHER: EC and Weather for each CG scenario are determined in RePh step 11.618 [EXC: for each Initial Scenario they are listed in that scenario's specific SSR]. Wind Force (and direction, if necessary) is determined in RePh step 11.6241.

CG4. GAME END: The Turn Record Chart for all CG scenarios is located in the river portion of the RB map (the northeast corner). All CG scenarios have a variable game length. At the end of Game Turn 5, and at the end of each Game Turn thereafter, the Russian player makes a Game End dr: if it is $\leq$ the circled number in the current turn's box on the RB CG Turn Record Chart the scenario ends immediately (e.g., at the end of Game Turn 6 the scenario will end on a Game End dr $\leq$ 3).

CG5. GUNS: No Bore Sighting is allowed. A Gun/AFV set up in a Pillbox or Fortified Building Location may never be moved during the course of that CG [EXC: if Eliminated]. Such an AFV/Gun, once revealed, may never again set up hidden, but may be set up Concealed if able to. Otherwise, Guns may always set up hidden in CG scenarios.

CG6. OBA: Each side is limited to using a maximum of two OBA modules per CG scenario (with "usage" of a module being defined as having its radio, field phone, or Spotter [whether offboard or aerial] in play at any time during a CG scenario; see also SSR CG10). When an OBA module is selected as a RG, the player may freely select a radio or field phone [EXC: 11.51, SSR I.2]. Each Russian Security Area must be traced (as per C1.23) to any friendly-Controlled east-edge hex (a Security Area in a Water Obstacle is immune to being "cut"). Each German Security Area must be traced (as per C1.23) to any friendly-Controlled north- or west-edge hex. The ground-level Location of each Security Area hex must be friendly-Controlled at scenario start.

CG7. TERRAIN CHANGES: During the course of the same CG, alterations of printed mapsheet terrain are bound to occur, all of which become "permanent" (barring subsequent Clearance/Removal or Deactivation [11.6123] if applicable). All counters for Fortifications, Rubble, Breaches, Trailbreaks, Shellholes and wrecks are left on-map from scenario to scenario. Any terrain Ablaze at scenario end is resolved as per RePh 11.609. A wreck in a terrain Blaze is not removed from play; instead, it remains on-map (still treated as a LOS Hindrance) and in step 11.6091 of the next RePh will become a Burnt-Out-Wreck.¹⁴ A Burnt-Out-Wreck may neither catch Fire nor be Scrounged, nor may it be removed from play as per D10.4. A Burnt-Out-Wreck is a LOS Hindrance in the same manner as a normal wreck.

CG8. SNIPERS: Due to the large playing area and the widespread sniper activity, each side must place two Sniper counters on the map at the start of each CG scenario. Both friendly Snipers must set up as per the first two sentences of A14.2, with $\geq$ 15 hexes between them (or as far apart as possible if they cannot set up 15 hexes apart). When a Sniper attack can occur, make a dr to determine which Sniper attacks; on a dr of $\leq$ 3 that side's northernmost Sniper attacks (if both are equally "northernmost", the owning player may select the one that attacks before performing the Target Hex DR; A14.2). The SAN is never altered by the presence of two friendly Snipers in play simultaneously. Any result (e.g., Pin) affecting a Sniper counter affects both friendly Snipers simultaneously. See also 11.6122.

CG9. REINFORCEMENTS: All Infantry/AFV RG purchased on the current CG Day [EXC: 11.6194], as well as Retained units voluntarily held off-map as reinforcements, enter on/after Turn 1 [EXC: SSR I.5, 11.51] during that scenario. Some, all or none (including individual RG units) may enter on each turn.

RUSSIAN AFV RG: enter on any friendly-Controlled (at scenario start) east-/south-edge land hex(es). If no such hex exists, the AFV may enter on any east-edge land hex(es) of hexrow JJ. All AFV of the same RG entering on the same turn must do so along the same edge.

RUSSIAN INFANTRY RG: enter on any east-edge land hex(es) of hexrow JJ that is currently friendly-Controlled and was friendly-Controlled at scenario start.¹⁵ If no such hex exists, such Russian RG may enter along the east edge on/south-of JJ36.

RUSSIAN/GERMAN GUN BATTERY RG: may set up on-map. May also be towed (if German) or Manhandled into Locations where other friendly Infantry could enter.

GERMAN INFANTRY/AFV RG: enter on north-/west-edge land hex(es) depending on the current CG Day [EXC: entry is always allowed on/ between A9 and N0, as well as via any edge hex that is currently friendly-Controlled and was friendly-Controlled at scenario start]:

17-19 October: on/between A9 and U1;

20-22 October: on/between A22 and U1;

On/after 23 October: on/between A45 and U1.¹⁶

Russians may still set up in their friendly-Controlled Locations, even if such a Location is in a potential German entry hex [EXC: as per 11.51's Russian setup restrictions for CG Day 17/10].

CG10. RETAINED RG: Each RG, or part thereof, not entering-play/used during a CG scenario is still available for the next CG scenario [EXC: Withdrawn AFV Platoon, 11.6142; Stuka]. Furthermore, each purchased RG, or part thereof (including any Pre-Registered-hex(es)/Offboard-Observer assigned to an OBA RG), is Retained until Eliminated/Recalled in a CG scenario or its subsequent RePh. For purposes of this rule, an OBA RG is considered "used" if $\geq$ one FFE:1 counter from that module was placed during the last scenario].

CG11. RUSSIAN FANATICISM: Each non-prisoner Russian Personnel unit in a Factory hex [EXC: if in a Sewer Location, or if currently in Bypass] is considered Fanatic (A10.8).¹⁷ If entering from outside the Factory it becomes Fanatic immediately, prior to all Defensive First Fire against it. If wishing to advance out of a Factory in order to CC an AFV, it need not take a PAATC since it is Fanatic when required to take it. A Russian unit already Fanatic receives no further benefit. Rubble occurring in an original Factory hex is still considered part of that Factory for purposes of this rule.

CG12. COMMISSARS: Each Commissar in the Russian OB at the end of the 31 October scenario in CG III is automatically replaced by its corresponding (A25.22) unwounded leader type (e.g., a wounded 9-0 Commissar becomes an unwounded "normal" 8-0 leader).¹⁸ Thereafter, no Commissar may be in the Russian OB.

CG13. MAP EXIT: Any Personnel (including their possessed Weapon) and Mobile AFV may exit the map during play but only from a hex that is currently friendly-Controlled and was friendly-Controlled at scenario start. Such a unit may not re-enter during that scenario, but is Retained [EXC: a broken Infantry unit must take an immediate NMC when exited; failure of the NMC results in the immediate Elimination of that unit and all its possessed Weapons] in their side's OB for the next CG Day. Players should place such counters in the friendly "Retained" box on the Chapter O divider (11.15). All counters exited off hexes (currently not and) not friendly-Controlled at scenario start are Eliminated, and count for Casualty Victory Condition purposes (but not for the CVP DRM of 11.616).

CG14. MASSACRE: Massacre (A20.4), if invoked during a CG scenario, is in effect only for the duration of that scenario. However, see also 11.608.

CG15. CONCEALMENT: All Infantry (and their possessed Weapon[s]) setting up in Concealment Terrain may do so concealed, regardless of LOS. Such "?" need not be purchased; i.e., they are placed freely. Otherwise, A12.12 and A12.34 apply. The side setting up first may conceal all eligible units before the other side views its setup; likewise, the side setting up second may conceal all eligible units before his opponent views that setup. "?" purchased in the RePh (11.621) are intended mainly for use as dummies.

O

CG16. MISCELLANEOUS: Non-captured Mobile non-halftrack AFV may not be voluntarily Abandoned. A $\frac{1}{2}$ " counter set up beneath a Trench counter (as per B27.51) may be removed from below that counter on any subsequent CG Day [EXC: if immobilized/wrecked].

CG17. SELF RALLY: Each side may attempt to Self Rally $\leq$ two (not just one) non-Disrupted broken MMC, provided (as per A18.11) both attempts are carried out before other friendly MMC Rally attempts.

CG18. SEWER RESTRICTION: On the final CG Day of each CG, Sewer Movement is not allowed after Game Turn 4. At the start of Game Turn 5, all units/SW in Sewer Locations are Eliminated (but do not count as Casualty VP).

11.5 INITIAL SCENARIO: First select one of the CG listed below (CG II—"Operation Hubertus"—is the shortest, being only five CG Days). Included there is the information needed to play that CG's Initial Scenario. For the Initial Scenario, players begin with RePh step 11.619 (Purchase Reinforcement Groups) and complete RePh steps 11.620-.622 (i.e., all steps preceded by a † in the RePh Sequence listing; 11.6). For each Initial Scenario, the actual Strength of each OB-given and purchased (RePh step 11.619) RG must still be determined normally (RePh step 11.620). Leaders received, if any, are determined in RePh steps 11.6205-.6207.

In the Initial Scenario of each RB CG the Russian sets up first and the German moves first. Furthermore, in each CG Initial Scenario, the German is assumed to have selected the "Attack" Initiative chit and the Russian the "Idle" chit (11.623) for CPP Replenishment (11.616) and ELR-Change (11.617) DRM purposes.

11.51 RB Campaign Game I: INTO THE FACTORY

CG Days: 17-29 October, 1942

Following the fall of the *Dzerzhizhsky* Tractor Factory, the Germans turned southwards against the Red Barricades Ordnance Factory. Fighting in the *Barrikady* Housing Estate and the Silicate Plant, west of the Red Barricades, had been raging since early October. Now the Germans were reinforced by units that had pulverized the Tractor Factory. Elements of Panzer Division 14 and Infanterie Division 389 commenced their attack from the north, while elements of Panzer Division 24, Infanterie Division 305 and Jaeger Division 100 came on from the west. The Russian 84th Tank Brigade and 308th Rifle Division struggled to hold the northern and western approaches to the factory. On 15 October, as Major Pechenyuk's 650th Rifle Regiment (138th Rifle Division) crossed the Volga, vicious fighting raged north of the *Barrikady* in the *Minusinsk* area. The next day a combined force of German tanks and infantry, supported by Stukas, advanced south along *Tramvaynaya* Street, striking the 84th Tank Brigade. Dug-in Soviet tanks destroyed a dozen panzers at close range, stalling the enemy infantry. The Germans attacked again, but took frightful losses from a well-placed *Karyusha* barrage. Both the 84th Tank Brigade and the 308th Infantry Division struggled on, buying precious time for the two remaining regiments (the 344th and 768th) of Col. Lyudnikov's 138th Rifle Division to cross the fire-swept river. Arriving during the early morning hours of 17 October, the men were ordered to hold the *Barrikady* at all costs. Later that morning, the Germans attacked again as the newly arrived Soviets were still preparing their positions.

CG I VICTORY CONDITIONS: The Germans win upon the conclusion of any CG scenario if they Control all but any three of the Stone Locations on/west-of hexrow U and north of the A39-JJ36 gully.

INITIAL SCENARIO VICTORY CONDITIONS: The Germans must Control $\geq$ 15 Stone Locations at scenario end.

INITIAL RUSSIAN OB:

Elements of the 138th Rifle Division [ELR: 3] set up $\geq$ two hexes from all allowed German entry hexes (see German entry restrictions): {SAN: 4}
 RG: Rifle Coy $\times 2$ Fortified Building Locations $\times 5$
 RG: SMG Coy 8 CPP
 45LL AT $\times 2$ 50 FPP
 2-2-8 $\times 2$

INITIAL GERMAN OB:

Elements of Infanterie Division 389 [ELR: 4] enter on/after Turn 1 along the north/west edge(s) on/between hexes A9 and U1 (see also SSR I.4): {SAN: 3}
 RG: Rifle Coy RG: PzKw III Pltn
 RG: Sturm Coy RG: Offb'd Observer (see also SSR I.3)
 RG: Btl Mortar OBA 15 CPP

INITIAL SCENARIO SPECIAL RULES:

The following SSR apply only to the 17 October Initial Scenario of CG I & III and their applicable RePh steps.

I.1 EC are Moderate, with no wind at start. Weather is Clear.

I.2 The Germans may purchase *none* of the following RG: AT battery, INF battery, or SAN increase. The only "Fortifications" the Germans may purchase are additional "?". No field phone may be selected by the Germans. No German RG may be purchased as "On-map" or "Reserve" (11.6194).

I.3 The German OB-given Btl Mortar RG must use the OB-given Off-board Observer RG (see German RG Chart note "o") and may freely Pre-Register (C1.73; E12.1) $\leq$ two hexes prior to Russian setup.

I.4 All map-edge hexes in the German entry area are considered German-Controlled at Initial Scenario start; all other hexes are Russian Controlled. Before set up begins, the German player places one friendly Perimeter marker in hex A9 and another in U1. Point the arrow on each directly along the map edge (Alternate) Hex Grain to the northwest corner of the map. This indicates the German-Controlled map-edge hexes at Initial Scenario start. Similarly, the Russian player should place friendly Perimeter Control markers in A10 and V1 (pointing southwards and eastwards, respectively) to indicate his friendly-Controlled map-edge hexes at CG start.

I.5 Reinforcing German (only) RG Infantry/AFV units enter on/after Game Turn 2. All other RG are available at scenario start.

AFTERMATH: By the end of the 17th, the 138th's link with the 308th Rifle Division to its right was severed, and the Germans were fighting at the factory's northwest corner. On 18 October determined German attacks broke the *Tramvaynaya* Street defenses and crossed the railway embankments. To bolster the defense, factory militia units were organized and sent into the firing line. By 22 October, German assault troops had breached the Russian line at the western side of the *Barrikady*, and had broken into some of the larger workhalls. The Soviets fought desperately, their weapons blazing from fortification apertures. Smoke hung over the battle area, limiting visibility. Small areas, even single rooms in buildings, were lost and recaptured by both sides each day. It was a microcosm of the savage combat that marked the entire battle of Stalingrad. The continuous fighting became so awful, that, according to one German officer, the dogs left the city and swam across the Volga to safety.

Slowly, brute force pushed the Soviets out of a number of the large workhalls. On 24 October, the Germans advanced deeper into the factory complex, gaining footholds in the central and southwest assembly halls. The close-quarter fighting moved slowly eastwards across the landscape of devastated buildings, twisted railroads cars, slag heaps and shellholes. The Russians would crawl stealthily, their boots bound in sacking to muffle the noise, through the darkness each night to infiltrate lost strongpoints. At dawn, the Germans would attempt to fight their way back. The Germans, with their total air superiority, forced their foe to move in the open only under cover of darkness. To offset this, Soviet engineers linked strongholds with slit-trenches and tunnels. To kill enemy snipers, German artillery leveled entire buildings; Russian artillery meanwhile strove to disrupt German troop concentrations.

By late October, the ragged survivors of the 138th Rifle Division had been forced back to within a few hundred meters of the Volga, but still clung doggedly to several of the gutted factory buildings. The 10th Rifle Regiment, from Lt. Col. Sokolov's 45th Rifle Division, began to filter into the lines in the Bread Factory area on 26 October, just in time to prevent further breakthroughs.

11.52 RB Campaign Game II: OPERATION HUBERTUS

CG Days: 11-15 November, 1942

For Paulus, the battle for control of Stalingrad had become the battle of attrition he had feared. He knew that time was running short for his Sixth Army to secure the remaining tenth of the devastated city still held by Vassily Chuikov's tenacious 62nd Army. As his forces regrouped in early November, Paulus fretted. The Germans were not equipped for winter warfare and intelligence reports indicated increasing Russian activity along the flanks of the Sixth Army. He therefore called on his troops for a final desperate effort to clear the rubble city—code-named "Operation Hubertus". Fresh German units, some four battalions of combat engineers (each with about 600 specialists trained in demolition of fortifications), would lead the assault. A dozen experimental assault guns (the *Sturmpanzer IV*, or StuIG 33B) mounting a 150mm gun would join other armored vehicles for the street fighting. At the same time, however, special aid stations and graves registration teams moved up close behind the front lines.

Behind the *Barrikady*, the German Pioniere troops were ordered to launch their initial assaults at two known Russian strongpoints—one called the "Chemist's Shop" and the other the "Commissar's House" (alternately known as the "Red House"). One German officer, Major Josef Linden, appraised the terrain in and around the gun factory with glum foreboding: "loosely hanging corrugated steel panels that creaked eerily in the wind; a perfect mess of iron parts, gun barrels, T-beams, huge craters." And every pile of rubble threatened, if not a Russian, at least a boobytrap.

The Soviet defenders (relatively fresh men of the 45th Rifle Division, leavened with battle-wise veterans of the 138th Division) were well aware that a German offensive was in the offing. Newly compressed into a narrow zone barely 10km long,

with the freezing river at their backs, the stalwart soldiers of the Soviet Union dug themselves even deeper into the rubble, well protected by numerous machineguns and anti-tank guns. Steel plates had holes drilled through to expose only the muzzles of the weapons, while mines and booby-traps were strewn with abandon. Heavy artillery shells were withheld by the Front Command in anticipation of the coming offensive, but General Chuikov was able to distribute precious ammunition and food to his front-line troops.

Finally, at 0300 hours on 11 November, "Operation Hubertus" opened with a violent German barrage. When the artillery fell silent at 0630 hrs, ten battalions of German infantry, supported by tanks and engineers, stormed towards the Soviet defenders.

CG II VICTORY CONDITIONS: The Germans win upon the conclusion of any CG scenario if they Control all but any five of the Stone Locations on the map.

INITIAL SCENARIO VICTORY CONDITIONS: The Germans win if at scenario end they Control ≥ 26 more Stone Locations than they have lost (or than they started with if they lost none).

INITIAL RUSSIAN OB:

Elements of the 138th and the 45th Rifle Divisions [ELR: 3] set up east of the German Perimeter (see SSR II.2): {SAN: 4}

RG: Rifle Coy $\times 3$	2-2-8 $\times 4$
RG: SMG Coy	Fortified Building Location $\times 20$
RG: Guards SMG Coy	14 CPP
45LL AT $\times 2$	80 FPP
76L ART $\times 2$	

INITIAL GERMAN OB:

Elements of Infanterie Division 305 and Pionier Bataillon 50 [ELR: 4] set up on/west of the German Perimeter (see SSR II.2): {SAN: 3}

RG: Rifle Coy $\times 2$	Fortified Building Location $\times 5$
RG: Pionier Coy $\times 2$	17 CPP
RG: Sturm Coy	50 FPP

INITIAL SCENARIO SPECIAL RULES:

The following SSR apply only to the 11 November Initial Scenario of CG II and their applicable RePh steps.

II.1 EC are Wet, with no wind at start. Weather is Clear.

II.2 The German Perimeter for the start of the Initial Scenario is defined as Hex Grains W1-W5-U6-U25-Q27-Q29-M31-S40-S45 (with the two map-edge hexes being W1 and S45). The Russian Perimeter Area consists of all Locations east of the German Perimeter. No No-Man's-Land hexes exist. Each side should place friendly map-edge Control markers as appropriate (11.6053).

II.3 The following hexes contain stone rubble at ground level: O9, P7, P8, P9, Q9, X9, S11, S12, T11, R16, S16, R29, R30, R31, S31, U33, U34, U35 and T35. Factories S18 and U23 are Guttled (O5.5).

AFTERMATH: Chuikov's troops leapt to meet the Germans head-on. The fighting was unusually bitter, even by Stalingrad standards. Quarter was neither asked nor given. Inside the great workhalls heavily armed soldiers fired point blank into each other in swirling melees. The "Chemist's Shop" fell on November 11, but the initial German efforts to storm the "Commissar's House" were repulsed. Meanwhile, elements of Infanterie Divisions 305 and 389 reached the Volga near the oil depot, thereby sealing off the remnants of Lyudnikov's division behind the *Barrikady*.

Casualties on both sides were extraordinarily heavy. Soviet and German commanders alike clamored for more men from higher headquarters and for situation reports from subordinate commands, all in vain. Entire regiments simply ceased to exist in the cauldron. Despite their horrendous losses, the Germans resumed their determined attacks on the morning of the 12th. When the combat engineers finally broke into the "Commissar's House", the surviving defenders scurried into the cellar, intent on carrying on the fight. The Germans ripped up the floorboards, tossed in full petrol cans and ignited them with gunfire. They then lowered and detonated satchel charges. At long last the fortress was cleared!

But such attrition could not long be taken, and the rubble city itself frustrated German efforts to coordinate operations. By the second evening, all thrusts spearheaded by the Pioniere had broken down into small, savage battles that differed little from the previous street-fighting. Scores of clashes ebbed and flowed along the Volga's bank for another three days, until finally dying out due to mutual exhaustion of the combatants. Nothing had changed. The Russians still clung to their toehold on the river bank, however reduced, thus allowing vital reinforcements their chance to debark into the ravaged city. At dawn on 19 November Chuikov and Paulus and all their weary men in the ruins heard the muted rumble of big guns carried by the wind from a new direction—far to the northwest. That barrage heralded the beginning of the Russian counterattack, "Operation Uranus"—and tolled the death knell for the battered Sixth Army.

11.53 RB Campaign Game III: THE BARRIKADY CG Days: 17 October-15 November, 1942.

CG III combines CG I and CG II, "connecting" them with CG Days 30 October through 10 November. During this time the Germans' intense attacks on the factory complexes subsided, as the Germans reformed and reinforced for the planned "final" offensive in November. The Russians took advantage of the lull to continue ferrying across the balance of Sokolov's 45th Rifle Division (the 61st and 253rd Rifle Regiments), putting them into the line near Bread Factory #2 as well as the 241st Rifle Regiment of Col. Gorishny's 95th Rifle Division. Sensing the Germans' exhaustion, the Soviets launched a counterattack with the available fresh forces on 31 October. Though gains were limited to several hundred yards, the assault did prove to the Germans that their foe was not beaten.

By night and day the Soviets continued limited offensive actions with small storm groups, seizing individual houses and factory rooms in attempts to expand their meager bridgehead. Meanwhile the temperature dipped sharply and ice floes appeared on the river, making even more hazardous the Russians' reinforcement ferry trips. It was at this critical point that the Germans had selected to launch "Operation Hubertus".

CG III VICTORY CONDITIONS: The Germans win upon the conclusion of any CG scenario if they Control all but any five of the Stone Locations on the map.

All Initial Scenario parameters are as per CG I, INTO THE FACTORY (11.51).

11.6 REPH PHASE (RePh): The following steps (11.601-11.625) are performed simultaneously by each side during the RePh, which occurs between CG scenarios. Each step (and sub-step) must be carried out in the numbered/lettered order given; those not applicable to the current situation may be omitted (e.g., if there are no Blazes on the map, skip RePh step 11.609). Those steps listed below preceded by an "*" are performed repeatedly until a new CG scenario is generated in RePh step 11.623; those preceded by a "+" are performed only if a CG scenario is to be played on the current CG Day. Those preceded by a "†" are the *only* steps necessary to complete before playing a CG Initial Scenario.

RePh Sequence

- 11.601 Conclusion of Melee
- 11.602 Marker Removal
- 11.603 Victory Determination & Rally
- 11.604 Encirclement & Minefields
- 11.605 Perimeter Determination
- 11.606 Isolation
- 11.607 Clearing the Map
- 11.608 Prisoners
- 11.609 Extinguishing Blazes
- 11.610 Wounded Leaders
- 11.611 Battle Hardening & Promotion
- *11.612 New CG Day & SAN Adjustment
- *11.613 Equipment Repair & Replenishment
- *11.614 Armor Withdrawal
- *11.615 Fortification Removal
- *11.616 CPP Replenishment
- *11.617 ELR Loss/Gain
- *11.618 Weather & EC Determination
- †11.619 Purchasing Reinforcement Groups
- †11.620 RG Strength, Weapons & Leaders
- †11.621 Purchasing Fortifications
- †11.622 Reconnaissance
- *11.623 Initiative Determination
- #11.624 Wind & Unit-Setup
- #11.625 Scenario Commencement

11.601 CONCLUSION OF MELEE: First, each unit currently on a Climb marker must be placed in either the Location it was attempting to reach or the Location it left when it began to climb, at the owner's choice. If the Location the unit is placed in contains enemy unit(s) mark them all with a Melee (not CC) marker.

All units in Melee must undergo an (unlimited) number of CC rounds until no Melees exist. Such units are free to perform any/all normal CCPH activities associated with Melee (i.e., Capture attempts, Withdrawal, attack, etc.). Consider the Russian side the ATTACKER. Following the conclusion of the first round of RePh Melee in a Location, each still-concealed unit therein loses its "?" and each AFV currently in Motion has its MOTION counter removed.

11.6011 ORDER OF RESOLUTION: Resolve all Melees in alphanumeric sequence (e.g., A1, then B16, then B35, then C19, etc.).

11.602 MARKER REMOVAL: All markers/counters listed below are removed from the map at this time:

- FFE, SR and Barrage markers.
- SMOKE.
- Acquired Target markers.
- Radios and Field Phones.
- DM, Disrupted, Fanatic, Berserk, Wall Advantage and HD markers, Dummy stacks and Dummy Cloaking counters.
- CX, Motion, CE, BU, Stun.
- All still hidden/Cloaked units and Equipment are placed on-map concealed in their setup Location [EXC: hidden Set DC (11.621) may remain Hidden until step 11.6073].¹⁹ Still-hidden Fortifications need not be revealed at this time.
- Sewer markers. Each unit/SW beneath such is Retained.
- Snipers.

11.603 VICTORY DETERMINATION & RALLY

11.6031 CG SCENARIO VICTORY DETERMINATION: The winner of the just-completed CG scenario is now determined (11.6235; see 11.51-.53 for Initial Scenario Victory Conditions). A Location Controlled *solely* due to having been deliberately set on Fire by the opponent (as per A26.13) does not count toward scenario Victory Conditions. Units/Equipment Eliminated in the RePh after this step (11.6031) never count for CG scenario Victory Determination nor for MMC Battle Hardening DRM (11.6112), but can be used for CPP DRM determination purposes (11.616).

11.6032 RALLY: After the scenario victor is determined, *all* currently broken units of both sides automatically rally, even if Disrupted. No DR are made. All Passengers/Riders are unloaded into their Vehicle's Location (a unit unloading into an A-P minefield is not immediately attacked, but 11.6042 will apply).

11.604 ENCIRCLEMENT & MINEFIELDS²⁰

11.6041 ENCIRCLEMENT: Each Encircled unit [EXC: prisoner] must take a 1TC (leader DRM apply). Failure of the 1TC results in the unit's immediate Elimination [EXC: the Encircled Vulnerable PRC of an Immobile AFV are Eliminated, leaving the AFV Immobile and Abandoned]. Each prisoner that an Eliminated Encircled unit was Guarding *must* if possible be claimed by another unit in that Location friendly to the Eliminated unit. If the prisoner is not claimed, it may automatically possess any Equipment dropped by its Eliminated Guard and is considered Rearmed (A20.551). Otherwise, any Equipment that an Eliminated Encircled unit possessed is left in the Location unpossessed.

Each Encircled unit that passes its 1TC remains in its present Location (Encircled markers are not removed until step 11.6064).

11.6042 MINEFIELDS: An AFV in any type of minefield undergoes the appropriate type(s) of mine attack(s), fully resolved in the normal manner, as if attempting to exit the minefield Location. Each Infantry unit in an A-P minefield hex (including a crew that just disembarked as a result of a minefield attack) must take a NTC (non-armor) leader DRM apply; failure of the TC causes Casualty Reduction. [EXC to both: A unit theoretically (even via Sewer Movement) able to exit the minefield hex without being attacked by the mines and without having to enter a minefield/enemy-Controlled hex need not take the NTC.] In all cases, each surviving unit remains in its respective Location in that minefield hex until removed in RePh step 11.607.

11.605 PERIMETER DETERMINATION: The Front Line between the Germans and Russians is now determined. In general, *each side* attempts to draw a closed "loop" (or "loops") of adjacent Locations around a section of the map by marking out connecting (Alternate [as shown in the E12.11 diagrams]) Hex Grains. The section thusly enclosed is the Perimeter Area. When *fully completed* (at the end of step 11.6066), the Perimeter Area must contain every friendly unit, and may contain some enemy units. Each side is free to try to enclose as many Locations within its Perimeter Area as it is able to, without violating any rule. If the "loop" is determined properly, each side will be able to start at any Front Line Location and, by moving only into an adjacent Front Line Location, and never re-entering the same Front Line Location, eventually end up back at that starting Front Line Location.

11.6051 NO MAN'S LAND: Since each side is marking a Perimeter, there will often be sections of the map outside of both Perimeter Areas and sections where the two Areas overlap. Hexes outside of both Perimeter Areas are No Man's Land, as are hexes *within* both Perimeters that contain no units; 11.6062. The overlapping hexes containing units are Isolated Areas. A Strategic Location can never be a No Man's Land Location, as one side will *always* Control it (at the start of CG I/III the Russians Control all non-German-entry-hex Locations; 11.51, SSR I.4).

11.6052 CONTROL MARKERS: Each side may (at *any time* during/after a CG scenario) place a friendly Location Control marker (supplied in the RB counter mix) in a Strategic Location (see Definitions; 11.2) that it currently Controls (or is awarded Control of, as per A26.13), if that Location's Control might affect victory determination or the alignment of either Perimeter. The Control marker must be removed (or flipped over) if the Controlling side loses Control of that Location. Note that non-Strategic Locations may still be Controlled (as per A26.11-.12) but never receive a Control marker.

11.6053 MAP-EDGE MARKERS: First, a Perimeter marker is placed in each friendly-Controlled non-Water-Obstacle map-edge hex that is adjacent to an enemy-Controlled map-edge hex. Each such marker is then pointed towards another friendly Perimeter marker along a map-edge (Alternate) Hex Grain that is devoid of enemy-Controlled hexes [EXC: If a map-edge hex is adjacent to two enemy-Controlled map-edge hexes, place a single marker in that hex, facing off the map]. This map-edge (Alternate) Hex Grain may even go "around the corner(s)", and along Shore Hexes, of the map if necessary (and therefore change from a normal to an Alternate Hex Grain, or vice-versa). Since the Control of map-edge Locations are especially important, players are urged to leave the map-edge Perimeter markers on the map during play (whereas others, at the player's discretion, may be removed after setup). Note that map-edge Perimeter markers usually occur in pairs, pointing towards each other.

11.6054 PERIMETER MARKERS: Each side now places Perimeter markers, *one at a time*, in ground level Locations that contain a friendly Infantry-MMC/Control-marker; it makes no difference which side places first, or if both sides place simultaneously. As each Perimeter marker is placed, it must be pointed towards a Location containing another friendly Perimeter marker, along a(n) (Alternate; E12.11) Hex Grain that is devoid of *ground level* non-SMC enemy units/Control-markers. In addition, the new (Alternate) Hex Grain may *not* overlap another friendly (Alternate) Hex Grain (even on the map edge) [EXC: in a hex already containing a friendly Perimeter marker]. The placement of Perimeter markers *must* continue in this manner until each side has formed a closed "loop" of connecting (Alternate) Hex Grains (including map-edge (Alternate) Hex Grains) which that side is satisfied encloses the *largest* Perimeter Area legally possible (though at *this point* not always encompassing every friendly unit). It is possible to have $\geq$ one such closed "loop" in this manner. The markers placed in this step "build on" the map-edge markers placed in the previous step. See the 11.6066 Perimeter EX.

11.6055 READJUSTMENT: Each side is free to remove or readjust their previously-placed Perimeter markers until it is satisfied with its Perimeter, as long as all of the markers are legally positioned. A side may even start over, but it must begin again with step 11.6053.

11.6056 POCKETS: Each friendly unit still outside its Perimeter Area is in a Pocket [EXC: SMC alone cannot create a Pocket; see 11.6059]. See 11.6057 if the unit is not at ground level. In order to enclose a ground level unit(s) within a friendly Pocket, *two* (if possible) Perimeter markers are placed simultaneously in hexes that contain such a friendly non-SMC-unit/Control-marker.²¹ The two markers are pointed towards *each other*

11.6056

along a(n) (Alternate) Hex Grain that is devoid of ground-level non-SMC enemy units/Control-markers. After the two markers are thusly positioned, additional Perimeter markers may (if possible) be placed (as per 11.6054) in order to expand the Pocket and enclose other friendly unit(s). However, a Pocket can *never* include any Location that was enclosed in the friendly Perimeter Area during step 11.6054, nor any map-edge hex (if the latter should happen, see 11.6058). If a Pocket consists of only one hex, no Perimeter marker is needed since the units enclosed will remain on-map and must set up in that hex for the next scenario [EXC: Escape; 11.6063]. All Pockets are Isolated Areas and part of the friendly Perimeter Area, even though physically separate from the main Perimeter Area.

11.6057 NON-GROUND-LEVEL POCKETS: Upper level, as well as RB Cellar, building Locations can also form a Pocket if a MMC present in such a Location cannot reach the ground level of that building hex except via enemy-Controlled Location(s). Such a Pocket is not indicated by Perimeter marker(s) since those markers are *always* placed at ground level; therefore, this type of Pocket is best recorded by direct notation on a photocopy of the reduced-size RB mapsheet (the appropriate circled level-number should suffice). All upper-level/RB-Cellar Pocket Locations (whether enemy- or friendly-Controlled) ADJACENT to another such Pocket Location in the same building constitute *one* Pocket, distinct from other possible Isolated Areas within that building or in adjacent hexes outside that building.

EX: If one side Controls the ground- and 2nd-level Locations in a building, while the other side Controls the 1st level (and has a MMC there), the 1st and 2nd floors together constitute one Pocket. This upper-level Pocket is separate from any possible Isolated Area that the ground level might be part of.

11.6058 If the process of expanding a Pocket adds a map-edge hex to a Pocket, that section of the Perimeter Area ceases to be a *Pocket* and is considered to be a "normal" section of the Perimeter Area (i.e., as if it had been marked out in step 11.6054). The Isolated status of any Location within that section does not change.

11.6059 At this point, each side gains Control of all *non-Isolated* Locations within their Perimeter Area and removes all enemy Control markers from such Locations. Each friendly SMC that is still *outside* of the friendly Perimeter Area is Eliminated.²² Each Location of an Isolated Area maintains its present Control status; all No Man's Land hexes become un-Controlled. See the 11.6066 EX.

11.606 ISOLATION: Isolated Areas are of four types (A-D), based on the units enclosed therein:

- A) No unit(s);
- B) Only SMC of one or both sides;
- C) MMC/vehicle(s) of one side;*
- D) MMC/vehicle(s) of both sides.*

* The presence of SMC (of either side) does not alter the classification.

11.6061 EFFECT ON UNITS:²³ In a type B Isolated Area each enclosed SMC *must* attempt to Escape (11.6063). In a type C Isolated Area each enemy SMC *must* attempt to Escape. In a type C/D Isolated Area each unit/Weapon enclosed begins the next scenario with Ammunition Shortage (A19.131) [EXC: Escaped (11.6063); Eliminated (11.6094-.6095, 11.610, 11.6132 and 11.6134-.6136)]. The ID of some may need to be recorded to distinguish them from others not suffering the same penalties. See 11.6242 for setup restrictions in Isolated Areas.

11.6062 EFFECT ON HEX CONTROL: Each type A, and each type B, Isolated Area becomes No Man's Land. [EXC: If all of the Controlled Locations (i.e., ignoring No Man's Land) ADJACENT to a type A or B *Pocket* (only) are Controlled by one side, all Locations of that Area become non-Isolated and pass to the Control of that side. If this occurs, the enemy Front Line Locations that delineated the Pocket are no longer considered Perimeter Locations for that side.] Each Location of a type C Isolated Area is Controlled by the occupying side. Each type D Isolated Area has some Locations Controlled by each side.

11.6063 ESCAPE FROM ISOLATION: Any unit in an Isolated Location may attempt to Escape by making a DR on the Escape Table. If more than one Infantry unit in the *same* Location wish to Escape, they may combine themselves into one or more stacks. Each stack then makes its own Escape DR. One German squad stacked with each leader may freely Deploy. Any SW/Gun may be dropped or transferred/dismantled-(if-possible) prior to its possessor's Escape attempt. Guns cannot accompany an Escaping unit [EXC: if dm].

ESCAPE TABLE

Final DR	Infantry:	AFV:
≤ 8	Escapes ¹	Escapes
9	Escapes, Replaced ^{2,3}	Escapes
10	Escapes, Casualty Reduced ³	Abandoned* (crew Escapes)
11	Escapes, Replaced then Casualty Reduced ^{2,3}	Abandoned* (crew Eliminated)
≥ 12	Eliminated	Eliminated* (CS NA)

¹ Original 2 DR always results in Escape and Heat of Battle (A15.); however a subsequent result of Berserk or Surrender Eliminates the unit(s).

² A unit that would become Disrupted is Eliminated instead.

³ Use Random Selection for a stack.

* In current hex and facing.

DRM:

- +x (Armor-)Leader/Heroic DRM (NA to a lone SMC)
- 1 If Russian*
- 1 If lone, unwounded SMC
- 1 If ≤ 2 hexes from a friendly-Controlled, non-Isolated hex
- 1 If adjacent to friendly-Controlled, non-Isolated hex
- +1 Per HS equivalency > 1 HS using the same Escape DR*
- +1 Per PP > IPC being carried (unit with most excess PP determines this DRM for a stack (a stacked leader may combine to increase a MMC's IPC)*)
- +2 If Encircled*
- +2 Captured AFV

* NA to AFV.

11.6064 ESCAPE RESULTS: If a unit survives the Escape attempt it and each SW portaged by it are Retained. An Original DR of 2 results in Escape and Heat of Battle; use Random Selection to determine the unit(s) affected if a stack is involved. [EXC: Any result other than Hero-Creation/Battle-Hardening results in the selected unit(s) Elimination.] All Encircled markers are now removed.

11.6065 If the Escape of a unit(s) changes the type of an Isolated Area, 11.6061-.6062 must be consulted again to determine the effects on remaining unit(s) and hex Control.

11.6066 DRAWING THE PERIMETER: The Perimeter determination procedure is now complete. Both sides should now record their Perimeter on a photocopy of the reduced-size RB map found on the back of the Chapter O divider (e.g., both sides draw their Perimeter on the *same* photocopy, using a different colored marker for each Perimeter drawn). Mark each *hexside* that a friendly Front Line Location shares with a No Man's Land or non-Isolated, enemy-Controlled Location. This procedure converts the connecting (Alternate) Hex Grains into a more understandable form on the reduced-size map.²⁴ The type (A, B, C, D) of an Isolated Area should also be recorded.

EX: This example describes the Perimeter determination procedure and its effects on Isolated units. Actions that each side takes in the various steps (11.605-.6066) are detailed. The illustration on the facing page shows the southwest corner of the RB map; it is important to note that for purposes of this example no other hexes exist (i.e., the edge of the map area depicted represents the "true" edge of the map). Perimeter markers are placed at ground level in the hex whose coordinates have been printed in **bold** in the EX text. The format "A38 → C39" indicates that a marker is placed in A38 pointing towards another Perimeter marker in C39 along Hex Grain A38-B38-C39; "B38-C39 → D38" indicates that a Perimeter marker is placed in B38 pointing towards D38 along the Alternate Hex Grain B38-C39-D38 (as per the E12.11 Alternate Hex Grain diagrams).

In RePh step 11.6052 each side places a friendly Location Control marker in the Strategic Locations shown with such markers in the illustration. Not every eligible Location is so marked, as it is only necessary to mark a Strategic Location that might affect the Perimeters' alignment. Then, as per step 11.6053, the German player places a friendly Perimeter marker in A41 and M44, pointing them towards each other along the A41 → A45, A45-B45 → M45, M45 → M44 map-edge (Alternate) Hex Grains (the 9-0 Commissar in hex I45 cannot disrupt the A45-B45 → M45 Alternate Hex Grain since a SMC cannot Control a hex; A26.11). The Russian player likewise places Perimeter markers in A40 and M43, pointing them towards each other along the A40 → A38, A38-B37 → M38, M38 → M43 map-edge (Alternate) Hex Grains.

Next, in step 11.6054, the German player starts by placing a Perimeter marker in L43, pointing towards the map-edge marker in M44 (Hex Grain L43 → M44). He continues by placing markers in the following order: J41-K42 → L43; G42-H41 → J41; F42 → G42; B42-C43 → F42; and finally B42-B41 → A41. This completes a "loop" of connecting (Alternate) Hex Grains comprising the following hexes: M44, L43, K43, K42, J41, I42, H41, G42, F42, E43, D42, C43, B42, B41, A41, A42, A43, A44, A45, B45, C45, D45, E45, F45, G45, H45, I45, J45, K45, L45 and M45. These hexes are all of the German Front Line Locations and enclose the German Perimeter Area.

At the same time the German side is marking his Perimeter the Russian may be doing likewise. First, the Russian player places a Perimeter marker in K41, pointing towards the friendly map-edge Perimeter marker in M43 along Alternate Hex Grain K41-L41 → M43. He continues by placing further Perimeter markers in the following order: G41-H40 → K41; C41-D41 → G41; C42 → C41; C42-B41 → A40 (map-edge Perimeter marker). The Russian Perimeter (Front Line Location) "loop" consists of the following hexes: M43, L42, L41, K41, J40, I41, H40, G41, F41, E41, D41, C41, C42, B41, B40, A40 and the remaining map-edge Perimeter hexes. These hexes are most of the Russian Front Line Locations; however, several more will be added during the subsequent steps in order to enclose "cut off" units.

In step 11.6056, the German player notes that all of his units are already successfully enclosed within/on the German Perimeter Area, therefore there are no German Pockets. However, the

O

Russian player notes with chagrin that he still has five friendly units not currently within the Russian Perimeter (the T-70, squads C, D, and T, and the 9-0 Commissar). Although the Russian player would like to have placed a marker in the T-70's hex during step 11.6054, he could not since there is no friendly MMC/Control-marker in that hex. Instead, he now places Perimeter markers simultaneously in H42 and I44, pointing towards each other along Alternate Hex Grain H42-H43 → I44. A marker is then placed H44 → I44 to expand Pocket #1 and enclose Russian squad C. Note that H44 → H42 would not be a legal placement since it would overlap the H42-H43 → I44 Alternate Hex Grain in hex H43; and that it is illegal to expand the Pocket with I41-I42 → H42 since hex I41 is already within the Russian Perimeter. Hexes H42, H43, H44 and I44 become Isolated Russian Perimeter hexes.

The Russian player notices that friendly squads D & T are in upper-level Pockets #2 and #3, respectively; as per 11.6057, no Perimeter markers are placed. Note that even though Pockets #2 and #3 are adjacent to Pocket #1, they are independent of that Pocket. H41 and G43 become Russian Perimeter Area hexes and therefore their ground levels become Isolated since they are now part of both Perimeters (the first levels were already Isolated because they are Pockets). Hex E42 is a No Man's Land hex and becomes un-Controlled (as it is outside both sides' Perimeters), while hex J38 passes to Russian Control (note that the German player could not form a Pocket with just the friendly Control marker in J38, as there must be a friendly unit present). The 9-0 Commissar is Eliminated (the Russian player could not expand Pocket #1 to include him because the leader is not an AFV/MMC/Control-marker).

The players now proceed to RefPh step 11.606, "ISOLATION". The only Isolated German unit is squad A in H41, whereas the following Russian units are Isolated: the T-70 (H42), squad C (H44), squad D (G43) and squad T (H41). German squad A and Russian squad T are in a one-hex type D Isolated Area which includes Pocket #3 (but is not in its entirety a Pocket); Russian Pocket #2 and the ground level in G43 are a one-hex type C Isolated Area; Russian Pocket #1 is a type C Isolated Area; hex B41 is a type A Isolated Area. As per 11.6061, all the aforementioned Isolated units will suffer from Ammunition Shortage at the start of the next CG scenario (unless such a unit successfully Escapes; 11.6063). Hexes B41 and E42 become No Man's Land (11.6062).

In step 11.6063 Russian 5-2-7 squad D attempts to Escape; it has an Escape Table DRM of -1 (-1 [Russian] +1 [extra HS] -1 [≤ 2 hexes from friendly-Controlled, non-Isolated hex G41] = -1). The Original DR is 12, modified to 11, which results in the squad being Replaced by a 4-2-6 Conscript and then Casualty Reduced to a 2-2-6 HS, which Escapes and is Retained in the Russian OB. In step 11.6065 the German side now gains Control of the 1st-level Pocket in G43 (vacated by the Escaping Russian squad) since the only ADJACENT Location (ground level of G43) is German-Controlled. Hex G43 is no longer part of the Russian Perimeter and is no longer Isolated.

DRAWING THE PERIMETER:

This enlargement of the reduced-size RB map shows how the players have marked their perimeters (11.6066). The Soviet Perimeter is in red; the German in blue. Note that both Perimeters have been recorded on the same reduced-size map.

11.607

11.607 CLEARING THE MAP: Each player now removes all remaining non-Isolated units/Equipment from friendly-Controlled Locations and places them in their proper box on his copy of the Chapter O divider (11.15) [EXC: A Gun/AFV in either a Fortified Building Location or Pillbox (SSR CG5; 11.4) and Immobile vehicles are left on the map].

11.6071 ISOLATED AREAS: Units/Equipment in Isolated Areas are not cleared from the map, and each must be left on the map in its current Location.

11.6072 RETAINED EQUIPMENT & SCROUNGING: All removed items, as well as all Equipment left on-map, are considered Retained by the side Controlling its Location [EXC: hidden Set DC; see 11.6073]. Each such item may be Eliminated [EXC: an AFV becomes a Wreck or Burnt-Out-Wreck] if its Retainer wishes to do so, after any desired Scrounging attempt (D10.5).

11.6073 HIDDEN FORTIFICATIONS: Each still-hidden Fortification, including all Fortified Building Locations and tunnel entrance/exits in Locations currently Controlled by its purchaser's opponent, is placed on-map [EXC: A tunnel is revealed only if both its entrance and exit Locations are currently enemy-Controlled]. Each minefield in such a Location is revealed by placement of a Known Minefield counter (i.e., one which indicates the presence but not the strength/type of the minefield)²⁵. The minefield's strength/type need not be revealed. Each on-map Fortification (i.e., from previous CG scenarios) is Controlled by the side Controlling its Location, regardless of which side Controlled it previously. A friendly-Set, hidden Set-DC in a friendly-Controlled Location may remain hidden or be "removed" and Retained; if in an enemy-Controlled Location it is now Eliminated instead.

11.608 PRISONERS: Each prisoner Guarded by a non-Isolated unit is Eliminated.²⁶ An Isolated Guard may retain possession of his prisoner(s) (though the latter may be freely transferred to another friendly unit in the same Isolated Area), execute them, or free them. If executed, Massacre (A20.4) will be in effect during the next CG scenario. If freed, a prisoner is automatically Retained by the side friendly to it. An unarmed MMC is Replaced by a friendly Conscript MMC of the same size; a freed SMC is Replaced by its original SMC type.

11.609 EXTINGUISHING BLAZES: Each Location currently marked with a Blaze (not Flame) counter is considered fully consumed by the fire. Players must remove each Blaze counter and make the appropriate terrain alterations when performing the following substeps (11.6091-.6097).

11.6091 BURNING WRECK: Each Burning Wreck (including a burning armored cupola; O.7) has its Blaze marker transferred to the Burnable Terrain (if any) in its Location (one of the following sub-steps will apply to the newly created terrain Blaze); otherwise, that Blaze marker is removed. The Wreck itself is replaced with a Burnt-Out-Wreck counter (see SSR CG19, 11.4) [EXC: an armored cupola that was burning is removed].

11.6092 BRUSH, ORCHARD, WOODEN RUBBLE: Place a Shellhole counter in the Location; the other previous terrain no longer exists.

11.6093 STONE RUBBLE: The stone rubble still exists, and the Location may catch Fire again in later scenarios.

11.6094 NON-FACTORY BUILDING: Place the correct Rubble counter (without a Cellar counter beneath it; 6.6) in all ground-level Locations of a non-Factory building that has at least one Blaze in any of its Locations. This rubble may catch Fire again in later scenarios. Each Isolated unit/Equipment that would have been confined to setting up again in that building is Eliminated, and those formerly Isolated rubble hexes become Controlled by the opponent.

11.6095 FACTORY BUILDING: A Factory is not reduced to rubble; rather, place a Guttered marker in any hex of it (5.5).²⁷ Each Isolated unit/Equipment that would have been confined to setting up again in that Factory is Eliminated, and those formerly Isolated Factory hexes become Controlled by the opponent.

11.6096 FLAME SPREAD:²⁸ Each Flame is now flipped over to its Blaze side [EXC: Each Flame in a now-Guttered non-rubble Factory Location is removed], and another Blaze counter is also

placed in each Burnable Terrain hex that is adjacent to it and does not currently contain a Blaze/Flame counter. All such Blazes will be in effect at the start of the next CG scenario and are assumed to occupy all existing Burnable Terrain levels in those hexes. Each Isolated unit/Equipment confined to setting up in a Location now containing a Blaze is Eliminated (replace an AFV with a Burnt Out Wreck).

EX: At scenario end there is a Blaze at ground level in W10 and a Flame at 1st level in X10 (both being hexes of building W10). In RePh step 11.6094 the Blaze in W10 is removed and all three hexes of the building become stone rubble at ground level. The Flame at 1st level in X10 is now transferred to the ground-level rubble. In RePh step 11.6096 that Flame becomes a Blaze, and additional Blazes are placed in adjacent hexes W10, X9 and X11.

11.6097 FORTIFICATIONS: Each Fortification/Equipment (including a Fortified Building Location) in a non-Factory terrain Blaze Location (including a building just reduced to rubble as per 11.6094) is Eliminated [EXC: Entrenchment and Pillbox, though all Equipment therein is Eliminated]. Each item of Equipment (but no Fortification) in a newly-Guttered Factory (11.6095) is Eliminated.

11.610 WOUNDED LEADERS: Each side makes a dr for each currently Wounded leader. On a Final dr ≤ 2 the leader is Retained in his wounded state. On a Final dr ≥ 3 the leader is considered to have sustained wounds serious enough to require his evacuation (or, if Isolated, to have died of his wounds) and is Eliminated. There is a +1 dr if the leader is confined to setting up in an Isolated Area (11.6061; 11.6242).

11.611 BATTLE HARDENING & PROMOTION

11.6111 RECOMBINING: All Retained same-class HS with the same strength Factors must now Recombine (A1.32) so that no more than one of each HS type is Retained. [EXC: Isolated HS may only Recombine with other Isolated HS of the correct type allowed to set up in the same Isolated Location(s); 11.6242.]

11.6112 HEROES & MMC: On each side, each Retained Hero [EXC: heroic leader; 11.6113] is Eliminated; however, each such Elimination enables that side to Battle Harden one MMC of the owner's choice (in the same Isolated Area as that Hero, if applicable). Each side also makes one Secret DR to determine the number of Retained Infantry MMC eligible for Battle Hardening. In all cases, an Elite MMC (as well as a crew) that Battle Hardens becomes Fanatic (but only for the duration of the next scenario; 11.602e). No MMC may Battle Harden more than once per RePh.

MMC

BATTLE HARDENING TABLE

Final DR	# of MMC
≤ -1	5
0	4
1	3
2-3	2
4-5	1
≥ 6	—

DRM:

- 3 Friendly side won this CG Day's scenario
- 1 If Russian
- 1 Per 20 CVP amassed by friendly side in the previous scenario

11.6113 LEADER: On each side, each Retained Heroic leader Battle Hardens and loses his heroic status [EXC: a heroic 10-3 or 10-0 loses his heroic status with no additional effect]. Each side also makes one Secret DR to Battle Harden a Retained Infantry leader, using that side's column on the following table [EXC: 11.6114]. If the leader selected is not currently Retained by that side the player then must Battle Harden the lowest-grade Retained non-wounded leader (if any).

LEADER

BATTLE HARDENING TABLE

Leader Type	German DR	Russian DR
10-2	≤ 2	≤ 2
9-2	3	3
9-1	4	4
9-0*	—	5
8-1†	5	6
8-0	6-7	7-8
7-0	8-9	9-10
6+1	10-12	11-12

DRM:

- 2 Friendly side won this CG Day's scenario (optionally, the player may, after the DR, choose to ignore this DRM, or apply only a -1 DRM)

* Always Battle Hardens to a 10-0

† Always Battle Hardens to a 9-1

O

11.6114 PROMOTION OUT OF THE RANKS: In lieu of making a DR on the 11.6113 Table, the player may choose to either:

- a) exchange one non-Isolated unwounded 8-0 Infantry leader for two 7-0s; or
- b) exchange one non-Isolated unwounded 8-1 Infantry leader for one 8-0 and one 7-0.

However, a player may not use any option (a/b) that would give him > one leader per four squad-equivalents (if German), or per eight squad-equivalents (if Russian) of his currently Retained units.

11.612 NEW CG DAY & SAN ADJUSTMENT

11.6121 NEW CG DAY: Each passage of this RePh step represents the start of a new CG Day. Should no scenario be generated (RePh step 11.623) players return to this step and repeat RePh steps 11.612-.623 until one is.

11.6122 SAN ADJUSTMENT: Each side whose SAN is currently ≥ 4 must make a dr, with a + drm equal to that side's current SAN minus 4. A Final dr of ≥ 5 immediately reduces that side's current SAN by one. Each side whose SAN is currently zero has it automatically raised to 2 (no CPP expenditure is necessary).

The Russian SAN is currently 6; there is a +2 drm to the Russian SAN adjustment dr ($6 - 4 = 2$). Therefore, an Original dr of 3, 4, 5 or 6 will lower the Russian SAN to 5.

11.6123 BOOBY TRAP DEACTIVATION: If Booby Trap Level A or B is currently in effect, the Russian player makes a dr: an Original dr of six decreases that Level by one (i.e., Level A goes to Level B; Level B reverts to Level C). Any other dr has no effect.

11.613 EQUIPMENT REPAIR & REPLENISHMENT

11.6131 AFV: Each side performs the applicable step(s) below for each AFV in a friendly-Controlled Location.

- a) Each abandoned non-Isolated AFV may remain abandoned, or may be remanned and operated (as per A21.22) by any Retained unit of that side. Such remanning unit must begin the next scenario manning that AFV.
- b) Each Shocked/UK AFV must have the necessary dr (C7.42) made for it until it is no longer under the effects of Shock/UK.
- c) Each manned, bogged AFV must undergo Bog Removal attempts (D8.3) until it is either unbogged or immobilized. MP expenditure is immaterial. If unbogged clear from the map if non-Isolated.
- d) Each manned, immobilized AFV must make a dr on the table below to determine if the Immobilization is repaired.

IMMOBILIZATION REMOVAL TABLE

Final dr	Effect	drm:
≤ 2	Becomes Mobile*	+x Per armor leader DRM
≥ 3	No change	+1 If only Non-Qualified Use (A21.13) possible
		+1 If Isolated
		+1 If manned by Inexperienced Crew (D3.45; 11.6207)

* Retained; clear from the map if non-Isolated.

11.6132 WEAPON REPAIR: Each side makes a separate dr on the table below for each malfunctioned non-Captured Retained Weapon.

WEAPON REPAIR TABLE

Final dr	Effect	drm:
≤ 2	Repaired	-2 If Vehicular-mounted
≥ 3	Eliminated*	-1 If Russian MG/ATR*
		+1 If only Non-Qualified Use (A21.13) possible
		+1 If Isolated

* If Vehicular-mounted, the Weapon is Disabled; if MA, the AFV is placed under RECALL (11.6141).

11.6133 AFV MG EXCHANGE: A Disabled non-Captured, non-Isolated AFV MG (even if Disabled in step 11.6132) may be automatically repaired by the Elimination of a friendly, non-Isolated Retained LMG.

11.6134 FT/DC: Each FT/DC removed from play during the preceding scenario (regardless of why it was removed) is Retained by its original owning side only if the Original effects DR causing its removal was ≤ 10 ; otherwise, it is Eliminated. Place each such Retained SW in the friendly side's "Retained" box on the Chapter O divider. However, the side may never Retain in this manner more friendly DC, nor friendly FT, than it has friendly non-Isolated Assault Engineer (only) squads at this point in the RePh.³⁰

11.6135 CAPTURED WEAPON: Make one dr for each functioning Captured Retained Weapon: if ≥ 3 it is Eliminated (Disabled if vehicular-mounted). Each already malfunctioned Captured Weapon is Eliminated (or Disabled). Disablement of MA by either means does not cause Recall.

11.6136 CAPTURED AFV: A Captured AFV may remain in play if it has any functioning Weapon (even if its MA is Disabled); otherwise, it becomes a wreck. See also 11.6072.

11.6137 SPECIAL AMMO: Each non-Captured, non-Isolated Retained Gun (including vehicular-mounted) has all of its Depleted ammunition types (if any) restored to normal availability.

11.6138 LOW AMMO REMOVAL: Each Low Ammo counter on each non-Isolated unit is removed.

11.6139 AMMUNITION SHORTAGE REMOVAL: Each non-Isolated Infantry-unit/Weapon currently suffering Ammunition Shortage (11.6061) now has such restrictions lifted.

11.614 ARMOR WITHDRAWAL:

11.6141 RECALL: Each Mobile, non-Isolated Retained AFV under Recall is Eliminated. If Mobile, under Recall and Isolated, it begins the next scenario under Recall (as well as suffering Ammunition Shortage; 11.6061).

11.6142 AFV PLATOON WITHDRAWAL: Each side makes a Secret dr on the following table for each friendly (including Captured) non-Isolated, non-Dug-In Retained AFV Pltn (or part thereof) [EXC: German SPW Pltn] that has had $\geq$ one AFV of its Pltn on the map in at least one CG scenario to determine whether the Pltn (or remainder thereof) must be Withdrawn. A Withdrawn result Eliminates each remaining non-Isolated AFV (even if abandoned/immobilized) of that platoon, as well as each armor leader originally entered with that Platoon (if any).³¹

AFV PLATOON WITHDRAWAL TABLE

Final dr	Result	drm:
≤ 5	Retained	-1 If friendly side's win:loss ratio is $\leq 1:2^*$
6	Withdrawn	

* Not applicable until $\geq$ two CG scenarios have been completed.

11.6143 ISOLATED AFV: An Isolated Mobile AFV that belongs to an AFV Platoon forced to Withdraw is not Withdrawn. Instead, such an AFV makes a dr in each friendly RPh of the next scenario. A dr of $\leq$ the current turn number immediately places that AFV under Recall. If, at scenario end, such a non-Isolated AFV is still on-map, it is then Eliminated (it is not Retained for the next scenario unless still Isolated).

11.615 FORTIFICATION REMOVAL:³² Attempts may be made to Eliminate any Known wire/minefield/Entrenchment (including an A-T Ditch) in any friendly-Controlled non-Isolated Location. A roadblock may also be rolled for removal, but only if the removing side Controls both ground-level Locations that share that hexside. If a Location contains more than one type of the above-mentioned items (all mines are considered the same "type"), the side may roll once for each, but must announce which one is currently being rolled for [EXC: all A-P mines must be Cleared from a Location before a removal attempt may be made for another same-Location non-mine fortification]. Only one attempt may be made per "item" per each such Location per completion of this RePh step. Pre-existing Labor drm are not applicable, nor does the dr create or increase Labor drm.

FORTIFICATION REMOVAL TABLE

Final dr	Result
≤ 3	Eliminated*
≥ 4	No Effect

drm:

- +2 Wire/minefield/Entrenchment is in a Front Line Location.
- +2 Roadblock is along a hexside of $\geq$ one Front Line Location.
- +1 Wire/minefield/Entrenchment is ADJACENT to—not in—a Front Line Location.
- +1 Roadblock is not along a hexside of a Front Line Location, but is along a hexside of a hex that is ADJACENT to a Front Line Location.
- 1 Friendly side currently Retains $\geq$ three non-Isolated Assault Engineer squads.

* Vs a Known minefield, this result Eliminates all mines (A-P and A-T) in the Location.

³⁰ An Original dr of 6 results in Casualty Reduction of a non-Isolated elite MMC (Assault Engineer if possible, otherwise owner's choice; if no elite MMC is available, Reduce a First Line MMC, etc.).

11.616

11.616 CPP REPLENISHMENT: Each side now makes a Secret DR to replenish its CPP.

CPP REPLENISHMENT TABLE

Final DR	CPP Increase
≤ 2	+18
3-4	+17
5-6	+16
7-8	+15
9-10	+14
11-12	+13
≥ 13	+12

DRM:

- y As per CG scenario Balance provision (11.32) in effect
- ±x Friendly Historical DRM (11.6161) for the current CG Day
- +1 If the friendly side selected the "Attack" Initiative chit on the previous CG Day
- 1 Per each 20 Casualty VP (A26.2) suffered by the friendly side on the previous CG Day (including friendly units[s] Eliminated since the last scenario during the current CG Day's RePh; e.g., Recalled or Withdrawn AFV; 11.614, etc.)

11.6161 HISTORICAL DRM CHART:³³ The DRM given in the chart below are used as DRM for the following Tables: CPP Replenishment (11.616), ELR Loss/Gain (11.617), and RG Strength determination (11.6201 & 11.6204), and also inversely to adjust the maximum number of Infantry Companies a side may purchase per CG Day (11.6195). Players may wish to write in the pertinent DRM for their side in the "Hist DRM" column on the CG Roster. Each side uses only the DRM listed for its side for the current CG Day.

HISTORICAL DRM CHART

Date	German DRM	Russian DRM	Date	German DRM	Russian DRM
17 Oct	-2	-1	1 Nov	+1	-1
18 Oct	-2	-1	2 Nov	+2	0
19 Oct	-1	0	3 Nov	+1	+1
20 Oct	0	0	4 Nov	+1	+1
21 Oct	-1	-1	5 Nov	+1	+1
22 Oct	-2	0	6 Nov	+1	0
23 Oct	-1	-1	7 Nov	0	0
24 Oct	-1	-1	8 Nov	0	0
25 Oct	-1	0	9 Nov	-1	-1
26 Oct	0	0	10 Nov	-2	-1
27 Oct	-1	-1	11 Nov	-3	-1
28 Oct	0	-1	12 Nov	-1	0
29 Oct	+1	0	13 Nov	0	0
30 Oct	+1	-1	14 Nov	+1	+1
31 Oct	0	-2	15 Nov	+1	+1

11.6162 CG ROSTER UPDATE: Record the final result of the CPP Replenishment DR in the "Repl" column, and on the proper line for the current CG Day, on the CG Roster. (Note: The "17/10" [17 October] CG Day's "Repl" box is shaded-in as CPP replenishment is not possible on that day). Add the current CG Day's "Repl" number and "Start" number (the latter is the number of CPP unspent from the previous CG Day), and record this sum in the "Total" box of the same line. This is the total CPP available for purchasing RG/Recon.

EX: Players have just completed the 17 October Initial Scenario of CG I, which ended in the Russians winning and amassing 44 Casualty VP. In RePh step 11.6121 the CG Day changes to 18 October. In RePh step 11.616 each side rolls for CPP Replenishment. The German Original DR is 10. This becomes a Final DR of 6 (-2 DRM [Historical DRM] + -2 [Germans suffered the loss of 44 Casualty VP] = -4), giving the Germans 16 CPP. Because the Germans also have two unspent CPP from the previous CG Day (as evidenced by a "2" in the "Start" box on the 18/10 CG Day of the German CG Roster), they now have 18 CPP to spend. The German player records "18" in the "Total" box for the 18 October CG Day.

11.617 ELR LOSS/GAIN: Each side makes a DR to determine if its present ELR changes. On a Final DR of ≤ 2 that side's current ELR increases by one, to a maximum of 4. On a Final DR of ≥ 13 its current ELR decreases by one, to a minimum of 0. Update any change in a side's ELR in the "ELR" column of the CG Roster for that CG Day. A side's ELR applies to all non-crew Infantry units of that side. Normal Battlefield Integrity [A16.] rules should *not* be used in the RB CG. The following cumulative DRM can apply to the ELR Loss/Gain DR:

DRM:

- 1 Friendly side won yesterday's CG scenario
- 2 Per Idle Day since the last-completed CG scenario
- 2 Per friendly elite Infantry Coy purchased on the previous CG Day
- 1 Per friendly first-line-Infantry-Coy/AFV-Pttn [EXC: SPW Pttn] purchased on the previous CG Day
- +1 If friendly side selected the Attack chit on the previous CG Day (Germans are assumed to select the Attack chit for each Initial Scenario; 11.5)
- +2 Per scenario completed since the start of the CG or since the last Idle Day (friendly side's choice)³⁴
- ±x Historical DRM for friendly side

11.618 WEATHER & EC DETERMINATION: The Russian side makes a DR on the RB Weather Table to determine the weather for the current CG Day, then makes a dr for the EC. Wind Force and direction are determined in RePh step 11.6241. Record the results in their respective columns, and on the proper line for the current CG Day, on the CG Roster.

RB WEATHER TABLE

Final DR	Result
≤ 2	Fog/Mist
3-6	Overcast
7-9	Clear
≥ 10	Clear & Gusty

DRM:

- 1 If the previous CG Day was Overcast.

RB EC TABLE

Final dr	Result
≤ 1	Wet
2-3	Moist
4-5	Moderate
≥ 6	Dry

drm:

- 3 If the previous CG Day was Overcast.
- 1 If the previous CG Day had Fog/Mist.
- 1 If the month is November.
- +1 If the previous CG Day had Dry EC.

11.619 PURCHASING REINFORCEMENT GROUPS: Both sides now secretly allot CPP for the purchase of RG. All CPP expended are subtracted from that side's current CPP total. The CPP expended, those remaining, and the RG(s) purchased may all be kept secret. Each side consults its respective RG chart for the different types of RG available, the CPP cost of each, the number of each that may be purchased during the course of the CG being played, and any special notes pertaining to each.

As each RG is selected, record its ID (and the CPP expended to purchase it) in the "RG Purchased" column, on the line for the current CG Day, on the CG Roster. After all RG are selected write the total CPP expended in the "Spent" column of the CG Roster for the current CG Day. Then write the number of CPP remaining, even if zero, in the "Left" column for the current CG Day. Any CPP remaining may be used in Recon (RePh step 11.622), or to purchase further RG in any subsequent RePh step 11.619 (-.6197).

Each RG chart contains the following columns:

11.6191 ID: Provides an alphanumeric identification for each RG. All AFV RG have an ID of "A#", all Infantry RG have an "I#" ID, etc.

11.6192 GROUP TYPE: Lists the name of the RG. This name and its ID are secretly recorded on the purchasing side's RG Purchase Record (RePh step 11.6197).

11.6193 FULL/DEPL UNIT TYPE: Lists the type(s) of units that each RG contains. The numbers listed immediately to the left and right of the "' (in Infantry Company and AFV Platoon RG only) represent the number of that Unit Type received at Full and Depleted Strengths respectively (RePh step 11.6201). HW/MOL-P RG use 11.6203 to determine Depleted Strength; OBA module and Gun Battery RG use 11.6204. The number of Stukas received is determined as per E7.21.

11.6194 CPP COST: Lists the CPP cost of the RG regardless of its (later-determined) Strength. This is the number of CPP that must be subtracted from the purchasing side's current CPP total in order to receive that RG. AFV, and most Infantry, RG enter play during the course of a CG scenario if purchased on that CG Day (see SSR CG9; 11.4). Place all the counters for each such reinforcing RG in a section of the "Reinforcements" box on the Chapter O divider until the units are set up to enter. The listed cost can be altered in three ways:

a) On-map Setup: Any AFV or Infantry RG (i.e., one whose ID on the Reinforcement Group Chart begins with an "A" or "I") may be used for normal on-map setup in a scenario played on the same CG Day they are purchased. Such an RG has its CPP cost increased by two (if Russian) or three (if German) [EXC: Russian RG I5, I7 and I8 and German RG I4 may always set up on-map on their CG Day of purchase at no additional cost].

EX: Players have just completed the 17 October CG scenario of CG I. In the following RePh (step 11.612) the CG Day changes to 18 October. Later, in RePh step 11.619, the German purchases an A6 RG (Pz IVF1 Pttn) at normal (5 CPP) cost. Thus, that RG may only enter from off-map on 18 October; if no scenario is played (or the German opts to keep it out of play) on that CG Day, that RG will be available for on-map setup on any scenario after 18 October (that RG's purchase date). Alternately, if he wishes to have it available for on-map setup in the 18 October scenario, he must purchase it for 8 CPP on that same Day (5+3=8 CPP).

b) Reserve: Any Infantry RG (i.e., one whose ID on the Reinforcement Group Chart begins with an "I") may be purchased as a Reserve RG by spending one < its normal CPP cost. A Reserve RG must be set up on-

^a Available for on-map setup on CG Day of purchase.

^b Apply a -2 drn to its Turn of Entry dr (E7.2) if purchased at two CPP. Each Stuka RG must be used on its CG Day of purchase or be forfeit (therefore, such an RG should not be purchased if the weather is Overcast or the German side anticipates being Idle (11.623).

^c Each MG is accompanied by a 1-2-7 crew; each Gun by a 2-2-8 crew.

^d To determine Depleted Strength see RePh step 11.620.

^e Assault Engineers (A11.5; H1.22) and Sappers (B28.8; B24.7).

^f After determining Strength (11.6201), the German may freely exchange one just-purchased SPW 251/1 for one SPW 251/10.

^g To determine SW and (armor) Leaders see RePh steps 11.6202 and 11.6205-6207, respectively.

^h Not available until November 5.

ⁱ Offboard Observer is at level 3 in (i.e., at the second level of) any friendly-Controlled west-edge hex or north-edge hex on/west-of hexrow N. Secretly record the hex prior to Russian setup. Cost is per module. Each Offboard Observer is Retained as long as the module he is assigned to is Retained (SSR CG10; 11.4).

^j Increase CPP cost by one per Pre-Registered hex (C1.73) purchased with module (no module may have > two Pre-Reg. hexes). Each Pre-Reg. hex is Retained as long as the module it is assigned to is Retained (SSR CG10; 11.4). Purchase of a Pre-Reg. hex(es) in the RB CG allows normal/Creeping Barrage (E12). A Creeping Barrage increases the cost of the module by 50% (FRU) and is not convertible (E12.771). Each Barrage (regardless of type) must have a north-south Hex Grain alignment (E12.11-12.2).³⁵ See also SSR CG6 (11.4).

^k Must enter as reinforcements if entered on the CG Day of purchase [EXC: 11.6194]. The RG is available for on-map setup if purchased on any CG Day prior to that of the scenario. See SSR CG9 (11.4) for Infantry/Armor RG entry restrictions.

^l Available for non-RCT OBA ≥ 100mm. The Spotter Plane is Retained as long as the module it is assigned to is Retained (SSR CG10; 11.4).

^m Subject to AFV Platoon Withdrawal as per 11.6142. If > one AFV Pltn of the same type are in the side's OB, the ID's of those AFV belonging to each Pltn should be recorded in case that Pltn is subsequently Withdrawn.

ⁿ No more than three RG of this type may be purchased prior to 8 Nov 1942.

map on the CG Day of purchase (should a scenario be played on that CG Day), using the principles of Cloaking (E1.4). [EXC: A Reserve RG (or part thereof) unable to set up on-map must instead be Retained off-map on its CG Day of purchase, but thereafter may be added to all other Retained friendly units.] Each Reserve RG purchased may (at purchaser's option) automatically include up to five Dummy Cloaking counters. Such an RG must have all its Cloaking counters set up at ground level ≥ six hexes from the closest enemy Front Line Location (on CG Day 17/10, each potential German entry hex is considered a Front Line Location for purposes of this rule). Each Cloaked Reserve unit/stack must remain Cloaked—and may conduct no action whatsoever—until an enemy unit is within three hexes of it and is in its LOS or until subjected to an enemy attack that results in the loss of the Cloaked unit/stack's Concealment, at which time the Controlling side may (or must, if thusly attacked) put that Cloaking counter's contents (if any) on-map. In general, the counter(s) represented by a Reserve Cloaking counter (if any) is considered not to exist until it appears on the map, except as noted below:

- A Reserve Cloaking counter is ignored for all Overstacking purposes;
- A non-Cloaked Dummy stack may neither set up in nor enter a Location that contains a Reserve Cloaking counter;
- A Reserve Cloaking counter is considered a non-Target vs an enemy Sniper attack (A14.22);
- A Reserve Cloaked leader may not use his leadership benefits for any purpose;

- If a Flame/Blaze not originally Kindled by a friendly unit occurs in a Location that contains a Reserve Cloaking counter (even a Dummy), that counter may move/advance once to an ADJACENT, non-Blazing Location—provided it is not moving closer to an enemy unit regardless of LOS. If it cannot do so, its owner may at that time place it anywhere within three hexes of its current hex, though he may not place it closer to an enemy unit and must otherwise abide by the rules pertaining to Cloaked Reserve setup. A Reserve Cloaking counter in a Location containing a Blaze that was originally Kindled by a friendly unit may not move/advance, and is Eliminated in the next friendly MPH.

Should Cloaked unit(s) still exist at the end of the scenario, or should no scenario be played on that CG Day, all such non-Dummy Cloaked Reserve units are Retained in the normal manner but are no longer considered Reserves. Cloaked Reserve units are subject to Isolation in the normal manner.

EX: During the 18/10 CG Day's RePh the Russian player purchases an I2 RG (Gds SMG Coy) as a Reserve at a cost of 6 CPP instead of the normal 7. All the units of this RG that remain Cloaked at the end of that CG Day are automatically Retained (i.e., become available for normal, non-Reserve on-map setup).

c) **Dug-In:** A Russian AFV Platoon may be purchased at 50% (FRU) of the normal CPP cost if set up on-map as Dug-In (use D9.5-.53; see also O.7). A Dug-In AFV may set up using HIP in Concealment Terrain (including Rubble) as per normal Gun HIP rules (A12.34), but firing any Weapon or changing TCA is con-

* Available for on-map setup on CG Day of purchase.

* Each SW is accompanied by a 1-2-7 crew; each Gun by a 2-2-8 crew.

* To determine Depleted Strength see RePh step 11.620.

* Assault Engineers (A11.5; H1.22) and Sappers (B28.8; B24.7). If other 6-2-8 are in play, record ID to distinguish. If Replaced, all Assault Engineer benefits are lost for the duration of the CG (even if the unit subsequently Battle Hardens).

* Available only in October.

* To determine SW and (armor) Leaders see RePh steps 11.6202 and 11.6205-.6207, respectively.

* Gives all Russian Personnel MOL capability (even if Isolated).

* Increase CPP cost by one per Pre-Registered hex (C1.73) purchased with a module (no module may have > two Pre-Reg. hexes). Each Pre-Reg. hex is Retained as long as the module it is assigned to is Retained (SSR CG10; 11.4). Purchase of a Pre-Reg. hex(es) in the RB CG allows normal/Creeping Barrage (E12). A Creeping Barrage increases the cost of the module by 50% (FRU) and is not convertible (E12.771). Each Barrage (regardless of type) must have a north-south Hex Grain alignment (E12.11-12.2).²⁴ See also SSR CG6 (11.4).

* Must enter as reinforcements if entered on the CG Day of purchase [EXC: 11.6194]. The RG is available for on-map setup if purchased on any CG Day prior to that of the scenario. See SSR CG9 (11.4) for Infantry/Armor RG entry restrictions.

* Subject to AFV Platoon Withdrawal as per 11.6142. A Russian AFV Platoon may be purchased as Dug-In (11.6194.c). If > one non-Dug-In AFV Pltn of the same type are in the side's OB, the ID's of those AFV belonging to each Pltn should be recorded in case that Pltn is subsequently Withdrawn.

* MOL capability is available only for the next CG scenario played.

considered a Concealment-loss activity (A12.141). Such HIP must be purchased separately (RePh step 11.621). A Dug-In AFV's BMG (if any) is Disabled. (Such a BMG is automatically Scrounged successfully by the Russian. A number of Russian LMG, equal to the number of AFV received for the Dug-In AFV Pltn, are added to the Russian OB.) Such a Dug-In AFV may never become Mobile. Furthermore, any Retained Russian AFV may be freely Dug-In at the Russian player's option.

EX: The Russian player purchases the Russian A3 RG (T-34 M41 Pltn) as a Dug-In AFV RG (normal CPP cost of 5) at a cost of 3 CPP (5×½=2½ [FRU]=3).

11.6195 DAILY MAX.: Lists the maximum number of RG of this type that may be purchased per CG Day. Additionally, a player may purchase no more than two Infantry Company RGs per CG Day [EXC: This maximum is modified inversely by the side's Historical DRM (11.6161) for that CG Day].

EX: On 12 November the German can purchase a maximum of three Infantry Companies (-1 Historical DRM). He can purchase two on 13 November (0 Historical DRM), but only one on 14 November (+1 Historical DRM).

11.6196 CG MAX.: Lists the maximum number of RG of this type that may be purchased during the course of the current CG. (Note that there is a separate column for each RB CG). Players must keep a written record (using the RG Purchase Record; 11.6197) of each RG purchased during the CG in order to know if additional RGs of that type are still available for purchase. RGs given in a CG's Initial Scenario OB (11.51-.53) never count against this maximum.

EX: The German side may purchase no more than seven Med Arty OBA RG during CG III.

11.6197 RG PURCHASE RECORD: After all RG for the current CG Day have been selected (and CPP expended for them), the RG Purchase Record must be updated. In order to record all units/Equipment received in a RG, one line of this sheet must be filled out for each RG purchased (or given

in an Initial Scenario OB) in order to keep track of the number purchased thus far in the CG (11.6196). The listing below helps to explain how each column of the RG Purchase Record is intended to be used.

CG Day: The CG Day the RG is purchased (e.g., "17/10" for 17 October).

RG ID: The RG's alphanumeric ID (e.g., "I1" for a German Rifle Coy).

Group Type: The RG's name (e.g., "Rifle Coy" for German RG I1).

#P (Number Purchased): The total number of friendly RG of this Group Type purchased thus far during the CG.

#R (Number Remaining): The number of this RG Group Type still available for subsequent purchase in the CG. This number is derived by subtracting the number in that RG's #P column from the number listed in the "Maximum" column (for that RG for that CG) in that side's RG Chart.

Str.: The RG's strength, as determined in RePh step 11.6201-.6204. Record "F" for a Full or "D" for a Depleted AFV/Infantry/Gun-Battery RG; record "P", "N" or "S" (for Plentiful, Normal or Scarce, respectively) for an OBA RG.

Units: The number of units received in that RG of the Unit Type listed in the respective RG Chart (e.g., "12" for a Full Strength German Rifle Coy).

SW/Gun(s) Received: As each SW/Gun for that RG is determined (RePh steps 11.6202-.6204), record the number of each Weapon type received. For a Gun Battery RG simply write each Gun Caliber Size and Barrel Length of each Gun received in any convenient boxes.

Leader(s) Received: As each eligible RG's leaders are determined (RePh step 11.6205-.6207) record the Strength Factor (A10.7) of each Leader received with that RG.

Other: This column may be used to record miscellaneous information, such as an (Offboard) Observer's Location, Pre-Registered hex(es), MOL capability for that CG Day, etc.

On-Bd: If the RG was purchased as an On-map Setup RG, put an "O" in this box; if purchased as a Reserve RG write an "R" here; if purchased as a Dug-In (Russian) AFV Pltn put a "D" in this box. See 11.6194 for more information.

11.620 RG STRENGTH, WEAPONS & LEADERS

11.6201 INFANTRY & AFV RG STRENGTH: Using the RG Strength Table, each player makes a separate DR for each Infantry Coy, each HW Pltn, each MOL-P Pltn and each AFV Pltn he has purchased (as well as each friendly Infantry RG given in an Initial-Scenario OB; 11.5). A Full-Strength RG receives the number (of specified units) listed to the left of the “/” in its respective RG chart and line; a Depleted RG receives the number listed to the right of the “/” (11.6193).

RG STRENGTH TABLE DRM:

Final DR	RG Strength	±x	Friendly Historical DRM (11.6161) for current CG Day
≤ 8	Full Strength	—y	As per CG scenario Balance provision (11.32) in effect
≥ 9	Depleted		

11.6202 INFANTRY COMPANY SW: To determine the number of SW received by each Infantry Company RG, consult the chart below. A Full-Strength Infantry Company receives the entire complement of SW listed for it. A Depleted Infantry Company RG must have a Secret dr made for each SW listed as available to a Full-Strength Company of that same type. On an Original dr of ≤ 4 the SW is in the Company's OB; otherwise it is forfeit. Record each SW received in its appropriate column on the RG Purchase Record on that RG's line.

INFANTRY COMPANY SW CHART*								
Nationality	Coy Type	HMG	MMG	LMG	ATR	LMTR	FT	DC
German	Rifle	1	1	1	1	1		
German	Sturm		1	2				2
German	Pionier			2			3	5
Russian	Gds Rifle	1	1	2	2	2		
Russian	Gds SMG							1
Russian	Rifle	1	1	1	1	1		
Russian	SMG							
Russian	Militia		1	1	1	1		
Russian	Aslt Eng			2			2	4

* Each SW received must set-up/enter possessed by a unit of its respective RG only during the first CG scenario in which its RG participates [EXC: if it is Retained off-map for an entire scenario].

11.6203 HW & MOL-P PLATOON WEAPONS: A Full-Strength HW/MOL-P Pltn receives all the Weapons and Personnel listed for it in its respective RG Chart. If the Platoon is Depleted, make a Secret dr for each such Weapon: an Original dr of ≤ 3 results in that Weapon being received (along with one crew [1-2-7 for a SW; 2-2-8 for a MTR]); if ≥ 4 that Weapon and crew are forfeit. [EXC: At least two Weapons are always received with a HW/MOL-P Pltn RG. If the Platoon's final total is < two Weapons, ignore this result; roll again for each Weapon in the Platoon, until a final total of ≥ two are received after rolling for each.] Each Weapon received must set-up/enter possessed by a unit of its respective RG only during the first CG scenario in which it participates. Record each Weapon received in its respective column on the RG Purchase Record.

11.6204 GUN BATTERY & OBA MODULE RG: To determine the Strength of each Gun Battery and each OBA Module RG purchased, make a Secret DR for each on the appropriate table below, applying the appropriate DRM listed in the Historical DRM Chart (11.6161). Record the Strength of the RG in the “Str.” column of the RG Purchase Record on that RG's line.

GERMAN OBA TABLE

Final DR	Ammo
≤ 4	Plentiful
5-8	Normal
≥ 9	Scarce

RUSSIAN OBA TABLE

Final DR	Ammo
≤ 2	Plentiful
3-7	Normal
≥ 8	Scarce

GUN BATTERY TABLE

Final DR	Strength
≤ 7	Full
≥ 8	-1 each type*

Gun Battery and OBA Tables' DRM:

±x	Friendly Historical DRM (11.6161) for current CG Day
—y	As per CG scenario Balance provision (11.32) in effect

* A depleted Battery receives one less of each type of Gun listed in its respective RG chart.

EX: The CG Day is 18 October. On this Day the German side has purchased a Sturm Coy, a HW Pltn and a Bln MTR OBA module. Since each of these RG is subject to Strength determination, the German now makes a separate Secret DR for each, applying the -2 Historical DRM (11.6161) for this CG Day. The respective Final DR are 10, 9 and 4, resulting in a Depleted Sturm Coy, a Depleted HW Pltn, and Plentiful Ammo for the OBA.

Since the Sturm Coy is Depleted, nine 5-4-8 are received but the types and numbers of their SW must still be determined. Five Secret dr are required, one for each SW (one MMG, two LMG and two DC) allotted to a Full-Strength Sturm Coy. For the MMG the dr is 3; for the LMG they are 6 and 4; and for the DC they are 2 and 5. Since a dr of ≤ 4 grants a SW to a Depleted Infantry Coy, this Sturm Coy receives one MMG, one LMG and one DC.

Now the units and Weapons of the Depleted HW Platoon are determined. The German makes a separate Secret dr for each Weapon (two HMG, two MMG and two 81mm MTR) allotted to a Full-Strength German HW Pltn. For the HMG the dr are 2 and 5, for the MMG they are 4 and 6, and for the 81mm MTR they are 5 and 5. Since a dr of ≤ 3 grants a Weapon to a Depleted HW Pltn, the only Weapon this RG would receive is one HMG. Therefore, the German rolls again for each Weapon, since, being a HW Pltn a minimum of two Weapons must be received (11.6203). This time the six dr are 3, 2, 6, 3, 1 and 5 respectively, resulting in the HW Pltn's receiving two HMG, one MMG and one MTR—plus three 1-2-7 and one 2-2-8 crews (as per German RG Chart note “***” and 11.6203).

It is even possible, using this method, to receive all Weapons for a Depleted-Strength RG (or even none for a non-HW/MOL-P-Pltn RG).

11.6205 LEADER DETERMINATION: For each Infantry Company RG purchased (or OB-given), make a Secret DR on the appropriate table below to determine the number and type(s) of Leaders received for that Company. Each Infantry leader must set-up/enter stacked with a MMC of his respective RG only during the first CG scenario in which he participates [EXC: if he is Retained off-map for an entire scenario].

GERMAN LEADER TABLE

Final DR	Leader Received
≤ 1	10-3, 9-1, 8-0
2	10-2, 8-1, 8-0
3	10-2, 8-1, 7-0
4	9-2, 9-1, 8-0
5	9-2, 8-1, 7-0
6	9-1, 8-1, 8-0
7	9-1, 8-1, 7-0
8	8-1, 8-0, 7-0
9	9-1, 8-0
10	8-1, 8-0
11	8-1, 7-0
12	8-0, 7-0
≥ 13	8-0, 6+1

Russian Leader DRM

-2	Assault Engineer Coy
-1	Guards Coy
+1	(First Line) SMG Coy
+2	If Depleted
+3	Militia Coy

* +1 If this is the sixth, seventh or eighth German Rifle Coy purchased; +2 if this is ≥ the ninth German Rifle Coy purchased.*

11.6206 COMMISSARS: The normal limit of two Commissars per scenario (A25.22) does not apply. After all Infantry Coy RG have been purchased and all leaders for them have been determined, a number of these new leaders ≤ the number of Infantry Coy RG purchased in the current CG Day's RePh may be exchanged for Commissars if this is an October CG Day. However, the number of Commissars thusly received may not exceed one per each twelve (FRD) squads (including HS equivalents) in the total Russian OB.

EX: The date is 19 October. The Russian has purchased one Rifle Coy (Depleted) and one Guards SMG Coy (Full Strength), and is now ready to determine the leaders received for each. For the Rifle Coy, the Russian makes an Original DR of 5, modified to 7 since the RG is Depleted, thus receiving one 8-1 and one 8-0 leader. For the Guards SMG Coy an Original DR of 6 is made, resulting in a Final DR of 5 (-1 Guards Coy), resulting in one 9-1 and one 8-0 leader. Since the month is October the Russian elects to exchange his newly received 8-1 leader for a 10-0 Commissar.

11.6207 ARMOR LEADERS: For each AFV platoon [EXC: German SPW Pltn] received (even if Depleted), that side must make a DR on the following table to determine the crew's quality. Each armor leader received for an AFV platoon must begin each scenario in an AFV of that platoon if possible (and Withdraw with that platoon if it is Withdrawn; 11.6142).

ARMOR LEADER TABLE

Final DR	Armor Leader
≤ 2	10-2
3	9-2
4	9-1
5	8-1
6-11	—
≥ 12	Inexperienced*

DRM

-1	German
+1	Russian

* All AFV of that Platoon have Inexperienced Crews (D3.45).

11.621 PURCHASING FORTIFICATIONS: Fortifications, which are received by spending FPP, may be purchased on each CG Day if the player has the requisite FPP (purchased in RePh step 11.619). All FPP unspent upon the completion of this step are forfeit.

As Fortifications are selected, the specific type (and strength, if mines) must be recorded on the CG Roster in the "Fortifications" area. However, the actual on-map positioning of Fortifications may be deferred until that side sets up for the next CG scenario.

EX: The Russian player has 40 FPP to spend on Fortifications. He buys one Fortified Building Location (10 FPP; for now, he simply writes a "1" in the "Total # of factors" box at the bottom of the "Fortified Building Locations" area; we suggest you use a softlead pencil, as these daily totals are erased after determining the specific map Location); he then spends 18 FPP on one 6-factor A-P minefield (at the bottom of the "Mines" area in the "Total # of factors", after "A-P:" he writes "6"; finally, he spends his remaining 12 FPP buying the ability to use HIP for two squads (6 FPP), two HS (4 FPP), one crew (1 FPP), and one SMC (1 FPP) (at the bottom of the HIP Locations area he thusly writes "2", "2", "1", and "1" after "Squad:", "HS:", "Crew:" and "SMC:", respectively). Note that no actual map Locations are recorded at this time, as actual on-map placement does not occur until that side is setting up. Later, during setup (RePh steps 11.6242 and 11.6242), the player uses the tallies written at the bottom of the various Fortifications columns to determine how many such "Fortifications" he has, and records the specific Locations on his Fortification record, and erases all notations made in the various "Total # of factors" boxes so that the tally areas may be used for subsequent Fortification purchases.

FORTIFICATION PURCHASE TABLE

Fortification Type	FPP Cost
Foxhole ¹	3/2/1 ¹
Trench ¹	7
A-T Ditch ²	21
A-P Mine	1/3 per factor ²
A-T Mine	3/9 per factor ^{2,3}
Roadblock ¹	12
Wire	15
Pillbox ⁴	(a + b + c) × 3 ⁵
Fortified Building ⁶	10 ⁷
Tunnel	30
HIP ⁸	5/3/2/1/1 ⁹
"?" ¹⁰	1 ¹
Booby Traps ⁸	40 ¹
Set DC (A23.7) ⁷	15 ¹

¹ For 3-, 2- and 1-squad capacity respectively.

² German/Russian FPP cost respectively. Each side may spend no > 90 FPP per CG Day on mines. During setup, the strength of friendly-Controlled, pre-existing minefields may be increased by adding extra A-P/A-T mine factors to them (though only in allowed increments and to allowed maximums). Minefields may not be decreased in this manner. Minefield factors purchased on the above Table may never be exchanged for Boobytrap capability/increase (B28.9).

³ Includes Daisy Chain.

⁴ Add the Capacity, CA DRM and NCA DRM, and multiply the sum by three.

⁵ Per building Location. A RB CG Fortified Building Location is never exchangeable for a Tunnel.

⁶ AFV/squad/HS/crew/SMC cost respectively. No more than 10% (FRU) of a side's non-Reserve Infantry squads (plus all SW/SMC set up with them in the same Location) may set up using HIP in a daytime scenario. The 25% allocation for a Scenario Defender at night (E1.2) costs no FPP. Only the Russian may set up AFV using HIP, and must do so as per D9.5; see also Russian RQ Chart note "???", Guns, and their manning crew may freely set up using HIP, as per A12.34. Neither side may purchase HIP for Cloaked Reserve units/?"¹⁰.

⁷ May be used as Dummy Reserve Cloaking counters (11.6194). See also SSR CG15 (11.4).

⁸ Increases pre-existing Level to next Level (Level C to B; Level B to A). Booby Traps affect all non-Aerial Locations on the RB map, and are triggered only by appropriate German TC.

⁹ Prior to play, a Retained DC (or a DC granted to an Infantry Company setting up on-map) may be set up using HIP in a friendly-Controlled building/rubble/pillbox/trench Location as a Set DC. Its setup Location must be recorded at that time, as must the ID of the "detonating" Infantry unit. Searching (A12.152) can reveal, and Random SW Destruction can Eliminate, a hidden Set DC.

¹⁰ Only those Fortifications marked with a "F" may be set up in a Front Line Location. A TC taken in a Front Line Location can still cause a Booby Trap attack in the normal manner.

¹¹ These are the only Fortifications that may be added to an Isolated Location.

¹² Only the Russian may purchase this Fortification type.

11.622 RECONNAISSANCE: Each side may now make a Recon dr, provided it first expends the required CPP for this purpose. If Recon can be purchased, that side deducts one (or two, for beneficial dr in its Recon dr) from its current CPP total (presently shown in the CG Roster's "Left" column) and records the new total in the "Start" column of the next CG Day. If a side cannot or opts not to use Recon, its current CPP total is simply copied in the "Start" column of the next CG Day. The number in the "Start" column always shows the side's CPP total at the start of that CG Day.

A Recon Final dr is the number of Locations which the opponent must reveal units and Fortifications (including Fortified Building Locations) in, if in fact he had set up in them. The Recon dr is modified by the following dr based on the reconnoitering side's Majority Squad Type.

drm:	
Spent 2 CPP	+3
Russian	+1
Stealthy	+1
Lax	-1

The number of Locations that may be reconnoitered on each CG Day is recorded on the RB CG Roster sheet in the "Recon" column for the current CG Day, as the process of inspection does not occur until all on-map units have been set up for the next CG scenario. See 11.6245 for further information on the effects of Recon.

11.623 INITIATIVE DETERMINATION: Each side selects its Initiative for the present CG Day, either to "Attack" or stand "Idle", representing its desired tactical plans.

11.6231 RUSSIAN ATTACK LIMITS: In the course of each CG, the Russian may select no more than one Attack chit per four (or part thereof) CG Days completed. Therefore, with this formula, each CG has a finite number of Attack chits that may be picked by the Russian as follows—CG I: 4; CG II: 2; CG III: 8.

EX: In CG I, the Soviets selected an Attack chit for 18/10 (CG Day 2); they may not choose the Attack chit again until 21/10 (CG Day 5). However, if the Soviets wait until 22/10 (CG Day 6) to pick their first Attack chit, they could also select it again for the next CG Day (23/10; CG Day 7). Similarly, the Russian player could choose the Attack chit for each of the final four CG Days of CG I if none had been selected by him prior to 26 October.

11.6232 PROCEDURE: Each side takes its respective Initiative chit and secretly places it on the playing area, hidden from the opponent's view, with the chit's face-up side displaying the side's choice for the next CG scenario. The selections are then revealed simultaneously and cross-indexed on the following matrix to determine if a new CG scenario is generated and, if so, what type it will be.

INITIATIVE MATRIX

chit selected	★ Attack	★ Idle
★ Attack	Dual Attack ¹	German Assault ¹
★ Idle	Russian Assault ¹	Idle Day ²

¹ Scenario generated; consult proper scenario type below for further information.

² No scenario generated for this Day; repeat RePh steps 11.612-.6231 until the next scenario is generated.

11.6233 SCENARIO TYPES

Dual Attack: Represents a CG Day when both sides have planned offensive action. Make a dr to determine which side sets up first: if ≤ 3 the Russians do; otherwise the Germans do. The side moving first, however, is not determined until after all setup is complete (RePh step 11.625).

German Assault: On this CG Day the German side is on the offensive, coming on doggedly against the prepared defenses of the Soviets. The Russian sets up first; German moves first.

Russian Assault: On this CG Day the Russians counterattack the regrouping Germans. The German sets up first; Russian moves first. At the Russian side's option, this CG scenario can be a Night scenario. See 11.6234.

Idle Day: Represents a CG Day in which both sides have chosen to remain relatively inactive, gathering strength and regrouping for the next attack. Repeat RePh steps 11.612-.6233 until the next CG scenario is generated.

11.6234 RUSSIAN NIGHT ASSAULT: If a "Russian Assault" CG scenario has been generated, the Russian may declare it to be a Night scenario (E1.). In such a scenario, the Russians are always the Scenario Attacker and the Germans always the Scenario Defender, despite both sides setting up on/off-map. Reinforcements entering from off-map always have Freedom of Movement (E1.21). Determine the Cloud Cover and initial Base NVR as per E1.11 [EXC: use the historical Moon Phase listing on the Moon column of the CG Roster]. Note that a result of Overcast on the NVR table does not invoke E3.5; Overcast weather does invoke E3.5, and also makes the Cloud Cover Overcast and the Moon Phase irrelevant.

11.6235 RB CG SCENARIO VICTORY CONDITIONS: The following Victory Conditions apply to the pertinent type of CG scenario (as determined in 11.6233). However, the Victory Conditions for each CG's Initial Scenario, as well as those for each CG, are given with the other information for the respective CG and its Initial Scenario (11.51-.53).

Dual Attack: The Germans win if at scenario end they have amassed more VP than the Russians. Each side receives Casualty VP, and also receives one VP for each Stone Location that it currently Controls but that was Controlled by the opponent at scenario start.

O

German (or Russian) Assault: The Russian wins either "Assault" scenario if he Controls all Stone Locations at scenario end. Otherwise the Attacker wins if at scenario end he Controls ≥ 24 (if German) or ≥ 12 (if Russian) more Stone Locations than he has lost (or than he started with, if he lost none) or if he has amassed at least twice as many Casualty VP as his opponent.

11.624 WIND & UNIT-SETUP

11.6241 WIND: Prior to setup, roll for Wind Force/Direction (B25.63-.64). If a Mild Breeze results and there is ≥ 1 Blaze on-map (11.6096), place Drifting Smoke counters immediately.

11.6242 ISOLATED UNIT SETUP: The side that sets up first (RePh step 11.6233) sets up all its Isolated Retained units/Equipment (if any), followed by the other side which does likewise (see also 11.4, CG15). In an Isolated Area (11.606), each unit may set up only in the Location in which it ended the previous scenario (as per 11.6071) or ADJACENT to that Location in a friendly-Controlled Strategic Location [EXC: a Gun/AFV in Fortified-Building-Location/Pillbox and Immobile/Abandoned vehicle may not be moved]. The Recovery of unpossessed Equipment may be attempted before play begins only if a unit sets up in its Location. For a list of the types of Fortifications that may be added to an Isolated Area see Footnote "1" of the Fortification Purchase Table (11.621). A radio/field-phone may never be set up in an Isolated Location. All Isolated units and Weapons suffer Ammunition Shortage (A19.131) [EXC: Captured Weapons; A21.11].

11.6243 AMMUNITION SHORTAGE REMOVAL: When a Good Order Isolated Infantry unit suffering from Ammunition Shortage begins a Friendly Player Turn in the same Location as a friendly Good Order armed Infantry MMC (that is not itself suffering from Ammunition Shortage) whose US# is $\geq$ that Isolated unit's, its Ammunition Shortage ceases to exist at the end of that Player Turn provided both units become TI and remain in Good Order throughout that Player Turn. A MG's Ammunition Shortage is removed whenever it is possessed by a Good Order, armed MMC not suffering from Ammunition Shortage.³⁸ All other Weapons suffering from Ammunition Shortage can lose that status only by ending a CG scenario non-Isolated (11.6139). Note that Ammunition Shortage does not apply to the use of a captured Weapon (A21.11).

11.6244 NON-ISOLATED UNIT SETUP: The side setting up first may set up the remainder of its Retained units, Equipment, purchased Fortifications, and on-map setup RG in non-Isolated friendly-Perimeter-Area Locations [EXC: Only those Fortifications marked with the "F" footnote on the 11.621 Fortification Purchase Table may be set up in a friendly Front Line Location]. Retained-units/RG not set up on the map may enter as per SSR CG9 (11.4); those kept completely out of play are still Retained for the next CG scenario [EXC: An AFV Platoon RG is subject to Withdrawal (11.6142) if any unit of it has been on the map in any CG scenario]. While setting up units/Equipment, the side also now determines in what specific Locations their Fortifications (RePh step 11.621) are to be set up in by writing the Locations in the respective boxes on the RG Roster sheet, under "Fortifications". Once the side setting up first has completed its setup, the other side follows the same procedure.

11.6245 RECON INSPECTION: After all setup is complete, each side may declare the Location(s) they wish to reconnoiter (11.622), if any. Each reconned Location must be $\leq$ four hexes from the nearest friendly-Controlled hex. The sides take turns declaring one Location at a time, with the Russians declaring first. "Reconned" hidden units are placed in their setup Locations concealed. The opponent also receives Right of Inspection of those units (A12.16), regardless of enemy LOS. If any hidden Fortifications are in the Location, they must be revealed and placed on-map [EXC: neither tunnels nor the type/strength of mines are revealed (see 11.6073 and its accompanying Footnote)]. All inspected stacks in Concealment terrain may regain any "?" they previously had, regardless of enemy LOS.

11.625 SCENARIO COMMENCEMENT: Players are now ready to begin the next CG scenario. Both sides announce their current ELR and SAN. If preparing for a Dual Attack scenario (only), determine which side moves first (if preparing to play an Assault scenario, the side setting up second always moves first; 11.6233) by making a dr. If that dr is ≤ 3 the Russians move first; otherwise the Germans do.

FOOTNOTES

FOOTNOTES

1. 0.4B FACTORY ROOFTOP ACCESS POINTS: Placing Factory stairwells in hexes containing a road hexside is done only as a convenience. Such hexes are simply easier for a player to spot. The road itself does not magically allow a unit to climb to the Factory roof; a stairwell is assumed to exist inherently in the interior of that Factory Location.

2. 0.4B FACTORY ROOFTOP ACCESS POINTS: The extensive use of Rooftops in the RB playtest highlighted the fact that an inherent stairwell in every hex of a 1½-level Factory is simply unrealistic. Hence it was decided to "refine" things a bit by stating that all such Factories must have a SSR-designated Rooftop Access Point when the use of Rooftops is allowed. Since all RB Factories have at least one printed Rooftop Access Point, this sentence of 0.4B really applies only to future/DYO non-RB scenarios having Factory Rooftops in effect.

3. 1.1 DEBRIS: Debris represents scattered cannon barrels, pipes, steel girders and wrecked machinery, as well as other "light" rubble from shelling and bombing, which littered the Red Barricades Ordnance Factory and surrounding area.

4. 2.1 RAILWAY EMBANKMENT: Historically the Germans advanced south towards the Barrikady along the railway embankments, which were among the few features in the area affording cover against the withering Soviet fire from the factories.

5. 5.43 ROOFTOP LOS: A rooftop unit wishing to see a lower elevation is assumed to crawl to the edge of the rooftop. The rooftop artwork overlapping into a Roofless Factory Hex therefore never blocks LOS, similar to the jagged edge of a cliff Hexside.

6. 6.1 RB CELLARS: Many accounts of the desperate fighting in Stalingrad talk of the extensive use of cellars for last-ditch defensive efforts—hence the decision to include this special dimension in the RB module. RB Cellar Locations are always considered Fortified (6.11) due to the fact that there is more limited access to the Location since most of it is underground, hence the higher TEM as well. Further, since most of the Location is below ground level (but limited firing ports exist, it is assumed) a squad firing its Inherent FP from such a Location into an non-ADJACENT Location is halved (6.4) due to smaller, and less numerous, apertures. A SW firing thusly is not halved, however, as it would usually be given the prime firing position. If agreeable to both players, they could use this as an Optional rule in some DYO games.

7. 6.7 ENCIRCLEMENT: Infantry in a RB Cellar Location are immune to the effects of Encirclement due to the fortress-like nature of the cellar. When surrounded in such a position a side neither asked for nor was given any quarter; it was invariably a battle to the last man.

8. 7.1 CULVERT: The Culvert represents an underground "gully" formed by a four- to five-foot wide concrete drainage system passing beneath street-level to connect to the normal gully. Since the Culvert is assumed to have a concrete floor as well, mines may not be set up hidden in the Culvert.

9. 9.1 STORAGE TANKS: These represent large man-made structures for storing various industrial fluids and chemicals, such as petroleum and solvents. Evidence suggests that those featured on the RB map were drained (empty) at the time of the battle.

10. 10.1 MOL-PROJECTOR: This little-known Soviet weapon, for which no official designation has come to light, was used in 1942-43 and then discarded. It looked somewhat like a PSK but, unlike the latter, did not fire a rocket. Moreover, not being recoilless, it was probably incapable of being shoulder-fired. The U.S. Army referred to it as a low-trajectory mortar for firing incendiary ampules at AFV, thus implying that it was a smooth-bore muzzle-loader with a glass, MOL-like projectile. (In this it was similar to the Northover Projector, a British Home Guard weapon of 1940 that fired a glass WP grenade.) Its issue was apparently not widespread, but in 1942-43 at least some rifle battalions contained one MOL-Projector platoon (probably 2-4 weapons). Photographic evidence indicates that it was used in Stalingrad.

11. 11.1 (CG) INTRODUCTION: Each CG scenario is intended to simulate the most crucial actions taking place in the Barrikady on that day of the campaign, perhaps picking up at the point with the most potential for a breakthrough. Players should realize that the events occurring on the map (within the span of about 10-15 "Game Time" minutes; with two minutes approximating one complete Game Turn) in real life might have taken considerably longer, given the cautious, close-quarter nature of the Stalingrad fighting.

12. 11.2 DEFINITIONS: "Strategic Location": It was decided early in the RB playtest that having to keep track of Control of every Location on the RB map was a well-nigh impossible task. Therefore, only Control of terrain with a TEM ≥ 2 (but including all Factory Locations and all map-edge/Shore hexes) is considered for Perimeter Determination purposes (though, granted, this in itself can still be a considerable chore).

13. 11.32 CG BALANCE PROVISIONS: More than just a means to balance the CG, this rule simulates the fact that, historically, if a side were faring poorly in a battle as important as this was to both participants it would probably have a better chance of receiving a few extra, and perhaps stronger, reinforcements.

14. 11.4 SSR CG7: A wreck in a terrain Blaze is not removed (as per D10.41) in the RB CG, since the burning terrain itself may be "removed". See also 11.6092.

15. 11.4 SSR CG9: RUSSIAN INFANTRY RG: Most Russian Infantry reinforcements were ferried across to the west bank of the Volga at night, and even then

FOOTNOTES

suffered considerable casualties due to German interdiction. The ferry landing in the *Barrikady* factory district was roughly midway between the Red Barricades and Red October factories (about where hexes LL41-LL47 would be, were the map to include such). Reinforcements entering play along the east edge represent released Divisional or Regimental reserves.

16. 11.4 SSR CG9; GERMAN INFANTRY/AFV RG: Historically, the Germans commenced the attack on the Barrikady from the north and northwest (i.e., from the direction of the Tractor Factory). However, German forces were never far off-map to the west in and around the *Barrikady Housing Estates*. From 23-25 October Infanterie Division 79 and Panzer Division 14 attacked from the west against both the *Barrikady* and *Krasnyi Oktyabr* factories.

17. 11.4 SSR CG11: The Red Barricades Ordnance Factory provided the Soviets with an important strategic anchor for the defense of the city. The thick-walled, concrete-block construction of the factory's massive workhalls provided numerous ideal, easily-fortified locations from which to carry on the struggle. Russian infantry fought with well-documented grim fanaticism for virtually every square meter of the devastated factories.

18. 11.4 SSR CG12: All commissars were recalled from front-line duty, by an order from Stalin himself, effective 1 November, 1942. The (8-0 or 8-1) leader substituted for such a removed Commissar represents a *fresh* Soviet leader, newly risen to fill the gap created by the recalling of the commissar.

19. 11.602g MARKER REMOVAL: During the playtest it was decided that each still-hidden unit at scenario end should be placed on-map Concealed (in its respective setup Location). In this way, such a unit can not "magically" escape from an Isolated Area, and can be used for friendly-Perimeter determination, if necessary. As a house-rule, such a unit could be kept off-map unless in danger of Isolation or needed to help set their friendly Perimeter. However, if such a unit's Location is later determined to be Isolated, it must then immediately be placed on-map Concealed in that Location.

20. 11.604 ENCIRCLEMENT & MINEFIELDS: The penalties suffered by a unit caught Encircled/in-a-minefield at CG scenario end are merely an abstract way to represent such unit's susceptibility to increased casualties while attempting to "break contact".

21. 11.6056 POCKETS: Note that there must be a friendly AFV/MMC present to allow the formation of a Pocket, not just a friendly SMC/Control-marker.

22. 11.6059: Isolated SMC are by definition within the friendly Perimeter Area; the only SMC Eliminated in this step are those completely outside the friendly Perimeter Area. This can occur since an SMC, by himself, is insufficient to allow the formation of a Pocket.

23. 11.6061 EFFECT ON UNITS: An Isolated unit is not necessarily cut off completely from the main body of friendly forces. Often it is merely in a position that is difficult for the friendly "supply lines" to reach due to enemy interdiction.

24. 11.6066 DRAWING THE PERIMETER: Once each side has carefully drawn out its respective Perimeter on the reduced-size RB mapsheet it is much easier to visualize any Isolated Area(s). For this reason alone we highly recommend that you do a new "Perimeter map" during this step for each CG scenario completed in order to clearly see each sides' "start line" and setup area(s) for the next CG scenario.

25. 11.6073 FORTIFICATIONS: The other uses for Known Minefields given in F.7-7B do not apply unless both players agree before the start of the CG.

26. 11.608 PRISONERS: "Eliminated" here actually represents the prisoners' evacuation to a POW collection area.

27. 11.6095 FACTORY BUILDING: A Factory building ablaze at CG scenario end is not reduced to stone rubble since most of its massive masonry walls remained upright after being consumed by the fire, as evidenced by the numerous photographs of such Stalingrad structures, clearly showing roofless, bombed-out buildings with only their walls left standing.

28. 11.6096 FLAME SPREAD: Some amount of terrain fire is allowed to "carry over" to represent the ongoing nature of the battles by having some pre-existing fires to continue to burn during the next scenario. Such fires could have special significance if the next scenario were a night assault, for, according to Chuikov, Russian night attacks were frequently carried out in the illumination of burning buildings and rubble.

29. 11.6132 WEAPON REPAIR: The relative "harshness" of this table on some repair attempts is simply a game mechanic to reduce SW accumulation noticed in the playtest of the CG, especially for the Germans (as they will normally capture several Russian SW, especially MMG/HMG). The Russians receive a -1 dpm to some of their SW repair attempts not because of the reliability of such SW, but to help make good some of the losses incurred during the scenario due to "leaving behind" those "heavy" MMGs when routing.

30. 11.6134 FT/DC: Special weapons such as flamethrowers and demolition charges, so easily expended in the course of an ASL scenario, would be replenished to the owning unit during a lull in the action.

31. 11.6142 AFV PLATOON WITHDRAWAL: Most AFV platoons/companies, when attached to an infantry organization, were done so temporarily until their job was completed (or needed more urgently in another sector).

32. 11.615 FORTIFICATION REMOVAL: This represents the work of sappers during a lull in the action, perhaps overnight, or even by the occupying units.

33. 11.6161 HISTORICAL DRM CHART: Most of these DRM are an attempt to represent the actual historical influx of reinforcements (for instance, the arrival of the Soviet's 45th Rifle Division near the end of October and early November), or the periods when there were historical lulls in the campaign. These same DRM are used not only for CPP Replenishment and RG Strength determination but ELR Adjustment as well, as such an infusion of new "blood" (or the lack thereof) could have a profound effect on the troops' morale and willingness to carry on the fight.

34. 11.617 ELR LOSS/GAIN: A player who continues to attack day after CG-Day will soon find his troops' ELR reduced to one or zero, and see them melt away before his very eyes. It is therefore imperative that a side "come up for air" every few days or so, as necessary, as their historical counterpart would have been forced to do.

35. 11.619 GERMAN REINFORCEMENT GROUP CHART; StuIG Pltn: The experimental StuIG 33B was the third attempt to mount the 150mm sIG 33B Infantry Gun on a PzKpfw chassis. Unlike its two predecessors, this one featured a fully enclosed fighting compartment on a StuIG III hull. A company of twelve was sent to Stalingrad in time to support the *Operation Hubertus* offensive in November 1942. A second company of twelve (formed as Company 9, Panzer Regiment 201, Panzer Division 23) was member to the forces that tried to break the Soviet encirclement of "Festung Stalingrad" in December of that year. These twenty-four were the total number of StuIG 33B produced.

36. 11.619 REINFORCEMENT GROUP CHART; footnote 2: Both sides must use a north-south Hex Grain alignment for all Barrages since each side's artillery was either due east (Russian) or west (German) of the *Barrikady* factory.

37. 11.6205 LEADER DETERMINATION DRM: This DRM is to reflect the fact that many of the best German leaders were sent into battle with the initial units.

38. 11.6243 AMMUNITION SHORTAGE REMOVAL: This rule simulates the ability of an Isolated unit to be "resupplied" in the midst of battle. Friendly MGs are the only SW allowed to be re-munitioned in this manner since most squads usually had MG ammunition more readily available than, say, mortar or ATR rounds.

Red Barricades Factory Building Identification Key

(for the reduced-size RB map on the back of the Chapter O divider)

1. Martin-Electro Furnace
2. Gun Construction Hall (gun tube processing and drilling)
3. Gun Tube Thermal Processing and Deburring Hall
4. Assembly Hall (gun construction and completion on conveyor belts)
5. Foundry Hall (mechanical workstations for forming, casting and forging)
6. Manufacturing Hall (with miscellaneous workstations)
7. Assistant Power Plant and Oil Heating
8. Workshop or Warehouse
9. Stockyard
10. Shipping Docks and Hangars

ORDER OF PRESENTATION:

1. Pine Woods
2. Slope Hexsides
3. Barbed-Wire Fences
4. Stream-Hex Terrain
5. Village Terrain
6. Hillside Walls & Hedges
7. Known Minefields
8. KGP Campaign Games

1. PINE WOODS

1.1 KGP includes a new type of terrain representing extensive stands of pine (ever-green) woods.¹ On the *KGP* maps, the standard "woods-green" background color in a woods hex indicates a *pine-woods* hex (EX: StKK13) while a normal (B13) woods hex (EX: StLL12) has a thin black outline and no standard background color. A pine-woods hex is treated exactly like a normal woods hex except as stated otherwise.

1.2 OBSTACLE HEIGHT: Pine woods are a two-level LOS Obstacle.

1.3 MF COST: Infantry enter pine woods at a cost of 1½ MF (3 MF for Cavalry).

2. SLOPE HEXSIDES

2.1 A slope hexside² represents an undulation in the terrain substantial enough to give an Up-Slope (2.2) unit a LOS advantage. On the *KGP* maps a slope hexside is represented by brown hash-marks along that hexside (EX: StG9-F8). The entire hexside (inclusive of vertices) marked by a slope, but *not* the slope artwork itself, is considered part of that slope hexside.

2.2 UP-SLOPE/DOWN-SLOPE: A Location whose hex contains ≥ one slope hexside is either Up-Slope or Down-Slope to LOS drawn across that hexside to or from that hex. If the slope lines are *in* the Location's hex, the Location is defined as being Down-Slope across that hexside; if the lines are in an adjacent hex along the hexside common to both hexes, the Location is Up-Slope across that hexside. A Location can be both Up- and Down-Slope across two different slope hexsides.

2.3 LOS: Slopes are neither obstacles nor Hindrances. Being Up-Slope affects LOS *only* in that an Up-Slope Location is treated as being ¾ of a level higher than normal to LOS that *begins or ends* in that Location and *crosses* an Up-Slope hexside of that Location.³ Thus, barring other obstructions to LOS, an Up-Slope unit—even if not in a hill Crest-Line hex—can trace a LOS across an Up-Slope hexside of its hex to a lower elevation (i.e., across a hill Crest Line) and/or over (B.4) obstacles and Hindrances whose topmost obstacle/Hindrance height is < the Up-Slope elevation of the viewing unit [EXC: entrenched LOS restrictions would still apply as per B9.21, as would wall/hedge TEM as per B9.3 (see also 6.2-3)]. Otherwise, being Up-Slope or Down-Slope *itself* has no effect on LOS (e.g., slopes are ignored if the LOS goes *through* their hex or *along* their hexside, and also when calculating an A6.41-43 increase or decrease in the number of Blind Hexes caused by an intervening obstacle). Being Up-Slope *itself* can neither grant HA nor allow an Up-Slope unit to make a HD attempt. The presence of ≥ one slope hexside does *not* change the elevation of that hex's Base Level.

EX: Squad A's LOS to squads B, E and F (and to hex J13) is unaffected by slopes. Squad A (which is at Level 3) has no LOS to Level 2 squads G, C or D. Squad B has a LOS to all squads depicted. Squad B could claim Height Advantage only if fired on by squad G or squad(s) C/D. Squad E can see squads A, B and F. Squad F has a LOS to squads A, B, D and E; however, it could see squads C and G (and hex I12) as well if it were Up-Slope from them along hexside K13-L13. In all cases, LOS reciprocity (A6.5) applies. See also the 6.2 example.

If hexes J11-K12 contained a two-hex Two Story House (B23.22), K11 would be a Blind Hex to squad B but L10 would not be (since the building's topmost height would be Level 3½; whereas squad B is at Level 3½, due to its being Up-Slope along that LOS).

An AFV/wreck in J13 would hinder squad A's—but not squad B's—LOS to squad E (and vice versa), but would not hinder squad A's/B's LOS to squad F (or vice versa). An AFV/wreck in H12/I13, and/or a wall/hedge/slope along hexside(s) H11-H12/H12-H13, would not hinder squad B's LOS to past squad G.

2.31 FIRE LANE: For the purposes of Fire Lane LOS/LOF drawn across ≥ one slope hexside, assume that the term "same-level" means "same-Base-Level". See also 2.42 and its example.

2.4 COVER: A slope can, in certain instances, provide a +TEM (2.41) or a +DRM (2.42).

2.41 DIRECT-FIRE TEM: Ground-level Infantry in a hex containing ≥ three (or two non-contiguous) Down-Slope hexsides may claim a +1 slope TEM vs Direct Fire [EXC: FT], provided the attack originates from a non-adjacent firer whose elevation advantage (if any) over that of the target is < the range of the attack and the attacker's LOS crosses ≥ one of the target hex's Down-Slope hexsides. (A.5 applies to a FG attack.) Slope TEM is cumulative with no other +TEM [EXC: Mud/Deep-Snow TEM]. Being Up-Slope *itself* provides no TEM, does not negate the FFMO/FFNAM DRM, and does not affect Wall Advantage rules.

EX: See the 2.3 illustration, and assume that the following attacks are Small Arms. Squad E can claim slope TEM if fired on by squad B (or from hex J12 or H14), but not if fired on by squad A (whose LOS does not cross a Down-Slope hexside of K14) or from H12, I12, etc. Squad F can fire on adjacent squad E with no slope TEM, regardless of which unit has Wall Advantage. If squad E is fired on by squad A or F, the -1 for FFMO can be claimed if otherwise applicable. If squad E is fired on by squads A and B (even in conjunction with [another firer(s)] in J13/I14/K13) as a FG, squad E can claim slope TEM (A.5).

2.42 FIRE-LANE DRM: Infantry being attacked by a Fire Lane receives a +1 Fire Lane slope DRM if the firer is Up-Slope from, ¾ of a level higher than, and not adjacent to, that target [EXC: if the Infantry is attacked by a Fire Lane Snap Shot (A9.221), the DRM applies only if these three conditions apply to *each* of the two hexes that form the Snap Shot hexside, as determined by the firer's separate LOS to each of them]. An Up-Slope attacker's Fire Lane cannot affect a target that lies at a different Base Level (see 2.3) from that of the attacker.

EX: See the 2.3 illustration, and assume that squads A and B each have a MG. If squad A places a Fire Lane counter in hex L13 (or beyond L13 along that same LOF), all moving Infantry in J13, J14, K13 (or I14, J13, K14; A9.221) and L13 can be attacked by that Fire Lane with no slope DRM (since squad A is not Up-Slope from any of those Locations). If squad B places a Fire Lane counter in K14, all moving Infantry in J13 (or J14) can be attacked by that Fire Lane with no slope DRM (since those hexes are adjacent to the firer), but moving Infantry in K14 could claim both the slope TEM (2.41) and slope DRM. If that Fire Lane counter were instead placed beyond K14 along that same LOF (e.g., in M14), moving Infantry in J13 (or J14) and K14 would be affected no differently while moving Infantry in L13 (or L14) would be attacked with no slope DRM (note that I14 is not Up-Slope from L13 and L14 along squad B's individual LOS to each of those two hexes), nor (for the same reason) would the slope DRM apply to Infantry attacked by a Fire Lane Snap Shot at hexside L13-L14. If squad B places a Fire Lane counter in I12 (or beyond I12 along that same LOF), moving Infantry in I12 and I13 could be attacked by that Fire Lane, but those in I12 would receive the slope DRM.

2.5 ENTRY: A unit crossing a slope hexside that it is Down-Slope from is moving Up-Slope. A unit crossing a slope hexside that it is Up-Slope from is moving Down-Slope.

2.51

2.51 MF COST/BONUS: Infantry/Cavalry (or a Wagon) must expend $\frac{1}{2}$ MF + COT in order to move Up-Slope. Infantry on skis would receive a $\frac{1}{2}$ -MF bonus for each Down-Slope hexside they cross (cumulative with any bonus received for moving to a lower elevation). Crossing a slope hexside while moving on a road does not negate the B3.4 MF road bonus.

EX: See the 2.3 illustration. Squad A must expend $2\frac{1}{2}$ MF to enter hex I14 (1 [COT] + 1 [crossing a barbed-wire-fence hexside; 3.2] + $\frac{1}{2}$ [moving Up-Slope] = $2\frac{1}{2}$); if it were also crossing a Crest Line to Level 4, the cost would be $3\frac{1}{2}$ MF ((1 [COT] $\times$ 2 [ascending across a Crest Line]) + 1 [crossing a barbed-wire-fence hexside; 3.2] + $\frac{1}{2}$ [moving Up-Slope] = $3\frac{1}{2}$). Squad A would expend $2\frac{1}{2}$ MF to enter graveyard hex H14. Squad B would expend one MF to enter J13, since there is no additional cost to move Down-Slope.

2.52 MP COST: A unit that expends MP must pay one MP + COT in order to move Up-Slope.

2.53 CREST-LINE SLOPE: No vehicle (or charging cavalry) may cross a combination Crest-Line-slope hexside (EX: StJ6-K6; ChX3-Y4).⁴

2.54 RAIN/SNOW: When crossing a slope hexside, E3.54 (or E3.723), if otherwise in effect, applies just as if the moving unit is changing elevation (in addition to any application of that rule due to crossing a Crest Line).

3. BARBED-WIRE FENCES

3.1 A barbed-wire fence is depicted by a series of small black Xs overlaying a hexside (EX: StC20-D20; ChB3-B4). Barbed wire is neither an obstacle nor a Hindrance, provides no TEM, does not negate the FFMO/FFNAM DRM, and cannot be Cleared or eliminated in any way.⁵

3.2 MF COST: Infantry must pay one MF + COT to cross a barbed-wire-fence hexside, unless using Armored Assault or moving within a trench or tunnel (in which case only the COT applies). The cost for Cavalry is two MF + COT. No Wagon, ridden bicycle, Infantry on skis, or currently-CX Infantry/Cavalry/horse may cross a barbed-wire-fence hexside. All barbed-wire-fence hexside MF costs are doubled at night. A Straying unit required, but unable, to cross a barbed-wire-fence hexside becomes TI instead.

3.21 TEMPORARY BREACH: A non-Straying, Good Order Infantry MMC neither beneath an Entrenchment/Pillbox nor above a Wire counter may create a temporary breach in one barbed-wire-fence hexside of its hex by expending two MF in its MPH while at ground level in (but not IN) that hex. Place the top edge of the MMC counter over the selected barbed-wire-fence hexside and mark the unit TI. For as long as that MMC remains TI, unpinned and in Good Order, it is considered to be using Hazardous Movement but that hexside's barbed-wire cost for Infantry [EXC: if broken, berserk, Manhandling, or part of a Human Wave] becomes $\frac{1}{2}$ MF. (A vehicle crossing that hexside would still be subject to Bog as per 3.3, but would not affect that hexside's temporarily-breached status.) Creating a temporary breach in barbed wire is a concealment-loss activity (A12.141).

3.3 MP COST & BOG: Barbed wire has no effect on MP costs; however, no motorcycle may cross a barbed-wire-fence hexside. Each vehicle that enters a new hex by crossing a barbed-wire-fence hexside must undergo a Bog DR, in addition to any other Bog Check required for entry of the Location. If it Bogs, it is left in the hex it was attempting to enter. (If it Bogs twice, due to both crossing a barbed-wire-fence hexside and other terrain in the hex, mark it with a Mired—not a Bog—counter.) The only DRM that can apply to a barbed-wire Bog Check are:

- +1 Vehicle is not fully-tracked;
- +2 Vehicle has Truck-type MP expenditure.

3.4 BYPASS: The barbed-wire-fence artwork (i.e., the small black Xs) along such a hexside has no effect on a unit's normal ability (if any) to Bypass along that hexside.

4. STREAM-HEX TERRAIN

4.1 STREAM- WOODS/BRUSH/ORCHARD: The KGP maps feature stream-woods (both pine [EX: StMM5] and normal [EX: StMM6]), stream-brush (EX: StMM11), and stream-orchard (EX: StLL14) hexes. Each such supplemental terrain type always rises (to its normal height) from the Crest level of—not from IN—the stream hex. See also B19.5-52.

4.11 ENTRY: A unit enters a stream- woods/brush/orchard hex across a stream hexside at the normal (for its depth; B20.4-44)) stream cost. If entering across a non-stream hexside, movement costs are cumulative (e.g., five MF to enter a shallow-stream woods/brush hex—three for the shallow stream [B20.43] plus two for the woods or brush [EXC: $4\frac{1}{2}$ MF if a shallow-stream pine-woods hex])—or four MF to enter a shallow stream-orchard hex).

4.12 CREST: All rules for Crest status (B20.9) apply in a stream-woods/brush/orchard hex. [EXC: Good Order Infantry may gain Crest status in such an Accessible hex, along the non-stream hexside they cross, at a cost of three MF for a stream- brush/woods hex ($2\frac{1}{2}$ MF if pine woods) or two MF for a stream-orchard hex. Otherwise, B20.91 applies unchanged.]

4.13 TEM: Disregarding SMOKE and Hindrances, a unit IN a stream- woods/brush/orchard hex is in Open Ground if the LOS INTO that hex emanates from within, or lies within the stream depiction (B20.2) as it enters, that hex. Otherwise, a unit IN such a hex is not in Open Ground and can claim the hex's woods, brush or orchard (or entrenchment, if applicable as per B20.91-92) TEM [EXC: Air Burst TEM can also apply to a unit(s) IN a stream-woods hex].

4.2 STREAM CULVERT: A Stream Culvert⁶ (EX: hex ChLL7; LgL5) represents a man-made, subterranean passage for a stream. It is a separate Location that is indicated by thick black dashed lines showing its outline underground. A unit IN a Stream Culvert is placed beneath a Culvert counter, is considered to be in Open Ground, and has a LOS only to ADJACENT stream (and Stream Culvert) Locations. The normal Stacking limit (A5.1) IN a Stream Culvert is one squad-equivalent. Normal rules pertaining to subterranean units/Locations apply unchanged (e.g., E1.923).

P

4.21 SETUP & ENTRY: No unit/Equipment/Fortification may be set up IN a Stream Culvert. Infantry enter a Stream Culvert as if entering INTO another hex of that stream, but such entry is allowed only from IN an ADJACENT stream (or Stream Culvert) Location [EXC: entry is NA if the stream is flooded]. No $\frac{1}{8}$ " vehicle/Gun counter may enter a Stream Culvert.

4.22 CREST: Crest status cannot be gained in a Stream Culvert hex, nor can it be gained along a stream-and-Stream-Culvert hexside (e.g., hexside ChLL6-LL7).

4.23 FRIGID: Each Infantry unit IN a Stream Culvert at the end of a Player Turn is subject to Replacement/Disruption at that time, just as if it were IN a frigid Water Obstacle (B20.7).

4.24 ATTACKS vs: No type of attack (or Bombardment) can affect a Stream Culvert itself. Nothing IN a Stream Culvert can be affected by Indirect Fire or Aerial attack. A unit IN a Stream Culvert is an ineligible (A14.22) Sniper target.

4.3 FORD: Printed fords exist on the KGP maps (EX: StMM10). All rules applicable to fords represented by counters (B20.8) apply unchanged.

5. VILLAGE TERRAIN

5.1 NARROW STREET: A Narrow Street⁷ is represented on the KGP maps by a road depiction overprinting $\geq$ one hexside (EX: hexside StN17-O17). A Narrow Street can be paved or unpaved.

5.11 MOVEMENT: A Narrow Street is always one-lane (i.e., the restrictions of B6.43-431 apply as if that "road"⁸ were a one-lane bridge). A unit Bypassing along a Narrow Street hexside is always assumed to be on the road within its hex—and, if that hexside is also a Crest Line hexside, in the lower of those two hexes. VBM along a Narrow Street is allowed regardless of hexside-to-obstacle clearance (D2.3), and costs *half* the normal Bypass MP expenditure [EXC: VCA change (D2.33) remains one MP (MF for a Wagon)]. Infantry/Cavalry Bypassing along a Narrow Street pay normal Bypass MF costs, but can still (as could a Wagon) qualify for the MF road bonus (B3.4). Contrary to the B3.4 example, a unit moving along/across a Narrow Street hexside cannot enter an obstacle at the road MF rate. Dashing (A4.63) across/along, as well as routing along, a Narrow Street is NA.⁹ SMOKE in *either/both* of the two ground-level Locations common to a Narrow Street hexside adds an extra MF/MP to the cost of using Bypass along that hexside [EXC: if the hexside is also a Crest Line hexside, only SMOKE in the lower hex can do so].

EX: See the 5.141 illustration. If squad G Bypasses along Narrow Street hexside O18-N18, it must still expend two MF to enter building O19 even though part of that Narrow Street extends into O19. The same would be true if squad G moved from N17 into the O17 building.

5.12 MOVEMENT RESTRICTIONS: The following movement-related restrictions apply on a Narrow Street (see also 5.141):

5.121 TCA: A turreted vehicle with a MA Caliber Size of $\geq$ 50mm and a Barrel Length of other than "*" may be Non-Stopped on a Narrow Street only if its TCA coincides with its VCA or "rear" VCA.

5.122 TCA CHANGE: A vehicle with a MA Caliber Size of $\geq$ 50mm attempting to change its TCA relative to its VCA while on a Narrow Street (or Single-Lane Road; SSR KGP7) must first make a Final TCA-Change dr of $\leq$ 3. (See also 5.121.) A maximum of two such dr per vehicle may be made per phase. In its MPH, each failed TCA-change attempt costs the vehicle two MP. Only the follow-

ing cumulative dr can apply:

+2 "LL" Barrel Length	+x Armor Leader modifier
+1 "L" Barrel Length	-1 "*" Barrel Length
+1 If BU	

5.123 VCA CHANGE: A motorcycle may expend $\frac{1}{4}$, while a very small (D1.75) Target Size vehicle may expend $\frac{1}{2}$, of its printed MP allotment to change its VCA 180° while on a Narrow Street. No other vehicle type may change its VCA [EXC: as per D2.33], nor may any vehicle change its VCA as part of a Motion attempt (D2.401), while on a Narrow Street.

5.124 TOWING: A vehicle towing a Gun or trailer *may* use VBM along a Narrow Street unless otherwise prohibited. However, such a Gun cannot be unhooked while in Bypass during play. A trailer may be unhooked while in Bypass during play (and is eliminated for all purposes thereafter), but only by the crew of the vehicle towing it.

5.125 (UN)LOADING: PRC may (un)load (and their possessed 76-107mm MTR [C10.1] may be "(un)hooked") from/onto a vehicle on a Narrow Street into/from either/both of the ground-level Locations forming that hexside.

5.126 RUBBLE/BLAZE/WRECK: All Bypass along a Narrow Street hexside is NA if either/both of the hexes forming that hexside contain(s) another vehicle/wreck in Bypass along that hexside, a Blaze counter [EXC: burning wreck along another hexside], and/or a Rubble counter. No wreck (or Immobile vehicle) on a Narrow Street may be removed as per D10.4.

5.13 ATTACK EFFECTS: The following special cases apply to attacks by/vs a firer/target in a Narrow Street (see also 5.141-142):

5.131 SMOKE/RESIDUAL-FP: SMOKE/Residual-FP in either of the two ground-level Locations common to a Narrow Street hexside can affect a unit in Bypass along that hexside. However, if *each* such Location contains SMOKE/Residual-FP of a different strength from that in the other Location, only the *higher* amount applies. [EXC to both: If that hexside is also a Crest Line hexside, the SMOKE/Residual-FP in the lower-Base-Level hex applies.]

5.132 CC: A vehicle on a Narrow Street is subject to Street Fighting (A11.8) when attacked in CC (including CC Reaction Fire) if its attacker occupies the ground level of a building in one of the two hexes common to that Narrow Street hexside. A +1 DRM applies to all CC CMG attacks by a vehicle currently in CC/Melee on a Narrow Street.

5.14 FORTIFICATIONS: Fortifications not normally allowed in a paved road hex may be placed in a hex with $\geq$ one paved Narrow Street hexside unless prohibited by other terrain in the hex.

5.141 ROADBLOCK: A roadblock may be placed "across" a Narrow Street by setting up the counter so that it straddles, with its arrow pointing to a vertex of, that hexside. For LOS and movement purposes, the roadblock is considered to extend from center dot to center dot of the two hexes formed by that hexside. A Narrow Street roadblock cannot convey Wall Advantage, provides *no* TEM vs Indirect Fire or Residual FP, and prohibits VBM *along* the straddled hexside. As a non-Bypassing unit *crosses* a hexside that is straddled by a Narrow Street roadblock, it must declare a vertex of that hexside in order to establish, vs any ensuing Snap Shot, which "side" of the roadblock it is on (thus determining whether it will be able to claim the roadblock's protective benefits vs that attack).

EX: A roadblock has been placed in hexes StO17-O18, with its arrow pointing toward the O17-O18-P17 vertex. Since the roadblock is considered to extend from the center dot of O17 to the center dot of O18, squads F and G have no LOS to each other (B9.2), and squad H can claim neither roadblock TEM nor Wall Advantage if fired on by squad F. Squad G must also expend one MF to cross the roadblock if it Bypasses directly to vertex O17-O18-P17 (the two MF being expended simultaneously).

Squad H may enter O17 (whether entering or Bypassing the building) without the roadblock affecting its entry cost. If it directly enters building O17, its owner must declare if it crossed the hexside on the vertex O17-O18-P17 or O17-O18-N17 side of the roadblock; if he chooses the latter, an ensuing Snap Shot conducted by squad F (or by any other unit—including one in Bypass at vertex O17-O18-P17—whose LOS to vertex O17-O18-N17 first crosses the roadblock) will be subject to the roadblock's TEM. If squad H instead enters O17 by Bypassing along Narrow Street hexside O17-N17, each ensuing attack vs it [EXC: Indirect Fire] at vertex O17-O18-N17 by any unit whose LOS to that vertex first crosses the roadblock will likewise be subject to roadblock TEM.

5.1411

5.1411 REMOVAL: Clearance attempts vs a Narrow Street roadblock can be made only from any of the four ground-level Locations that touch the straddled hexside. A unit wishing to use a DC to eliminate a Narrow Street roadblock must occupy one of the three hexes that form a vertex of the straddled hexside, and must declare the attempt to eliminate it. The DC is then Placed/Thrown/Set vs that vertex, and can affect nothing but the roadblock when it detonates. Direct Fire ordnance can eliminate a Narrow Street roadblock only if the firer has a LOS to the entire straddled hexside and declares the roadblock as its sole target prior to firing; the attack can affect nothing but the roadblock. Indirect Fire HE eliminates a Narrow Street roadblock with the proper result vs *either* of the two ground-level Locations that form the straddled hexside. B29.5 applies otherwise unchanged.

5.142 MINES: All mines set up in a hex that contains $\geq$ one paved Narrow Street hexside must be placed on-map revealed (i.e., with the type and strength of that minefield displayed) unless all the Narrow Street hexsides of that hex are also Crest Line hexsides formed by lower-Base-Level hexes. The removal of such revealed mines as per B28.53 is NA. Mines in *either* of the two hexes common to a Narrow Street hexside (or in both such hexes, if one contains A-P mines and the other A-T mines) can possibly affect a unit using Bypass along that hexside; however, if *each* such hex contains mines of the same type but of a different strength from that in the other Location, only the *higher* strength can be used to attack the Bypassing unit. [EXC to both: If that hexside is also a Crest Line hexside, only the mines in the lower-Base-Level hex are used.]

EX: See the 5.141 illustration, and assume that N17, O18 and N18 contain A-P minefields of six, eight and twelve factors respectively. The minefields in N17 and O18 have to have been set up revealed. Any unit Bypassing along the N17-O17 Narrow Street hexside, regardless of which hex that unit occupies, will be attacked by the six-FP N17 minefield. A unit Bypassing along the N17-O18 Narrow Street hexside would undergo the eight-FP attack of the O18 minefield. Note that mines set up in N18 could use HIP since its sole Narrow Street hexside is unpaved.

5.15 RUBBLE: Placing a Rubble counter in a hex that contains a Narrow Street hexside eliminates any roadblock across that hexside, affects all units/Equipment (see 8.2 definition) currently in Bypass (in either/both hexes) along that hexside as if they were hit by falling rubble (i.e., as per B24.121), and eliminates all mines along that hexside (in both hexes).

5.2 STEEPLE: A building hex with a black center dot in a white cross (EX: SUI9) denotes a church with a Steeple Location in that hex—i.e., an additional building Location, with an inherent stairwell leading to it from ground level, above what would otherwise be the highest building Location of that hex. Except as stated otherwise, a Steeple Location is treated as a normal building Location [EXC: it cannot be Fortified, has no Rooftop Location, and the +1 drm for stone rubble determination (B24.11) is NA]. Each building Location in the hex beneath the Steeple Location is a normal building Location in all respects.

EX: Building SUI9 contains normal ground- and 1st-level building Locations, but hex SUI9 also contains a 2nd-level Steeple Location. Hex CHAA10 has a 1st-level Steeple Location with an inherent stairwell leading to it from the otherwise-normal ground-level building Location.

5.21 STACKING: A Steeple Location has a normal stacking limit (A5.1) of one HS-equivalent. No Gun may be set up in a Steeple Location.

5.3 SINGLE-HEX TWO-STORY HOUSE: A building with a large white center dot (EX: Lg120) is a 1½-level LOS obstacle with both a ground- and first-level Location and an inherent stairwell. Like a Single Story House (B23.21), it has no Rooftop Location. In all other respects it is a normal building.

6. HILLSIDE WALLS & HEDGES

6.1 A Hillside wall/hedge¹⁰ is one which lies along a hexside that is common to two adjacent hexes with different Base Levels, with none of the lower Base-Level's terrain appearing between the wall/hedge depiction and the higher Base-Level's terrain depiction. Examples of Hillside hedges are StX32-Y32 and ChK2-K3; an example of a Hillside wall is StS17-T16. All normal wall/hedge rules apply to Hillside wall/hedges except as modified herein.

6.2 LOS: A Hillside wall/hedge (including both its depiction and its associated hexside; B9.1) is ignored when determining whether or not a LOS exists between units whose elevations differ by $\geq$ one full level [EXC: a unit entrenched behind a Hillside wall/hedge still has its LOS restricted as per B9.21]. It is likewise ignored when determining the number of Blind Hexes created by a Crest Line. If a hill Crest Line ends at a Hillside wall/hedge, the line along which the hill depiction meets the wall/hedge depiction is considered to be the actual Crest Line.

EX: The following serve to further illustrate various LOS possibilities with Hillside hedges/walls and slopes:

Squad A (whose Base-Level elevation is Level 2) has a LOS to squads B, C, D, F, G and I. If squad A were entrenched, it would have a LOS to all squads *except* B, C, D, E and H.

Squad B (at Level 1) has a LOS to all squads *except* G (since G is not Up-Slope across hexside T12-T13).

Squad C has a LOS to all squads *except* H and I.

Squad D has a LOS to all squads *except* G.

Squad E has a LOS to all squads *except* A and G.

Squad F has a LOS to all squads. If entrenched, it would have a LOS to all squads *except* B, D and H.

Squad G has a LOS to squads A, C, F and I.

Squad H has a LOS to squads B, D, E, F and I.

Squad I has a LOS to all squads *except* C (since squad I is not Up-Slope across hexside T12-U13).

P

6.3 ELEVATION, TEM & WALL ADVANTAGE: A Hillside wall/hedge is always at the higher of the two Base Levels it lies between, and is treated as a normal wall/hedge when calculating the TEM of targets at $\geq$ the wall/hedge's base elevation. However, a unit at any level lower than that on which a Hillside wall/hedge sits never receives any benefit (including Wall Advantage; B9.32) from that wall/hedge hexside. A unit in Crest status may claim Wall Advantage over a Hillside wall/hedge that forms a hexside of that unit's hex only if both are at the same elevation and on the same side of the Depression. Otherwise, a unit's inability to claim Wall Advantage over a Hillside wall/hedge hexside does not prevent it from claiming Wall Advantage over another wall/hedge hexside, provided the unit meets all the other B9 criteria for doing so.

EX: See the 6.2 illustration. Only squad F can claim Wall Advantage across hillside hedges T12-S12/T12-T11. Furthermore, squads C and E can never receive any benefit from the hillside hedges along hexside(s) of their hexes, as the units are both lower than those hedges.

7. KNOWN MINEFIELDS

7.1 Special minefield counters have been included in *KGP*. These are termed Known MinefieldTM counters, and are treated as normal mines except as specified otherwise.

Known Minefield counters have the normal depiction on the front but list no attack strength; the reverse side is the same but with the strength shown. When Known minefields are called for in any scenario (or RePh; 8.6073), the owner places the desired number of these counters onboard (with the strength-side down). Once the strength of such a counter has been revealed, it is flipped over. Known Minefield counters may represent minefields previously discovered by reconnaissance or in a previous engagement; therefore, Known minefields are set up onboard even in night scenarios. If a Known Minefield counter has its strength reduced or eliminated by OBA/bomb attack (B28.62), that counter is replaced by one having the appropriate new strength (or by a Dummy Minefield counter [7.2] if its strength was eliminated); if its strength was unrevealed at the time, its new strength remains unrevealed.

EX: A player whose OB contains 24 Known minefield factors may set up two Known Minefield counters with 12 factors each, or three with 8 factors each, or four with 6 factors each, or two with 6 factors each plus one with 12 factors, etc.

7.2 DUMMY MINEFIELDS: Some Known Minefield counters have "Dummy" printed on their reverse side in lieu of a FP factor, thus representing Dummy minefields.

When the opponent discovers that it is a Dummy (which must be announced when any ground unit enters, or successfully Searches [A12.152], its Location), simply remove it from play. A Dummy minefield is unaffected by a K/KIA resulting from a bomb/OBA attack (B28.62). The number that may appear beneath a Dummy Minefield counter depiction in a printed scenario OB represents the number of Dummy counters allotted. In a scenario that does not allot Dummy minefields (which includes all CG scenarios), a player may add (at no extra FPP cost) one Dummy Minefield counter to his OB for every 24 Known minefield factors he sets up. In addition, in any scenario in which a player has received $\geq$ one Dummy Minefield counter, he may make a Secret dr (halved; FRD) and receives an additional number of Dummy mine counters equal to the result.

7.3 HIDDEN MINES: Known Minefield counters may also be used to mark hexes containing hidden mines whose presence (but not strength) is discovered either by Searching (A12.152) or by a unit's being subjected to a mine attack DR therein. In addition, any "normal" Minefield counter (i.e., one of the types covered in Section B28) is considered to indicate the presence of Known mines when placed onboard. Normal mines may not be otherwise exchanged for or converted to Known mines [EXC: 8.6073].

8. KAMPFGRUPPE PEIPER CAMPAIGN GAMES

8.1 INTRODUCTION: The *KGP* Campaign Games offer two or more players a series of interrelated scenarios dealing with the advance and subsequent entrapment of *Kampfgruppe Peiper* in the Stoumont-Cheneux-La Gleize area of Belgium during the German "Ardennes Offensive" of December 1944. Using this system, a variable number of scenarios are played, each simulating a part of the actual battle occurring on those days of the campaign. Up to three scenarios may be played per "day" per Map Group (see the 8.2 definition of "CG Date").

8.11 BETWEEN SCENARIOS: Between Campaign Game (CG) scenarios, players make use of a special CG phase called the Refit Phase (RePh) wherein each side takes stock of what has happened and prepares for further combat in the next CG scenario. In the RePh, Reinforcement Groups (RG) in the form of infantry/vehicle/gun sections/platoons and OBA modules—to name a few—may be purchased through the expenditure of Campaign Purchase Points (CPP).

8.12 CASUALTIES: Casualties suffered in a CG scenario, as well as those suffered in the ensuing RePh through *CG-Scenario End* (defined in 8.2), should be recorded on the ASL Scenario Aid Card (Chapter E divider) since amassed Casualty VP (A26.2) totals are used to determine certain RePh DRM (e.g., 8.6113).

8.13 TEAM PLAY: Each CG herein (8.51-53) is easily adapted—indeed, recommended—for team play, with each player commanding certain unit types (e.g., one player controlling all the armor, and another all the Infantry, on their side). In addition, U.S. units may be easily apportioned according to their Entry Code color (8.6197). If desired, an overall commander may determine which RG his subordinate players will receive, assigning each to the one who requires it most.

8.14 CG ROSTER & RG PURCHASE RECORD: The enclosed printed copies of the *KGP* "CG Roster" and "RG Purchase Record" should be photocopied and used by players to record important CG information. See RePh steps 8.617-619, 8.6032-33 and 8.622 for most information on updating the CG Roster. See 8.6198 for specifics on the RG Purchase Record.

8.15 CHAPTER P DIVIDER: The Chapter P divider provides an offboard Holding Box for each mapboard Entry Area, for both available reinforcements and already-exited units/Equipment that are Retained for the next scenario. Units/Equipment eligible to enter play should be kept in the top (unshaded), and Retained exited units/Equipment in the lower (shaded), portion of the box. Since reinforcements (and even Retained units) for each side can be kept secret, it is suggested that players make two photocopies of this divider so that each side has one on which to keep its forces out of the opposing side's view.

8.2 DEFINITIONS & ABBREVIATIONS: The following glossary explains abbreviations and important terms used in the *KGP* Campaign Game system.

CG: Campaign Game.

CG Date: Each CG Date consists of the calendar date plus an AM, PM or Night reference (e.g., "19 AM"). One CG scenario may be played per Map Group per CG Date—hence up to three CG scenarios may be played per Map Group per calendar day: one in the morning (AM), one in the afternoon/early-evening (PM), and one at night (N).

CG End: The CG-Scenario End (see definition below) that occurs on the final CG Date listed in 8.51-53 (and on the CG Roster) for that CG—or, if one side concedes CG victory, the CG-Scenario End that occurs at the conclusion of the final CG scenario played in that CG—is also the CG End (i.e., is the end of the CG).

CG-LVP Total: The LVP value calculated by adding the side's Current-LVP Total (see definition below) to that side's CG-LVP Total from the preceding CG Date (if any); see 8.6033.

CG Roster: The sheet used to record information for each CG Date. During the RePh, one line is filled out for each CG Date. Players are urged to photocopy the one provided herein.

CG-Scenario End: Occurs when both the CG scenario being played and the ensuing RePh step 8.6031 have been completed.

CPP (Campaign Purchase Points): Used for purchasing RG in RePh step 8.619.

Current-LVP Total: The LVP value of all LVP Locations currently Controlled by the side.

Depleted: A German RG received at < Full Strength (see definition below).

Eligible: The status of an Entry Area enabling its use by a side for entry (and numerous other) purposes; see SSR CG6: (8.4).

Eliminated: Units/Equipment/Fortifications/RG "Eliminated" in a CG are removed from that side's OB (i.e., are not Retained). A vehicle/Burnt-Out-Wreck that is Eliminated while on-map is removed from the map.

Enterable: A hex/Location that the unit in question could enter (disregarding its occupation by a Fortification/enemy-unit) during a hypothetical MPH/APH. If defined in relation to a Setup-Entry Area (or to a "path" of hexes drawn to/from/between such), the hex/Location must be Enterable along that "path". Neither a terrain-Blaze hex nor a river Location is Enterable.

Entry Area: Each map-edge hex that contains a large arrow with a blue/red/green/gray background color, plus each edge-hex within four hexes of that hex, plus the Holding Box (see definition below) of that Entry Area. The nationality symbol(s) in the arrow indicate(s) if the Entry Area is U.S./German. See also SSR CG6 (8.4).

Equipment: Any SW/Gun/Vehicle/Daisy-Chain that can be part of a side's OB. Any counter that can be Portaged/driven/Manhandled about on the map.

Escape: The RePh process by which a unit attempts to exit an Isolated Location, No Man's Land, an enemy Setup Area, or Uncontrolled Territory that it cannot remain in, to a friendly Setup Area or Eligible Entry Area; 8.606.

FPP (Fortification Purchase Points): Used to purchase Fortifications in RePh step 8.621.

Front-Line Hex: A Setup-Area hex that shares $\geq$ one hexside with $\geq$ one hex of an enemy-Setup-Area/No-Man's-land/Uncontrolled-Territory hex.

Full Strength: A RG received *in toto*. (U.S. RG are always received at Full Strength, while some German RG may be Depleted; see 8.6193 & 8.6201.)

Holding Box: The off-map (see 8.15) portion of an Entry Area. It is used for holding all units/Equipment that are Retained in (including those that Shift/Escape/Exit to), as well as those that will enter play as reinforcements via that Entry Area. Each Holding Box contains (from top to bottom) the hex coordinate of that Entry Area's center (arrow) hex, the name of the Entry Area, the name(s) of the formation(s) that entered there historically, the CG Date on which the Entry Area becomes Eligible, an unshaded portion for the placement of reinforcements, and a shaded portion for exited units/Equipment. See also 8.15.

8.2

Idle Date: A CG Date in which both sides have picked an Idle chit (meaning that no scenario is played); 8.6232.

Initial Scenario: The first scenario of a CG (see 8.51-53). A CG's Initial Scenario gives each side's setup/entry restrictions, Initial-Scenario Victory Conditions, starting OB (including certain predetermined RG and a pool of CPP to spend on additional RG), and SSR applicable only to that Initial Scenario. Each RG not available for use in an Initial Scenario is marked by a "4" next to the number in that CG's "CG Maximum" column of the side's RG Chart.

Isolated: A unit/Weapon in a friendly Setup-Area Location from which it cannot trace a path of contiguous, Enterable, Uncontrolled-Territory/friendly-Setup-Area Locations to an Eligible Entry Area (or, for Germans on the "Lg" Map Group, to a designated "HQ hex"); see 8.6052. A Location/hex/Setup-Area is considered Isolated if an Infantry MMC would be Isolated upon being set up therein. See also SSR CG17 (8.4), 8.6057 and 8.6241.

KGP: Of, or pertaining to, the *Kampfgruppe Peiper* Historical ASL Modules.

LVP (Location Victory Point): Each KGP Map Group has several hexes marked with a red dot that contains a white number. This number corresponds to the VP value of each playable Location of that feature. For example, each existing non-roofed/cellar Location (even if rubble) of a building so marked is worth a number of LVP equal to the number in that red dot, even if that particular hex of the building does not contain the dot. Rubble falling from an LVP building (B24.12-121) is worth no LVP itself, and has no effect on the LVP value (if any) of the Location it falls into [EXC: whenever the rubble of a LVP building/bridge reduces the number of its playable Locations, its total LVP value is correspondingly reduced]. See also the definitions of Current-LVP Total and CG-LVP Total.

EX: If all ten Locations of the St. Edoard sanatorium building (StAA15) are still non-rubbed and Controlled by one side at CG-Scenario End, they are worth 20 LVP to that side, since each such Location is worth two LVP. If, however, two ground-level Locations of the sanatorium have been rubble, the building's LVP value is only 16 (two LVP for each of its eight existing, playable building/rubble Locations).

Map Group: Each Map Group¹ comprises two Map Sections [EXC: the "Ch" Map Group (used in CG II) contains only one Map Section]; see SSR KGP1. The "Ch" and "Lg" Map Groups will be contained in KGP II.

Map Section: One of the five KGP mapsheets. The five Map Sections included in the KGP modules are organized into three Map Groups.

No Man's Land: A non-Strategic Location within two hexes of both friendly- and enemy-Controlled Strategic Locations; 8.6051.

OB (Order of Battle): All units, Equipment, Fortifications and RG of a side that are eligible to participate in the next CG scenario.

Objective Hex: Each initial-OB-given or purchased RG whose ID on a Reinforcement Group Chart begins with an "I" or "HW" allows the owning side to secretly designate an Objective Hex during RePh step 8.6198. An Objective Hex remains a potential Strategic Location even if not revealed on the CG Date it was designated. As soon as (but never before) such an Objective Hex is Controlled (as per A26.11-12; even if during setup) by Infantry of the designating side, its identity must immediately be revealed to the opponent and it becomes a permanent Strategic Location. Once revealed, use a Control marker of the Controlling side to mark the hex. When designated, such a hex cannot already be a Strategic Location and must have at least one of the following attributes:

- Any in-hex TEM of $\geq +1$;
- Any combination of $\geq$ three Crest-Line/slope/wall/hedge/road hexsides;
- A ford Location.

Pttn (Platoon): A CG RG organization type.

RePh (Refit Phase): The series of steps performed after each CG scenario. All Chapter P rules beginning with "8.6" are KGP CG RePh rules/steps. See also 8.6.

Reserve: German "I", "V" and "HW" type RG purchased on the same CG Date as the CG scenario being played must be set up in Reserve status (SSR CG7a; 8.4) [EXC: as per Initial-Scenario SSR, or if purchased at extra CPP cost for Standard On-Map Setup (8.6194a)].

Retained: All units, Equipment and RG in a side's OB that are available for setup/entry in the next CG scenario; i.e., all Initial-Scenario OB-given/purchased units/Equipment (or all units/Equipment remaining available from the previous scenario of the CG), and all RG purchased since the previous (if any) scenario of the CG. In KGP, such a unit/Equipment is required either to be set up in the Setup Area it was Retained in (8.6055; 8.6061) or to enter at an Eligible Entry Area (SSR CG6; 8.4) if Retained off-map; e.g., a unit ending a CG scenario in friendly Setup Area "X" must begin the next CG scenario in that same Setup Area [EXC: if Shifted to another Setup/Entry Area; 8.613].

RG (Reinforcement Group): Usually a number of units/Equipment purchased, as a group, for use in the CG as additions to a side's OB. Also includes FPP, Air Support, SAN increase, Bombardment, OBA, and Pre-Registered-hex capability.

RG Purchase Record: The sheet used to record the units-in/information-for each CG RG type (see 8.6198). One line is filled out for each RG purchased. Players are urged to photocopy the one provided herein.

Sect (Section): A CG RG organization type.

Setup Area: Each Strategic Location Controlled by a side, plus each non-Strategic-Location hex that is within two hexes of such a Strategic Location but not within two hexes of an enemy-Controlled Strategic Location (i.e., not a No-Man's-Land hex; 8.6051). Each such non-Strategic-Location hex must also be Enterable by Infantry from $\geq$ one Strategic Location of that Setup Area. Friendly Setup Areas that touch/overlap are treated as a single Setup Area. For an Initial Scenario, see also 8.5.

Shift: The RePh process by which a Retained unit attempts to exit its current Setup/Entry Area to another friendly Setup Area or Eligible Entry Area; 8.613.

P

Strategic Location: Each building/rubble/bridge/entrenchment Location, each Objective Hex, and each Location that is occupied by a non-Abandoned Immobile vehicle with functioning MA of ≥ 20 mm (or functioning FT MA) and/or by an unhooked non-malfunctioned Gun, is a Strategic Location [EXC: an Objective Hex not yet occupied by the designating side; see Objective Hex definition above].

Strength: A Ptn/Sect RG is received at Full—or, if German, possibly at Depleted—Strength (8.6193).

Uncontrolled Territory: All non-No-Man's-Land hexes that are part of no Setup Area; i.e., that are $>$ two hexes from all Controlled Strategic-Location hexes (8.6053).

Weapon: Any SW/Gun/Vehicular-armorment/Daisy-Chain using the IFT/TH table(s) to cause damage to the opponent.

8.3 THE CG SCENARIOS: The parameters of the Initial Scenario for each CG are given in 8.51-53. Additional scenarios for that CG (and the Victory Conditions for each) are generated in a special between-CG-scenario sequence called the Refit Phase (RePh); 8.6. The CG continues until the specific CG Victory Conditions are fulfilled by one side (if applicable) or the completion of the last CG Date of that CG, whichever occurs first. Each side's initial Setup Area(s) for a non-Initial CG scenario is determined by the Strategic Locations Controlled by both sides at the previous CG-Scenario End.

8.31 CG BALANCE PROVISIONS: Should each player wish to play the same side (A26.5), the following Balance is used throughout each CG:

- ✦ The German Secret DR of 8.616 is halved (FRD).
- ✧ The U.S. Secret DR of 8.616 is halved (FRD).

8.4 CAMPAIGN GAME SPECIAL RULES: The following CG SSR apply in all KGP CG scenarios and RePh:

CG1. MAPS: Each CG uses its own Map Group; see 8.51-53 and SSR KGP1.

CG2. KGP SSR: All KGP# SSR (see the Chapter P divider) are in effect except as amended below.

CG3. WEATHER: The historical weather for each CG Date is listed in 8.617. Alternatively, players may agree to use the optional 8.6171 random weather rules.

CG4. ELR/MASSACRE: Each side's printed ELR given in the Initial Scenario (8.51-53) of each CG is also treated as that side's printed ELR for all subsequent scenarios of that CG [EXC: for non-SS German ELR see SSR KGP11; if a Massacre (A20.4) occurs during any CG scenario/RePh, all effects listed in A20.3-4 are applicable for the remainder of that CG; the Scenario Defender's ELR at night is one $<$ it would be in a daytime scenario].

CG5. CG NIGHT SCENARIO: The NVR of a CG Night scenario is determined using E1.11 and the historical Moon Phase and Cloud Cover given in the 8.617 chart. The side(s) selecting the Attack chit in a night Assault scenario (8.6233) is considered the Scenario Attacker (E1.4; despite usually having units available to set up on-map); a side selecting the Idle chit is the Scenario Defender (E1.2). The Scenario Defender in a CG night Assault (8.6233) scenario has automatic Freedom of Movement (following any enemy attack besides a successful Ambush; E1.21) for his two best non-Reserve leaders. The Scenario Attacker may use normal Cloaking (E1.4-43) for his Infantry, even if they set up on-map. (German Cloaking counters must be a different color than those used for any Reserves [SSR CG7a; 8.4].) Cloaking-counter HIP is NA. On-map Cloaked SW need not be dm. Scenario Defender reinforcements Retained off-map may enter at an Eligible Entry Area only following a RPh reinforcement dr of $<$ the current Game Turn number, or automatically once any Scenario Defender unit has been attacked by other than OBA/Sniper or has seen a Known enemy unit. A reinforcing AFV with a radio releases other friendly AFV with radio as per E1.21 [EXC: those in Reserve; SSR CG7b]. See also SSR CG4 and CG23.

CG6. ENTRY AREAS: A large arrow denotes the center hex of each nine-hex-wide Entry Area (EX: StGG1; StN56; ChA10). If it is a U.S. Entry Area, the arrow contains a U.S. star and is color-coded to match $\geq$ one of the colors in the "Entry Code" column (8.6197) of the U.S. RG Chart. If it is a German Entry Area, the arrow is gray and contains a German cross. An arrow that is partly gray and partly a U.S. Entry-Code color indicates a U.S. and German Entry Area.

a) **U.S.:** A U.S. unit may initially enter only at an Entry Area whose arrow color-code matches at least one colored dot in the Entry Code column (8.6197) for the RG that unit is part of [EXC: if the unit Escaped, or Shifted, to its currently occupied Entry Area (8.6061; 8.613)], and only on/after the CG Date listed on that arrow (SSR CG6c) for the U.S. side [EXC: U.S. Early Entry (8.6194b)], regardless of the hex's current Control.

b) **GERMAN:** German units generally set up on-map, but may enter at an Eligible Entry Area if Retained in a Holding Box due to exit (SSR CG21), Escape (8.6061), Shift (8.613), or purchase for off-map reinforcement (8.6194a). See also SSR CG6c.

P

8.4 (SSR CG15)

c) ELIGIBILITY: An Entry Area is *Eligible* to a side if the center (arrow) hex displays that side's nationality symbol *and* that side's CG Date listed on the arrow is (or antecedes) the current CG Date [EXC: if the U.S. uses Early Entry (8.6194b) in a CG scenario, that Entry Area is considered Eligible for the U.S. side during that scenario—but *only* for each U.S. RG using Early Entry therein, and for *all* U.S. units/Equipment exiting (SSR CG21) via, or Escaping (8.606) or Shifting (8.613) to, that Area *after* Early Entry has been used there]. Furthermore, the center (arrow) hex of a *German* Entry Area must also be German-Controlled in order for the German to consider it Eligible [EXC: German units/Equipment Retained in an otherwise-Eligible Entry-Area Holding Box at the start of a CG scenario may *enter* at that Entry Area regardless of who currently Controls its center (arrow) hex]. If the Germans currently have *no Eligible* Entry Area on the Map Group, all German units/Equipment Retained off-map (including all purchased since the previous CG-Scenario End) may *only* enter from off-map at a *German* Entry Area; i.e., none of them may be set up on-map [EXC: on the "Lg" (only) Map Group, they must set up on-map (and in Reserve as per SSR CG7a if "T", "V", or "HW"-type RG)].¹² A U.S. Entry Area may be used by the U.S. side regardless of who Controls the center (arrow) hex. See also SSR CG20.

CG7. RG SETUP/ENTRY: Each RG listed in an Initial Scenario's OB is available for on-map setup/entry as specified below. If set up on-map, units/Equipment of a RG must be set up in the friendly Setup Area they are Retained in (or as defined by Initial Scenario setup restrictions). All units/Equipment that set up off-map during the RPh (A2.51) but do not enter during that same Player Turn are returned to the *shaded* portion of their Entry Area's Holding Box; they forfeit their entry in the present, but are Retained for the next, CG scenario. All units/Equipment of the same RG must *initially* either be set up in the same Setup Area or enter at any hex(es) of the same Entry Area. In addition, certain *purchased* RG must also set-up/enter as per the following nationality-specific rules:

a) GERMAN RG: Each German RG whose ID (8.6191) on the German RG Chart begins with "T", "V" or "HW" which was *purchased* on the same CG Date as the CG scenario being played may be set up on-map only if set up in Reserve using the principles of Cloaking (E1.4; see also below) [EXC: if it would set up on the "St" or "Ch" Map Group but the Germans have *no Eligible* Entry Area thereon; if purchased at extra CPP-cost for Standard On-Map Setup (8.6194a); Initial-Scenario SSR L2 (8.51)], even when the German is the Scenario Attacker/Defender at night. If unable to be set up in Reserve, such a RG is instead Retained in the unshaded portion of any German-Entry-Area Holding Box of that Map Group and may enter on/after Turn 1 [EXC: as per Initial-Scenario SSR or SSR CG5] as per SSR CG6c; all, some or none (including individual RG units) may enter on each turn. For non-Reserve German RG, see SSR CG15 and 8.6194-6194a.

For each Reserve RG purchased, the German receives one Reserve Cloaking counter (i.e., a $\frac{1}{2}$ "T" of any unused nationality) for each MMC that will set up as Infantry, plus one for each vehicle, in that RG. Each Reserve RG purchased may (at its owner's option) also automatically include one Reserve Dummy Cloaking counter (usable in a day/night scenario). Each Reserve Cloaking counter may represent a maximum of one vehicle (plus its PRC and towed Gun or trailer) *or* one Infantry unit/stack (and its possessed Equipment), and must be set up at ground level in a non-Isolated, friendly-Setup-Area Location $\geq$ eight hexes (or, if this is not possible, as far away in hexes as possible) from all U.S. Setup-Area and all U.S. Entry-Area hexes. Reserve Cloaking-counter HIP is NA. The pertinent CA/CE-status information of each Reserve vehicle must be recorded (each Reserve AFV is considered CE unless noted otherwise by the owning player; see also SSR CG10 and SSR KGP8). The Cloaking counter of a Reserve vehicle in Bypass is set up *in* the hex in the normal manner rather than straddling its hexside, but that hexside and the vehicle's CA/PF must be recorded. Reserves cannot Deploy/Recombine, and are ignored for the purposes of Deployment/HIP/"?" limits.

b) RELEASE: During a CG scenario, each Reserve unit/stack must remain Cloaked—and may conduct no action whatsoever—until an enemy ground unit is in its LOS within six hexes, *or* until subjected to an *enemy* attack (including Bombardment/WP/Sniper) that results in loss of the Cloaked Reserve unit's stack's concealment, at which time its owner may (or must, if the Reserve Cloaking counter was so attacked or was revealed by Detection as per A12.15) reveal that Reserve Cloaking counter's contents (if any) by placing them on-map unconcealed. In general, the contents (if any) of a Reserve Cloaking counter are considered to not exist until they are revealed. The following apply to Reserve Cloaking counters:

- A Reserve Cloaking counter is ignored for all Overstacking, concealment loss/gain, Interrogation and Control purposes;
- A non-Cloaked Dummy stack and a Reserve Cloaking counter may neither set up, nor end a phase, together in the same Location;
- A Reserve Cloaking counter is an ineligible Sniper target (A14.22);
- A Reserve Cloaked leader may not use his leadership benefits for any purpose;
- If a Flame/Blaze occurs in a Location that contains a Reserve Cloaking counter

(even a Dummy), that counter may move/advance once to an ADJACENT non-Blazing Location—provided it is not moving closer (in hexes) to an enemy ground unit regardless of LOS. If it cannot do so, its owner may at that time place it anywhere within three hexes of its current hex, though he may not place it closer to an enemy ground unit and must otherwise abide by the rules pertaining to Reserve setup.

- Each Dummy Cloaking counter is Eliminated at the end of play (8.602e).
- Each RG unit/Equipment piece that is still Cloaked at scenario end is revealed (8.602g) and Retained (8.605-606).

c) U.S. RG: Each U.S. RG whose ID (8.6191) on the U.S. RG Chart begins with "T", "V" or "G" which was purchased on the same CG Date as the CG scenario being played enters on/after Turn 1 as per SSR CG6a [EXC: as per Initial-Scenario SSR, SSR CG5, or 8.6194a]—as do all U.S. units/Equipment Retained off-map in Holding Boxes from the previous CG scenario. All, some or none (including individual RG units) may enter on each allowed turn. U.S. RG cannot be set up in Reserve. For other U.S. RG types, see SSR CG15 and 8.6194-6194b.

CG8. OPTIONAL VEHICULAR EQUIPMENT: All desired optional armament (e.g., AAMG; bow-mounted FT [U.S. Vehicle Note F]) must be rolled for individually (H1.41). Consult the applicable Vehicle Note(s). If so equipped, no additional CPP cost is assessed. For Schürzen see SSR KGP14. For Gyrostabilizers see SSR KGP17.

CG9. WEAPON/CREW REMOVAL: A Retained vehicle may begin (i.e., set-up/enter) a CG scenario with any/all eligible armament Removed (D6.631). A Retained vehicle may begin a CG scenario abandoned. Such a Removed-Weapon/-crew counter must begin that CG scenario in the same Setup/Entry Area as the vehicle it came from.

CG10. STATUS MARKERS: During its setup, each side may opt to secretly record the BU, CE, TCA, bogged (SSR KGP8), Immobilized, abandoned, Out-of-Gas, malfunctioned, disabled, Fanatic and/or Low-Ammo status of its vehicles/Guns/personnel in lieu of placing the appropriate marker(s) on them. Place the actual marker(s) when the piece is non-concealed and within 16 hexes of any enemy ground unit that has a LOS to it.

CG11. CONCEALMENT: Each Infantry unit (and its possessed Equipment) setting up in Concealment Terrain may set up concealed, regardless of enemy LOS. Each vehicle may begin concealed if it is set up in Concealment Terrain $\geq$ six hexes from the nearest enemy Setup-Area Location. Such "?" need not be purchased; i.e., each is placed freely. Otherwise, A12.12 applies in the normal manner. The side setting up first may conceal each eligible unit before the opponent views the setup; likewise, the side setting up second may conceal all eligible units before his opponent views that setup. For purposes of "?" placement prior to the start of play, a Location is also considered Concealment Terrain if it is out of the LOS of all *opposing* Setup Area Locations (including an Initial Scenario's listed setup limits), considering current Mist/NVR visibility limits. "?" purchased in the RePh (8.621) and those received at night (E1.2) are intended mainly for use as Dummies.

CG12. BORE SIGHTING & GUNS: Bore Sighting is NA [EXC: Eligible SW MG may Bore Sight at night]. A12.34 applies in the normal manner. Each non-vehicular Gun that ended the last CG scenario on-map must be set up within three hexes of the Location in which it ended that scenario [EXC: 81mm MTR; Escape (8.606-6061); Shift (8.613); if at the start of setup (RePh step 8.624) it is hooked up to a Mobile vehicle; if a CG Idle Date has been generated; instead, it may set up anywhere in its current Setup Area], regardless of whether it may be set up (un)hooked. Each SW/Gun in a Setup Area that contains Personnel may be set up (un)hooked/(un)limbered/(non-jdm unless otherwise prohibited.

CG13. GERMAN PF: For each CG scenario, the number of PF initially available to the German side is $1\frac{1}{2}$ times the number of non-Reserve German *squads* set up on-map. During play, whenever $\geq$ one *squad* is released from Reserve (SSR CG7b) or enters as a reinforcement, the number of available PF is immediately increased by $1\frac{1}{2}$ per such *squad*. (To indicate an extra " $\frac{1}{2}$ PF", move the PF Remaining marker *halfway* into the next box of the PF Usage Track; a " $\frac{1}{2}$ PF" does not itself entitle the German to a PF attempt.)

CG14. GERMAN FANATICISM: For two CG scenarios of each CG [EXC: *once* during CG II], the German may declare that all of his Personnel are Fanatic for the entire scenario (including vs Bombardment). This must be declared immediately upon the conclusion of all on-map setup.

CG15. OBA: Each side's available OBA is limited to a maximum of two (including U.S. 60mm) modules per Map Group per CG Date [EXC: this limit does not apply to U.S. RG "O3" (M12 GMC OBA); a Bombardment RG is not an OBA module]. For the purposes of this

8.4 (SSR CG15)

rule, "available" means having the module's radio/field-phone in play (or using its Offboard Observer) at any time during a CG scenario. A radio/field-phone counter (and its associated OBA module) is immediately Eliminated when its OBA is exhausted, or in the RePh (8.602d) if its OBA was "used" as per SSR CG22 in the previous scenario. On an OBA RG's CG Date of purchase, its radio or field phone is placed with non-Isolated Personnel in any friendly Setup/Entry Area [EXC: field phones may be used only by the U.S., and only if they set up on-map with non-Isolated Infantry; see also U.S. RG Chart footnote "o"]. Each field phone's Security Area (C1.23) must comprise Enterable (by Infantry) Locations that are not within an enemy Setup Area, and must be drawn to a map-edge that contains $\geq$ five edge-hexes of a U.S. Eligible Entry Area. A new Security Area may be recorded for each CG scenario. If no legal Security Area can be traced during setup, that field phone is Eliminated but the player may immediately add a new radio or field phone (for the Eliminated phone's OBA module) to some other non-Isolated friendly Setup (or, for the radio, Eligible Entry) Area. See also SSR CG22 and 8.6206.

CG16. SNIPERS: Each side may use two Sniper counters per CG scenario per Map Group [EXC only one on the "Ch" Map Group]. If $>$ one Sniper per side is in play, each must still be set up initially as per the first two sentences of A14.2, but with ≥ 15 hexes between them (or as far apart as possible if they cannot set up ≥ 15 hexes apart); when a Sniper attack can occur, make a dr to randomly determine which one actually attacks (assign numbers so that each has an equal chance). The SAN is never altered by the presence of $>$ one friendly Sniper in play simultaneously. Any result (e.g., Pin) affecting a Sniper counter affects all friendly Snipers on that Map Group simultaneously. See also 8.6122.

CG17. U.S. AMMO SHORTAGE REMOVAL: When a Good Order U.S. Infantry unit suffering from Ammunition Shortage due to Isolation (8.6241) begins a friendly Player Turn in the same Location as an armed, Good Order U.S. Infantry MMC that is not itself suffering from Ammunition Shortage and whose US# is $\geq$ that of the other MMC, its Ammunition Shortage ceases to exist at the end of that Player Turn provided both units become TI and remain in Good Order throughout that Player Turn. A U.S. MG [EXC: .50-cal HMG] SW's Ammunition Shortage is removed whenever it is possessed by an armed, Good Order U.S. MMC that is not suffering from Ammunition Shortage. All other U.S. Weapons suffering from Ammunition Shortage lose that status only by ending a CG scenario non-Isolated.

CG18. SELF RALLY: Each side is allowed a number of non-Disrupted MMC Self Rally attempts (per Map Group) equal to the number of Map Sections of that Map Group, provided (as per A18.11) each such attempt is carried out before other friendly MMC Rally attempts.

EX: Two Self Rallies may be made on the "St" Map Group per friendly Player Turn.

CG19. TERRAIN CHANGES: Each alteration of printed terrain that occurs during a CG is permanent, barring subsequent Clearance/removal (as applicable). All Fortification, Rubble, Breach, Trailbreak, Shellhole and (Burnt-Out; SSR KGP10) Wreck counters are left on-map from scenario to scenario (unless removed due to a Blaze or falling rubble, etc.; for Wrecks, see also the 8.2 definition of "Eliminated"). Each terrain Blaze is resolved in RePh step 8.609-6095. No Wreck is removed from play due to being in a terrain Blaze; it remains on-map (still treated as a LOS Hindrance), and in RePh step 8.6091-6093 it becomes/remains a Burnt-Out Wreck [EXC: 8.6095]. Whenever a vehicle is Out of Gas, Immobilized, Abandoned, and all of its present Inherent Weapons are disabled (or it has no Inherent Weapons), it is immediately replaced by a Burnt-Out Wreck (if this occurs during play, the opponent is awarded the appropriate number of Casualty VP). However, a vehicle that has no Wreck depiction (D1.9) can never be turned into a (Burnt-Out) Wreck; it is instead simply removed from play. Whenever a non-Burnt-Out Wreck is Out of Gas and Scrounged (if it had any Scroungeable Weapon), it is immediately replaced by a Burnt-Out Wreck.

CG20. VIADUCT ENTRY AREA: No vehicle may ever use (i.e., enter/exit via, Escape to, or Shift to/from) the ChHH0 "Viaduct" Entry Area.¹³

CG21. MAP EXIT: Each Personnel/Equipment piece that exits the map via an Eligible Entry Area during play cannot re-enter during that scenario, but is Retained (unless Shifted; 8.613) in that Entry Area's Holding Box [EXC: all German Personnel/Equipment so exited off the "Lg" Map Group during CG III are immediately Eliminated]. However, each such broken Personnel unit must take a NTC (a Good Order leader's DRM can apply) immediately upon exiting; failing this NTC causes its Casualty Reduction (if it is Eliminated, so is its possessed Equipment). Everything exited at any other Location during play is Eliminated. In both cases, such Elimination counts for Casualty VP purposes. Retained exited units/Equipment are placed in the shaded portion of that Entry Area's Holding Box.

CG22. RETAINED RG: Regardless of whether it was used during a CG scenario, each purchased/OB-given RG (or part thereof, including each Pre-Registered-hex-/radio/field-phone assigned to an OBA RG, even if that radio/field-phone counter was Eliminated during play), is Retained until Eliminated/Recalled in a CG scenario or its subsequent RePh. For purposes of this rule, an OBA RG is considered to have been used (and thus will be Eliminated in the next RePh; SSR CG15) if $\geq$

one FFE:1 counter from that module was placed during the previous scenario. (If Retained, the OBA's Draw Pile [C1.211] is restored to the number of red and black chits it had at the start of the previous scenario, and its radio or field phone is restored if it was Eliminated. During the RePh, each radio/field-phone may be freely relocated within its present Setup Area, or Shifted [8.613], and each non-Eliminated Pre-Registered hex may have its hex coordinate changed to that of a legal new hex.) A FB RG is considered to have been used if $\geq$ one of its FB made a Sighting TC DR; once so used (or if the FB RG was Recalled as per SSR KGP3), the entire FB RG is Eliminated at the end of the scenario. Each unentered RG (or part thereof) is Retained in the Holding Box of its Entry Area [EXC: if Shifted; 8.613]. U.S. 60mm OBA is considered an OBA RG for the purposes of SSR CG15 and CG22 (only).

CG23. GAME END: A Turn Record Chart is printed on one map of each Map Group. Each CG scenario has a variable Game Turn length. At the end of each Player Turn of Turn 6, and at the end of each Player Turn thereafter, the AT-TACKER makes a Game End dr; if it is $\leq$ the circled number in the current turn's box on the CG Turn Record Chart, the scenario ends immediately. There is a +1 dr to each CG Night scenario Game End dr.

EX: At the end of either Player Turn of Game Turn 7 in a daytime scenario, play ends immediately on a Game-End Original dr of ≤ 3 .

8.5 INITIAL SCENARIO: The special information needed to play each CG's Initial Scenario is provided in 8.51, 8.52 and 8.53 respectively. For each Initial Scenario, players begin with RePh step 8.618 (German Ammunition Shortage) and complete RePh steps 8.618-621 (these steps are preceded by a $\dagger$ in the RePh Sequence; 8.6). In addition, for each Initial Scenario:

- The actual Strengths of most German OB-given and purchased (8.619) RG must be determined in the normal manner (8.620);
- German Initial-Scenario OB-given (as opposed to purchased) RG need not be set up in Reserve;
- The Quality (8.6202) and exact unit type (8.6203) of certain U.S. OB-given and purchased RG must be determined in the normal manner (8.620);
- Weapons and leaders are determined in RePh steps 8.6204-6206;
- Each side is considered to initially Control each Strategic Location and Entry Area within—but not those outside of—its initial setup boundaries.

8.51 KGP Campaign Game I: CLASH AT STOUMONT

CG Dates: 19 AM – 21 PM [eight CG Dates]

One of the two armored spearheads of the German 6. Panzer Armee in the Ardennes offensive was Kampfgruppe Peiper of SS-Panzer Division 1 "Leibstandarte Adolf Hitler". This Kampfgruppe comprised various elements of SS-Panzer Regiment 1, SS-Panzergrenadier Regiment 2, SS-Panzer Artillerie Regiment 1 and SS-Panzer Pioneer Battalion 1, with schwere SS-Panzer Abteilung 501 and FlaK-Sturm Abteilung 84 attached. After a slow start on 16 December due to poor road conditions, traffic jams, minefields, and the less than satisfactory progress of Volksgrenadiers trying to breach the initial American positions, the Kampfgruppe rolled through the U.S. lines with relative ease. A bridge across the Amblève river at Stavelot was seized on the morning of the 18th; but at Trois-Ponts, a village nestled amidst high hills and named after its three bridges, American engineers blew the bridge that controlled the exit west from the Amblève valley, forcing Peiper to follow the right bank of the river to La Gleize through the most mountainous terrain in Belgium. After capturing another bridge over the Amblève at Cheneux that afternoon, Peiper's lead column was rebuffed farther on near Habiémont. Denied exit from the river valley once again, the armored tip of KG Peiper halted for the night in the woods between La Gleize and Stoumont. At about the same time, the U.S. 3/19th Infantry began detrucking in the latter village. To the sound of Germans singing loudly in the distance, the GIs deployed and dug in—though darkness prevented them from choosing positions with optimum fields of fire. Just before dawn, several Shermans and two 90mm AA guns arrived to bolster the defenses; unfortunately for the Americans, one of the latter fell into a ditch as it was being positioned and had to be abandoned. On this ominous note, the stage for the coming battle was set.

MAP GROUP: "St"

P

CG I VICTORY CONDITIONS: The Americans win if their CG-LVP Total is ≥ 130 at any CG-Scenario End—or if they Control all hexes occupied by buildings AA15, J19 and P56 (even if $\geq$ one of these buildings becomes partially/totally rubble at ground level) at CG End.

ATTACK-CHIT LIMITS (8.6231): U.S. 5; German 3.

INITIAL-SCENARIO VICTORY CONDITIONS: The Germans win if at CG-Scenario End they have amassed ≥ 50 Casualty VP more than the Americans and/or the German Current-LVP Total is ≥ 28 .

INITIAL-SCENARIO SETUP SEQUENCE: U.S. sets up first; German moves first.

INITIAL U.S. OB:

- Elements of the 3rd Battalion, 119th Infantry Regiment, of Company C, 743rd Tank Battalion, of the 823rd Tank Destroyer Battalion (SP), and of Battery C, 143rd AAA Gun Battalion (Mobile) [ELR: 3] set up within three hexes of any building hex(es) with a coordinate of ≥ 19 but ≤ 34 [EXC: see SSR I.2]; each Gun, and ≥ 15 non-crew MMC squad-equivalents, must set up in non-building Locations: {SAN: 3}

RG: Inf Pltn $\times 6$	RG: AT Pltn I	2-2-7 $\times 5$
RG: Med Tank Pltn II	76L AT $\times 4$	1S Foxhole $\times 15$
M4A3 MT $\times 3$	90L AA (M2)	25 CPP
M8 AC $\times 2$	M4 Tractor	

INITIAL GERMAN OB:

- Elements of SS-Panzer Regiment 1 and SS-Panzer Grenadier Regiment 2 [ELR: 5] set up on/east-of Hex Grains A29-S38-S57 [EXC: $\leq$ three infantry-type pltns (RG I1/I2/I4 only) may enter along the south edge on/after Turn I; all, some or none may enter on each turn]: {SAN: 2}

RG: SS PzGr Pltn $\times 4$	RG: Pz V Sect $\times 4$	85 CPP
RG: SS PzGr HW Pltn	RG: Pz IV Sect $\times 4$	

INITIAL-SCENARIO SPECIAL RULES:

The following SSR apply only to the 19 AM Initial Scenario of CG I.

I.1 See KGP SSR. Weather is Extremely Heavy Mist (SSR KGP3).

I.2 All OB-given and purchased RG of both sides may be set up on-map at no extra CPP cost [EXC: Germans need not set up in Reserve; the U.S. OB-given Med Tank Pltn II RG must enter at HH0 following a reinforcement dr of two < the current Game Turn number; if still unentered at scenario end, it is Retained in the Holding Box of the Targnon Entry Area].

I.3 Each U.S. Gun must be set up unhooked and unlimbered, and its starting CA is determined by a dr when it is initially revealed. If this dr is ≤ 2 the Gun uses its pre-recorded CA; on a dr of 3-4 it must pivot one hexspine clockwise; on a dr of ≥ 5 it must pivot one hexspine counter-clockwise. [EXC: If an AT is attacked by non-ordnance fire before its CA has been determined, its owner makes the dr secretly; this sets the CA (thus determining, as applicable, if the gunshield will modify the attack) even if the Gun is not revealed by the attack.]

- I.4** U.S. cannot purchase trenches. One M4A3 MT in the initial U.S. OB may be recorded as automatically equipped with a FT as per U.S. Vehicle note F (Only one of the three initial M4A3's may be equipped with a FT).

AFTERMATH: At first light, through a dense early-morning mist, the Germans mounted a full-scale assault. The main push came from the east, with smaller groups attacking from the south and northeast. With visibility so poor, they were almost into the American defenses before the latter could open fire. The GIs resisted bravely for several hours, and for a time the German attack seemed to falter—but the eventual loss of all the U.S. AT guns shifted the balance in the Germans' favor. The Americans were finally forced to fall back, and, covered by the remaining Sherman tanks, most withdrew along the N.33 through the lines of the 1/119th Infantry some 3000 yards west of Stoumont. In its defense of the town the 3/119th had suffered losses of over 250 men, including about 100 taken prisoner. A small German force probed ahead on the heels of the withdrawal, but was stopped cold—with the loss of three Panthers—in front of the 1/119th. To conserve his dwindling stocks of fuel and ammunition, Peiper called a halt to await resupply and pulled most of his advance force back down the N.33 to the edge of Stoumont. That village, along with Cheneux and La Gleize, were to become strongholds until the supply situation permitted further advance. However, unbeknownst to Peiper, U.S. forces had already cut his link to the rear by retaking Stavelot. On the 20th, Task Force Jordan arrived from Theux and probed the defenses of the rocky pass just north of Stoumont; but the loss of two tanks to German fire, combined with the restrictive terrain, forced it to halt for the night. In the late afternoon, the 1/119th Infantry and the "bastard tanks" of the 740th Tank Battalion (their crews had not yet seen action and on the previous day had hurriedly drawn a menagerie of AFVs from a nearby repair depot) attacked from the west along the N.33; at dusk they reached the outskirts of Stoumont, and later that night captured the St. Edouard Sanatorium. Around mid-

night, however, the Germans unexpectedly counterattacked the building and quickly retook most of it. Shortly before daybreak they also tried to push the Americans back along the N.33, but were stopped with little gain. On the afternoon of the 21st, the 1/119th attempted, to no avail, to recapture the sanatorium. At the same time, TF Jordan and the 3/119th tried using the forest tracks through the woods north of Stoumont; they reached the edge of the trees despite heavy resistance, but German tanks prevented further progress. In the meantime, however, the fresh 2/119th Infantry, moving through the Bois de Bassenge, reached the N.33 near the St. Anne Chapel only about 800 yards from Peiper's HQ. The Germans soon pushed them back, but this new and dangerous threat to Peiper's rear, combined with U.S. artillery fire pouring incessantly into Stoumont, prompted him to order a withdrawal to La Gleize. This was accomplished without incident after dark; and on the afternoon of the 22nd the Americans—who ironically had decided to forego further attacks until reinforcements could be brought up—entered Stoumont virtually unopposed.

8.52 KGP Campaign Game II: THE BRIDGE AT CHENEUX

CG Dates: 20 PM – 21 PM [four CG Dates]

Although Peiper's attempt on the 18th to exit the Amblève valley via Cheneux had been stopped by the "damned engineers" near Habiémont, the German commander decided to hold Cheneux as a bridgehead across the river. To this end he ordered it garrisoned, mainly by elements of *Flak-Sturm Abteilung 84*. Even as this was being done, the U.S. 82nd Airborne Division was moving east to plug the gap in the American defenses between the 30th Infantry and 7th Armored divisions. When scouts from the 504th Parachute Infantry Regiment, already warned by civilians that the Germans were in Cheneux, approached the western outskirts of the village on the morning of the 20th, they spotted a woman standing between two houses. Her warning gestures clearly indicated that her house was occupied by Germans; having also spotted two *flakwagens* and a machinegun position near Boutet's house, the scouts withdrew to report. Consequently, the paratroopers of B and C Companies were ordered to move up from Rahier. In the meantime the German bridgehead was reinforced by the last elements of *KG Peiper* to reach La Gleize before the Americans shut the door completely in the Trois-Ponts area: *Battalion II of SS-Panzer Grenadier Regiment 2*, which arrived on foot with only the supplies and equipment its men could carry. As Company B neared Cheneux, it was met by a wall of fire from automatic weapons. Both paratroop companies then deployed in the dense mist and advanced, supported by a captured German half-track mounting a 75mm howitzer.

MAP GROUP: "Ch"

CG II VICTORY CONDITIONS: The Americans win if they Control ten LVP hexes [EXC: the NN6 bridge Location counts as 5 such hexes] at game end, or immediately if the Germans cause (even accidentally) that bridge's destruction.

ATTACK-CHIT LIMITS (8.6231): U.S. 3; German 1.

INITIAL-SCENARIO VICTORY CONDITIONS: The Americans win if their Current-LVP Total is ≥ 1 at CG-Scenario End.

INITIAL-SCENARIO SETUP SEQUENCE: German sets up first; U.S. moves first.

INITIAL GERMAN OB:

Elements of *Battalion II, SS-Panzer Grenadier Regiment 2*, and of *Flak-Sturm Abteilung 84* [ELR: 5] set up on/east-of (Alternate) Hex Grains G1-G14-CC25-TT25; however, a maximum of one German MMC (and all SMC/SW stacked with it), or one vehicle (and all its PRC), may be set up per hexrow on/west-of hexrow V (even if in Reserve), and each entrenchment set up on/west-of hexrow V must contain $\geq$ one German MMC: {SAN: 4}

	RG: AAtr Sect	

8.52

**INITIAL U.S. OB:**

Companies B and C of the 1st Battalion, 504th Parachute Infantry Regiment [ELR: 5] enter along the west edge as per SSR CG6a (8.4); [SAN: 2]

RG: Para Inf Pltn x3 SPW 251/9 (see SSR II.5) 24 CPP

INITIAL-SCENARIO SPECIAL RULES:

The following SSR [EXC: II.5 and II.6] apply only to the 20 PM Initial Scenario of CG II.

II.1 See KGP SSR. Weather is Very Heavy Mist (SSR KGP3).

II.2 Each hex that is *not* an eligible German setup hex is considered a U.S. Setup-Area hex for the purposes of Reserve setup (SSR CG7; 8.4) only.

II.3 Place one Burnt-Out Wreck in hex K10 and one in GG8.

II.4 Purchased U.S. "I#" and "V#" RG units enter on/after Turn 2. All, some or none may enter on each allowed turn.

II.5 The U.S. OB-given SPW 251/9 is manned by a U.S. vehicle-crew (A21.22). Captured penalties apply, but for *this* Inherent crew (only), all such penalties are reduced by one (A21.11-12) [EXC: the MA's ROF is "1"]. MA/Immobilization repair attempts and the optional CMG are NA. Red MP penalties apply (D2.51).

II.6 No mines or German vehicle may be set up in, nor may any German vehicle voluntarily Stop, change VCA or attempt ESB in, bridge Location NN6.

AFTERMATH: As the paratroopers moved through the thick mist, the Germans again unleashed a hail of fire from machine guns and 20mm flak pieces. To make matters worse, the Americans also found their path of advance down the bare hill crossed by numerous barbed-wire fences which greatly impeded their movement. With losses mounting rapidly, they were forced to pull back and await further orders. The 504th's commander, Col. Reuben Tucker, insisted that they resume the attack, so after nightfall the two companies advanced again. This time, with the darkness aiding their concealment but facing no less intense fire from the defenders, they managed to close in on Boutet's house and engage several *flak-wagens* in close combat. As this was occurring, two self-propelled tank destroyers sent forward by Col. Tucker made a fortuitous appearance, enabling the surviving paratroopers to take the house. They now had a toehold in the western outskirts of the village; despite heavy losses, the fighting continued all night. On the 21st, Company G of the 3/504th arrived to bolster the assault on the village. Furious house-to-house combat continued, with the Germans slowly yielding ground. In the meantime the other two companies of the 3rd Battalion, now south of Cheneux, pushed north through the hamlet of Monceau with the Ambève bridge as their objective. By late afternoon the German position was desperate, and that evening they retreated across the railroad viaduct to La Gleize, leaving behind all their heavy equipment. Peiper's bridgehead was eliminated, at a cost of some 225 "All-Americans" of the 504th. B Company had only 18 men left and no officers; C Company but 38 men and 3 officers. The Germans had suffered about 200 killed in the fighting, plus an unknown number of wounded and 31 taken prisoner.

**8.53 KGP Campaign Game III: DECISION AT LA GLEIZE**

CG Dates: 19 PM – 23 PM [thirteen CG Dates]

The picturesque village of La Gleize, situated on a small promontory some 700 yards north of the Ambève river, commanded the road north to Spa, those leading west to Stoumont and Cheneux, and those going south to Trois-Ponts and Stavelot where the main body of *SS-Panzer Division I* was laboring to catch up with *Kampfgruppe Peiper*. La Gleize was thus the linchpin of Peiper's defenses, and throughout the fighting he retained a significant portion of his forces in that area. When on the morning of the 19th the Americans first detected enemy activity around La Gleize, the commander of the 117th Infantry Regiment moved his Company K to Cour and Company L to Roanne, allotting each some Sherman tanks for support. In the afternoon, the first platoon of GIs to arrive at Roanne was ordered to push on toward La Gleize, some 2000 yards to the southeast, to reconnoiter the situation there.

P

MAP GROUP: "Lg"

CG III VICTORY CONDITIONS: The Americans win if at any CG-Scenario End their CG-LVP Total is ≥ 160 and/or they Control *all* existing LVP Locations.

ATTACK-CHIT LIMITS (8.6231): U.S. 8; German 3.

INITIAL-SCENARIO VICTORY CONDITIONS: The Americans win if at CG-Scenario End they have amassed ≥ 10 Casualty VP and/or Control both hex S55 and bridge Location R46.

INITIAL-SCENARIO SETUP SEQUENCE: German sets up first; U.S. moves first.

**INITIAL GERMAN OB:**

Elements of Kampfgruppe Peiper [ELR: 5] set up, using HIP if in Concealment Terrain and not in Reserve, on/west-of Hex Grains A44-AA57-FF56 and on/south-of Hex Grain FF1-FF56; [SAN: 2]

RG: SS PzGr Pltn PzKpfw VIB (see SSR III.4)

RG: SS Inf Pltn 30 CPP

**INITIAL U.S. OB:**

Elements of Company L, 3rd Battalion, 117th Infantry Regiment, and the 1st Platoon of Company A, 743rd Tank Battalion [ELR: 4] enter as per SSR III.5; [SAN: 2]

RG: Inf Pltn RG: Med Tank Pltn II 8-0 14 CPP

INITIAL-SCENARIO SPECIAL RULES:

The following SSR apply only to the 19 PM Initial Scenario of CG III.

III.1 See KGP SSR. Weather is Moderate Mist (SSR KGP3).

III.2 Each hex that is *not* an eligible German setup hex is considered a U.S. Setup-Area hex for the purposes of Reserve setup (SSR CG7; 8.4) only.

III.3 The German player may not spend additional CPP for Standard On-Map setup (8.6194a) of purchased RG, nor may he purchase any roadblock(s).

III.4 The OB-given PzKpfw VIB must be set up Immobilized (not Out of Gas) in hex R44 (VCA: R43-S44).

III.5 The U.S. OB-given Inf Pltn RG and 8-0 enter on Turn 1 within two hexes of V56. All other U.S. "I#" "V#" "G" RG enter as per SSR CG6a (8.4) following a reinforcement dr of $\leq$ the current Game Turn number (make a separate dr for each such RG).

III.6 Beginning on Turn 3, the German player may make a DR during each friendly RPh. If this Final DR is $\leq$ the current Game Turn number, any one Reserve Cloaking counter (German's choice) is immediately Released (SSR CG7b; 8.4). A +1 DRM applies for each Reserve Cloaking counter that has already been Released.

AFTERMATH: The small force of GIs duly moved out, and advanced uneventfully at first—but near a ford across the Roanne stream they were ambushed by hidden *SS-panzergrenadiers*. Their supporting Shermans arrived shortly thereafter, and began firing through the mist at a King Tiger sitting on the N.33 where it had thrown a track the previous day. Suddenly one of the Shermans blew up violently, hit by a German gun firing from Hassoumont. These reverses stopped the Americans cold; they pulled back to Roanne and, after such an inauspicious start, made no further moves against La Gleize that day. In the meantime, however, U.S. troops and equipment continued to arrive. On the morning of the 20th, Company K and its supporting Shermans advanced to Borgoumont, where around noon they were joined by the tanks and armored infantry of Task Force McGeorge. Shortly afterward they advanced along the road toward La Gleize, catching the Germans offguard in Hassoumont. However, after heavy fighting that lasted into the night, the GIs were forced to withdraw behind the Nabonru stream. Also at about noon, U.S. forces advanced from the east toward Marechal's mill, but were rebuffed by the Germans holding the buildings. The 21st saw TF McGeorge, following another futile attempt to close in on La Gleize, abandon Borgoumont for a wide flanking move to the east and south in order to attack northward along the N.33. Fighting continued around Marechal's mill as well—and all the while, American artillery pounded the defenses in and around La Gleize. That night the Germans abandoned the mill, and the exhausted survivors of the fighting at Stoumont and Cheneux made their way into the perimeter, only to be sent immediately into the line. Before dawn on the 22nd, a force of *SS-panzergrenadiers* infiltrated into Les Tchéous. After daylight they, along with several tanks coming up the Spa road, attacked toward Borgoumont in a last desperate attempt to break the encirclement. Heavy and accurate artillery fire, along with that of a 90mm AA gun newly set up on the Roanne heights, forced them to withdraw, leaving behind a King Tiger and two Pz IVs. While this was happening, TF McGeorge made another push on La Gleize, but this attack also gained little and the task force found itself stalled along the Les Minières road. That night, the temperature dropped sharply and a rising breeze cleared the clouds and mist. The Luftwaffe attempted to drop supplies to Peiper, but most fell into American hands. On the morning of the 23rd, U.S. artillery fire increased even more in ferocity, leading the Germans to dub their position *der Kessel* ("the Cauldron"). An earlier-requested air strike failed to materialize, however, the planes instead mistakenly hitting Malmédy, killing a number of soldiers and civilians in the U.S.-held town.

P

When the terrific bombardment on La Gleize eased, the Americans attacked from all sides: TF McGeorge pushed west along the N.33 while the 90mm AA gun and Sherman tanks on the Roanne heights duelled with Tigers around the Wermont farm; the GIs in Bourgmont, supported by mortar concentrations and a few Shermans, moved southwest; and TFs Harrison and Jordan attacked eastward and toward La Venne. The latter were quickly halted at the La Venne crossroads and by accurate fire from the Dinheid and Les Montis heights—while elsewhere the Americans fared not much better, as the Germans threw every last able-bodied man into the fray. The fighting was furious, but the defenders frustrated every assault. Finally the attack was called off, and in its place was substituted another intense bombardment. Though his men had fought brilliantly, supplies of every kind were now almost totally exhausted, and amidst the deluge of artillery shells Peiper knew his position was no longer tenable. Around 1700 hours he received permission from *I SS-Panzerkorps* to evacuate to the main German lines, though with the stipulation to bring out his heavy equipment. With virtually no fuel left, Peiper ignored this demand, and at about 0200 on the 24th he and some 800 of his men quietly abandoned the La Gleize defenses and walked south to La Venne. Left behind was a small rearguard to delay the Americans and destroy the remaining guns and vehicles. The sun rose to the sound of demolitions, and a renewed American attack met with minimal resistance instead of the expected desperate last stand. GIs cautiously entering the smoldering ruins of La Gleize liberated about 170 Americans and captured some 300 Germans, almost all of the latter too seriously wounded to have accompanied Peiper. Just before dawn on Christmas Day, Lt-Col. Peiper and about 770 others, almost asleep on their feet, reached the main force of *SS-Panzer Division I*—a formation now effectively reduced to being armored in name only.

8.6 REPT PHASE (RePh): The following steps (8.601-.625) are performed simultaneously by each side during the RePh, which occurs after each CG scenario. Each step (and sub-step) must be carried out in the numbered/lettered order given; those not applicable to the current situation may be omitted (e.g., if there are no Flames/Blazes on the map, skip RePh step 8.609). Those steps listed below preceded by “†” are the only steps to be completed before setting up to play a CG Initial Scenario. Those preceded by “‡” are performed only if, as per the result of Initiative Determination (8.623), a non-Initial CG scenario is to be played on the current CG Date. Those preceded by “§” are the only steps necessary to achieve CG-Scenario End after the last-Player-Turn CCPh. Those preceded by “*” are performed in repeated sequence until a new CG scenario is generated in RePh step 8.623.

RePh Sequence

- §8.601 Conclusion of Melee
- §8.602 Marker Removal
- §8.603 Rally, Unloading, Victory Determination, & CG-LVP Totals
- 8.604 Encirclement, Minefields, Bog & Shock
- 8.605 Setup Area Determination
- 8.606 Escape
- 8.607 Equipment Possession & Hidden Fortifications
- 8.608 Prisoners
- 8.609 Extinguishing Flames & Blazes
- 8.610 Wounded Leaders
- 8.611 Battle Hardening & Promotion
- *8.612 New CG Date & SAN Adjustment
- *8.613 Shift
- *8.614 Equipment Repair & Replenishment
- *8.615 Fortification & Wreck Removal
- *8.616 CPP Replenishment
- *8.617 KGP Weather
- †8.618 German Ammunition Shortage
- †8.619 Purchasing Reinforcement Groups
- †8.620 RG Strength, Quality, Weapons & Leaders
- †8.621 Purchasing Fortifications
- ‡8.622 Purchasing Reconnaissance
- ‡8.623 Initiative Determination
- ‡8.624 Unit Setup
- ‡8.625 Scenario Commencement

8.601 CONCLUSION OF MELEE: First, each unit currently on a Climb marker must be placed in either the Location it was attempting to reach or the Location it left when it began to climb, at the owner's choice. If the Location the unit is placed in contains an enemy unit(s), mark them all with a *Melee* counter.

All opposing units in the same Locations are now assumed to be in *Melee*, and must undergo an (unlimited) number of *Melee* rounds until no more CC attacks can be made. Such units are free to perform any/all normal CCPh activities associated with *Melee* (i.e., attack, Capture attempts, Withdrawal, etc.; Ambush is NA). Consider the side that moved first in that scenario to be the ATTACKER. Following the conclusion of the first round of RePh *Melee* in a Location, each still-hidden/concealed unit therein is revealed, each pinned unit therein becomes unpinned, each CX counter is removed, each vehicle currently in Motion therein has its Motion counter removed, and each Stun counter on a vehicle therein is flipped over to its “+” side (the vehicle is still subject to Recall, if applicable, and may be marked as CE if so desired).

8.6011 ORDER OF RESOLUTION: Resolve all *Melee*s in alphanumeric sequence (e.g., A1, then B16, then B35, then C19, etc.).

8.602 MARKER REMOVAL: All markers/counters listed below are removed from the map at this time (Right of Inspection does not apply to revealed stacks):

- a) SR and FFE counters;
- b) SMOKE counters;
- c) Acquired counters;
- d) Radios and Field Phones [EXC: if Retained; SSR CG22 (8.4)];
- e) DM, Disrupted, Fanatic, Berserk, Wall Advantage and HD markers, Dummy stacks, Dummy Cloaking counters, and “?”;
- f) CX, Motion, CE, BU and Labor markers;
- g) All hidden/Cloaked units, entrenchments and Equipment are placed on-map in their setup Location¹⁴ (other still-hidden Fortifications need not be revealed at this time);
- h) Sniper counters;
- i) FB counters (see also SSR CG22; 8.4).

8.603 RALLY, UNLOADING, VICTORY DETERMINATION, & CG-LVP TOTALS

8.6031 RALLY & UNLOADING: All currently broken units of both sides automatically rally, even if Disrupted. No DR are made. All Passenger/Rider Personnel and Equipment are then unloaded into their vehicle's Location (a unit unloading into an A-P minefield is not immediately attacked, but 8.6042 will apply). All Guns hooked up and in tow remain so (for now—see SSR CG12 [8.4]); if its vehicle is Eliminated in the RePh, so is the Gun that is being towed. When step 8.6031 has been completed, CG-Scenario End has occurred.

8.6032 CG-SCENARIO VICTORY DETERMINATION: Final hex/building Control and Casualty-VP/Current-LVP totals are now determined, and the winner of the just-completed CG scenario is determined as per 8.6234 or 8.51-.53 as applicable. Units/Equipment Eliminated in the RePh after CG-Scenario End never count for CG-scenario Victory Determination (nor for MMC Battle Hardening DRM; 8.6113) [EXC: prisoners count for Casualty VP purposes as per A26.21]. On its CG Roster, each side records its Current-LVP Total in the upper half of the “LVP” column, and the winning side in the “Win” column, on the line for the current CG Date.

8.6033 NEW CG-LVP TOTALS: Each side now calculates its new CG-LVP Total by adding its Current-LVP Total to its preceding CG Date's CG-LVP Total, and records this number below its Current-LVP Total on its CG Roster. The total LVP value of each Map Group is:

Stoumont: 52 Cheneux: 14 La Gleize: 34

EX: If the Americans end the CG I Initial Scenario Controlling Locations worth 10 LVP, their Current-LVP and CG-LVP Totals for that CG Date are “10”. If at the next CG-Scenario End, on 19 Dec PM, they Control additional Locations worth 5 LVP without having lost any of those they Controlled at scenario start, their new Current-LVP Total is “15” and their new CG-LVP Total is “25” (15 + 10). If on 19 Dec N at the next CG-Scenario End their Current-LVP Total has dropped to “12”, their CG-LVP Total will then be “27” (12 + 25).

8.604 ENCIRCLEMENT, MINEFIELDS, BOG & SHOCK

8.6041 ENCIRCLEMENT: Each Encircled unit [EXC: prisoner] must take a separate ITC (leader's DRM can apply). If it passes its ITC, it remains in its present Location (Encircled markers are not removed until 8.6062). Failing the ITC results in the unit's immediate Elimination [EXC: the Encircled Vulnerable PRC of an Immobile vehicle are Eliminated, leaving the vehicle abandoned]. Each prisoner that an Eliminated Encircled unit was Guarding must if possible be claimed by another unit in that Location friendly to the Eliminated unit. If the prisoner is not claimed, it is considered Rearmed (A20.551) and may automatically possess any Equipment dropped by its Eliminated Guard. Otherwise, any Equipment that an Eliminated Encircled unit possessed is left in the Location unpossessed.

8.6042 MINEFIELDS: Each Mobile vehicle (and its Vulnerable Inherent crew, if required; B28.43) in any type of minefield undergoes the appropriate type(s) of mine attack(s), fully resolved in the normal manner, as if it is attempting to exit the minefield Location [EXC: if the crew breaks, it is unloaded in *Good Order* into the minefield's Location]. Each Infantry unit in an A-P minefield hex (including a crew that just unloaded due to a minefield attack) must take a NTC (leader's DRM can apply); failure of the TC causes Casualty Reduction. [EXC to both: A unit theoretically able to exit the minefield hex without being attacked by the mines and without having to enter a minefield/enemy-Controlled Location need not take the NTC.] In all cases, each surviving unit must remain in its respective Location in that minefield hex until its Setup Area is determined in 8.605-.606.

EX: These illustrations show a portion of the Stoumont Map Group at the end of a CG scenario and how the Setup Areas, No-Man's-Land and Uncontrolled-Territory hexes have been marked; see 8.605-6054 and "MARKING THE MAP" above 8.6054. Strategic-Location Control is indicated by a solid-colored line (red for U.S., blue for German; where feasible, units have been removed from Strategic Locations for the sake of clarity). Each player has marked his own allowed Setup Area(s) for the next CG scenario with dashed lines of

the matching color; e.g., the two German Setup Areas comprise those hexes within the blue dashed- and solid-line areas. By comparing the proximity of opposing-Controlled Strategic Locations, players have also highlighted all No-Man's-Land (8.6051) hexes in yellow. Hexes neither enclosed by a colored line nor shaded yellow are Uncontrolled Territory (8.6053).

The U.S. Setup Area includes all Strategic Locations outlined in red, as well as all hexes enclosed by the red dashed lines (non-Strategic Locations within two hexes of a friendly-Controlled Strategic Location but not within two hexes of an enemy-Controlled Strategic Location). The German Setup Area has been likewise marked in blue.

Note that both sides Control $\geq$ one Location in hex J19 (the St. Hubert church's Steeple hex), putting that hex within each side's Setup Area A. The ground-level and second-level Steeple (5.2) Locations are in the U.S. Setup Area. With the first-level Location being German Controlled, the U.S. unit in the Steeple is Isolated since it lacks the required path to a friendly-Controlled, non-Isolated, non-Blazing, ground-level building Location (8.6057). The German unit in that first-level Location is not Isolated, because it can trace such a path (through I20's first level, thence to ground level in that hex). However, if there was no immobilized German vehicle with functioning MA of $\geq$ 20mm in H20, all German-Controlled Locations of the church would be Isolated because H20 would then be a No-Man's-Land hex (since it would be a non-Strategic Location within two hexes of both German- and U.S.-Controlled Strategic Locations).

The U.S.-Controlled J21 Strategic Location is Isolated since it is surrounded by hexes that are either No-Man's-Land or German-Controlled Strategic Locations. The U.S. Gun in L21 is not Isolated, as it is not thusly surrounded.

SHOCK
DR: 12

8.6043 SHOCK/UK: Each Shocked/UK AFV must undergo $\geq$ one recuperation attempt (C7.42) until either the marker is removed or the AFV is Eliminated.

BOG
DR: 12

8.6044 BOGGED/MIRED: Each non-abandoned, bogged/mired vehicle must undergo $\geq$ one Bog Removal attempt (D8.3) until it is either bogged or immobilized (MP expenditure is immaterial). If Vehicle

Note L applies to the vehicle, one squad-equivalent (as explained in the Note) in its Setup Area may be used to claim a -2 (-1 per crew or HS) dr to the colored dr of its Bog Removal DR. Every non-captured, bogged/mired U.S.-color vehicle in a U.S. setup Area but not in a Front-Line Hex receives a -1 dr.¹⁵

8.605 SETUP AREA DETERMINATION: Each side now determines its Setup Area(s) for the next CG scenario. If a side Controls *no* non-Isolated Strategic Location on the Map Group, all of its currently on-map Personnel/Mobile-vehicle units in Uncontrolled Territory on that Map Group must be Retained into a Holding Box (8.6053), while such units in enemy Setup-Area hexes must attempt Escape (8.606).

Location

Location

Each side may, at any time during/after a CG scenario, place a friendly Location Control marker (supplied in the KGP I counter mix) in a Strategic Location that it currently Controls, especially if that Location's Control might become disputed at some later point. A Control marker must be removed (or flipped over) if the Controlling side loses Control of that Location. A non-Strategic Location may still be Controlled (as per A26.11-12), but does not receive a Control marker.

A Setup Area may currently contain no units, but can still have friendly units Shifted into it unless it is Isolated.

8.6051 NO MAN'S LAND: As each side determines its Setup Area(s), there will be portions of the map where two opposing Setup Areas "overlap". A *non-Strategic Location* within two hexes of both friendly- and enemy-Controlled Strategic Locations is a No-Man's-Land hex. A No-Man's-Land hex can *never* be part of a Setup Area. A Strategic Location can never be No Man's Land (though it can be Isolated). Each manned, Immobile vehicle without functioning MA (or whose functioning non-FT MA is $<$ 20mm) in No Man's Land becomes abandoned, and its crew (if any) must attempt Escape as per 8.606. See also 8.6056 and 8.6072.

8.6052 ISOLATED UNIT: An Isolated unit/Weapon is one in a friendly-Setup-Area Location from which that unit (or, for a Weapon only, a hypothetical Infantry MMC) would be *unable* to trace a path of contiguous, Enterable, Uncontrolled-Territory/friendly-Setup-Area Locations to an Eligible Entry Area. [EXC: On the "Lg" (only) Map Group, the *German* path must instead be traced to Location LgN25 ("Peiper's HQ"). Should that (or any such subsequently designated "HQ") Location become U.S.-Controlled, the German must, as part of step 8.6052 and before determining Isolated units/Weapons, record some other *secret* "HQ" Location (using any ground-level building level of his choice) on that Map Group.] See 8.6057 for upper-building-level Isolation, 8.606 for Escape requirements, 8.6241 for setup restrictions and penalties, and SSR CG17 (8.4). See also 8.6056.

● **8.6053 UNCONTROLLED TERRITORY:** Uncontrolled Territory refers collectively to all hexes that are neither No-Man's-Land nor part of either side's Setup Area (i.e., $\geq$ three hexes from all Controlled Strategic Locations). Each Personnel/Mobile-vehicle unit (and its portaged/possessed/towed Equipment) in an Uncontrolled-Territory hex at scenario end is Retained into the nearest (along the shortest path of contiguous, Enterable, Uncontrolled-Territory hexes) friendly Setup Area (even if Isolated) or Eligible Entry Area (Holding Box); unit's owner's

P

choice of Area if equidistant. Each Personnel/Mobile-vehicle unit unable to trace such a path is required to attempt Escape (8.606). Each Immobile vehicle without functioning MA (or whose functioning non-FT MA is < 20mm) becomes abandoned, and its crew (if any) is then either Retained (if it can trace such a path) or required to attempt Escape. See also 8.6056 and 8.6072.

8.6054 SURROUNDED HEXES: Each Uncontrolled-Territory, and each *unoccupied* Strategic, Location that is currently *completely* enclosed within a Setup Area of only one side becomes part of that Setup Area [EXC: a Location vacated later due to the Escape of an enemy unit; 8.6131].

8.6055 IN FRIENDLY SETUP AREA: Each unit/Equipment currently in a friendly Setup Area is Retained therein.

IMPORTANT: Each Gun must (for now; see SSR CG12 [8.4] and 8.613) remain in its *current* Location, due to setup restrictions.

8.6056 NOT IN FRIENDLY SETUP AREA: Use the following chart to determine what happens to on-map units/Equipment that do *not* end a CG scenario non-Isolated inside a friendly Setup Area. Note, however, that the actions listed are to be implemented in their proper RePh order (8.6).

MARKING THE MAP: Included in the KGP modules is a reduced-size map of each KGP Map Group. Each side should now record its Setup Area(s) on a new photocopy of the respective reduced-size map. Both sides outline (using different color pens, but on the same photocopy) each Strategic Location Controlled by them. Other Strategic Locations can be marked by an appropriate letter inside a square; e.g., "E" for Entrenchment, "F" for Fortification, "G" for a functioning Gun, "V" for a manned, Immobile vehicle with functioning MA of ≥ 20 mm or functioning FT MA. See the illustration and example on page P12.

Once all Strategic Locations have been indicated, mark all No-Man's-Land hexes using another color (suggestion: a yellow "highlighter"). Next, each side draws its Setup-Area boundaries, enclosing all non-Strategic Locations within two hexes of each friendly-Controlled Strategic Location (excluding No Man's Land).

After all Setup Areas have been determined, each side should record (on the reduced-size map) an ID for each one. Subsequent changes in the status of (potential) Strategic Locations (e.g., Blazing wooden rubble turned to shell-holes [8.6092], a manned, immobilized vehicle with functioning MA of ≥ 20 mm that becomes Mobile [8.6141b], etc.) do not alter or otherwise affect either side's Setup Area(s) in any way; once all Setup Areas have been correctly marked, they remain thus until the start of the next CG scenario.

Personnel/Mobile-Vehicle:	
in enemy Setup Area	must attempt Escape (8.606)
in No Man's Land	must attempt Escape (8.606)
in Uncontrolled Territory	is Retained into the nearest friendly-Setup/Eligible-Entry Area or must attempt Escape (8.6053)
if Isolated	may attempt Escape or remain in place [EXC: if Overstacked]; 8.606
Abandoned (but otherwise Mobile) Vehicle—or Unpossessed Non-Vehicle Equipment other than Functioning Gun:	
in enemy Setup Area	is Captured or Eliminated (enemy's choice; 8.6071)*
in No Man's Land	is left in place unpossessed (8.6072)
in Uncontrolled Territory	is left in place unpossessed (8.6072)
if Isolated	is Retained by the Controlling side (8.6071)
Crewed, Immobile Vehicle without Functioning MA (or with Functioning non-FT MA of < 20mm):	
in enemy Setup Area	is Captured or Eliminated (enemy's choice; 8.6071)*
in No Man's Land	is Abandoned; the crew (if any) must attempt Escape (8.6051)†
in Uncontrolled Territory	is Abandoned (8.6053); the crew (if any) is Retained into the nearest friendly-Setup/Eligible-Entry Area or must attempt Escape (8.6053)‡
if Isolated	is Retained by the Controlling side (8.6071)
Crewed, Immobile Vehicle with Functioning MA of ≥ 20 mm (or FT)—or Functioning Gun:	
in Bypass of enemy-Controlled Strat. Loc.	is Captured or Eliminated (enemy's choice; 8.6071)*
in any other Location	becomes a Strategic Location

* Capturing/Eliminating side may Remove/attempt-to-Scrounge allowed Weapon(s) and/or turn vehicle into (Burnt-Out) Wreck.

† Abandoning crew may Remove allowed Weapon(s) and/or turn vehicle into (Burnt-Out) Wreck.

8.6057 UPPER-LEVEL ISOLATION: Any Infantry/Weapon in an upper-level building Location is not Isolated if a path (of $\geq$ one contiguous, Enterable, friendly-Controlled building Location) exists to a friendly-Controlled, non-Blazing, non-Isolated ground-level building Location. Such Infantry/Weapon(s) are Retained in the Setup Area the path is traced to. If such a path cannot be traced, the Infantry/Weapon is Isolated (see 8.6052 and 8.6241).

8.606 ESCAPE: Each Personnel/Mobile-vehicle unit ending a scenario in No Man's Land, or in an enemy Setup Area, or in Uncontrolled Territory from which it is required to attempt Escape (8.6053), *must* attempt Escape. Each Personnel/Mobile-vehicle unit ending a scenario Isolated *may* attempt Escape [EXC: each such Isolated, Overstacked unit must attempt Escape (or be freely moved to another Location within that same Isolated Setup Area) until the Location is not Overstacked]. If > one Personnel unit in the same Location wishes to Escape, they may combine into one or more stacks; each stack then makes its own DR on the Escape table. When attempting to Escape, each MMC may portage $\leq$ five PP, and each SMC may portage $\leq$ two PP [EXC: a wounded SMC can portage nothing]. Each squad stacked with a leader may freely Deploy. Prior to its possessor's Escape attempt, each SW/Gun may (must, if the unit exceeds its allowed portage limit) be dropped or freely Eliminated/Transferred/dismantled-if-possible. A non-dm Gun can Escape only if already hooked up to an Escaping vehicle.

ESCAPE TABLE

Final DR	Infantry	Mobile Vehicle
≤ 8	Escapes ¹	Escapes
9	Escapes; Replaced ^{2,3}	Abandoned; ^{4,5} crew (if any) Escapes
10	Escapes; Casualty Reduced ²	Eliminated; ⁵ crew (if any) Escapes
11	Escapes; Replaced, then Casualty Reduced ^{2,3}	Abandoned; ⁵ crew (if any) is Eliminated
≥ 12	All units and Equipment Eliminated	Eliminated; crew (if any) is Eliminated

¹ An Original 2 DR results in Escape and Heat of Battle for an eligible unit (A15); use Random Selection to determine the unit(s) affected in a stack. [EXC: Any result other than Hero-Creation/Battle-Hardening results in Elimination of the unit(s).]

² A crew, or unit that would become Disrupted, is Eliminated instead.

³ Use Random Selection for a stack.

⁴ The surviving crew (if any) may turn the vehicle into a (Burnt-Out) Wreck.

⁵ In current hex and VCA, the surviving crew (if any) may attempt to Scrounge the vehicle/Wreck.

⁶ The surviving crew (if any) may attempt to Scrounge the vehicle prior to its Elimination.

DRM:

-1	If local, unwounded SMC
-1	If an OT APV
-2	If a CT APV
-1	If current CG Date is Night
-2	If adjacent to a Friendly Setup Area. -1 If two hexes away from a Friendly Setup Area.
+x	(Armor-)Leader/Hero DRM (NA to Personnel Leader/Hero if alone)
+y	Total Status DRM (D5.34; SSR KGP12) currently applicable to vehicle's inherent crew
+1	If in enemy Setup Area, or if it must trace a path through $\geq$ one enemy Setup-Area hex to intended area of Retention
+1	Per HS-equivalent $\geq$ one HS using the same Escape DR*
+1	Per PP $\geq$ IPC being carried (unit with most excess PP determines this DRM for a stack (a stacked leader may combine to increase a MMC's IPC)*
+1	If unarmed
+1	If a Captured vehicle
+2	If Encircled*
+2	If Isolated

* NA to vehicle Escape attempt.

8.6061 ESCAPE RESULTS: If a unit survives the Escape attempt, it and all Equipment it took with it are Retained into a friendly Setup Area or Eligible Entry Area—whichever is nearest in a path of contiguous, Enterable, Uncontrolled-Territory/enemy-Setup-Area Locations (Escapee's choice if $\geq$ two such Areas are equidistant, but always using as few enemy Setup-Area Locations as possible). A U.S. unit that Escapes to an Eligible Entry Area may subsequently enter play at that Entry Area even if its Entry Code color (8.6197) does not match the (partial) background color of that Entry Area's center (arrow) hex.

If a unit is Eliminated by the Escape attempt, all Equipment it took with it is Eliminated on a subsequent dr of ≥ 4 ; on a dr of ≤ 3 the Equipment is left in the Eliminated unit's last-occupied Location. See also 8.6131.

EX: See the illustration on page P12. The U.S. squad in Uncontrolled-Territory hex E18 is freely relocated into any Location of the U.S. Setup Area. The U.S. squad and Mobile truck in German Setup Area A must attempt Escape. The U.S. player must roll for each attempt separately, and rolls an Original 6 and 7 respectively. The squad successfully Escapes on a Final DR of 8 (+1 DRM for being "in an enemy Setup Area" and +1 "per HS-equivalent $\geq$ one HS using the same Escape DR"), and is relocated into the nearest U.S. Setup Area. The truck's DR, a Final 9 since it is both unarmed and in an enemy Setup Area, results in "Abandoned; crew Escapes". However, since an unarmed truck has no crew, it is simply left in place, marked by an Abandoned counter. In RePh step 8.6071 the German Retains the truck as Captured, and may even use it (as one of the three vehicles required) to "gas up" a same-Setup-Area Out-of-Gas vehicle (8.6141c). The Mobile German tank in U.S.-Setup-Area hex L23 and the two German squads in No-Man's-Land hex K23 must also attempt Escape. The tank successfully Escapes on a Final DR of 7 and is Retained into German Setup Area B. The squads roll an Original 8 and 10 respectively for their Escape

DR; since both DR are modified by +1 ("per HS-equivalent > one HS using the same Escape DR"), the Final DR of 9 and 11 result in one squad being Replaced by two 3-4-8 HS and the other Replaced and then Casualty Reduced (one 3-4-8). Thus three 3-4-8s are added to the units Retained in either German Setup Area shown, since the closest hex of each is three Uncontrolled-Territory hexes from K23. The Isolated U.S. squad in the J19 Steeple Location must attempt to Escape (due to being Overstacked; 5.21), and will have a +3 Escape DRM (+1 per HS-equivalent > one HS using the same Escape DR, and +2 for being Isolated). Despite being vacated, that Location will still be U.S.-Controlled at the start of the next scenario (8.6131). If the squad in the steeple had been a HS instead, it could have opted to remain in place (and 8.6241 would have applied to it).

8.6062 ENCIRCLED-MARKER REMOVAL: All Encircled markers are now removed.

8.607 EQUIPMENT POSSESSION & HIDDEN FORTIFICATIONS

8.6071 IN SETUP AREA: Each piece of Equipment in a Setup Area is Retained (as Captured, if applicable) therein by the side Controlling that Setup Area. At its (new) owner's option, each such non-vehicle piece may be Eliminated by any Personnel (even an Abandoning crew) Retained in that Setup Area, and each such vehicle may be Abandoned, etc. exactly as per 8.6145. The Inherent crew of each now-Captured Immobile vehicle with no functioning MA is also Captured. Each unpossessed/abandoned Equipment piece in a Setup Area may remain unpossessed/abandoned (in which case it retains its present CA), or may be automatically repossessed/remanned and operated (as per A21.11-13, A21.21-22, D5.42 or D6.631) by Personnel Retained in that Setup Area. Each Immobile vehicle must remain in its present Location and VCA until such time as it becomes Mobile.

8.6072 NOT IN SETUP AREA: All unpossessed/abandoned Equipment in No Man's Land or Uncontrolled Territory must remain in its present Location (and vehicular/Gun CA) until Eliminated or repossessed/remanned in (or after; 8.6071) a subsequent scenario. Each Immobile vehicle must remain in its present Location and VCA until such time as it becomes Mobile.

8.6073 HIDDEN FORTIFICATIONS: Each still-hidden Fortification within a Setup Area of the purchaser's opponent is placed on-map. Each such minefield is marked by placing a Known Minefield counter as per 7.1 to reveal its presence but not its strength/type. Each on-map Fortification (i.e., from previous CG scenarios) is Controlled by the side (if any) Controlling its Location.

8.608 PRISONERS: Each prisoner Guarded by a non-Isolated unit is Eliminated.¹⁶ An Isolated Guard may retain possession of his prisoner(s), freely transfer them to another friendly unit (capable of being a Guard) in the same Isolated Area, Massacre them (see SSR CG4; 8.4), or free them. If freed, a prisoner is automatically Retained (by the side friendly to it) into the nearest (in the shortest path of contiguous, Enterable Locations) friendly-Setup/Eligible-Entry Area (of the Unarmed-unit side's choice if ≥ two such Areas are equidistant). An unarmed MMC is Replaced by a friendly Conscript (Green if U.S.) MMC of the same size; a freed SMC is Replaced by his original SMC type (if unknown, replace him with a 6+1 leader).

8.609 EXTINGUISHING FLAMES & BLAZES: Each building/rubble Location currently marked with a Flame/Blaze counter is considered fully consumed by the fire. Players must remove each Flame/Blaze counter and make the appropriate terrain alterations when performing the following sub-steps (8.6091-6095):

8.6091 BURNING WRECK: Each Burning Wreck has its Blaze marker removed [EXC: if that Wreck is in a building/rubble hex, move the Blaze marker to the building/rubble so that it is now a terrain Blaze]. Replace the wreck with a Burnt-Out Wreck.

8.6092 WOODEN RUBBLE: Remove both the Rubble and Flame/Blaze marker, and place a Shellhole counter in the Location. All other previous terrain in the Location is eliminated (each vehicle/wreck in the Location becomes/remains a Burnt-Out Wreck).

8.6093 STONE RUBBLE: Remove the Flame/Blaze marker. The stone rubble still exists (each vehicle/wreck in the Location becomes/remains a Burnt-Out Wreck), and the Location may catch Fire again in a later scenario.

8.6094 BUILDING: Place the correct Rubble counter in all ground-level Locations of each building that has at least one Flame/Blaze in any of its Locations, removing each Flame/Blaze marker. Such rubble may catch Fire again in a later scenario.

8.6095 ELIMINATIONS: All Fortifications/Equipment in what were (as per 8.6092-6094) building/rubble Flame/Blaze Locations (including all building Locations just rubbled as per 8.6094) are Eliminated. All (Burnt-Out) Wrecks in buildings just rubbled as per 8.6094 are Eliminated. All Isolated units/Equipment that would have been confined to setting up in Locations (/rubble-built-buildings; 8.6094) from which a terrain Flame/Blaze has just been removed are Eliminated.

8.610 WOUNDED LEADERS: Each side makes a dr on the following table for each currently wounded Retained leader:

WOUNDED LEADER TABLE

Final dr	Result	drm:
≤ 1	Retained unwounded	-1 If German
2-3	Retained wounded	-1 If Heroic
≥ 4	Eliminated (evacuated)	+1 If Isolated

8.611 BATTLE HARDENING & PROMOTION

- 8.6111 (RE)COMBINING:** All Retained same-class HS with the same Strength Factors within the same Setup/Entry Area must now Recombine (A1.32) so that no more than one of each HS type is Retained in that Area [EXC: each side may Retain one HS per Retained (.50-cal) HMG, and the U.S. side may Retain one HS per Retained 60mm mortar, counter in that Setup/Entry Area even if that SW is currently malfunctioned].

8.6112 VEHICLE-CREW COMBINING: A side Retaining ≥ two vehicle-crews currently marked with a "+#" (Stun) counter (see also SSR KGP12) as Infantry in the same Setup/Entry Area must Eliminate all but one such unit within each such Area. However, for every two so Eliminated per Area, one vehicle-crew not marked with a "+#" (Stun) counter is added as Infantry to that Area.¹⁷

EX: The German player has three 1-2-7 vehicle-crews Retained as Infantry in the same friendly Setup Area. One is marked with a "+#" (Stun) counter, and the other two with a "+2" (Stun). In RePh step 8.6112 the German player must eliminate any two of those crews and replace them with a single 1-2-7 crew not marked with a "+#" (Stun) counter.

8.6113 HEROES & MMC: On each side, each Retained hero [EXC: leader; 8.6114] is Eliminated; however, each such Elimination enables that side to Battle Harden one non-crew MMC of the owner's choice within the same Setup/Entry Area as that hero [EXC: if unable to so Battle Harden a MMC in that Area, the hero is Retained]. Each side also makes one Secret DR to determine the number of Retained non-crew MMC eligible for Battle Hardening. In all cases, an Elite non-crew MMC that Battle Hardens becomes Fanatic (but only for the duration of the next scenario; 8.602e). No MMC may Battle Harden > once per RePh.

MMC BATTLE HARDENING TABLE†

Final DR	# of MMC	DRM:
≤ -1	5	-2 Friendly side won this CG Date's scenario
0	4	-1 Per 25 Casualty VP amassed by friendly side on the current CG Date [EXC: see 8.6032]
1	3	
2-3	2	
4-5	1	
≥ 6	-	

† Crews are ineligible

8.6114 LEADERS: On each side, each Retained heroic leader Battle Hardens and loses his heroic status [EXC: a heroic 10-3 loses his heroic status with no additional effect]. Each side also makes one Secret DR on the following table [EXC: 8.6115] to Battle Harden a Retained Personnel leader. If the leader selected is not currently Retained by that side, the player must Battle Harden his lowest-grade, non-wounded Retained Personnel leader.

LEADER BATTLE HARDENING TABLE†

Final DR	Type	DRM:
≤ 2	10-2	-2 Friendly side won this CG Date's scenario (the player may, after the DR, choose to ignore this DRM or apply only a -1 DRM)
3	9-2	
4	9-1	
5	8-1	
6-7	8-0	
8-9	7-0	
≥ 10	6-F1	

† Or may create a 7-0 (8.6115)

† Armor leader NA

8.6115 PROMOTION OUT OF THE RANKS: In lieu of making a DR on the 8.6114 Table, the player may instead automatically create one 7-0 leader.

8.612 NEW CG DATE & SAN ADJUSTMENT

8.6121 NEW CG DATE: Each passage of this RePh step represents the start of a new CG Date. Should no scenario be generated (8.623), players return to this step and repeat steps 8.6121-623 until one is.

8.6122 SAN ADJUSTMENT: Each side whose SAN is currently ≥ 4 must make a dr, with a +drm equal to that side's current SAN minus four. A Final dr of ≥ 5 immediately reduces that side's current SAN by two. Each side whose SAN is currently < 2 has it automatically raised to 2 (no CPP expenditure necessary).

EX: The U.S. SAN is currently 6. Due to the +2 drm (6 - 4 = 2) to the U.S. Sniper adjustment dr, an Original dr of ≥ 3 will lower the U.S. SAN to 4.

P

8.613 SHIFT: A Personnel/Mobile-vehicle unit (or group of such) Retained in a Setup Area may attempt to Shift to another friendly Setup Area, or Eligible Entry Area, of that Map Group [EXC: in CG II, no German vehicle may Shift to an Entry Area]. A Personnel/Mobile-vehicle unit (or group of such) Retained in an Entry Area may attempt to Shift to the next Eligible Entry Area along the edge of, or to a non-Isolated friendly Setup Area on, that Map Group. A unit/group that wishes to Shift from a Setup Area must be able to trace a path (of any length) of contiguous, Enterable (by all units of the Shifting group), Uncontrolled-Territory/-friendly-Setup-Area/Eligible-Entry-Area hexes from any friendly-Controlled hex of that Setup Area to any hex of the Area to which it is attempting to Shift.

Each MMC may portage $\leq$ five PP, and each SMC may portage $\leq$ two PP [EXC: a wounded SMC may portage nothing]. Prior to its possessor's Shift (attempt), each SW/Gun may (must, if the unit exceeds its allowed portage limit) be dropped or freely Eliminated/Transferred/dismantled-if-possible. A non-dm Gun can be Shifted only if already hooked up to a Shifting vehicle. Each squad stacked with a leader may freely Deploy.

Make a separate Secret DR on the following table for each unit/group attempting to Shift [EXC: no DR is required if a unit/group Retained in a Setup Area wishes to Shift to an Eligible Entry Area that is part-of/adjacent-to that Setup Area; i.e., such a Shift is automatically successful]. Only one Shift attempt may be made per unit/group per CG Date, and all units attempting to Shift from the same, and to the same new, Entry or Setup Area must do so as a single group. A unit/group that successfully Shifts to an Entry Area is placed in the unshaded portion of that Area's Holding Box. A U.S. unit/group that Shifts to an Eligible Entry Area may subsequently enter play at that Entry Area even if its Entry Code color (8.6197) does not match the (partial) background color of that Entry Area's center (arrow) hex.

SHIFT TABLE

Final DR	Result	DRM:
≤ 8	Shifted safely	-1 If that entire path can be traced on road hexes;
9-10	No Shift*	+1 Per every five Uncontrolled-Territory hexes along that path between the current Setup/Entry Area and the desired new Setup/Entry Area†
11	Shifted with Casualties†	
≥ 12	All units, Inherent crews and Equipment Eliminated	

* Unit/group cannot Shift (the orders were not received or could not be carried out). It may not attempt to Shift again until the next CG Date, and must remain in its current Holding Box (if Retained off-map) or Setup Area (if Retained on-map), though it may participate normally in the next CG scenario.

† Each Personnel unit suffers Casualty Reduction on a subsequent dr of ≥ 4 . Each vehicle is Eliminated on a subsequent dr of ≥ 5 ; if it is Eliminated, make a CS DR for its Inherent crew (if any; Casualty Reduction is NA). Roll separately for each unit.

‡ Not applicable to a Shift from one Entry Area to another.

8.6131 VACATED SETUP AREA: If the last unit in a friendly Setup Area is Eliminated or successfully Escapes/Shifts elsewhere, each Location of that Setup Area remains Controlled by the last Controlling (i.e., by the vacating) side. [EXC: The German must be informed if all Retained, on-map U.S. units on a Map Group are Eliminated or successfully Escape/Shift to (a) Holding Box(es). In such a case the Germans immediately gain Control of all Strategic Locations on that Map Group, and may automatically include them within their Setup Area for the next CG scenario. See also 8.6095.]

8.614 EQUIPMENT REPAIR & REPLENISHMENT

8.6141 VEHICLES: Each side performs the applicable step(s) below for each vehicle in a friendly-Setup/Eligible-Entry Area.

a) STUNNED/ABANDONED: A side Retaining $\geq$ two Inherent crews currently marked with a "+#" (Stun) counter (see also SSR KGP12) in the same Setup or Entry Area may Eliminate $\geq$ one of those crews. For every two so Eliminated per Area, one vehicle-crew not marked with a "+#" (Stun) counter is added as Infantry to that Area. Each abandoned vehicle may remain abandoned, or may be remanned and operated (as per A21.22 or D5.42/-D6.631) by Personnel (including each just-created vehicle-crew) Retained within the same Setup Area.

b) IMMOBILIZATION REPAIR: Each non-captured, non-abandoned, immobilized vehicle that is not Out of Gas must make a dr on the following table to determine if the immobilization is repaired:

IMMOBILIZATION REMOVAL TABLE

Final dr	Effect	DRM:
≤ 2	Becomes Mobile*	+x Per armor leader DRM
≥ 3	No change	+1 If only Non-Qualified Use (A21.13) possible
		+1 If in a Front-Line Hex
		+1 If Isolated
		+1 If German

* And is Retained in its current Setup Area.

Out of Gas

c) GERMAN GAS SIPHONING: For each three vehicles/wrecks (including any captured U.S. vehicle[s]) that are neither Out of Gas nor Burnt-Out but that are retained in the same German Setup Area and are now voluntarily marked by the German player as being Out of Gas (SSR KGP13), the German may "refuel" one currently Out-of-Gas vehicle within that same Setup Area [EXC: PSW 234/2 (their non-Burnt-Out Wrecks) may be used to refuel only other such PSW and M10 TD and vice-versa]. Each otherwise-Mobile vehicle now marked as Out of Gas may be placed in any Enterable (by that vehicle) Location [EXC: not in a building] within its Setup Area. He may then replace any/all of those now-Out-of-Gas vehicles with one Burnt-Out Wreck apiece.

If the current CG Date is Dec 22 N, the German may make a Secret dr and automatically refuel a number of currently Out-of-Gas vehicles [EXC: PSW 234/2 and U.S. M10 TD] equal to that dr.²⁰

A refueled vehicle need not make its first otherwise-required Out-of-Gas DR.

RECALL

d) U.S. AFV RECALL: Each Mobile, non-Isolated Retained U.S. AFV under Recall is Eliminated. If Mobile, under Recall and Isolated, such an AFV begins the next scenario under Recall (as well as suffering from Ammunition Shortage; 8.6241).

8.6142 WEAPON REPAIR: Each side now makes a separate dr on the table below for each malfunctioned, non-captured Retained Weapon in each friendly Setup/Entry Area that contains Personnel (or, for a vehicular Weapon, an Inherent crew in that vehicle).

WEAPON REPAIR TABLE†

Final dr	Effect	DRM:
≤ 2	Repaired	-2 If vehicular-mounted
≥ 3	Eliminated‡	-1 If U.S.
		+1 If only Non-Qualified Use (A21.13) possible
		+1 If Isolated
		+1 If German and suffering from Ammunition Shortage

† Captured Weapon NA.

‡ If vehicular-mounted, the Weapon is disabled; if MA, the AFV is immediately Recalled (8.6141d applies) [EXC: see SSR KGP12].

8.61421 BAZ/PSK/FT/DC: Each player makes a separate dr for each SCW, FT (including vehicular-mounted FT) and DC of his nationality that was eliminated (by any means) in the previous scenario. If the Final dr is ≤ 4 , that SW is Retained in functioning order. Each dr made for a German SW receives a +1 DRM, and an additional +1 DRM if Ammunition Shortage (8.618) is already in effect. Each SW so Retained may be added to any friendly Entry/non-Isolated-Setup Area in which the current ratio of Squad counters to such SW counters is $> 4:1$ [EXC: $> 2:1$ for DC; ignore all engineer squad counters when determining the ratio for SCW; ignore all non-engineer squad counters when determining the ratio for FT/DC; no SW may be added if it would lower the ratio in that Setup/Entry Area to $< 3:1$ ($< 3:2$ for DC)].

8.6143 VEHICULAR-MG EXCHANGE: A disabled, non-captured, vehicular MG may be automatically repaired (even if disabled in step 8.6142) by Eliminating a MG of the type that would be given were the disabled MG to be Removed. If the disabled MG is one whose Removal is NA (e.g., a CMG), use a German LMG if the AFV is German-color or a U.S. MMG (or U.S.-color British LMG—see 8.6145) if the AFV is U.S.-color. In all cases, the MG to be Eliminated must be one Retained within the same Setup/Entry Area as the AFV. See also SSR CG9 (8.4).

8.6144 CAPTURED EQUIPMENT: Each side makes a separate dr for each functioning, captured, Retained Weapon in each friendly Setup/Entry Area that contains Personnel: if ≥ 4 it is Eliminated (disabled if vehicular). Each already-malfunctioned Captured Weapon is Eliminated (disabled if vehicular). Disablement of MA by either means does not cause Recall. At its captor's option, a captured vehicle may remain in play if it has any functioning Weapon (even if its MA is disabled); otherwise, it is turned into a (Burnt-Out) Wreck as per 8.6071.

8.6145 ABANDONING, SCROUNGING & REMOVAL: At the Controlling player's option, $\geq$ one non-Recalled vehicle in each friendly Setup Area may be Abandoned and/or turned into a (Burnt-Out)Wreck and/or have allowed armament Removed. Likewise, he may attempt to Scrounge $\geq$ one non-Recalled-vehicle/non-Burnt-Out-wreck in each friendly Setup Area. [EXC to all: Such actions are NA unless $\geq$ one Personnel unit (even an Abandoning crew) is Retained in that Setup Area.] Use a U.S.-color British LMG (provided in KGP II) for a MG Scrounged from a U.S.-built vehicle.

8.6146 SPECIAL AMMO: Each non-captured, non-Isolated U.S. Weapon in a U.S. Setup/Entry Area has all of its Depleted ammunition types (if any) replenished to normal availability. Each such German Weapon in a German Setup/Entry Area must make a Final dr of ≤ 3 (a +1 DRM applies if Ammunition Shortage [8.618] is already in effect) for each Depleted Ammo type in order for that special ammunition to be restored. Adjust side records accordingly.

Low Ammo

8.6147 U.S. LOW-AMMO REMOVAL: Each Low Ammo marker on each non-captured, non-Isolated U.S. unit/Weapon in a U.S. Setup/Entry Area is removed.

8.615

8.6148 U.S. AMMUNITION-SHORTAGE REMOVAL: Each non-captured, non-Isolated U.S. Infantry-unit/Weapon in a U.S. Setup/Entry Area and currently suffering from Ammunition Shortage now has that penalty lifted.

8.6149 SW/GUN dm/ELIMINATION: At the Controlling player's option, $\geq$ one SW/Gun in each friendly Setup/Entry Area that contains Retained Personnel may be Eliminated/dismantled/assembled.

8.615 FORTIFICATION, WRECK & IMMOBILE-VEHICLE REMOVAL: Attempts may be made to Eliminate (Burnt-Out) wrecks, Immobile vehicles, roadblocks and Known minefields in friendly-Controlled Locations [EXC: an attempt vs a roadblock is allowed only if the removing side Controls both ground-level Locations that form the roadblock's (Narrow-Street; 5.141) hexside]. Vs roadblocks/minefields, the number of removal attempts cannot exceed the number of squad-equivalents Retained within that Setup Area; vs (Burnt-Out)-wrecks/Immobile-vehicles, the number of removal attempts cannot exceed the number of Mobile tracked vehicles of $\geq$ 30 tons Retained within that Setup Area.

Only one removal attempt dr may be made per item per completion of this RePh step (and does not create a Labor marker). If a Location contains $>$ one of the above-mentioned items (all mines in the same Location are considered one minefield for this purpose), the side may roll once for each (if so allowed as per the preceding paragraph), but must announce which item it is currently rolling for [EXC: a Location must be devoid of mines before a removal dr may be made vs a (Burnt-Out) wreck, or Immobile vehicle, in a non-Bypass position in that Location; vs a (Burnt-Out) wreck, or Immobile vehicle, in Bypass along—or vs any roadblock that lies along/across—a hexside, both ground-level Locations sharing that hexside must be devoid of mines before its removal may be attempted].

FORTIFICATION/WRECK/IMMOBILE-VEHICLE REMOVAL TABLE

Final dr	Result
≤ 3	Eliminated†
≥ 4	No Effect

drm:

- +2 Minefield/Burnt-Out-wreck/Immobile-vehicle is in a Front-Line Hex.
- +2 Roadblock is along/across a hexside of $\geq$ one Front-Line Hex.
- +1 Minefield/Burnt-Out-wreck/Immobile-vehicle is ADJACENT to, but not in, a Front-Line Hex.
- +1 Roadblock is not along/across a hexside of a Front-Line Hex, but is along/across a hexside of a hex that is ADJACENT to a Front-Line Hex.
- 1 Per Assault Engineer HS-equivalent Retained in that Setup Area (vs minefield/roadblock only).

* Vs a Known minefield, this result Eliminates all mines (A-P and A-T) in the Location.

† An Original dr of 6 results in Casualty Reduction of a non-Isolated Elite MMC within that item's Setup Area (Assault Engineer if possible, otherwise owner's choice; if no Elite MMC is available, Reduce a First-Line MMC, etc.).

8.616 CPP REPLENISHMENT: CPP are replenished according to the following formula: the CPP Base # (8.6161) minus a Secret DR (see also 8.31) = the final amount of CPP Replenished. This final amount should be kept secret. See also 8.6162.

8.6161 CPP BASE NUMBER: Each side's CPP Base # is given below for the current CG Date and CG:

CPP BASE # CHART

CG Date	CG I	CG II	CG III
19 PM	35	35	—
19 N	50	25	—
20 AM	65	20	—
20 PM	45	20	—
20 N	50	50	40
21 AM	60	20	35
21 PM	75	25	10
21 N	—	—	20
22 AM	—	—	40
22 PM	—	—	20
22 N	—	—	20
23 AM	—	—	175
23 PM	—	—	175

8.6162 CG ROSTER UPDATE: On the line for the current CG Date in the CG Roster's "Repl" column, record the final amount of CPP Replenished. (The 19 AM box is shaded, since CPP Replenishment is NA prior to each CG's Initial Scenario.) Copy the number in the preceding CG Date's "Left" box (8.619) into the current CG Date's "Start" box, then add it to the number just written in the "Repl" box and record the sum in the "Total" box of the same line. This is the total CPP available for RG/Recon purchases.

EX: Players have just completed the 19 AM Initial Scenario of CG I, which resulted in a German victory. In RePh step 8.6121 the CG Date changes to 19 PM. In RePh step 8.616 each side replenishes its CPP. The German, with a CPP Base # of 30 (8.6161), makes a CPP Replenishment DR of 6. This DR is subtracted from the German CPP Base # to yield a final replenishment of 24 CPP (30 - 6 = 24), so on the German CG Roster the German player writes "24" in the "Repl" box of the 19 PM line. The German also has two unspent CPP from the preceding CG Date (as evidenced by a "2" in the "Left" box of the 19 AM line), so he writes "2" in the "Start" box of the 19 PM line. He then adds the "2" to the "24", and writes "26" in the "Total" box of the 19 PM line. He thus has 26 CPP to spend.

8.617 KGP WEATHER: Consult the Historical Weather Chart²¹ for each CG Date's weather (plus Moon Phase and Cloud Cover information if night). Alternatively, by mutual consent players may choose to use the optional 8.6171 table(s) to randomly determine the weather. Record the current weather on the CG Roster, in the "Weather" column on the line for the current CG Date. For Wind see SSR KGP2.

KGP HISTORICAL WEATHER CHART

CG Date	CG Weather	Moon Phase	Cloud Cover
Dec 19 AM	Extremely Heavy Mist	—	—
Dec 19 PM	Moderate Mist	—	—
Dec 19 N	Moderate Mist	No Moon	Overcast
Dec 20 AM	Extremely Heavy Mist	—	—
Dec 20 PM	Very Heavy Mist	—	—
Dec 20 N	Very Heavy Mist	No Moon	Overcast
Dec 21 AM	Heavy Mist	—	—
Dec 21 PM	Heavy Mist	—	—
Dec 21 N	Light Mist & Overcast	No Moon	Overcast
Dec 22 AM	Light Mist & Overcast	—	—
Dec 22 PM	Very Light Mist & Overcast	—	—
Dec 22 N	Clear (Mist Change DR is NA)	No Moon	None
Dec 23 AM	Clear (Mist Change DR is NA)	—	—
Dec 23 PM	Clear (Mist Change DR is NA)	—	—

- * **8.6171 RANDOM WEATHER:** In lieu of using the KGP Historical Weather Chart (see 8.617), the U.S. player makes a DR on the KGP Random Weather Table to determine the weather for the current CG Date. Record the results on the proper line of the CG Roster for the current CG Date.

*KGP RANDOM WEATHER TABLE§

Final DR	Result
≤ 3	Mist† & Overcast
4-8	Mist†
9	Overcast†
≥ 10	Clear†

DRM:

- 1 If the preceding CG Date's Weather was Overcast
- 1 If the current CG Date is AM or Night
- +1 If the preceding CG Date's Weather was Clear
- +6 If the current CG Date is Dec 22 N or later

§ Wind applies as per SSR KGP2.

† Also make a subsequent dr on the KGP Random Mist Density Table below.

‡ There is no Mist initially, but make Mist Change DR as per SSR KGP3 unless the current CG Date is Dec 22 N or later.

*KGP RANDOM MIST DENSITY TABLE

Final dr	Density
0	Extremely Heavy
1	Very Heavy
2-3	Heavy
4-5	Moderate
6-7	Light
≥ 8	Very Light

drm:

- 1 If the current CG Date is AM
- +1 If the current CG Date is PM
- +2 If the current CG Date is Dec 21 N or later

8.618 GERMAN AMMUNITION SHORTAGE: Beginning on Dec 20 AM, and on each CG Date thereafter (if necessary), the German makes a DR. On a Final DR of $\geq$ 12 the German OB suffers from Ammunition Shortage (A19.131) for the duration of the CG. A +1 DRM applies per CG scenario completed after 20 AM.

8.619 PURCHASING REINFORCEMENT GROUPS: Both sides now secretly allot CPP for the purchase of RG. All CPP expended are subtracted from that side's current CPP total. The CPP expended, those remaining, and the RG(s) purchased may all be kept secret. Each side consults its respective RG chart for the different types of RG historically available, the CPP cost of each, the number of each that may be purchased during the course of the CG being played,²² and any pertinent footnote(s). As each RG is selected, record its ID (and the CPP expended to purchase it) in the "RG Purchased" column, on the line for the current CG Date, on the CG Roster. After all RG are selected, write the total CPP expended in the "Spent" column of the CG Roster for the current CG Date; then write the number of CPP remaining, even if zero, in the "Left" column for the current CG Date. Any CPP remaining may be used in Recon (RePh step 8.622), or to purchase further RG in any subsequent RePh step 8.619 (-.6198).

See SSR CG6-CG7 (8.4), 8.6194a, 8.6197 and 8.6198 for setup/entry restrictions on purchased RG. Each RG chart contains the following columns:

8.6191 ID: Provides an alphanumeric identification for each RG; e.g., vehicular-type RG have an ID of "V#", infantry-type RG have an "I#" ID, etc.

8.6192 GROUP TYPE: Lists the name of the RG. This name and its ID are secretly recorded on the purchasing side's RG Purchase Record (8.6198).

P

U.S. REINFORCEMENT GROUP CHART

ID	Group Type	Unit Type(s)	CPP COST	CG Date Max.	CG Maximum			Entry Code

* Each colored number represents the maximum number of such RG that may be purchased for entry (or setup as per 8.6194a) via an Entry Area of that same color (see 8.6197).

8.6193 (FULL/DEPL) UNIT TYPE(S): Lists the type(s) of units that each RG contains. U.S. RG always include each unit listed (i.e., are always at Full Strength), while most German RGs are subject to Depletion (see 8.6201).

8.6194 CPP COST: Lists the CPP cost of the RG (regardless of its later-determined Strength, if German). This is the number of CPP that must be subtracted from the purchasing side's current CPP total in order to receive that RG. If purchased on a CG Date on which a scenario will be played (8.6232), most German RG types must be set up on-map in Reserve (SSR CG7a; 8.4) while most U.S. RG types enter play during the course of the scenario (SSR CG6a and CG7c) [EXC: as per Initial Scenario SSR, or if purchased for Standard On-Map Setup as per 8.6194a]. Place all counters for each entering RG in an Eligible-Entry-Area Holding Box (as per 8.15) until they set up to enter. The listed CPP cost of certain RG may be altered as follows:

a) STANDARD ON-MAP SETUP: Unless otherwise prohibited, each U.S./German RG whose ID on the RG Chart begins with the letter "I", "V", "G" or "HW" may be set up on-map in a friendly, non-Isolated Setup Area in a scenario played on the same CG Date that it is purchased if it has its listed CPP cost increased by three [EXC: German "G" type RG need not pay the extra three CPP in order to use Standard On-Map Setup]. A German RG purchased for Standard On-Map Setup is not set up in Reserve—and, if it can use an Eligible Entry Area, may instead be Retained in that Entry Area's Holding Box to enter as a reinforcement (see SSR CG6c; 8.4). A U.S. RG may be purchased for Standard On-Map Setup only if there is ≥ one Eligible Entry Area with that RG's Entry Code (8.6197) on the Map Group it will be set up on, and for setup purposes that U.S. RG must be able to trace a path (of any length) of contiguous, Enterable (by all units of that RG) friendly-Setup/Uncontrolled-Territory Locations from its Setup Area to that Entry Area. Only the listed CPP is paid to gain current-CG-Date use of an "M" or "B" type RG, regardless of nationality.

b) U.S. EARLY ENTRY: By increasing the listed CPP cost of a U.S. RG

U.S. RG CHART NOTES:

* Roll for armor leader availability on table 8.6206.

¹ When the U.S. player purchases a pre-game Bombardment, he records a secret Pre-Registered hex for it. To resolve each Bombardment, after all on-map setup is completed he places an AR counter in the Pre-Reg. hex and makes a C1.31 error DR (with the white dr halved; FRU) to determine the Bombardment Center Hex. He then places a FFE/C counter in that Center Hex. All hexes within seven hexes of that hex now undergo Bombardment as per C1.82-823. There are no "spared hexes". After the Bombardment has been fully resolved, its FFE/C is removed and that Bombardment RG is Eliminated. Each Bombardment is fully resolved before conducting another Bombardment (if any). The maximum number of Bombardments useable per CG scenario is equal to the number of new CG Dates since the last CG-Scenario End (e.g., if one Idle Date occurred between scenarios, no > two Bombardments may be conducted for the current scenario). No Bombardment is resolved on an Idle Date.

² Each MG is accompanied by a 3-4-7 HS [EXC: 3-3-7 HS in CG III]; each Gun by a 2-2-7 crew.

³ Assault Engineers (A11.5; H1.22) and Sappers (B28.8; B24.7).

⁴ Determine arrival turn, number of FB and presence/lack-of bombs as per E7.2-21. (All bombs are HE.) No > two FB RG may enter play per CG scenario, and no > one (or part thereof) may be in play at any given time during the scenario.

⁵ Available only on 21 PM in CG I and 23 PM in CG III. M12 GMC OBA² is a 150mm module (HE only) with an Offboard Observer (in lieu of a radio/phone) who in CG I is at Level 0 on/south-of StU1 [EXC: he has no LOS to any hex on/north-of hexrow SX]; and in CG III is at Level 3 on/south-of LgK1; secretly record the actual hex during U.S. setup. Normal OBA rules apply to M12 GMC OBA [EXC: each red chit drawn is automatically mixed back into the Draw Pile; each FFE can affect (i.e., its Blast Area comprises) only the hex containing the FFE counter; the FFE creates no LOS Hindrance].

⁶ The initial Inherent crew of each M4A1 MC halftrack is a 2-2-7 (not a 1-2-6).

⁷ Determine SW and leader type(s) as per 8.6204 and 8.6206 respectively.

⁸ Receives a -2 DRM to its Radio Maintenance DR (C1.22).

⁹ As of 23 AM in CG III, an Offboard Observer (in lieu of a radio/phone) is automatically available for each module (if so desired, and at no extra CPP cost) at Level 3 on/south-of LgK1; secretly record the actual hex during U.S. setup.

¹⁰ Increase CPP cost by one per Pre-Registered hex (C1.73) purchased with the module (no module may have > two Pre-Reg. hexes). Each Pre-Reg. hex is Retained as long as the module it is assigned to is Retained (see SSR CG22; 8.4). Barrage (B1.2) is NA. See also SSR CG15.

¹¹ Determine MMC types as per 8.6202. For RG I6 and I8, see also U.S. Vehicle Note 30.

¹² Must enter as reinforcements if entered on the CG Date of purchase (SSR CG6c; 8.4) [EXC: 8.6194a]. See also 8.6194b.

¹³ May fire only HE and SMOKE [EXC: no Smoke for 80+mm].

¹⁴ Determine model type(s) as per 8.6203.

¹⁵ See also SSR CG15 and CG22 (8.4).

¹⁶ Purchase for use during the Initial Scenario of the CG is NA.

whose ID begins with "I", "V" or "G" by 50% (FRD), that RG may enter at a U.S. Entry Area of the proper (for that RG) Entry Code color (8.6197) one CG Date prior to the CG Date printed in that Entry Area's arrow. See also SSR CG6c (8.4).

EX: The CG Date is 20 N of CG I. U.S. RG must still normally enter within four hexes of StGQ11-SetT19. However, each "blue" Entry-Code "1P"/"VW"/"G" RG the U.S. side purchases at 150% (FRD) of its printed CPP cost may instead enter within four hexes of StGQ53 on 20 N, one CG Date earlier than the "21 AM" date printed in the arrow in that hex.

8.6195 CG DATE MAX.: Lists the maximum number of RG of this type that may be purchased per CG Date per Map Group.

8.6196 CG MAXIMUM: Lists the maximum number of RG of this type that may be purchased during the course of each CG. Players must keep a written record (using the RG Purchase Record; 8.6198) of each RG purchased during the CG in order to know if additional RG of that type are still available for purchase. RG given in a CG's Initial-Scenario OB (8.51-53) never count against this maximum. EX: The German side may purchase a maximum of six SS Inf Pltn RG during CG II.

8.6197 U.S. ENTRY CODE: The "Entry Code" column of the U.S. RG Chart contains ≥ one color-coded dot for each "I", "V" and "G" RG type. This dot corresponds to the (partial) background color of the arrow in the Entry Area that in most cases must be used by that RG initially (see SSR CG6a; 8.4), and also serves to identify that RG's parent formation:

- ("S" Map Group): Task Force Harrison (the 119th Infantry Regiment of the 30th Infantry Division, and the 740th Tank Battalion), with elements of the 743rd Tank Battalion and 823rd Tank Destroyer Battalion (SP) attached;
- ("L" Map Group): Elements of the 117th Infantry Regiment (30th Infantry Division) and 743rd Tank Battalion;
- ("S" Map Group): Task Force Jordan (elements of the 1st Battalion, 33rd Armored Regiment, and of the 36th Armored Infantry Regiment) of Combat Command B, 3rd Armored Division;

GERMAN RG CHART NOTES:

- * Roll for armor leader availability on table 8.6206.
- † Each MG is accompanied by a 3-4-8 HS; each Gun by a 2-2-8 crew.
- ‡ Subject to Depletion (8.6201).
- § Assault Engineers (A11.5; H1.22) and Sappers (B28.8; B24.7).
- ¶ The initial Inherent crew of each SPW 251/2 halftrack is a 2-2-8 (not a 1-2-7).
- || Has IFE of "6" (German Ordnance Note 26).
- || The German player may freely select Pz IV H or I, but each such Section must be of the same model.
- || SW and leader types are determined as per 8.6204 and 8.6206 respectively.
- || Receives a -2 DRM to its Radio Maintenance DR (C1.22).
- || Increase CPP cost by one per Pre-Registered hex (C1.73) purchased with the module (no module may have > two Pre-Reg. hexes). Each Pre-Reg. hex is Retained as long as the module it is assigned to is Retained (see SSR CG22; 8.4). Barrage (E12.) is NA. See also SSR CG15.
- || Cannot be set up in Reserve (SSR CG7a; 8.4).
- || Each German OBA module has Scarce Ammunition, and may fire only HE and smoke.
- || The second module cannot be purchased until the first one has been Eliminated as per SSR CG15 (8.4).
- || Purchase for use during the Initial Scenario of the CG is NA.
- || In CG II, the German may purchase only *one* of these three Pz Sect RG. Once one is purchased, the remaining two become unavailable.
- || § SPW 251/21: When the *Luftwaffe* began uparming its aircraft with 30mm machine-cannons, numbers of now-surplus MG 151 15mm and 20mm rapid-fire aircraft guns were made available to the *Wehr*. Some of these weapons were installed in specially built halftracks for use in both ground and AA roles. Designated the 251/21, this halftrack carried in its passenger compartment a modified *Kriegsmarine* pedestal mount with three such guns of the same caliber. Production of the SPW 251/21 began in the late summer of 1944, but relatively few were produced. It was apparently intended that three such vehicles would equip the AA section of the 4th (heavy weapons) platoon in each *panzergranadier kompanie*. Two SPW 251/21 were left behind in La Gleize by *Kampfgruppe Peiper*.
- || † The MA has AA capability—as signified by "MA: AA" on the counter.

● ("Lg" Map Group): Task Force McGeorge (elements of the 1st Battalion, 33rd Armored Regiment, and of the 36th Armored Infantry Regiment) of Combat Command B, 3rd Armored Division;

●: Elements of the 504th Parachute Infantry Regiment (82nd Airborne Division) and 703rd Tank Destroyer Battalion (SP);

●: Elements of Task Force Harrison and 823rd Tank Destroyer Battalion (SP), and of Task Force Jordan.

8.6198 RG PURCHASE RECORD: After all RG for the current CG Date have been selected and CPP expended for them, the RG Purchase Record must be updated. In order to record all units/Equipment received in an RG, one line of this sheet must be filled out for each RG purchased, in order to keep track of the number purchased thus far in the CG. If preparing for a CG Initial Scenario, one line is also filled out for each RG given in the Initial-Scenario OB (but these latter do not apply towards RG purchase limits; 8.6196). The following listing explains how each column of the RG Purchase Record is intended to be used.

CG Date: The CG Date the RG is purchased (e.g., "20 PM").

RG ID: The RG's alphanumeric ID (e.g., "I2" for a German SS Inf Pltn).

Group Type: The RG's name (e.g., "SS Inf Pltn" for German RG I2).

#P (Number Purchased): The total number of friendly RG of this Group Type purchased thus far during the CG.

#R (Number Remaining): The number of this RG Group Type still available for subsequent purchase in the CG. This number is derived by subtracting the number in that RG's #P column from the number listed in the "Maximum" column (for that RG for that CG) in that side's RG Chart.

Str. (German RG only): The RG's strength, as determined in RePh step 8.6201. Record "F" for a Full, or "D" for a Depleted, RG.

Units: The number of units received in that RG of the Unit Type listed in the respective RG Chart (e.g., "3" for a Full Strength German SS Inf Pltn), and the unit type (if subject to Quality; 8.6202).

SW/Gun(s) Received: As each SW/Gun for that RG is determined (RePh steps 8.6203-8.6205), record the number of each Weapon type received. For a "G#"^R RG simply record (in any convenient box) the Gun Caliber Size and Barrel Length of each Gun received.

Pltn/Sect Leader: As each eligible RG's (armor) leader is determined (RePh step 8.6206), record his A10.7/D3.4 Strength Factor.

Objective Hex: This column is used to record the Objective Hex of each "T"-type RG when it is initially purchased, or that of each Initial-OB-given "T"-type RG before the opponent sets up. See also the 8.2 definition.

Setup/Entry Area ID: On its CG Date of purchase, each RG [EXC: each whose ID begins with "F" or "M"; U.S. RG O3 and B1] must have a friendly, non-Isolated Setup Area or Eligible Entry Area recorded for it (or, if OBA, for its radio/field-phone). Use the hex coordinate of each Entry Area's center (arrow) hex as the ID for that Area.

8.620 RG STRENGTH, QUALITY, WEAPONS & LEADERS

8.6201 GERMAN RG STRENGTH: Each German RG whose ID begins with "I", "V", "G" or "HW" is subject to Depletion. For each such RG the German player has just purchased (as well as for each such RG he receives in an Initial-Scenario OB; 8.5), he must make one DR on the RG Strength Table to determine whether it is received at Full or Depleted Strength. A Full-Strength "I", "V" or "G" RG contains the number of specified units/Guns listed to the left of the "I" in the Full/Depl column of the German RG Chart, while such a Depleted RG contains the number listed to the right of the "I". For German "HW" RG, see 8.6205. U.S. RG are always received at Full Strength (8.6193).

GERMAN RG STRENGTH TABLE

DR	RG Strength	DRM:
≤ 11	Full Strength	+1 per day after Dec 19 N
≥ 12	Depleted	-1 if "V" or "G"-type RG

8.6202 U.S. INFANTRY-TYPE-PLTN QUALITY: Each U.S. Inf Pltn (RG II), Arm'd Inf Pltn (RG I6) and Arm'd MG Pltn (RG I8) is subject to a quality dr on the following table. The U.S. player must make one dr for each such just-purchased (as well as for each such Initial-Scenario OB-given) RG. Each MMC of that RG must be of the dr-determined type.

P

U.S. (ARM'D) INF PLTN QUALITY

Final dr MMC type

≤ 1	Elite (6-6-7/3-4-7)
2-4	1st Line (6-6-6/3-4-6)
5	2nd Line (5-4-6/2-3-6)
6	Green (5-3-6/2-2-6)

drmm:

-1 If "Arm'd" RG (I6 or I8)

EX: The U.S. player has purchased one Inf Pltn RG and one Arm'd Inf Pltn RG. In this step he must make a quality dr for each. An Original dr of 5 for the Inf Pltn results in its being composed of three 2nd-Line 5-4-6 squads and one 2-3-6 HS. A Final dr of 1 for the Arm'd Inf Pltn results in elite MMC being received, resulting in a Personnel/vehicle composition of three 6-6-7, one 3-4-7, three M3 hit, one M3A1 hit, and one M3(MMG) hit with an additional 6-6-7 Passenger squad (or its two HS; see U.S. Vehicle Note 30). SW and leaders for these RG will be determined as per 8.6204 and 8.6206.

8.6203 U.S. MEDIUM TANK MODELS: Make a DR on the appropriate table below for each purchased or OB-given U.S. Med Tank Pltn (RG V3 or V4).

MED TANK PLTN I ●●

DR	Model Type(s)
2	M4A1 x4; M4A3E2(L)
3	M4A1 x3; M4A3E2; M4A1(76)W
4-5	M4 x4; M4A3(76)W
6-8	M4A1 x5
9-10	M4A1 x3; M4 x2
11-12	M4A1 x3; M4A1(76)W; M4

MED TANK PLTN II ●●

DR	Model Type(s)
2	M4A3(76)W x2; M4A3(75)W x2; M4A3E2(L)
3	M4A3 x4; M4A3E2
4-6	M4A3(75)W x4; M4A3(76)W
7-8	M4A3 x5
9-10	M4A3(75)W x3; M4A3(76)W x2
11	M4A3(76)W x5
12	M4A3(76)W x2; M4A3(75)W x2; M4A3E2

8.6204 INFANTRY-TYPE-PLTN SW: Determine the number of SW received by each infantry-type RG listed in the following "Infantry-Type-Platoon SW Charts". A Full-Strength platoon receives the entire complement of SW listed for it. A Depleted (German; 8.6201) platoon RG must have a Secret dr made for each SW listed as available to a Full-Strength platoon of that same type. On an Original dr of ≤ 4 the SW is in the platoon's OB; otherwise it is forfeit. Record each SW received in its appropriate column on the RG Purchase Record on that RG's line.

INFANTRY-TYPE-PLATOON SW CHARTS§					
U.S.					
Platoon Type	MMG	MTR (M2)†	BAZ 45	FT	DC
Inf	1	1	1		
Para Inf	1	1	1		
Combat Eng	1			1	2
Arm'd Inf		1*			
* Each M2 MTR, as well as its manning HS, that is traded for 60mm OBA as per U.S. Ordnance Note 1 is Eliminated. See also SSR CG15 (8.4) and SSR KGP16.					
* See U.S. Vehicle Note 29. * WP ammo is available as if it were 1945.					
GERMAN					
Platoon Type‡	LMG	Lt MTR	PSK	FT	DC
Para Inf	1	1			
SS Inf	2		1		
SS PzGr	1		1		
SS Eng	1			1	2
‡ If the platoon is Depleted, each listed SW is received only on a dr of ≤ 4.					
§ Each SW received must set-up/enter stacked with (and possessed by) a unit of its respective RG during the first CG scenario in which its RG participates [EXC: if it is Retained off-map for an entire scenario].					

8.6205 GERMAN HW PLTN: Each Full-Strength German "HW"-type Pltn RG receives all Equipment/Personnel counters listed for it. If Depleted (8.6201), the German makes a Secret dr for each listed piece of Equipment: an Original dr of ≤ 3 results in that piece of Equipment being received (each MG SW received is accompanied by a 3-4-8 HS); if ≥ 4 that piece of Equipment (and its respective HS) is forfeit. [EXC: At least two pieces of Equipment must be received with a German "HW" Pltn RG; if the Platoon's final total is < two pieces of Equipment, ignore this result; roll again for each piece of Equipment in the Pltn until a final total of ≥ two are received after rolling for each.] Each piece of Equipment received must set-up/enter stacked with (and possessed by) another unit of its RG during the first (only) CG scenario in which it participates. Record each piece of Equipment received in its respective column on the RG Purchase Record.

EX: The CG Date is 21 AM in CG I. The German has just purchased two SS Inf Pltn, a Pz IV Sect, an

SS PzGr HW Pltn and a 120-mm battalion mortar OBA module. The German OBA automatically has Scarce Ammunition (German RG Chart footnote "s"). All other RG purchased are subject to Depletion (8.6201). The German now makes a separate Secret DR for each; a +2 DRM applies as the day is two days past 19 December. The Final DR are 12, 6, 8 and 13 respectively, resulting in one Depleted and one Full SS Inf Pltn, a Full Strength Pz IV Sect, and a Depleted SS PzGr HW Pltn.

Since one SS Inf Pltn is Depleted, two 6-5-8 squads are received but the types and numbers of their SW must be determined by dr (8.6204). Three Secret dr are required, one per SW (two LMG and one PSK) allotted to a Full-Strength SS Inf Pltn. For the LMG the dr are 6 and 4; for the PSK it is 3. Since a dr of ≤ 4 grants a SW to a Depleted Pltn, the Depleted SS Inf Pltn receives one LMG and one PSK. The Full-Strength SS Inf Pltn automatically receives both LMG and the PSK with no dr needed.

Now the units of the Depleted SS PzGr HW Pltn are determined (8.6205). The German makes a separate Secret dr for each piece of Equipment allotted to a Full-Strength SS PzGr HW Pltn (i.e., one apiece for the SPW 251/4MG, SPW 251/2 and SPW 251/9). The respective dr are 2, 5 and 6. Since a dr of ≤ 3 grants an Equipment piece to a Depleted HW Pltn, the only Equipment this RG would receive is the SPW 251/4MG. Therefore, the German rolls again for each Equipment since ≥ 2 Equipment pieces must be received (8.6205) by each HW Pltn. This time the three dr are 6, 2 and 3 respectively, resulting in the SS PzGr HW Pltn receiving the SPW 251/2 (with a 2-2-8 Inherent crew) and the SPW 251/9.

Using the above methods for Depleted RG, it is possible to receive all, some or none of the Equipment listed for those types of RG [EXC: each HW Pltn will always receive ≥ two Equipment pieces].

8.6206 LEADER DETERMINATION: For each purchased/OB-given "I"-type RG marked with RG-chart footnote "I", and for each "V"-type RG marked with RG-chart footnote "a", make one Secret DR on the appropriate column of the following table to determine the type of leader received for that RG. Each leader must set-up/enter with a unit of his respective RG during the first (only) CG scenario in which he participates [EXC: if he possesses a radio/phone (see SSR CG15; 8.4), or is Retained off-map for an entire scenario].

LEADER TABLES

	+	☆	+	☆
Final DR	Personnel Leader	Personnel Leader	Armor Leader	
1	10-3	10-3	-	
2	10-2	10-2	10-2	
3	9-2	9-2	9-2	
4	9-1	9-1	9-1	
5	8-1	8-1	8-1*	
6	8-1	8-0	-	
7-8	8-0	7-0	-	
9	7-0	7-0	-	
10	6-1	6-1	-	
≥ 11	-	-	-	

DRM:

-1 If all MMC in the RG are Elite (NA to armor leader)

+1 If the RG is Depleted (NA to U.S.)

+1 If the current CG Date is on/after 21 Dec PM (NA to U.S.)

* Exchange for a 9-1 armor leader if for a Pz VIB RG

8.621 PURCHASING FORTIFICATIONS: Fortifications, which are obtained by spending FPP, may be purchased on each CG Date if the player has the requisite FPP (purchased in step 8.619). All FPP unspent upon the completion of this step are forfeit.

As Fortifications are selected, the specific type (and strength, if mines) must be recorded in the "FORTIFICATIONS" area of the CG Roster.

EX: The German player has 30 FPP to spend on Fortifications. He spends 16 FPP on four factors of A-T mines, so on his CG Roster he writes "4" beside "A-T:" in the "Total # of Factors" area at the bottom of the "Mines" column. (Use of a soft-lead pencil is recommended, since these per-CG-Date totals are erased after determining the specific map Location.) He spends 9 FPP buying HIP for one squad (3 FPP), two HS (4 FPP), one crew (1 FPP) and one SMC (1 FPP), so at the bottom of the "HIP Locations" column he writes "1", "2", "1" and "1" after "Squad:", "HS:", "Crew:" and "SMC:" respectively. With his remaining 5 FPP he purchases five "I" for use as Dummies. Note that no actual map Locations are recorded at this time, as actual on-map placement does not occur until that side is setting up. Later, during setup (steps 8.6241-6242), the player uses the tallies written at the bottom of the various Fortifications columns to determine how many such "Fortifications" he has, and records the specific Locations (as applicable) on his Fortification record, erasing all notations made in the various "Total #" boxes so that the tally areas may be used for subsequent Fortification purchases.

FORTIFICATION PURCHASE TABLE

Fortification Type	FPP Cost
Trench ¹	7
Foxhole ¹	3/2/1 ¹
A-P Mine Factor ²	1/1.5 ²
A-T Mine Factor ²	3/4 ²
Roadblock ³	7
Booby Trap ⁴	1
HIP ⁵	3/2/1/1 ¹

¹ For 3-, 2- and 1-squad capacity respectively.

² U.S./German cost respectively, regardless of whether hidden or Known (7.1) mines. Each side may spend no > 30 FPP per CG Date per Map Group on mines. During setup, the strength of pre-existing minefields may be increased by the Controlling side, if their strength is known to that side, by adding extra A-P/A-T factors to them (in allowed increments and to allowed maximums). Minefields may not be decreased in this manner. Mine factors purchased on this table cannot be exchanged for Booby Trap (B28.9).

capability. A-T mine factors may be used in a Daisy Chain (B28.531). See also 7.2.

³ Squad/HS/crew/SMC cost respectively. No > 10% (FRU) of a side's non-Reserve Infantry squads (plus all SW/SMC set up with them in the same Location) may use HIP in a daytime scenario. For Emplaced-Gun HIP see also SSR CG12 (8.4). HIP is NA for Cloaked (including Reserve) units.

⁴ Must be added to a Setup-Area Location. Of the items in this table, only those items marked with an "F" may be set up in a Front-Line Hex.

⁵ Of the items in this table, only those items marked with an "I" may be added to an Isolated Location.

⁶ This type of Fortification may be added only to a Setup Area that contains ≥ one Retained squad-equivalent. Furthermore, the number of all Fortifications (counting each 6-A-P/2-A-T factor minefield [or part thereof], and each "1S" foxhole capacity, as one Fortification) added to a Setup Area during a RePh cannot exceed the number of squad-equivalents Retained within that Setup Area.

8.622

P

- **8.622 PURCHASING RECONNAISSANCE:** Each side may now make a Recon dr, provided it first expends the required CPP for this purpose and the players are not preparing to play an *Initial Scenario*. If Recon can be purchased, that side deducts one (or two, for a beneficial dr on its Recon dr) from its current CPP total in the CG Roster's "Left" column, and records the new total in the "Start" column of the next CG Date. (The number in the "Start" column shows the side's CPP total at the start of that CG Date.) If a side cannot or opts not to use Recon, its current CPP total is simply copied in the "Start" column of that next CG Date.

A Recon Final dr is the number of *Locations* in which the opponent will have to reveal units and Fortifications, if he has in fact set up in them; see 8.6243. The Recon dr is modified by the following cumulative drs:

- +5 Spent 2 CPP
- 1 Reconnoitering side's Majority Squad Type (E.4) is Lax

The number of *Locations* that may be reconnoitered (8.6243) per Map Group per CG Date is recorded on the CG Roster in the "Recon" column of the current CG-Date line. The number recorded for each Idle CG Date is cumulative with the number recorded for each succeeding CG Date, but not beyond the next CG scenario.

8.623 INITIATIVE DETERMINATION: Each side selects its Initiative for the current CG Date, either to "Attack" or stand "Idle", representing its desired tactical plans.

8.6231 ATTACK-CHIT LIMITS: Each CG (8.51-53) lists the maximum number of Attack Chits (8.6232) each side may select during the course of that CG. (There is no limit otherwise on selecting Attack Chits on consecutive CG Dates.) For purposes of this rule, neither side is considered to have selected an Attack Chit for an Initial Scenario.

8.6232 PROCEDURE: Each side takes its respective Initiative Chit and secretly places it on the playing area, hidden from the opponent's view, with the chit's face-up side displaying the side's Initiative selection (i.e., either an Attack Chit or an Idle Chit) for the next CG scenario. The counters are then revealed simultaneously and cross-indexed on the following matrix to determine if a new CG scenario is generated and, if so, what type it will be.

INITIATIVE MATRIX

Chit selected	☆ Attack	☆ Idle
◆ Attack*	Dual Attack ¹	German Assault ¹
◆ Idle	U.S. Assault ¹	Idle ²

* The Attack Chit cannot be selected by the German player if the U.S. player currently has no on-map Retained units (8.6131).

¹ Scenario generated; consult proper scenario type below for further information.

² No scenario generated for this CG Date; each side calculates its Current-LVP and CG-LVP Totals and records them (in the current CG Date's line) on its CG Roster, then repeats RePh steps 8.612-8.6233.

8.6233 SCENARIO TYPES

a) **DUAL ATTACK:** Represents a CG Date when both sides have planned offensive action. The U.S. player makes a dr to determine which side sets up first: if ≤ 3 the U.S. does; otherwise the German does. The side moving first, however, is not determined until after all setup is complete (step 8.625).

b) **NIGHT DUAL ATTACK:** If both sides choose Attack for a *Night* CG Date, both are considered Scenario Attackers. Both sides may use Cloaking as per SSR CG5 (8.4). Neither side is restricted by the use of No Move counters (E1.21), and neither side receives the benefits/penalties of a Scenario Defender (E1.2; E1.22). The side moving first is still determined in step 8.625. See also SSR CG5.

c) **GERMAN ASSAULT:** On this CG Date the German side is attacking. The U.S. sets up first, and the German moves first.

d) **U.S. ASSAULT:** On this CG Date the U.S. side is attacking. The German sets up first, and the U.S. moves first.

8.6234 KGP CG-SCENARIO VICTORY CONDITIONS: The following Victory Conditions apply to the pertinent type of CG scenario (as determined in 8.6232). However, the Victory Conditions for each CG's Initial Scenario, as well as those for each CG, are given with the other information for the respective CG and its Initial Scenario (8.51-53). A side may concede prior to the end of play in a CG scenario only if allowed by the opposing side.

a) **DUAL ATTACK:** The Americans win if at CG-Scenario End their Current-LVP Total is $>$ what it was at scenario start.

b) **U.S. OR GERMAN ASSAULT:** The *Assaulting* side wins if at CG-Scenario End its Current-LVP Total is $\geq 20\%$ (FRU, with a minimum increase of 1 LVP) more than it was at scenario start, and/or it has amassed $\geq 25\%$ more Casualty VP (see also 8.6032) than the Idle opponent.

EX: If the *Assaulting* Controls no LVP Locations at scenario start (regardless of his present CG-LVP Total), he must have a Current-LVP Total of ≥ 1 at CG-Scenario End in order to win the scenario by LVP. If the *Assaulting* Current-LVP Total is (e.g.) "26" at scenario start (regardless of his present CG-LVP Total), at CG-Scenario End his Current-LVP Total must be higher by ≥ 6 (i.e., must equal ≥ 32) in order to win by LVP ($26 \times .2 = 5.2$ [FRU] = 6).

8.624 UNIT SETUP

8.6241 ISOLATED UNIT SETUP: The side that sets up first (8.6233) now sets up all of its Retained units, Equipment and new Fortifications which will go in *Isolated Locations*, after which the other side does likewise. Each Isolated unit/Equipment piece may be set up only in its current Setup Area [EXC: in its current Location and VCA, if an Immobile vehicle; 8.6071]. For Fortifications, see also footnotes "F", "I" and "S" in the Fortification Purchase Table (8.621). See also SSR CG7-CG12 (8.4) and SSR KGP8.

Each unit/Weapon that sets up Isolated [EXC: Captured Weapon; A21.11] is automatically affected by Ammunition Shortage (A19.131); if already so affected (e.g., as per 8.618) at start, there is no additional effect. The ID of an Isolated unit/Weapon should be recorded to distinguish it from others not suffering the same penalties. See also SSR CG17 (8.4).

8.6242 NON-ISOLATED UNIT SETUP: The side that sets up first now sets up the remainder of its Retained units, Equipment and new Fortifications in eligible Locations of the Setup Area each is Retained in [EXC: each Immobile vehicle must remain in its current Location and VCA (8.6071); for Fortifications see also footnotes "F" and "S" in the Fortification Purchase Table (8.621)]. Record the hex coordinates of new Fortification setup Locations on the CG Roster, in the appropriate line(s) and column(s) under "FORTIFICATIONS". Units/Equipment Retained in a Holding Box are placed in its unshaded portion for entry as reinforcements (see SSR CG15 [8.4] and 8.6206 for radios). See also SSR CG6-CG12, SSR KGP6 and SSR KGP8. Once the side setting up first has completed its setup, the other side follows the same 8.6242 procedure.

8.6243 RECON INSPECTION: After all setup is complete (but prior to Bombardment, if any), each side may declare the Location(s) they wish to reconnoiter (8.622), if any. Each reconnoitered Location must be within six hexes of a friendly Setup/Eligible-Entry Area hex. The sides take turns declaring one Location at a time, with the U.S. declaring first. Each hidden unit/Equipment in a reconnoitered Location is placed on-map concealed, and all hidden Fortifications in the Location are revealed [EXC: the type/strength of mines is not revealed; use a Known Minefield counter as per 8.6073]. All concealed (including Cloaked/Reserve) units/Equipment therein then lose their "?" (Eliminating Dummies) and the opponent receives Right of Inspection vs the Location (A12.16), regardless of LOS. All units/Equipment in Concealment Terrain in the Location then immediately regain any "?" (but not HIP) they previously had, regardless of LOS [EXC: all Reserve units/Equipment regain their Cloaked Reserve counter (and status), even if not in Concealment Terrain].

8.625 SCENARIO COMMENCEMENT: Players are now ready to begin the CG scenario. Each side announces its current SAN. If this is an Assault scenario, the side setting up second always moves first (8.6233). If this is a (day/night) Dual Attack scenario, the side that will move first is determined by the U.S. player making a dr on the following table:

DUAL ATTACK TABLE

dr	Side Moving First
≤ 3	U.S.
≥ 4	German

CHAPTER P FOOTNOTES

1. **1.1 PINE WOODS:** The KGP pine woods represents old stands of conifers, where many boughs are above "head" level and in which undergrowth is reduced by the limited amount of sunlight able to filter down to the forest floor.

2. **2.1 SLOPE HEXSIDES:** The normal ASL hill rules, having been composed for the smaller hills depicted on the standard 8"x22" mapboards, do not portray the very large KGP hills realistically in the sense that the per-level width between Crest Lines effectively creates a series of plateaus (or wide terraces) that greatly restrict LOS between different levels. Slopes were devised primarily to alleviate this plateau/terraced-hillside effect.

3. **2.3 SLOPE LOS & ELEVATION ADVANTAGE:** Giving an Up-Slope unit a $\frac{1}{2}$ -level elevation advantage may seem overly complicated, but it in effect allows the unit to see over half-level—yet not over full-level—obstacles/Hindrances rising from the same Base Level as that unit. The "half-level" Hindrances referred to are brush, bridge, grain, marsh, crag and APV/wrecks.

4. **2.53 CREST-LINE SLOPES:** The presence of a slope along a Crest-Line hexside sometimes also represents an embankment. These often occurred along the roads, some of which were cut far enough into the hillside that the high-side embankment completely blocked vehicular movement. Since the two embankments along the opposite sides of such a road usually differed significantly in height/steepness, it could not be considered a true sunken road.

5. **3.1 BARBED WIRE FENCES:** Farmers' barbed wire fences so criss-crossed some of the areas depicted on the KGP maps that they had a definite impact on the outcome of several battles. In game terms, it was decided early on to prohibit the elimination of barbed-wire-fence hexsides simply because otherwise the maps would quickly become cluttered with the dozens of counters that would be needed to mark such hexsides.

P

6. 4.2 **STREAM CULVERT:** The Stream Culvert represents a three- to five-foot-wide pipe beneath the road, providing an underground passageway for the stream. Its small size and the continuous presence of cold water in it should make the reasoning behind its many game restrictions and penalties self-evident.

7. 5.1 **NARROW STREETS:** The local villages and hamlets had quite a number of narrow streets, which are represented on the KGP maps by "hexside roads". Such streets were notorious for restricting the maneuverability of even average-size vehicles.

8. 5.11 **ONE-LANE:** Here "road" is defined to mean a string of $\geq$ one contiguous Narrow Street hexside between the two vertices/hexsides where that string either ends (EX: vertex S018-O19-N18), joins with two other Narrow Street hexsides (EX: vertex O17-O18-N17), or becomes a non-hexside road (EX: vertex P17-O18-O17). Hence, each of the following constitutes a separate "road" for one-lane purposes: hexsides N17-O18 and N18-O18; hexside N17-O17; hexside O17-O18; hexsides N16-O16 and N16-O17; hexsides N15-O15 and N15-O16; hexside N15-N16 to hexside L15-M15 (inclusive); hexside N16-N17 to hexside J18-K19 (inclusive); hexside J18-J19; hexside J19-K19—and so on.

9. 5.11 **DASHING/ROUTING:** Dashing across/along a Narrow Street is NA mainly to prevent any conflict between the rules for First Fire vs a Dashing unit and those for Snap Shots. Routing along a Narrow Street is NA because a routing unit may not Bypass (A4.3).

10. 6.1 **HILLSIDE WALLS & HEDGES;** & 7.1 **KNOWN MINEFIELDS:** These are essentially reprints of the Hillside Walls & Hedges (F10.) and Known Minefield (F7-7C) rules in *WEST OF ALAMEIN*. They are reprinted (and Known Minefield counters are provided) in *KGP I* so that WOA need not be a prerequisite for this module.

11. 8.2 **MAP GROUP:** Phrases like "per Map Group" and "of that Map Group" might be construed to imply that > one Map Group is being used. This is, of course, not true for CG I-III, but such phrases have been left in the body of the rules in case another CG using all the Map Groups appears in some future edition of the *ASL Annual*.

12. 8.4 **SSR CG6c: ELIGIBILITY:** If the Germans have no Eligible Entry Area on the "Sc" or "Ch" Map Group, newly purchased German RG must enter from off-map (representing a relief force attempting to break through to their isolated compatriots). If the same situation occurs on the "Lg" Map Group, newly purchased German RG are instead added directly to a friendly Setup Area (representing units that were already in the pocket but not yet committed to the battle).

13. 8.4 **SSR CG20 VIADUCT ENTRY AREA:** Vehicles are prohibited from using this Entry Area on the northern edge of the "Ch" map due to the presence (just off-map) of a very steep embankment beside a set of railroad tracks which cross the Amblève via a narrow viaduct. Infantry were able to traverse the viaduct and embankment with no problem.

14. 8.602g **MARKER REMOVAL:** Each unit still hidden at scenario end is placed on-map concealed (in its respective setup Location) so that it cannot "magically" escape from an Isolated Area, and for use in determining Controlled Strategic Locations. As a house rule, such a unit could be kept off-map unless in danger of being Isolated or needed to verify Control of Strategic Terrain. However, if such a unit's Location is later determined to be Isolated or part of an enemy Setup Area, it must immediately be placed on-map concealed in that Location.

15. 8.6044 **BOGGED:** Each bogged, non-captured U.S.-color vehicle receives a -1 drm to reflect the greater chance of support being available to aid in its unbogging—and also to help minimize the possible U.S. "sneak tactic" of intentionally trying to bog a vehicle in the hope that it will become Immobilized, thus forming a Strategic Location.

16. 8.608 **PRISONERS:** Prisoners are actually being withdrawn to a holding area. Historically, the Germans kept the U.S. POWs they had captured in Stoumont (as well as all German wounded) at the Château de Froidcourt. When the château was abandoned during the night of 21-22 December, most able-bodied prisoners and the German walking wounded were taken to La Gleize; severely wounded men remained at the château in the care of two U.S. medics and a German doctor.

17. 8.6112 **CREW COMBINING:** The German side, especially, tends to accumulate "dismounted" vehicle-crews, due in part to less-important Mobile vehicles (e.g., halftracks) being abandoned in order to enable the refueling of more valuable Out-of-Gas vehicles. Frequently such a crew has also been previously stunned, leaving it marked with a "+H"(Stun) counter when it is not Inherent (D5.34). Even though this counter imposes no penalty to the vehicle-crew counter, it does represent the wounding, incapacitation or death of one or more crewmen. This rule represents the combining of two such crews into one "full" one.

18. 8.6131 **VACATED SETUP AREA:** Due to the normally limited visibility conditions, the enemy is assumed not to notice that all friendly units have vacated their positions.

19. 8.6141c **U.S. M10 & GERMAN SPW 234/2:** The special restrictions on siphoning gas from and refueling M10 TD and SPW 234/2 arise from the fact that, unlike all other vehicles used in *KGP*, these two required diesel fuel (see U.S. Vehicle Note 23 and German Vehicle Note 75).

20. 8.6141c **GERMAN REFUELLING dr:** This represents the fuel obtained from a Luftwaffe air-drop made on the evening of the 22nd.

21. 8.617 **HISTORICAL WEATHER:** During the *KGP* playtest the most commonly asked question about the CG weather was, "Where's the snow?". The answer is that during the period 19-23 December there was none to speak of in the area depicted by the maps. This was due to a thaw that began on 18 December, melting the snow and turning the frozen ground soggy. For several days thereafter, dense mist blanketed the wet battlefield. Gradually it began to thin out (particularly in the afternoons), and on the morning of 22 December an alternating mixture of rain and snow fell. Then, on the night of 22-23 December, a "Russian high" moved in from the east, bringing freezing temperatures, clear skies, and a breeze that dispersed the last of the mist. The temperature was not to rise above freezing again for weeks—and 29 December would bring blizzards and arctic winds.

22. 8.619 **RG COUNTERMIX LIMITS:** Normal countertermix limits do not apply to RG purchases (including any associated Availability DR for optional armament; H1.41). Players should agree on the substitution of other types for those lacking—or purchase more countersheets.

23. **U.S. REINFORCEMENT GROUP CHART footnote "g", M12 GMC OBA:** On 21 December a lone M12 Gun Motor Carriage (U.S. Vehicle Note 45) appeared at Turgnon (off-map to the west of

FOOTNOTES

the "St" Map Group) and positioned itself there to fire into Stoumont. After Peiper withdrew to La Gleize the M12 moved to the Château de Froidcourt, from where it plastered La Gleize with 196 155mm rounds on 23 December.

24. **SSR KGP13 GERMAN FUEL SHORTAGE:** Some playtesters disliked the "abruptness" with which German vehicles run out of gas, and wondered why its occurrence couldn't be preceded by a "low fuel" status similar to the way Low Ammo (D3.71) works. The reasoning behind the present rule is that, historically, Peiper's vehicles were *already* low on fuel by the 19th, and by the 20th the situation was becoming critical. Hence in game terms players might visualize each German vehicle's fuel gauge as being almost on "Empty" on the 19th, and on or below the Empty mark after the 21st.

25. **SSR KGP13 TCA-CHANGE DRM:** This extra DRM represents the fact that, when the AFV was out of fuel, the turret's electric/hydraulic power-traverse system was inoperable. Hence when the gunner traversed the turret he had to do so manually, using a handwheel—a significantly slower (and more fatiguing) method.

26. **SSR KGP15 U.S. PF:** The 504th Parachute Infantry Regiment had captured an entire truckload of PF in Holland. The firing instructions were translated and disseminated to the men, who then underwent training in the use of the weapon.

27. **8.619 U.S. REINFORCEMENT GROUP CHART: G5 AA SECT; M4 18-Ton High Speed Tractor:** During the war, the U.S. Army desired to have all artillery towed by purpose-built, fully-tracked vehicles, but their supply could never meet the demand. One of the more commonly used types was the M4 18-Ton High-Speed Tractor, which was designed and produced by Allis-Chalmers. Entering production in late 1942, it was used for towing the 3-in. or 90mm AA gun, or (with different ammunition racks and a small swing crane at the rear) the 155mm gun, 8-in. howitzer. The M4 utilized chassis components of the obsolete M2A1 Medium Tank, and was powered by a Waukesha 6-cylinder gasoline engine.

IMPORTANT: Note the existence of a Level 8 Crest Line in "Sc" hexrows TT28-0031-MM30-JJ31-JJ32-II33-II34-HH34-HH37-GG38-GG40-HH40-HH47-II48-II54-JJ54-JJ56. Also, the Level 3 Crest Line in SLM49 runs into hexes M50 and N50, and thence off-map along the south side of unpaved road N51-O57.

KGP SSR: SPECIAL RULES for all KGP Scenarios

(Unless noted otherwise, all SSR below apply in all KGP scenarios—both CG and non-CG type)

KGP1. KGP MAPS: The five Map Sections included in the KGP modules are organized into three Map Groups, as illustrated at right (e.g., the "St" Stoumont Map Group contains two Map Sections, one east and one west, while the "Ch" Cheneux Map Group has only one Map Section). Only Map Sections *within the same Map Group* overlap to form one continuous playing area (e.g., the east edge of the "St" Map Group neither overlaps nor abuts against the west edge of the "Lg" Map Group). Each Map Group's name and ID are derived from the name of its primary village. When the Map Group is not otherwise stated, each KGP-map hex will be referenced by its two-letter Map Group abbreviation, followed by the hex coordinate (e.g., the Stoumont cemetery occupies hexes StH14 and StI15).

The colors used to depict the various elevation levels on the KGP maps do not in all cases correspond to those on other ASL maps. The KGP Base Levels range from Level -2 (the Amblyère River) through Level 9.

KGP2. EC, WIND & WEATHER: EC are *always* Wet. Through Dec 22 PM, Wind Force is *always* "No Wind" and Gusts are NA; Wind Change DR are still made, but can affect *only* building collapse (B25.66), NVR change (E1.12), Interrogation (SSR KGP18), and whether or not rain starts/stops (or intensifies; E3.51). As of 22 Dec N, there is always a Mild Breeze from the Southeast at scenario start, and Wind Change DR apply in the standard manner. Weather is Clear or Overcast only if so specified by SSR, or as per P8.617 or P8.6171.

KGP3. KGP MIST: Due to the extremely misty conditions during most of the fighting, the E3.32 Mist rules have been expanded to allow for greater degrees of Mist density, ranging from Very Light to Extremely Heavy, as indicated in the following chart. Mist still affects all levels. Note that Very Light Mist is the same as E3.32 Mist, while Light Mist equates to the effects of "heavy rain" (E3.51). Very Heavy and Extremely Heavy Mist are LOS—not LV—hindrances.

KGP MIST LV DRM CHART

RANGE:	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	...
V. Light	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Light	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1
Mod.	+1	+1	+1	+1	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2
Heavy	+1	+1	+1	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2
V. Heavy*	+1	+1	+1	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2	+2
X. Heavy*	+1	+2	+2	+3	+3	+3	+3	+3	+3	+3	+3	+3	+3	+3	+3	+3	+3	+3	+3

* Treat as a LOS (not LV) Hindrance that neither affects the placement/attack LOS of (A9.22), nor applies as a DRM to (A9.222), a Fire Lane.

MIST DENSITY CHANGE: Whenever rain starts (or intensifies to "heavy rain"; E3.51), the Mist density increases one level ("no mist" would become Very Light Mist, etc.). Conversely, whenever rain stops, the Mist density decreases one level (two levels, if "heavy rain" was occurring). In addition, immediately following each Wind Change DR, a Mist Change DR is made (unless stated as NA) to determine whether the Mist density (if any) changes. There is a -1 DRM to the Mist Change DR in each "PM" scenario. If the Final Mist Change DR is ≤ 3 , the Mist density decreases one level (Very Light Mist would become "no mist") [EXC: if it is raining, the Mist density cannot fall below that of the rain's current intensity]; if the Final DR is ≥ 11 , the density increases one level. Mist density can never exceed Extremely Heavy. The current Mist density can be conveniently recorded on the Mist Density Track found near each Map Group's CG Turn Record Chart (SSR CG23; P8.4).

AIR SUPPORT: During a KGP scenario, the use of Air Support is NA whenever the Mist density is > Light—as well as at night, or if the Weather is specified as Overcast. Air Support that is already on-map when the Mist density becomes > Light remains available but unusable (and immune to all AA Fire) during that scenario until Mist conditions again allow its use [EXC: while the Mist density is currently > Light, a Recall dr must be made for each group of FB that arrived on-map together; the dr is made during the reinforcement step of the group's ATTACKER RPH, and if it is a 6 that group is immediately Recalled]. Air Support may still be rolled for when the Mist density is > Light, but once it arrives it is treated as per the preceding sentence (including the EXC).

KGP4. TERRAIN: The river is Deep, with a Moderate current flowing in a northerly direction. All streams are Shallow (B20.4) [EXC: the LgA44-M48-U57 stream is Deep]. All bridges are one-lane stone [EXC: LgH46 and LgS55 are one-lane wooden, and entry by vehicles is NA].

KGP5. SOFT GROUND: To reflect the soggy conditions, each vehicle must expend one additional MP per hexside (as per E3.9) unless crossing/traversing a paved-road or stream hexside or entering a building/woods/rubble obstacle. In addition, each Bog Check receives the Soft Ground DRM (D8.21) [EXC: if on a paved road or in a building (D8.21); if crossing a barbed-wire-fence hexside (P3.3)].

KGP6. OFF-MAP ROADS: Any road that exists off-map (i.e., to beyond the printed mapsheet area of the Map Group) is considered for the purposes of A2.51 to extend beyond that map edge either along the same lettered hexrow, or in hexes of the same coordinate, as that edge hex (depending on the configuration of the Map Group's hex grid). The off-map road is considered to be the same (un)paved type as the on-map road hex it connects to. All terrain in the off-map setup area is still considered Open Ground [EXC: half-hexes; A2.51].

EX: On the Stoumont map, a paved road extends off the east edge along hexrows E, J and Q, while an unpaved road extends off the south edge along each hex with a coordinate of 7 or 25.

On the other hand, all on-map terrain that is *not* in play in a given scenario remains in effect for "offboard" movement/entry purposes during that scenario.

(The Map Groups are shown in their proper geographical relationship)

KGP7. SINGLE-LANE ROADS: Each unpaved Sunken Road is a Sunken Lane (B4.43), and each unpaved road in a (normal or pine) woods hex is one-lane (i.e., the restrictions of B6.43-431 apply as if the road were a one-lane bridge). These two road types are referred to collectively as Single-Lane Roads. P5.122 applies to a vehicle that wishes to change its TCA relative to its VCA while on a Single-Lane Road.

A vehicle with a +2 Target Size (D1.75) treats a path in a (normal or pine) woods hex as an unpaved one-lane road, even if towing a Gun.

KGP8. CELLARS: The B23.41 Cellar rules apply only to multi-hex buildings. An AFV falls into such a cellar (B23.41) on a Bog DR Original colored dr of ≥ 4 . Every AFV that sets up in a building must immediately undergo a Secret Bog DR [EXC: A vehicle ending a CG scenario in a building location may set up in that location with the same VCA without a Bog DR].

KGP9. FIRES: Kindling Attempts (B25.11) are NA. Furthermore, due to the extremely wet EC, a Flame (B25.15) can occur *only* in a building/rubble Location.

KGP10. BURNT-OUT WRECKS: A Burnt-Out Wreck cannot be Scrounged, set Ablaze or removed from play as per D10.4. A Burnt-Out Wreck is a LOS Hindrance exactly like a normal wreck.

KGP11. SS UNITS: All units in each KGP German OB are SS (A25.11), including CG RG and a vehicle's "inherent" Passenger (i.e., German Vehicle Note 58) [EXC: 4-4-7/2-3-7 MMC, and each MMC subsequently created from such, are not SS and have a "printed" ELR of "3"]. Each German Depletion number is one > the printed number (C8.2) until Ammunition Shortage applies to the Weapon (A19.131).

KGP12. GERMAN STUN/RECALL: A vehicle of the German OB (including a captured U.S. vehicle) does *not* suffer Recall due to MA disablement. A Recall due to attack effects (D5.341-342) suffered by a German Inherent crew is always treated as a Stun result *only* [EXC: an armor leader may be Eliminated as per D5.341]; i.e., no Recall ensues. However, the +1 DRM effects of all Stun results vs a German Inherent crew are *cumulative*. In addition, when these total +DRM equal one < the vehicle's CS# (D5.6), its Inherent crew's abilities are limited to those of a SMC crew (A21.22); when the total +DRM equal the CS#, the crew is Eliminated and the vehicle abandoned (leave the "+#" [Stun] counter(s) on the vehicle). Infantry wishing to re-crew that vehicle *during play* must first, using Hazardous Movement in the vehicle's Location (and position—e.g., not in an entrenchment), expend one MF separately to reduce the total "+#" by one; and only when that total "+#" equals zero (or "1" if OT or unarmored) may the vehicle be remanned.

KGP13. GERMAN FUEL SHORTAGE: Commencing on Dec 20 AM, before an on-map German vehicle attempts to expend its first MP during its MPh, and whenever it attempts to change its VCA in any other phase, it must first (even before any applicable Stall DR: German Vehicle Note H) make an Out-of-Gas DR [EXC: a Stopped vehicle (un)loading, firing armament/sD/sN, or attempting to place smoke grenades (F.10)]; if the Final DR is ≥ 12 the vehicle is out of fuel and thus immobilized; mark it with an "Out of Gas" counter. A +1 DRM applies *per day* after 21 December.²⁴ If in Motion, the vehicle immediately Stops without expending any MP. If it is the start of the vehicle's MPh and it has not yet expended any MP, its PRC may immediately Abandon-it-(D5.4-411)/unload if in the present Player Turn it/they have not engaged in (un)loading, firing armament/sD/sN and/or an attempt to place smoke grenades. If the German player forgets to make an Out-of-Gas DR, the U.S. player can thereafter call for it to be made immediately at any time during that MPh as the vehicle expends any MP.

While "out of gas", an AFV with a 75LL/88LL/90L MA, or "T" Type (D1.31) 75/5L/76L MA, has its TH Case A TCA-change DRM increased by one for the "1st Hexspine" adjustment in its TCA (as explained in C5.1; i.e., to +2 for "T" type and +3 for "ST" type).²⁵

For the purposes of SSR KGP13, each vehicle in the German OB at the start of the current scenario is considered German during that scenario; i.e., neither a captured German vehicle starting the scenario as part of the U.S. OB (even if recaptured by the Germans during play) nor a U.S. vehicle captured by the Germans during play, is considered German for that scenario.

KGP14. SCHÜRZEN: All PzKpfw IVH and IVJ have Schürzen (D11.2).

KGP15. U.S. CAPTURED PF: Each non-Assault-Engineer U.S. 7-4-7 squad (and hero created from such a 7-4-7 or its 3-3-7 HS) has an Inherent PF usage number of "1". C13.31 and C13.32-36 apply normally, with no penalty for Captured use. The number of such PF TH DR made may not exceed the number of non-Assault-Engineer 7-4-7 squads in the U.S. scenario OB.²⁶

KGP16. U.S. 60mm MTR/OBA: Each 60mm mortar counter may fire WP as if it were 1945. The range of each 60mm OBA module (U.S. Ordnance Note 1) is traced from a separate, secretly pre-recorded edge-hex of an Eligible (SSR CG6; P8.4) U.S.-Controlled Entry Area. 60mm OBA may fire WP, but only one WP Fire Mission if the scenario is $\leq$ ten turns long or two WP Fire Missions if it is $\geq$ eleven turns in length. Each 60mm OBA module receives one Pre-Registered hex.

KGP17. GYROSTABILIZERS: Before assigning armor leaders, the U.S. player may make a Secret dr, using the H1.42 table, for *each eligible* AFV to determine if it has a functioning Gyrostabilizer (D11.1).

KGP18. INTERROGATION: Civilian (only) Interrogation (E2.4) is allowed. The Americans are considered to be in a friendly, and the Germans in a hostile, country.

Q. PEGASUS BRIDGE

ORDER OF PRESENTATION:

1. Irrigation Ditches
2. Partial Orchards
3. Slope Hexsides
4. Village Terrain
5. Combination Terrain
6. Towers
7. Barbed-Wire Hexsides
8. Hillside Walls & Hedges
9. PB Campaign Game

1. IRRIGATION DITCHES

1.1 Irrigation Ditches represent narrow, shallow, water-filled channels.¹ Any hex containing one or more solid blue lines is an Irrigation Ditch hex. Hexes FF25, GG26, and GG27 are examples of Irrigation Ditches. Irrigation Ditches are *not* Water Obstacles.

1.2 Irrigation Ditches are neither an obstacle nor a Hindrance to LOS. Irrigation Ditches are considered Open Ground for MF/MP expenditures for scenarios in which Mud weather conditions (E3.64-.65) are in effect [EXC: an Irrigation-Ditch Partial Orchard hex entered across an orchard hexside (5.2;2.2)].

1.3 TEM: An Irrigation Ditch has a conditional TEM of +1 which is never cumulative with any other possible TEM. Only Infantry may utilize this conditional TEM [EXC: Infantry manning/Manhandling Guns/Boats never receive the protective TEM benefits of an Irrigation Ditch].

1.4 MOVEMENT: Infantry may enter an Irrigation Ditch hex at the COT of the other terrain in the hex *or* it may expend that COT and one additional MF. If it only expends the COT of the other terrain to enter an Irrigation Ditch hex, it may (barring other terrain in the hex) be subject to FFMO (or Interdiction in the RtPh) in that hex during that MPh until Pinned. If an Infantry unit either starts the phase already in an Irrigation Ditch hex or it expends the additional 1 MF when entering the hex, it is considered to be taking cover in an Irrigation Ditch and may claim the conditional +1 TEM (thereby avoiding any FFMO penalties).

1.41 Cavalry entering an Irrigation Ditch hex across a non-road hexside enter at 1 MF plus COT, but never receive any protective TEM benefits from an Irrigation Ditch.

1.42 Guns/Boats may be Manhandled into an Irrigation Ditch hex across a non-road hexside at a cost of 2 MF plus COT.

1.43 Wheeled and horse-drawn vehicles may not enter/exit an Irrigation Ditch hex across a non-road hexside. Tracked vehicles may enter an Irrigation Ditch hex across a non-road hexside by expending 2 MP (3 MP for halftracks) plus the COT of the other terrain in the hex, and making a Bog Check; they must also make a Bog Check if changing VCA while not in a road hex. Additionally, a tracked vehicle that exits² an Irrigation Ditch across a non-road hexside must pay 2 MP (3 MP for halftracks) and make a Bog Check in the hex being exited [EXC: if the vehicle already expended those MP, and made the Bog Check, for entering the hex or if it sets up in that hex].

1.5 DEEP SNOW: When Deep Snow (E7.33) is present, Infantry may not benefit from an Irrigation Ditch's protective TEM and the cost for entry across a non-road hexside is always 1 MF plus COT (plus Deep Snow expenditures).

1.6 PARATROOPS & GLIDERS: A 5/8" parachute that lands in an Irrigation Ditch hex must take a NMC as per E9.42. Gliders landing in an Irrigation Ditch hex must add a +1 dr to their Crash dr (E8.23).

1.7 FORTIFICATIONS: Entrenchments cannot be placed in an Irrigation Ditch hex.

1.8 The Kindling/Spread numbers of other terrain in an Irrigation Ditch hex are reduced by two.

2. PARTIAL ORCHARDS

2.1 Partial Orchards allow for tree-lined roads (akin to B14.6) to exist, but with the trees on only one side of the road.³ Any whole hex [EXC: a whole hex created by butting two mapboards together] containing only two round, green orchard symbols is a Partial Orchard hex. Hex DD17 is an example of a Partial Orchard hex. All rules pertaining to orchards apply to Partial Orchards unless otherwise stated.

2.2 LOS: The orchard obstacle/hindrance of a Partial Orchard hex is *not* Inherent Terrain. A Partial Orchard's effect on LOS/LOF is determined by which of the Partial Orchard's hexsides/vertices are crossed by that LOS/LOF. The three contiguous hexsides closest to the hex's orchard symbols (including the two vertices joining them together) are termed Orchard Hexsides; the three hexsides farthest from the hex's orchard symbols (including their four vertices) are termed Open Ground Hexsides. If a LOS *crosses* one or more of the Partial Orchard hex's Orchard Hexsides, that hex is treated as an orchard hex; for LOS *crossing only* one or more Open Ground Hexsides, that hex⁴ is treated as an Open Ground hex.

2.21 Since Partial Orchard hexes are not Inherent Terrain, the orchard obstacle/hindrance in them is treated as Inherent Terrain for LOS *along* a hexside

EX: Squad A's LOS to G is subject to a +1 orchard hindrance (and vice versa), as is the LOS between Squads B and E. Squad A's LOS to I is subject to a +2 orchard hindrance because both Partial Orchard hexes along that LOS are considered to be orchard hexes for that LOS. Since Partial Orchard hexes are not Inherent Terrain, Squad C has an unhindered LOS to F and H. Additionally, because the vertices formed where a Partial Orchard hex's Open Ground Hexsides and its Orchard Hexsides meet are Open Ground, Squad D's LOS to G is unhindered. As per 2.21, there is a +1 orchard hindrance for LOS between Squads B and I. See also the 8.3 example.

EX: As Squad H enters N21 (without expending 1 MF to enter the Irrigation Ditch), it is subject to FFMO for fire from Squads A, B, and D only.

EX: Assuming Mud is in effect, Squad I could expend 1 1/2 MF to enter hex O22 (considered Open Ground for the move), while Squad B would expend only 1 MF to cross the Orchard Hexside into the same hex.

2.21

that is common to two Partial Orchard hexes only if that hexside is an Orchard Hexside for *both* of those hexes.

2.3 MOVEMENT: For movement purposes when entering a Partial Orchard hex, units are considered to be entering an Orchard hex if they cross an Orchard Hexside, and entering an Open Ground hex if they cross an Open Ground hexside [EXC: OBA, Residual FP and TPBF are resolved as though any target was entering an Open Ground hex regardless of hexside crossed].

2.31 RIDERS: AFV Riders may only enter/exit a Partial Orchard hex across an Open Ground hexside (D6.2-.21).

2.4 Partial Orchard hexes are not considered Concealment Terrain for any purpose.

2.5 AERIAL: An in-season Partial Orchard hex is considered an in-season orchard hex for Sighting TC (E3.7) purposes [EXC: a target in an in-season Partial Orchard hex receives only a +1 DRM if the aircraft counter's Attack Position is predesignated as entering the target hex through an Open Ground hexside]. A glider landing in a Partial Orchard hex receives a +1 Crash drm, but only if landing across an Orchard hexside.

3. SLOPE HEXSIDES

3.1 A slope hexside² represents an undulation in the terrain substantial enough to give an Up-Slope (3.2) unit a LOS advantage. On the PB map a slope hexside is represented by brown hash-marks along that hexside (EX: PBK5-L5). The entire hexside (inclusive of vertices) marked by a slope, but *not* the slope artwork itself, is considered part of that slope hexside.

3.2 UP-SLOPE/DOWN-SLOPE: A Location whose hex contains $\geq$ one slope hexside is either Up-Slope or Down-Slope to LOS drawn across that hexside to or from that hex. If the slope lines are *in* the Location's hex, the Location is defined as being Down-Slope across that hexside; if the lines are in an adjacent hex along the hexside common to both hexes, the Location is Up-Slope across that hexside. A Location can be both Up- and Down-Slope across two different slope hexsides.

3.3 LOS: Slopes are neither obstacles nor Hindrances.⁶ Being Up-Slope affects LOS only in that an Up-Slope Location is treated as being $\frac{3}{4}$ of a level higher than normal to LOS that *begins or ends* in that Location and *crosses* an Up-Slope hexside of that Location. Thus, barring other obstructions to LOS, an Up-Slope unit—even if not in a hill Crest-Line hex—can trace a LOS across an Up-Slope hexside of its hex to a lower elevation (i.e., across a hill Crest Line) and/or over (B.4) obstacles and Hindrances whose topmost obstacle/hindrance height is $<$ the Up-Slope elevation of the viewing unit

EX: Squad A has a LOS to B, D, and E unaffected by slopes and can see F because the latter is Up-Slope. An AFV/wreck in DD14 would hinder the LOS of squads B and E—but not squad A—to squad D. Squad B can see all squads depicted. Squad F can see A and B, but C, D, and E are in the one-hex blind zone created by the woods.

[EXC: entrenched LOS restrictions would still apply as per B9.21, as would wall/hedge TEM as per B9.3]. Otherwise, being Up-Slope or Down-Slope *itself* has no effect on LOS (e.g., slopes are ignored if the LOS goes *through* their hex or *along* their hexside, and also when calculating an A6.41-43 increase or decrease in the number of Blind Hexes caused by an intervening obstacle). Being Up-Slope *itself* can neither grant HA nor allow an Up-Slope unit to make a HD attempt. The presence of $\geq$ one slope hexside does *not* change the elevation of that hex's Base Level.

3.31 FIRE LANE: For the purposes of Fire Lane LOS/LOF drawn across $\geq$ one slope hexside, assume that the term "same-level" means "same-Base-Level". See also 3.42 and its example.

3.4 COVER: A slope can, in certain instances, provide a +TEM (3.41) or a +DRM (3.42).

3.41 DIRECT-FIRE TEM: Ground-level Infantry in a hex containing $\geq$ three (or two non-contiguous) Down-Slope hexsides may claim a +1 slope TEM vs Direct Fire [EXC: FT], provided the attack originates from a non-adjacent firer whose elevation advantage (if any) over that of the target is $<$ the range of the attack *and* the attacker's LOS crosses $\geq$ one of the target hex's Down-Slope hexsides. (A.5 applies to a FG attack.) Slope TEM is cumulative with no other +TEM [EXC: Mud/Deep-Snow TEM]. Being Up-Slope *itself* provides no TEM, does not negate the FFMO/FFNAM DRM, and does not affect Wall Advantage rules.

EX: See the 3.3 illustration, and assume the following attacks are Small Arms. Squad E can claim slope TEM if fired on by squad A or D, but not if fired on by squad B (whose LOS does not cross a Down-Slope hexside of DD13). Likewise, squad C could fire on adjacent squad E with no slope TEM and could claim the -1 FFMO if otherwise applicable, as could squad B. If squad E is fired on by squads C and D as a PG, squad E can claim slope TEM (A.5).

3.42 FIRE-LANE DRM: Infantry being attacked by a Fire Lane receives a +1 Fire Lane slope DRM if the firer is Up-Slope from, $\frac{3}{4}$ of a level higher than, and not adjacent to, that target [EXC: if the Infantry is attacked by a Fire Lane *Snap Shot* (A9.221), the DRM applies only if these three conditions apply to *each* of the two hexes that form the Snap Shot hexside, as determined by the firer's separate LOS to each of them]. An Up-Slope attacker's Fire Lane cannot affect a target that lies at a different Base Level (see 3.3) from that of the attacker.

EX: See the 3.3 illustration and assume squads A and D each have a MG. If squad D places a Fire Lane counter in hex CC12, all moving Infantry in DD14, DD13, CC13, and CC12 (or EE14, DD13, DD12, and CC12; A9.221) can be attacked by that Fire Lane with no slope DRM (since squad D is not Up-Slope from any of those Locations), although Infantry moving in DD13 would get the slope TEM (3.41). If squad A places a Fire Lane counter in EE15, all moving Infantry in CC13 (or DD12) can be attacked by that Fire Lane with no slope DRM (since those hexes are adjacent to the firer) but moving Infantry in DD14 and EE15 would receive the slope DRM, while moving Infantry in DD13 would receive both the slope DRM and slope TEM (3.41). Moving Infantry in EE14 (assuming there is a LOS) would not receive the slope DRM because CC12 is not Up-Slope to EE14, nor (for the same reason) would the slope DRM apply to Infantry attacked by a Fire Lane snap Shot at hexside DD14-EE14.

3.5 ENTRY: A unit crossing a slope hexside that it is Down-Slope from is moving Up-Slope. A unit crossing a slope hexside that it is Up-Slope from is moving Down-Slope.

3.51 MF COST/BONUS: Infantry/Cavalry (or a Wagon) must expend $\frac{1}{2}$ MF + COT in order to move Up-Slope. Infantry on skis would receive a $\frac{1}{2}$ -MF bonus for each Down-Slope hexside they cross (cumulative with any bonus received for moving to a lower elevation). Crossing a slope hexside while moving on a road does not negate the B3.4 MF road bonus.

EX: See the 3.3 illustration. Squad D must pay 2 $\frac{1}{2}$ MF to enter hex EE14 (2 [COT] + $\frac{1}{2}$ [moving Up-Slope] = 2 $\frac{1}{2}$); if it were also crossing a Crest Line up to Level 2 the cost would be 4 $\frac{1}{2}$ MF (2 [COT] x 2 [ascending across a Crest Line] + $\frac{1}{2}$ [moving Up-Slope] = 4 $\frac{1}{2}$). Squad C could expend 1 MF to enter DD14, since there is no additional cost to move Down-Slope. If, however, it had Rained (E3.54) or there were Ground Snow (E3.723), squad C would expend 2 MF to enter DD14 (2.54).

3.52 MP COST: A unit that expends MP must pay one MP + COT in order to move Up-Slope.

3.53 CREST-LINE SLOPE: No vehicle (or charging cavalry) may cross a combination Crest-Line-slope hexside (EX: B16-B17).⁷

3.54 RAIN/SNOW: When crossing a slope hexside, E3.54 (or E3.723), if otherwise in effect, applies just as if the moving unit *is* changing elevation (in addition to any application of that rule due to crossing a Crest Line).

4. VILLAGE TERRAIN

4.1 NARROW STREET: A Narrow Street is represented on the PB map by a road depiction overprinting $\geq$ one hexside (EX: hexside PBK13-L12).⁸ A Narrow Street can be paved or unpaved.

Q

4.11 MOVEMENT: A Narrow Street is always one-lane (i.e., the restrictions of B6.43-431 apply as if that "road" were a one-lane bridge).⁹ A unit Bypassing along a Narrow Street hexside is always assumed to be on the road within its hex—and, if that hexside is also a Crest Line hexside, in the lower of those two hexes. VBM along a Narrow Street is allowed regardless of hexside-to-obstacle clearance (D2.3), and costs half the normal Bypass MP expenditure [EXC: VCA change (D2.33) remains one MP (MF for a Wagon)]. Infantry/Cavalry Bypassing along a Narrow Street pay normal Bypass MF costs, but can still (as could a Wagon) qualify for the MF road bonus (B3.4). Contrary to the B3.4 example, a unit moving along/across a Narrow Street hexside cannot enter an obstacle at the road MF rate. Dashing (A4.63) across/along, as well as routing along, a Narrow Street is NA.¹⁰ SMOKE in either/both of the two ground-level Locations common to a Narrow Street hexside adds an extra MF/MP to the cost of using Bypass along that hexside [EXC: if the hexside is also a Crest Line hexside, only SMOKE in the lower hex can do so].

EX: See the 4.141 illustration. If squad G Bypasses along Narrow Street hexside K13-L12 (+1 MF for crossing the roadblock), it must still expend two MF to enter building K12 even though part of that Narrow Street extends into K12. The same would be true if squad G moved from L13 into the K13 building.

4.12 MOVEMENT RESTRICTIONS: The following movement-related restrictions apply on a Narrow Street (see also 4.141):

4.121 TCA: A turreted vehicle with a MA Caliber Size of ≥ 50 mm and a Barrel Length of other than "*" may be Non-Stopped on a Narrow Street only if its TCA coincides with its VCA or "rear" VCA.

4.122 TCA CHANGE: A vehicle with a MA Caliber Size of ≥ 50 mm attempting to change its TCA relative to its VCA while on a Narrow Street must first make a Final TCA-Change dr of ≤ 3 . (See also 4.121.) A maximum of two such dr per vehicle may be made per phase. In its MPH, each failed TCA-change attempt costs the vehicle two MP. Only the following cumulative dr can apply:

- | | |
|-----------------------|--------------------------|
| +2 "LL" Barrel Length | +x Armor Leader modifier |
| +1 "L" Barrel Length | -1 "*" Barrel Length |
| +1 If BU | |

4.123 VCA CHANGE: A motorcycle may expend $\frac{1}{4}$, while a very small (D1.75) Target Size vehicle may expend $\frac{1}{2}$, of its printed MP allotment to change its VCA 180° while on a Narrow Street. No other vehicle type may change its VCA [EXC: as per D2.33], nor may any vehicle change its VCA as part of a Motion attempt (D2.401), while on a Narrow Street.

4.124 TOWING: A vehicle towing a Gun or trailer may use VBM along a Narrow Street unless otherwise prohibited. However, such a Gun cannot be unhooked while in Bypass during play. A trailer may be unhooked while in Bypass during play (and is eliminated for all purposes thereafter), but only by the crew of the vehicle towing it.

4.125 UNLOADING: PRC may (un)load (and their possessed 76-107mm MTR [C10.1] may be "[un]hooked") from/onto a vehicle on a Narrow Street into/from either/both of the ground-level Locations forming that hexside.

4.126 RUBBLE/BLAZE/WRECK: All Bypass along a Narrow Street hexside is NA if either/both of the hexes forming that hexside contain(s) another vehicle/wreck in Bypass along that hexside, a Blaze counter [EXC: burning wreck along another hexside], and/or a Rubble counter. No wreck (or Immobile vehicle) on a Narrow Street may be removed as per D10.4.

4.13 ATTACK EFFECTS: The following special cases apply to attacks by/vs a firer/target in Bypass on a Narrow Street (see also 4.141-.142):

4.131 SMOKE/RESIDUAL-FP: SMOKE/Residual-FP in either of the two ground-level Locations common to a Narrow Street hexside can affect a unit in Bypass along that hexside. However, if each such Location contains SMOKE/Residual-FP of a different strength from that in the other Location, only the higher amount applies. [EXC to both: If that hexside is also a Crest Line hexside, the SMOKE/Residual-FP in the lower-Base-Level hex applies.]

4.132 CC: A vehicle on a Narrow Street is subject to Street Fighting (A11.8) when attacked in CC (including CC Reaction Fire) if its attacker occupies the ground level of a building in one of the two hexes common to that Narrow Street hexside. A +1 DRM applies to all CC CMG attacks by a vehicle currently in CC/Melee on a Narrow Street.

4.14 FORTIFICATIONS: Fortifications not normally allowed in a paved road hex may be placed in a hex with ≥ 1 paved Narrow Street hexside unless prohibited by other terrain in the hex.

4.141 ROADBLOCK: A roadblock may be placed "across" a Narrow Street by setting up the counter so that it straddles, with its arrow pointing to a vertex of, that hexside. For LOS and movement purposes, the roadblock is considered to extend from center dot to center dot of the two hexes formed by that hexside. A Narrow Street roadblock cannot convey Wall Advantage, provides no TEM vs Indirect Fire or Residual FP, and prohibits VBM along the straddled hexside. As a non-Bypassing unit crosses a hexside that is straddled by a Narrow Street roadblock, it must declare a vertex of that hexside in order to establish, vs any ensuing Snap Shot, which "side" of the roadblock it is on (thus determining whether it will be able to claim the roadblock's protective benefits vs that attack).

EX: A roadblock has been placed in hexes L12-K13, with its arrow pointing toward the L12-K13-K12 vertex. Since the roadblock is considered to extend from the center dot of L12 to the center dot of K13, squads F and G have no LOS to each other (B9.2), and squad H can claim neither roadblock TEM nor Wall Advantage if fired on by squad F. Squad G must also expend one MF to cross the roadblock if it Bypasses directly to vertex L12-K13-K12 (the two MF being expended simultaneously).

Squad H may enter K12 (whether entering or Bypassing the building) without the roadblock affecting its entry cost. If it directly enters building K13, its owner must declare if it crossed the hexside on the vertex L12-K13-K12 or L12-K13-L13 side of the roadblock; if he chooses the latter, an ensuing Snap Shot conducted by squad F (or by any other unit—including one in Bypass at vertex L12-K13-K12—whose LOS to

vertex L12-K13-L13 first crosses the roadblock) will be subject to the roadblock's TEM. If squad E enters L12 by Bypassing along Narrow Street hexside L12-K12, each ensuing attack vs it [EXC: Indirect Fire] at vertex L12-K12-K13 by any unit whose LOS to that vertex first crosses the roadblock will likewise be subject to roadblock TEM.

4.141 REMOVAL: Clearance attempts vs a Narrow Street roadblock can be made only from any of the four ground-level Locations that touch the straddled hexside. A unit wishing to use a DC to eliminate a Narrow Street roadblock must occupy one of the three hexes that form a vertex of the straddled hexside, and must declare the attempt to eliminate it. The DC is then Placed/Thrown/Set vs that vertex, and can affect nothing but the roadblock when it detonates. Direct Fire ordnance can eliminate a Narrow Street roadblock only if the firer has a LOS to the entire straddled hexside and declares the roadblock as its sole target prior to firing; the attack can affect nothing but the roadblock. Indirect Fire HE eliminates a Narrow Street roadblock with the proper result vs either of the two ground-level Locations that form the straddled hexside. B29.5 applies otherwise unchanged.

4.142 MINES: All mines set up in a hex that contains ≥ 1 paved Narrow Street hexside must be placed on-map revealed (i.e., with the type and strength of that minefield displayed) unless all the Narrow Street hexsides of that hex are also Crest Line hexsides formed by lower-Base-Level hexes. The removal of such revealed mines as per B28.53 is NA. Mines in either of the two hexes common to a Narrow Street hexside (or in both such hexes, if one contains A-P mines and the other A-T mines) can possibly affect a unit using Bypass along that hexside; however, if each such hex contains mines of the same type but of a different strength from that in the other Location, only the higher strength can be used to attack the Bypassing unit. [EXC to both: If that hexside is also a Crest Line hexside, only the mines in the lower-Base-Level hex are used.]

EX: See the 4.141 illustration, and assume that L13, K13, and K12 contain A-P minefields of six, eight and twelve factors respectively, which have to have been set up revealed. Any unit Bypassing along the L13-L12 Narrow Street hexside, regardless of which hex that unit occupies, will be attacked by the six-FP L13 minefield. A unit Bypassing along the K12-K13 Narrow Street hexside would undergo the twelve-FP attack of the K12 minefield. Note that mines set up in D011 (not shown) could use HTP since its sole Narrow Street hexside is unpaved.

4.15 RUBBLE: Placing a Rubble counter in a hex that contains a Narrow Street hexside eliminates any roadblock across that hexside, affects all units/Equipment (see 9.2 definition) currently in Bypass (in either/both hexes) along that hexside as if they were hit by falling rubble (i.e., as per B24.121), and eliminates all mines along that hexside (in both hexes).

4.2 STEEPLE: A building hex with a black center dot in a white cross (EX: PBIII3) denotes a church with a Steeple Location in that hex—i.e., an additional building Location, with an inherent stairwell leading to it from ground level, above what would other-

4.2

wise be the highest building Location of that hex. Except as stated otherwise, a Steeple Location is treated as a normal building Location [EXC: it cannot be Fortified, has no Rooftop Location, and the +1 drm for stone rubble determination (B24.11) is NA]. Each building Location in the hex beneath the Steeple Location is a normal building Location in all respects.

4.21 STACKING: A Steeple Location has a normal stacking limit (A5.1) of one HS-equivalent. No Gun may be set up in a Steeple Location.

4.3 SINGLE-HEX TWO-STORY HOUSE: A building with a large white center dot (EX: PBZ13) is a 1 1/2-level LOS obstacle with both a ground- and first-level Location and an inherent stairwell. Like a Single Story House (B23.21), it has no Rooftop Location. In all other respects it is a normal building.

5. COMBINATION TERRAIN

5.1 TERRAIN COMBINATIONS: Some hexes on the PB map contain combinations of two terrain types that are not normally found in the same hex. For these combinations, all rules for both individual terrain types apply normally. (The terrain effects of both terrain types are cumulative as per B.1.) The existing rules for these situations are further clarified below.

5.2 IRRIGATION-DITCH PARTIAL-ORCHARD HEX: A unit that enters an irrigation ditch across an orchard hexside (EX: PBPP16-QQ17) and that pays the additional MF to claim the conditional +1 TEM expends 2 MF to do so. A fully-tracked vehicle entering an irrigation ditch across a non-road orchard hexside pays 3 MP (4 MP for a half-track).

5.3 STREAM-PARTIAL-ORCHARD HEX: A unit enters a stream-partial-orchard hex (EX: PBP17) across a stream hexside at the normal stream cost. If entering across an orchard hexside, movement costs are cumulative (e.g., 4 MF to enter a shallow stream-partial-orchard hex). All rules for Crest Status (B20.9) apply in a stream-partial-orchard hex [EXC: Good Order Infantry may gain Crest status in such an Accessible hex, along the non-stream partial-orchard hexside they cross, at a cost of 2 MF]. The orchard terrain rises (to its normal height) from the Crest level of—not from IN—the stream hex.

5.4 BUILDING-ORCHARDS: The entry COT for a Building-Orchard hex (EX: PBZ14) prior to any further modification for Infantry is 3 MF and that for vehicles is 1 MP plus normal building COT.

5.41 Units may bypass the building obstacle (unless otherwise prohibited; A4.3, D2.3-31) by moving through the orchard portion of the building-orchard hex and in such case would not be subject to FFMO.

5.42 A LOS *through* a building-orchard hex (i.e., a LOS that is not blocked by the building) is subject to the normal orchard LOS rules (B14.2-21).

5.43 The TEM of a building-orchard hex is +2 or +3 according to the type of building in the hex and it does not apply to a unit in Bypass.

5.44 The Kindling Number of a building-orchard hex is 7 or 8 according to the type of building in the hex; EC DRM do not apply to Kindling attempts. A building-orchard hex's Spreading Fire Number is 9 and EC DRM *do* apply to the Spreading Fire DR provided that the spreading fire is not from a Flame in that hex, nor from a directly attached building. The -1 DRM for a Fortified Building applies to all Kindling/Spreading-Fire DR if the building Location is fortified.

5.5 BUILDING-ROAD: Hexes PBW18 and PBX18 are unique in that each contains a building with a road running *through* the hex.¹¹ For all purposes, the building is treated as a normal single-story house (B23.21) and the road is treated as a Narrow Street (4.1) that runs along hexsides X18-X19 and W18-W19 [EXC: The TCA change restrictions of 4.121-122 do not apply; instead, a vehicle using VBM along these Narrow Street hexsides may never have its own hex within its TCA. LOS to units on the road is always traced to its center dot (or as per A4.132), not to its vertex, although the building depiction *can* block such LOS. Vehicles move directly from hexside X18-X19 to hex PBY18 (and vice versa) and from hexside X18-X19 to hexside W18-W19 (and vice versa)].

5.6 SLOPES & ORCHARDS: Because an Up-Slope unit is treated as being at a different elevation than its Base Level (3.3), in-season orchards are same-level LOS *obstacles* to units in hexes with the same Base Levels as those orchards if the unit is Up-Slope to the target.

6. TOWERS

6.1 Towers represent tall, narrow building-like structures that contain an upper level Location with no ground level Tower Location (although the hex contains a Location at ground level).¹² Towers are represented by an obviously round, single-hex structure containing a white, square stairwell symbol (EX: PBC9). A Tower (but not the ground level Location of its hex) is treated as a wooden building unless otherwise stated.

6.2 The height and LOS characteristics for each Tower are specified by SSR. Towers will be defined by SSR as being either an LOS Obstacle *or* Hindrance. Each Tower contains only a single Tower Location that exists at a Level above ground level which is specified by SSR; the Tower Obstacle/Hindrance height is 1/2 Level above the SSR designated Tower Location height.

EX: An SSR that reads, "Hex PBC9 contains a Tower Hindrance with a Tower Location 1 Level above ground level," describes a 1 1/2 Level LOS Hindrance.

6.21 STACKING: The stacking capacity of a Tower hex's ground level Location is unaffected by the presence of the Tower. A Tower Location has a normal stacking limit (A5.1) of one HS-equivalent and 5PP. Towers have no Rooftop Locations and may never be fortified.

6.3 TEM: A unit at the ground-level Location of a Tower hex is considered to be occupying the other terrain in that hex and so uses the TEM of that other terrain. A Tower Location has a TEM of 0, although units therein are eligible for the +1 Height Advantage TEM. Units entering a Tower hex/Location are never subject to FFMO.

6.31 AIR BURSTS: Locations of a Tower that are in a woods hex are subject to Air Burst TEM only if those Locations are not higher than the top-most Level of those woods.

6.4 MOVEMENT: The cost for Infantry to enter the ground level of a Tower hex is 1 MF plus COT. Cavalry may only enter a Tower hex using bypass movement. A Gun may neither set up in nor enter, nor may a dm 76-82mm mortar be assembled in, a Tower hex/Location.

6.41 Vehicles must use VBM to enter a Tower hex. Fully-tracked, BU, CT, AFV may also enter the Tower obstacle as per B23.41 [EXC: a Tower has no cellar and adds an extra -1 drm to the colored dr of the AFV's Bog Check as though the tower was a single story building].

Q

6.42 Infantry may move to/from a Tower Location via the Tower's stairwell or by Scaling (B23.424). Movement along a stairwell costs 1 MF per Level changed and is subject to movement penalties for Snow. A unit may never end its MPH in an intermediate stairwell Location (i.e., it must end its MPH either in the Tower Location or in the Tower Hex's ground level Location).

6.43 Infantry moving to/from a Tower Location via the Tower's stairwell may be attacked at ground level (if descending) and/or the Tower Location (if ascending) in the normal manner. If there is a second-level Location, however, they may also be attacked at the first-level "quasi-Location" of that hex by a unit that has a LOS to that quasi-Location. Such a quasi-Location is not considered Open Ground, but such an attack vs it receives no TEM. The target is assumed to expend one MF per level changed; if pinned or broken while at that quasi-Location it reverts to the level it was attempting to leave (and may be attacked by any Residual FP at that level as it re-enters it). The Residual FP left by an attack vs such a quasi-Location remains at that level (place the Residual FP counter on the appropriate Level counter) to attack each unit subsequently entering that level in that hex during the same MPH.

6.5 CONCEALMENT: The other terrain in a Tower hex determines whether or not the ground-level Location of that hex is Concealment Terrain. A Tower Location is treated as a building Rooftop (SSR PB7; B23.82) for HIP/concealment purposes (only).

6.6 ROUT: A Tower hex/Location is not considered a building for rout purposes.

6.7 The ground level Location of a Tower hex is not considered a building Location for Victory purposes, but any Tower Location is.

7. BARBED-WIRE FENCES

7.1 A barbed-wire fence is depicted by a series of small black Xs overlaying a hexside (EX: PBS11-T11). Barbed wire is neither an obstacle nor a Hindrance, provides no TEM, does not negate the FFMO/FFNAM DRM, and cannot be Cleared or eliminated in any way.¹³

7.2 MF COST: Infantry must pay one MF + COT to cross a barbed-wire-fence hexside, unless using Armored Assault or moving within a trench or tunnel (in which case only the COT applies). The cost for Cavalry is two MF + COT. No Wagon, ridden bicycle, Infantry on skis, or currently-CX Infantry/Cavalry/horse may cross a barbed-wire-fence hexside. All barbed-wire-fence hexside MF costs are doubled at night. A Straying unit required, but unable, to cross a barbed-wire-fence hexside becomes TI instead.

7.21 TEMPORARY BREACH: A non-Straying, Good Order Infantry MMC neither beneath an Entrenchment/Pillbox nor above a Wire counter may create a tem-

porary breach in one barbed-wire-fence hexside of its hex by expending two MF in its MPH while at ground level in (but not IN) that hex. Place the top edge of the MMC counter over the selected barbed-wire-fence hexside and mark the unit TI. For as long as that MMC remains TI, unpinned, and in Good Order, it is considered to be using Hazardous Movement but that hexside's barbed-wire cost for Infantry [EXC: if broken, berserk, Manhandling, or part of a Human Wave] becomes 1/2 MF. (A vehicle crossing that hexside would still be subject to Bog as per 7.3, but would not affect that hexside's temporarily-breached status.) Creating a temporary breach in barbed wire is a concealment-loss activity (A12.141).

7.3 MP COST & BOG: Barbed wire has no effect on MP costs; however, no motorcycle may cross a barbed-wire-fence hexside. Each vehicle that enters a new hex by crossing a barbed-wire-fence hexside must undergo a Bog DR, in addition to any other Bog Check required for entry of the Location. If it Bogs, it is left in the hex it was attempting to enter. (If it Bogs twice, due to both crossing a barbed-wire-fence hexside and other terrain in the hex, mark it with a Mired—not a Bog—counter.) The only DRM that can apply to a barbed-wire Bog Check are:

- +1 Vehicle is not fully-tracked;
- +2 Vehicle has Truck-type MP expenditure.

7.4 BYPASS: The barbed-wire-fence artwork (i.e., the small black Xs) along such a hexside has no effect on a unit's normal ability (if any) to Bypass along that hexside.

8. HILLSIDE WALLS & HEDGES

8.1 A Hillside wall/hedge¹⁴ is one which lies along a hexside that is common to two adjacent hexes with different Base Levels, with none of the lower Base-Level's terrain appearing between the wall/hedge depiction and the higher Base-Level's terrain depiction. An example of a Hillside hedge is PBX16-X17; an example of a Hillside wall is PBN11-N12. All normal wall/hedge rules apply to Hillside wall/hedges except as modified herein.

8.2 LOS: A Hillside wall/hedge (including both its depiction and its associated hexside; B9.1) is ignored when determining whether or not a LOS exists between units whose elevations differ by $\geq$ one full level [EXC: a unit entrenched behind a Hillside wall/hedge still has its LOS restricted as per B9.21]. It is likewise ignored when determining the number of Blind Hexes created by a Crest Line. If a hill Crest Line ends at a Hillside wall/hedge, the line along which the hill depiction meets the wall/hedge depiction is considered to be the actual Crest Line.

8.3 ELEVATION, TEM & WALL ADVANTAGE: A Hillside wall/hedge is always at the higher of the two Base Levels it lies between, and is treated as a normal wall/hedge

EX: Only squad A can claim Wall Advantage across hexside H16-I17. Furthermore, squad D can never receive any benefit from the hillside wall along that hexside, as it is lower than that wall.

EX: The following serve to further illustrate various LOS possibilities with Hillside hedges/walls, slopes, and Partial Orchards.

Squad A has a LOS to squads B, C, D, and H, but not to squads E, F, and G (which are blocked due to the blind hexes caused by hexes J17, J18, and K18 being treated as orchard hexes (2.2)—the latter two hexes because hexside J17-K18 is a Partial Orchard hexside of both hexes). If squad A were entrenched, it would have LOS only to squads B and D.

Squad B has a LOS to squads A and C.

Squad C has a LOS to squads A, B, D, and H. If squad C were entrenched, it would have a LOS only to squad B.

Squad D has a LOS to all squads except B, and its LOS is subject to a +1 orchard hindrance to F and +2 to G.

Squad E has a LOS to all squads except B and C, and its LOS is subject to a +1 hindrance to G.

Squad F has a LOS to squads D, E, G and H; its LOS to D is subject to a +1 orchard hindrance.

Squad G has a LOS to squads D, E, F, and H, and its LOS is subject to a +1 orchard hindrance to E and +2 to D.

Squad H has LOS to squads A, C, D, E, F, and G, none of which are hindered.

8.3

when calculating the TEM of targets at $\geq$ the wall/hedge's base elevation. However, a unit at any level *lower* than that on which a Hillside wall/hedge sits never receives *any* benefit (including Wall Advantage; B9.32) from that wall/hedge hexside. A unit in Crest status may claim Wall Advantage over a Hillside wall/hedge that forms a hexside of that unit's hex only if both are at the same elevation and on the same side of the Depression. Otherwise, a unit's inability to claim Wall Advantage over a Hillside wall/hedge hexside does not prevent it from claiming Wall Advantage over another wall/hedge hexside, provided the unit meets all the other B9 criteria for doing so.

9. PEGASUS BRIDGE CAMPAIGN GAME

9.1 INTRODUCTION: The Pegasus Bridge (PB) Campaign Game offers two or more players a series of interrelated scenarios dealing with the seizing and holding of the Canal bridge in the Bénouville area of France on D-Day of the Allied Overlord campaign. Using this system, up to eight separate scenarios may be played, each simulating a portion of the actual battle.

9.11 BETWEEN SCENARIOS: Between each of the scenarios, players make use of a special CG phase called the Refit Phase (RePh) wherein each side takes stock of what has happened and prepares for further combat in the next scenario. The British player may receive reinforcements during the RePh, while the German player may purchase Reinforcement Groups (RG) using Campaign Purchase Points (CPP).

9.12 CASUALTIES: Casualties suffered in a CG scenario, as well as those suffered in the ensuing RePh through CG-Scenario End (defined in 9.2), should be placed in the appropriate on-map box since amassed Casualty VP (A26.2) totals are used to determine CG Scenario Loss Points (9.6162).

9.13 CG ROSTER AND RG PURCHASE RECORD: The enclosed printed copies of the PB "CG Roster" and "RG Purchase Record" should be photocopied and used by players to record important CG information.

9.2 DEFINITIONS

CG: Campaign Game.

CG Date: Each CG Date takes place on June 6 1944, and has a unique title. The titles are Night I, Night II, Night III, Dawn, Day I, Day II, Day III, and Dusk.

CG End: The CG-Scenario End (see definition below) that occurs in the Dusk CG Scenario, if one side concedes CG victory, or if one side meets its CG Victory Conditions.

CG Roster: The sheet used to record information for each CG Date. During the RePh, one line is filled out for each CG Date. Players are urged to photocopy the one provided herein.

CG-Scenario End: Occurs when both the CG scenario being played and the ensuing RePh step 9.603 have been completed.

Coy (Company): A CG RG organization type.

CPP (Campaign Purchase Points): Used by the Germans for purchasing RG in RePh step 9.617.

CPP Entry Cost: The value listed in an Entry Arrow which is added to the cost of a German RG so that that Entry Arrow becomes Enterable by that RG.

Depleted: A German RG received at < Full Strength (see definition below).

Eliminated: Units/Equipment/Fortifications/RG "Eliminated" in a CG are removed from that side's OB (i.e., are not Retained). A vehicle/(Burnt-Out)-wreck that is Eliminated while on-map is removed from the map.

Enterable: A hex/Location that the unit in question could enter (disregarding its occupation by a Fortification/enemy-unit) during a hypothetical MPh/APH. If defined in relation to a Setup/Entry Area (or to a "path" of hexes drawn to/from/between such), the hex/Location must be Enterable along that "path." A terrain-Blaze hex is not Enterable.

Entry Area: Each map-edge hex that contains a large arrow with a red background color, plus each edge-hex within four hexes of that hex. The Nationality symbol(s) in the arrow indicate(s) if the Entry Area is British/German. See SSR CG5 (9.4).

Equipment: Any SW/Gun/Vehicle that can be part of a side's OB. Any counter that can be Portaged/driven/Manhandled about on the map.

Escape: The RePh process by which a unit attempts to exit an Isolated Location, No Man's Land, an enemy Setup Area, or Uncontrolled Territory that it cannot remain in, to a friendly Setup Area or Eligible Entry Area; 9.606.

FPP (Fortification Purchase Points): Used to purchase Fortifications in RePh step 9.619.

Front-Line Hex: A Setup-Area hex that shares $\geq$ one hexside with $\geq$ one hex of an enemy Setup-Area/No-Man's-Land/Uncontrolled-Territory hex.

Full Strength: A RG received *in toto*.

Initial Scenario: The first scenario of a CG. A CG's Initial Scenario gives each side's setup/entry restrictions, starting OB (possibly including predetermined RG, units, and a pool of CPP/FPP to spend on additional RG/fortifications), and SSR applicable only to that Initial Scenario.

Isolated: A unit/Weapon in a friendly Setup-Area Location from which it cannot trace a path of contiguous, Enterable, Uncontrolled-Territory/friendly-Setup-Area Locations to a friendly Entry Area (if German), or to a landed but not wrecked glider and/or the PBZ28 Entry Area (if British). See 9.6052, 9.6057, and 9.62021.

No-Man's Land: A *non*-Strategic Location within two hexes of both friendly- and enemy-Controlled Strategic Locations; 9.6051.

OB (Order of Battle): All units, Equipment, Fortifications, and RG of a side that are eligible to participate in the next CG scenario.

Pltn (Platoon): A CG RG organization type.

RePh (Refit Phase): The series of steps performed after each CG scenario. All Chapter Q rules beginning with 9.6 are PB CG RePh rules/steps.

Retained: All units, Equipment, and RG in a side's OB that are available for setup/entry in the next CG scenario; i.e., all Initial-Scenario OB-given/purchased units/Equipment (or all units/Equipment remaining available from the previous scenario of the CG), all RG purchased, and all reinforcements received since the previous (if any) scenario of the CG. In PB, such a unit/Equipment is required either to be set up in the Setup Area it was Retained in [EXC: Shift] (9.6055) or to enter at an Eligible Entry Area if Retained off-map; e.g., a unit ending a CG scenario in a friendly Setup Area must begin the next CG scenario in that same Setup Area.

RG (Reinforcement Group): Usually a number of units/Equipment purchased, as a group, for use in the CG as additions to a side's OB. Also includes FPP.

RG Purchase Record: The sheet used to record the units-in/information-for each CG RG type (see 9.6178). One line is filled out for each RG purchased. Players are urged to photocopy the one provided herein.

Setup Area: Each Strategic Location Controlled by a side, plus each *non*-Strategic Location within two hexes of such a Strategic Location but not within two hexes of an *enemy*-Controlled Strategic Location (i.e., not a No-Man's-Land hex; 9.6051). Each such *non*-Strategic-Location hex must also be Enterable by *Infantry* from $\geq$ one Strategic Location of that Setup Area. Friendly Setup Areas that touch/overlap are treated as a single Setup Area, provided that $\geq$ one of the touching/overlapping hexes is Enterable by *Infantry* from the other Setup Area. For an Initial Scenario, see also 9.5.

Shift: The RePh process by which a Retained unit attempts to exit its current Setup/Entry Area to another friendly Setup Area or Eligible Entry Area; see 9.613.

Strategic Location: Each building/rubble/bridge/entrenchment/pillbox/landed-but-not-wrecked-glider Location, and each Location occupied by a non-Abandoned Immobile vehicle with functioning MA and/or by an unhooked non-malfunctioned Gun, is a Strategic Location.

Strength: An I or V type RG is received at Full or Depleted Strength; see 9.6181.

Uncontrolled Territory: All *non*-No-Man's-Land hexes that are part of *no* Setup Area; i.e., are > 2 hexes from all Controlled Strategic-Location hexes.

Weapon: Any SW/Gun/Vehicular-armament using the IFT/TH table(s) to cause damage to the opponent.

9.3 THE CG SCENARIOS: The parameters of the CG Scenarios are given in 9.5-52. The CG continues until the CG End (9.2). Each side's initial Setup Area(s) for a non-Initial CG scenario is determined by the Strategic Locations Controlled by both sides at the previous CG-Scenario End.

9.31 CG BALANCE PROVISIONS: Should each player wish to play the same side (A26.5), the following Balance is used throughout each CG:

German: All 9.61741 CPP Entry Costs with a printed cost > 0 are reduced by two.

British: All British Airborne non-prisoner MMC are Fanatic (A10.8) when in a stone building Location.

Q

9.4 CAMPAIGN GAME SPECIAL RULES: The following CG SSR apply only in the PB CG scenarios and RePh:

CG1. MAP: Each CG Scenario uses the entire PB map.

CG2. PB SSR: All PB SSR (see the flip-side of scenario PB6) are in effect except as amended below.

CG3. ELR/MASSACRE: Each side's ELR listed in SSR PB12 is also treated as that side's ELR for all scenarios of that CG [EXC: in the event of a Massacre, all effects listed in A20.3-4 are applicable for the remainder of the CG].

CG4. CG NIGHT SCENARIOS: The initial Base NVR of the Night CG scenarios is 2 hexes regardless of whether the NVR changed in a prior CG scenario. Rather than the provisions of E1.21, a German unit gains Freedom of Movement only if attacked by other than a Sniper or if it has both seen a Known Enemy unit and an enemy unit moves/advances/routes within three hexes of it [EXC: if an AFV with a radio is allowed to move, all other friendly Mobile AFV (and their PRC as long as they remain PRC) with a radio may also]. Only German units with Freedom of Movement may fire at distances of ≥ 6 hexes.

CG4a. CG Date Night I: The British are the Scenario Attacker, the Germans are the Scenario Defender.

CG4b. CG Date Night II: The Germans are the Scenario Attacker. Although the Germans set up on-map, they may be cloaked at the German player's option. No German unit south of hexrow CC has Freedom of Movement [EXC: those units which gained Freedom of Movement during CG Scenario Night I]. The British are the Scenario Defender, although they have Freedom of Movement. It is important to note that during a RePh, No Move markers are not removed, thus units south of hexrow CC which are on a No Move marker may not change locations during that RePh.

CG4c. CG Date Night III: The Germans are the Scenario Defender and the British are the Scenario Attacker. All German units have Freedom of Movement.

CG5. ENTRY AREAS: A large red arrow denotes the center hex of each nine-hex-wide Entry Area. If it is a British Entry Area, the arrow contains a British rondel and the CG Date in which the Entry Area is available for entry. If it is a German Entry Area, the arrow contains a German cross and a CPP Entry Cost. All German Entry Areas are available for use, however certain Entry Areas require an additional expenditure of CPP for each RG which wishes to enter there (9.61741).

CG6. RG SETUP/ENTRY: Each RG listed in an Initial Scenario's OB is available for on-map-setup/entry as specified below. If set up on-map, units/Equipment of a RG must be set up in the friendly Setup Area they are Retained in (or as defined by Initial Scenario setup restrictions). All other units/Equipment enter on/after turn 1; if they set up off-map during the RPh (A2.51) but do not enter that same Player Turn, they are unavailable for use during the remainder of the current CG Scenario. Such units are, however, Retained for the next CG Scenario. All units/Equipment of the same RG must initially either be set up in the same Setup Area or enter at any hex(es) of the same Entry Area. Equipment of a just purchased RG must initially be possessed by a unit of that RG.

CG7. OPTIONAL VEHICULAR EQUIPMENT: All German PzKpfw IVH are equipped with Schuerzen. Optional AAMG must be rolled for individually (H1.41). If so equipped, no additional CPP cost is assessed.

CG8. ABANDONMENT: A Retained vehicle may begin a CG scenario abandoned, but the resulting crew counter must begin that CG scenario in the same Setup/Entry Area as the vehicle it came from.

CG9. STATUS MARKERS: During its setup, each side may opt to secretly record the BU, CE, TCA, bogged, Immobilized, abandoned, malfunctioned, and/or disabled status of its vehicles/Guns in lieu of placing the appropriate marker(s) on them. Place the actual marker(s) when the piece is non-concealed and within 16 hexes of any enemy ground unit which has LOS to it.

CG10. CONCEALMENT: Each Infantry unit (and its possessed Equipment) setting up in concealment terrain may be set up concealed, regardless of enemy LOS. Vehicles may not be concealed unless out of enemy LOS. Such "?" need not be purchased; i.e., each is placed freely. Otherwise, A12.12 applies in the normal manner. Eligible units may be concealed prior to the opponent viewing the setup. For purposes of "?" placement, all Locations outside the LOS of all opposing Setup Area Locations are considered concealment terrain. "?" purchased in the RePh and those received at night (E1.2) are used as Dummies.

CG11. GUNS: Each non-vehicular Gun that ended the last CG scenario on-map must be set up within three hexes of the Location in which it ended that

scenario [EXC: the German 50L AT in X20 may never move during the CG]. No Gun may be towed [EXC: CG Scenario Dusk].

CG12. GERMAN PF: For each CG scenario, the number of PF initially available to the German side is 1/2 times the number of German squads set up on-map.¹⁵ During play, whenever ≥ 1 squad enters as a reinforcement, the number of available PF is immediately increased by 1/2 per such squad. (To indicate an extra "1/2 PF", move the PF Remaining marker halfway into the next box of the PF Usage Track; a "1/2 PF" does not itself entitle the German to a PF attempt.)

CG13. SNIPERS: During each dawn/day/dusk CG Date, the German SAN is immediately increased by two while the Germans Control the building in II13.¹⁶ The German SAN is immediately reduced by two while the British Control building II13; the German SAN can be increased to, but not beyond, "7."

Each side must use two Sniper counters. Each Sniper counter must be set up initially as per the first two sentences of A14.2, but with ≥ 10 hexes between them (or as far apart as possible if they cannot set up ≥ 10 hexes apart); when a Sniper attack can occur, make a dr to randomly determine which one actually attacks (assign numbers so that each has an equal chance). The SAN is never altered by the presence of > 1 friendly Sniper in play simultaneously. Any result (e.g., Pin) affecting a Sniper counter affects all friendly Snipers. See also 9.6122.

CG14. TERRAIN CHANGES: Each alteration of printed terrain that occurs during a CG is permanent, barring subsequent Clearance/removal (as applicable). All Fortifications, Rubble, Breach, Trailbreak, Shellhole, and (Burnt-Out) Wreck counters are left on-map from scenario to scenario (unless removed due to a Blaze or falling rubble, etc.; for Wrecks, see also the 9.2 definition of "Eliminated"). Each terrain Blaze is resolved in RePh step 9.609-.6095 (see SSR PB9). No Wreck is removed from play due to being in a terrain Blaze, it remains on-map (still treated as a LOS Hindrance), and in RePh step 9.6091-.6093 it becomes/remains a Burnt-Out Wreck [EXC: 9.6095]. Whenever a vehicle is Immobilized, Abandoned, and all of its present Inherent Weapons are disabled (or it has no Inherent Weapons), it is immediately replaced by a Burnt-Out Wreck. Whenever a non-Burnt-Out Wreck is Scrounged (if it had any Scroungable Weapons), it is immediately replaced by a Burnt-Out Wreck. Regardless, vehicles which have no Wreck depiction can never turn into a (Burnt-Out) Wreck.

CG15. MAP EXIT: Each German Personnel/Equipment piece that exits the map via a Friendly Entry Area during play cannot re-enter the map during that scenario but is Retained for use during the next CG scenario. However, each such broken Personnel unit must take a NTC (a Good Order leader's DRM can apply) immediately upon exiting; failing this NTC causes Casualty Reduction (if it is Eliminated, so is its possessed Equipment). Everything exited at any other location during play is Eliminated.

CG16. RETAINED RG: Regardless of whether it was used during a CG scenario, each purchased/OB-given RG is Retained until Eliminated in a CG scenario. Each unentered RG (or part thereof) is Retained.

CG17. WALKING WOUNDED (WW) MMC: Each RePh, the British player may replace a portion of eliminated Airborne MMC with Walking Wounded MMC.¹⁷ During play, each non-Wounded British Airborne MMC removed due to "Double Break" (A10.3), Casualty MC (A10.31), or Fate (A10.64) should be placed in the WW box on the map. In step 9.6102, for every squad equivalent of the same type (FRD) in the WW box, the British player receives one MMC of the same type in any non-Isolated Setup Area. Each such MMC should be marked with a "Walking Wounded MMC" counter to reflect its status. A WW MMC has a 3 MF allotment which cannot be increased for any reason [EXC: while being carried by any form of conveyance], its IPC is reduced to 2, and it receives a +1 DRM for all CC attacks it makes while all CC attacks made against it receive a -1 DRM. Under no circumstances may a WW MMC become unwounded. A HS created from a WW squad is marked with a Walking Wounded MMC counter and suffers all the penalties associated with that status. Any SMC created by a WW MMC is not initially wounded. Two WW HS may Recombine into a WW squad per A1.32. If a non-Wounded HS and a WW HS Recombine, the resulting squad is considered WW and is marked as such.

EX: The British player has two 6-4-8s, a 4-5-8, a 2-4-8, and three 3-3-8s in the WW box during the RePh. He may now place three 6-4-8s and a 4-5-8 (or their equivalents), each marked with a WW counter, in any non-Isolated Setup Area.

CG18. DAWN/DUSK: A +1 LV Hindrance applies to all non-CC attacks for the duration of the Dawn CG scenario. During the Dusk CG scenario, on a WC DR $\leq$ the current Turn Number, a +1 LV Hindrance will apply to all non-CC attacks for the duration of the Dusk CG scenario.

9.4

CG19. GAME END: A Turn Record Chart is printed on the map. Each CG scenario has a variable Game Turn Length. At the end of each Player Turn of Turn 5, and at the end of each Player Turn thereafter, the ATTACKER makes a Game End dr; if the result is $\leq$ the circled number in the current Turn's box on the CG Turn Record Chart, the scenario ends immediately. Additionally, a CG scenario ends immediately if both the ATTACKER and DEFENDER agree to end the scenario.

9.5 INITIAL SCENARIO: The special information needed to play the Initial Scenario for CGI and CGII is provided in 9.51 and 9.52, respectively. For each Initial Scenario, the German player begins with RePh step 9.6178 (RG Purchase Record) and completes RePh steps 9.6178-.62023 (these steps are preceded by a "1" in the RePh Sequence; 9.6).

9.51 PB CAMPAIGN GAME I: COUP DE MAIN

CG LENGTH: A CG scenario is played for all eight CG Dates in this CG (Night I, Night II, Night III, Dawn, Day I, Day II, Day III, and Dusk).

CG VICTORY CONDITIONS: The Germans win at any Dawn, Dusk, or Day CG Scenario End if they Control Pegasus Bridge (PB SSR 4), or if they have a Good Order German MMC ≤ 3 hexes from the TT12-LL11-JJ12-III2-EE12-Y13-Y28-Z28 road at CG End, or if the British do not have ≥ 8 VP worth of non-Airborne 6-4-8s/3-3-8s east of the Canal at the Day II CG-Scenario End while having lost ≤ 20 CVP of the non-Airborne 6-4-8s/3-3-8s during that scenario.¹⁸

INITIAL-SCENARIO SETUP SEQUENCE: German sets up first; British moves first.

INITIAL GERMAN OB:

Elements of Grenadier Regiment 736, Infanterie Division 716 [ELR: See SSR PB12] set up within 4 hexes of Y19 (see SSR I-2): {SAN: 2}

RG: Garrison Pltn (Full) 50L AT 1+3+5 Pillbox

RG: Garrison Pltn (Depleted) 1-2-7 Trench (x3)

Wire (x3)

Elements of PanzerPionier Kompanie 2 set up in building Locations within 4 hexes of M12:

RG: PzPionier Coy (Depleted)

Elements of PanzerPionier Kompanie 1 set up in/Adjacent to building Locations within 4 hexes of JJ12:

RG: PzPionier Coy (Full)

RG: Lt Tank Pltn II (Roll as per 9.6181)

Elements of the Fallschirmjäger Regiment 6 (Ind.) [ELR: 4] enter Uncloaked on Turn 2, with all Personnel as Passengers, on hex TT12 having expended 18 MP (see SSR I-6):

2-3-8 8-1 Kfz 1 (no AAMG)

INITIAL BRITISH OB:

Elements of Companies B and D, 2nd Oxfordshire and Buckinghamshire Light Infantry [ELR: See SSR PB12] enter by Glider (E9.) on Turn 1 (see SSR I-3 and I-4): {SAN: 2}

6-4-8 (x3) 4-5-8 (x3) 2-4-8 (x3)

9-2 8-1 8-0 (x2)

LMG (x2) PIAT (x3)

51 MTR (airborne) Glider (x3)

INITIAL-SCENARIO SPECIAL RULES:

The following SSR apply during the Initial Scenario

I-1) There is no Wind Change DR made during the first RPh. Night Rules are in effect (CG SSR4). See PB SSR.

I-2) All German Infantry units must set up in building/Gun/Fortification Locations with ≤ 1 MMC per Location. The pillbox must be set up in Z21 (CA: Y22/Z22); no Wire counters may be set up in a paved-road/bridge hex. No Fortification/Gun may set up HIP. The 50L AT and 1-2-7 crew must set up in hex X20, the Gun is Emplaced but is unpossessed at start.

I-3) All initial ILH (E8.2) must be east of the canal, ≤ 2 hexes from at least one other initial ILH.

I-4) Each glider must contain one 2-4-8.

I-5) During the British Player Turn 1, the German player may conduct only TPBF attacks. Only German leaders may fire starshells; the hex containing a leader that is attempting starshell placement need not be disclosed unless that attempt is successful.

I-6) When there are no Passengers in the Kfz 1, it is marked with an Abandoned counter; when so marked it may neither move nor change CA.

9.52 PB CAMPAIGN GAME II: HOLD UNTIL RELIEVED

CG LENGTH: A CG Scenario is played for five¹⁹ CG Dates in this CG (Dawn, Day I, Day II, Day III, and Dusk).

CG VICTORY CONDITIONS: The Germans win if at any CG-Scenario End they Control the Pegasus Bridge (PB SSR 4), or if they have a Good Order German MMC ≤ 3 hexes from the TT12-LL11-JJ12-III2-EE12-Y13-Y28-Z28 road at CG End, or if the British do not have ≥ 8 VP worth of non-Airborne 6-4-8s/3-3-8s east of the Canal at the Day II CG-Scenario End while having lost ≤ 20 CVP of the non-Airborne 6-4-8s/3-3-8s during that scenario.

INITIAL-SCENARIO SETUP SEQUENCE: British sets up first; German moves first.

INITIAL BRITISH OB:

Elements of 7th Battalion, 5th Regiment, 6th Airborne Division [ELR: See SSR PB12] set up as follows: {SAN: 3}

Set up on/between hexrows K and Q in hexes numbered ≥ 8 and ≤ 18 :

6-4-8 (x7) 3-3-8

9-2 8-0

LMG (x2) PIAT (x2)

51 MTR (airborne) ? (x6)

Set up within 5 hexes of BB16:

6-4-8 (x7) ? (x8)

9-1 7-0

LMG (x2) PIAT (x2)

Set up on/between hexrows U and AA in hexes numbered ≥ 10 and ≤ 18 :

6-4-8 (x8) ? (x10)

10-2 8-0

LMG PIAT

Elements of Companies B and D, 2nd Oxfordshire and Buckinghamshire Light Infantry set up within 5 hexes of Y21, east of the canal:

6-4-8 (x4) 4-5-8 (x4) 2-4-8 (x3) 2-2-8 (x2)

9-2 8-1 8-0 (x2)

LMG (x3) PIAT 51 MTR (airborne)

German LMG German MMG 57L AT (x2)

Set up in any Friendly Setup Area:

30 FPP

Set up emplaced in X20 above the trench (see SSR I-2):

German 50L AT

INITIAL GERMAN OB:

25 CPP

Elements of PanzerPionier Kompanie 2 [ELR: See SSR PB12] set up on/between hexrows A and J in hexes numbered ≤ 18 : {SAN: 4}

RG: PzPionier Pltn (Full)

Elements of PanzerPionier Kompanie 1 set up in/Adjacent to building Locations on/north-of hex grain EE1-EE11-FF11-FF12-HH13-HH14-JJ15-JJ17-KK18-TT17:

RG: PzPionier Coy (Depleted)

35-S 739 (f)

Q

INITIAL SCENARIO SPECIAL RULES:

The following SSR apply during the Initial Scenario

1-1) See PB SSR.

1-2) Place the following fortification counters prior to setup. One 1+3+5 pill-box in hex Z21(CA: Y22/Z22); one trench each in W21, X20, Z21; and one Wire each in hexes W21, X21, Z21. Place a Burnt-Out wreck in hex Y14.

9.6 REFIT PHASE:

The following steps (9.601-9.620) are performed simultaneously by each side during the RePh, which occurs after each CG scenario. Each step (and sub-step) must be carried out in the numbered/lettered order given; those not applicable to the current situation may be omitted (e.g., if there are no Flames/Blazes on the map, skip RePh step 9.609). Those steps listed below preceded by a "!" are the only steps to be completed before setting up to play a CG Initial Scenario. Those preceded by a ">" are the only steps necessary to achieve CG-Scenario End after the last Player-Turn CCPh.

RePh Sequence

- >9.601 Conclusion of Melee
- >9.602 Marker Removal
- >9.603 Rally and Unloading

9.601 CONCLUSION OF MELEE: First, each unit currently on a Climb marker must be placed in either the Location it was attempting to reach or the Location it left when it began to climb, at the owner's choice. If the Location the unit is placed in contains an enemy unit(s), mark them all with a *Melee* counter.

All opposing units in the same Locations are now assumed to be in *Melee*, and must undergo an (unlimited) number of *Melee* rounds until no more CC attacks can be made. Such units are free to perform any/all normal CCPh activities associated with *Melee* (i.e., attack, Capture, Withdrawal, etc.). Consider the side that moved first in that scenario to be the **ATTACKER**. Following the conclusion of the first round of RePh *Melee* in a Location, each still-hidden/concealed unit therein is revealed, each pinned unit therein becomes unpinned, each CX counter is removed, each vehicle currently in Motion therein has its Motion counter removed, and each Stun counter on a vehicle therein is flipped over to its "+1" side (the vehicle is still subject to Recall, if applicable, and may be marked as CE if so desired).

9.6011 ORDER OF RESOLUTION: Resolve all *Melee*s in alphanumeric sequence (e.g., A1, then B16, then B17, then C19, etc.).

9.602 MARKER REMOVAL: All markers/counters listed below are removed from the map at this time (Right of Inspection does *not* apply to revealed stacks):

- a) SR and FFE counters;
- b) SMOKE counters;
- c) Acquired counters;

d) DM, Disrupted, Fanatic, Berserk, Wall Advantage, HD markers, Dummy Stacks, Dummy Cloaking Counters, and "P";

e) CX, Motion, CE, BU, and Labor markers;

f) All hidden/Cloaked units, entrenchments and Equipment are placed on-map in their present Location³⁰ (other still-hidden Fortifications need not be revealed at this time);

g) Sniper counters;

h) If the next CG Scenario is Night III, all No Move counters are removed.

9.603 RALLY AND UNLOADING: All currently broken units of both sides automatically rally, even if Disrupted. No DR are made. All Passenger/Rider Personnel and Equipment are then unloaded into their vehicle's Location (a unit unloading into an A-P minefield is not immediately attacked, but 9.6042 will apply). When step 9.603 has been completed, CG-Scenario End has occurred.

9.604 ENCIRCLEMENT, MINEFIELDS, BOG, AND SHOCK

9.6041 ENCIRCLEMENT: Each Encircled unit [EXC: prisoner] must take a separate ITC (leadership DRM may apply if present and at owner's choice). If it passes its ITC, it remains in the present Location (Encircled markers are not removed until 9.6062). Failing the ITC results in the unit's immediate Elimination [EXC: Encircled Vulnerable PRC of an Immobile vehicle are Eliminated, leaving the vehicle abandoned]. British Airborne units failing this TC are *not* placed in the Walking Wounded Box. Each prisoner that an Eliminated Encircled unit was Guarding must, if possible, be claimed by another unit in that Location friendly to the Eliminated unit. If the prisoner is not claimed, it is considered Rearmed (A20.551) and may automatically possess any Equipment dropped by its Eliminated Guard. Otherwise, any Equipment that an Eliminated Encircled unit possessed is left in the Location unpossessed.

9.6042 MINEFIELDS: Each Mobile vehicle (and its Vulnerable Inherent crew, if required; B28.43) in any type of minefield undergoes the appropriate type(s) of mine attack(s), fully resolved in the normal manner, as if it is attempting to exit the minefield Location [EXC: if the crew breaks, it is unloaded in *Good Order* into the minefield's Location]. Each Infantry unit in an A-P minefield *hex* (including a crew that just unloaded due to a minefield attack) must take a NTC (leader's DRM can apply); failure of the TC causes Casualty Reduction. [EXC to both: A unit theoretically able to exit the minefield *hex* without being attacked by the mines and without having to enter a minefield/enemy-Controlled Location need not take the NTC.] In all cases, each surviving unit must remain in its respective Location in that minefield *hex* until its Setup Area is determined in 9.605-606.

9.6043 BOG: Each non-abandoned, bogged/Mired vehicle must undergo ≥ one Bog Removal attempt (D8.3) until it is either unbogged or immobilized (MP expenditure is immaterial). If Vehicle Note L applies to the vehicle, one squad-equivalent (as explained in the Note) in its Setup Area may be used to claim the -2 (-1 per crew or HS) drm to the colored dr of its Bog Removal DR.

9.6044 SHOCK/UK: Each Shocked/UK AFV must undergo ≥ one recuperation attempt (C7.42) until either the marker is removed or the AFV is Eliminated.

9.605 SETUP AREA DETERMINATION: Each side now determines its Setup Area(s) for the next CG scenario.

Each side may, at any time during/after a CG scenario, place a friendly Location Control marker (supplied in the PB counter mix) in a Strategic Location that it currently Controls, especially if that Location's Control might become disputed at some later point. A Control marker must be removed (or flipped over) if the Controlling side loses Control of that Location. A non-Strategic Location may still be Controlled (as per A26.11-12), but does not receive a Control marker.

A Setup Area may currently contain no units, but can still have friendly units Shifted into it unless it is Isolated.

9.6051 NO MAN'S LAND: As each side determines its Setup Area(s), there will be portions of the map where two opposing Setup Areas "overlap." A *non-Strategic Location* within two hexes of both friendly- and enemy-Controlled Strategic Locations is a No-Man's-Land *hex*. A No-Man's-Land *hex* can *never* be part of a Setup Area. A Strategic Location can *never* be No Man's Land (though it can be Isolated). Each manned, Immobile vehicle without functioning MA in No Man's Land becomes abandoned, and its crew (if any) must attempt Escape as per 9.606. See also 9.6056 and 9.6072.

9.6052 ISOLATED UNIT: An Isolated unit/Weapon is one in a friendly-Setup-Area Location from which that unit (or, for a Weapon only, a hypothetical Infantry MMC)

9.6052

would be *unable* to trace a path of contiguous, Enterable, Uncontrolled-Territory-/friendly-Setup-Area Locations to an Eligible Entry Area or, for the British, a landed, unwrecked glider. See 9.6057 for upper-building-level Isolation, 9.606 for Escape requirements, 9.62021 for setup restrictions and penalties. See also 9.6056.

9.6053 UNCONTROLLED TERRITORY: Uncontrolled Territory refers collectively to all hexes that are neither No-Man's-Land nor part of either side's Setup Area (i.e., $\geq$ three hexes from all Controlled Strategic Locations). Each Personnel/Mobile-vehicle unit (and its portaged/possessed/towed Equipment) in an Uncontrolled-Territory hex at scenario end is Retained into the nearest (along the shortest path of contiguous, Enterable, Uncontrolled-Territory hexes) friendly Setup Area (even if Isolated) or Eligible Entry Area; unit's owner's choice of Area if equidistant. Each Personnel/Mobile-vehicle unit unable to trace such a path is required to attempt Escape (9.606). Each Immobile vehicle without functioning MA becomes abandoned, and its crew (if any) is then either Retained (if it can trace such a path) or required to attempt Escape. See also 9.6056 and 9.6072.

9.6054 SURROUNDED HEXES: Each Uncontrolled-Territory, and each *unoccupied* Strategic Location that is currently *completely* enclosed within a Setup Area of only one side becomes part of that Setup Area [EXC: a Location vacated later due to the Escape of an enemy unit; 9.6131].

MARKING THE MAP: Included in the PB module is a reduced-size map. Each side should now record its Setup Area(s) on a new photocopy of the respective reduced-size map. Both sides outline (using different color pens, but on the same photocopy) each Strategic Location Controlled by them. Other Strategic Locations can be marked by an appropriate letter inside a square; e.g., "E" for Entrenchment, "F" for Fortification, "G" for a functioning Gun, "V" for a manned, Immobile vehicle with functioning MA.

Once all Strategic Locations have been indicated, mark all No-Man's-Land hexes using another color (suggestion: a yellow "highlighter"). Next, each side draws its Setup-Area boundaries, enclosing all non-Strategic Locations within two hexes of each friendly-Controlled Strategic Location (excluding No Man's Land).

After all Setup Areas have been determined, each side should record (on the reduced-size map) an ID for each one. Subsequent changes in the status of (potential) Strategic Locations (e.g., Blazing wooden rubble turned to shellholes [9.6092], a manned, immobilized vehicle with functioning MA that becomes Mobile [9.6141b], etc.) do not alter or otherwise affect either side's Setup Area(s) in any way; once all Setup Areas have been correctly marked, they remain thus until the start of the next CG scenario.

Personnel/Mobile-Vehicle:	
in enemy Setup Area	must attempt Escape (9.606)
in No Man's Land	must attempt Escape (9.606)
in Uncontrolled Territory	is Retained into the nearest friendly-Setup/Eligible-Entry Area or must attempt Escape (9.6053)
if Isolated	may attempt Escape or remain in place [EXC: if Overstacked]; 9.606
Abandoned (but otherwise Mobile) Vehicle—or Unpossessed Non-Vehicle Equipment other than Functioning Gun:	
in enemy Setup Area	is Captured or Eliminated (enemy's choice; 9.6071)*
in No Man's Land	is left in place unpossessed (9.6072)
in Uncontrolled Territory	is left in place unpossessed (9.6072)
if Isolated	is Retained by the Controlling side (9.6071)
Crewed, Immobile Vehicle without Functioning MA:	
in enemy Setup Area	is Captured or Eliminated (enemy's choice; 9.6071)*
in No Man's Land	is Abandoned; the crew (if any) must attempt Escape (9.6051)†
in Uncontrolled Territory	is Abandoned (9.6053); the crew (if any) is Retained into the nearest friendly-Setup/Eligible-Entry Area or must attempt Escape (9.6053)†
if Isolated	is Retained by the Controlling side (9.6071)
Crewed, Immobile Vehicle with Functioning MA—or Functioning Gun:	
in Bypass of enemy-Controlled Strat. Loc.	is Captured or Eliminated (enemy's choice; 9.6071)*
in any other Location	becomes a Strategic Location

* Capturing/Eliminating side may Remove/attempt-to-Scrounge allowed Weapon(s) and/or turn vehicle into (Burnt-Out) wreck.

† Abandoning crew may Remove allowed Weapon(s) and/or turn vehicle into (Burnt-Out) wreck.

9.6055 IN FRIENDLY SETUP AREA: Each unit/Equipment currently in a friendly Setup Area is Retained therein.

IMPORTANT: Each Gun must (for now; see SSR CG11 [9.4] and 9.613) remain in its current Location, due to setup restrictions.

9.6056 NOT IN FRIENDLY SETUP AREA: Use the chart above to determine what happens to on-map units/Equipment that do *not* end a CG scenario non-Isolated inside a friendly Setup Area [EXC: British non-Airborne units/SW; 9.6153]. Note, however, that the actions listed are to be implemented in their proper RePh order (9.6).

9.6057 UPPER-LEVEL ISOLATION: Any Infantry/Weapon in an upper-level building Location is not Isolated if a path (of $\geq$ one contiguous, Enterable, friendly-Controlled building Location) exists to a friendly-Controlled, non-Blazing, non-Isolated ground-level building Location. Such Infantry/Weapon(s) are Retained in the Setup Area the path is traced to. If such a path cannot be traced, the Infantry/Weapon is Isolated (see 9.6052 and 9.62022).

9.6058 NO MOVE: If the upcoming CG Date is Night II, all German units which are on a No Move counter must begin the Night II CG scenario in the same location where they ended the Night I CG scenario [EXC: All German units on/north-of hexrow CC gain Freedom of Movement and may move

(Use the adjacent illustration along with the Q18 illustration.)

EX: These illustrations show a portion of the PB Map at the end of a CG scenario and how the Setup Areas, No-Man's-Land and Uncontrolled-Territory hexes have been marked; see 9.605-6054 and "MARKING THE MAP" above 9.6055. Strategic-Location Control is indicated by a solid-colored line (red for British, blue for German); where feasible, units have been removed from Strategic Locations for the sake of clarity. Each player has marked his own allowed Setup Areas for the next CG scenario with dashed lines of the matching color; e.g., the two German Setup Areas comprise those hexes within the blue dashed- and solid-line areas. By comparing the proximity of opposing Controlled Strategic Locations, players have also highlighted all No-Man's-Land (9.6051) hexes in yellow. Hexes neither enclosed by a colored line nor shaded yellow are Uncontrolled Territory (9.6053).

The British Setup Areas include all Strategic Locations outlined in red, as well as all hexes enclosed by the red dashed lines (non-Strategic Locations within two hexes of a friendly-Controlled Strategic Location but *not* within two hexes of an enemy-Controlled Strategic Location). The German Setup Areas have been likewise marked in blue.

Note that both sides Control $\geq$ one Location in hex Z15, porting that hex within German Setup Area A while leaving the British unit in the first-level Location on its own in British Setup Area D.

All British units in Setup Areas A and B are Isolated since hex Y21 is a No-Man's Land hex. The German units in Setup Area B are all Isolated since they cannot trace an eligible path to a friendly Entry Area.

The British squad in the first-level Location of Z15 is also Isolated and would be even if it were at ground level. The British units in Setup Area C are not Isolated, since they can all trace an eligible path to the landed but not wrecked glider in X22 and to the Z28 Entry Area; if the glider were wrecked, the British units in Setup Area C would still not be Isolated. If a German squad were entrenched in hex AA27, hex Z28 would be in German Setup Area B, but the British units in Setup Area C could still trace an eligible path to hexes V28-Y29 of the Z28 Entry Area.

Q

within a setup area during the RePh.) All German units have Freedom of Movement for the Night III CG scenario.

9.606 ESCAPE: Each Personnel/Mobile-vehicle unit ending a scenario in No Man's Land, or in an enemy Setup Area, or in Uncontrolled Territory from which it is required to attempt Escape (9.6053), must attempt Escape. Each Personnel/Mobile-vehicle unit ending a scenario Isolated may attempt Escape [EXC: each such Isolated, Overstacked unit must attempt Escape (or be freely moved to another Location within that same Isolated Setup Area) until the Location is not Overstacked]. If > one Personnel unit in the same Location wishes to Escape, they may combine into one or more stacks; each stack then makes its own DR on the Escape table. When attempting to Escape, each MMC may portage ≤ five PP [EXC: a Walking Wounded MMC may only portage ≤ three PP], and each SMC may portage ≤ two PP [EXC: a wounded SMC can portage nothing]. Each squad stacked with a leader may freely Deploy. Prior to its possessor's Escape attempt, each SW/Gun may (must, if the unit exceeds its allowed portage limit) be dropped or freely Eliminated/-Transferred/dismantled-if-possible. A non-dm Gun can never Escape.

ESCAPE TABLE

Final DR	Infantry	Mobile Vehicle
≤ 8	Escapes ¹	Escapes
9	Escapes; Replaced ²	Abandoned; ^{3,5} crew (if any) Escapes
10	Escapes; Casualty Reduced ³	Eliminated; ⁴ crew (if any) Escapes
11	Escapes; Replaced, then Casualty Reduced ³	Abandoned; ⁵ crew (if any) is Eliminated
≥ 12	All units and Equipment Eliminated	Eliminated; crew (if any) is Eliminated

¹ An Original 2 DR results in Escape and Heat of Battle for an eligible unit (A15.); use Random Selection to determine the unit(s) affected in a stack. [EXC: Any result other than Hero-Creation/Battle-Hardening results in Elimination of the unit(s).]

² A crew, or unit that would become Disrupted, is Eliminated instead.

³ Use Random Selection for a stack.

⁴ The surviving crew (if any) may turn the vehicle into a (Burnt-Out) wreck.

⁵ In current hex and VCA; the surviving crew (if any) may attempt to Scrounge the vehicle/wreck.

⁶ The surviving crew (if any) may attempt to Scrounge the vehicle prior to its Elimination.

DRM:

-1	If lone, unwounded SMC
-1	If a CT AFV
-1	If current CG Date is Night*
-2	If adjacent to a Friendly Setup Area (-1 If two hexes away from a Friendly Setup Area).
+x	(Armor-)Leader/Hero DRM (NA to Personnel Leader/Hero if alone)
+1	If in enemy Setup Area, or if it must trace a path through ≥ one enemy Setup-Area hex to intended area of Retention
+1	Per HS-equivalent > one HS using the same Escape DR*
+1	Per PP > IPC being carried (unit with most excess PP determines this DRM for a stack (a stacked leader may combine to increase a MMC's IPC)*)
+1	If unarmed, Wounded, or Walking Wounded
+1	If a Captured vehicle
+1	If stunned
+2	If Encircled*
+2	If Isolated

* NA to vehicle Escape attempt.

9.6061 ESCAPE RESULTS: If a unit survives the Escape attempt, it and all Equipment it took with it are Retained into a friendly Setup Area or off-map at an Eligible Entry Area—whichever is nearest in a path of contiguous, Enterable, Uncontrolled-Territory/enemy-Setup-Area Locations (Escapee's choice if ≥ two such Areas are equidistant, but always using as few enemy Setup-Area Locations as possible).

If a unit is Eliminated by the Escape attempt, all Equipment it took with it is Eliminated on a subsequent dr of ≥ 4; on a dr of ≤ 3 the Equipment is left in the Eliminated unit's last-occupied Location. See also 9.6131.

EX: See the illustration on page Q10. The British squad in Uncontrolled-Territory hex W25 is freely relocated into any Location of the British Setup Area C, the German squad and Mobile Kuebelwagen in British Setup Area A must attempt Escape. The German player must roll for each attempt separately, and rolls an Original 6 and 7 respectively. The squad successfully Escapes on a Final DR of 8 (+1 DRM for being "in an enemy Setup Area" and +1 "per HS-equivalent > one HS using the same Escape DR"), and is relocated into German Setup Area A. The Kuebelwagen's DR, a Final 9 since it is both unarmed and in an enemy Setup Area, results in "Abandoned; crew Escapes". However, since an unarmed truck has no crew, it is simply left in place, marked by an Abandoned counter. In RePh step 9.6071 the British Retains the Kuebelwagen as captured. The Mobile German tank in No-Man's-Land hex Y17 and the German squad in No-Man's-Land hex Z23 must also attempt Escape. The tank successfully Escapes on a Final DR of 7 and is Retained into German Setup Area A. The squad rolls an Original 8 for its Escape DR; since it has a

+3 Escape DRM (+1 per HS-equivalent > one HS using the same Escape DR" and +2 for being Isolated), the Final DR of 11 results in it being Replaced and then Casualty Reduced (one 2-3-7). The Isolated British squad in the Z15 First-Level Location may attempt to Escape and would have a +3 Escape DRM (+1 per HS-equivalent > one HS using the same Escape DR, and +2 for being Isolated). Despite being vacant, that Location would still be British-Controlled at the start of the next scenario (9.6131). The squad could opt to remain in place (and 9.6201 would apply to it).

9.6062 ENCIRCLED-MARKER REMOVAL: All Encircled markers are now removed.

9.607 EQUIPMENT POSSESSION AND HIDDEN FORTIFICATIONS

9.6071 IN SETUP AREA: Each piece of Equipment in a Setup Area is Retained (as Captured, if applicable) therein by the side Controlling that Setup Area. At its (new) owner's option, each such non-vehicle piece may be Eliminated by any Personnel (even an Abandoning crew) Retained in that Setup Area, and each such vehicle may be Abandoned, etc. exactly as per 9.61423. The Inherent crew of each now-Captured Immobile vehicle with no functioning MA is also Captured. Each unpossessed/abandoned Equipment piece in a Setup Area may remain unpossessed/abandoned (in which case it retains its present CA), or may be automatically repossessed/remanned and operated (as per A21.11-13, A21.21-22, D5.42 or D6.631) by Personnel Retained in that Setup Area. Each Immobile vehicle must remain in its present Location and VCA until such time that it becomes Mobile.

9.6072 NOT IN SETUP AREA: All unpossessed/abandoned Equipment in No Man's Land or Uncontrolled Territory must remain in its present Location (and vehicle/Gun CA) until Eliminated or repossessed/remanned in (or after; 9.6071) a subsequent scenario. Each Immobile vehicle must remain in its present Location and VCA until such time as it becomes Mobile.

9.6073 HIDDEN FORTIFICATIONS: Each still-hidden Fortification within a Setup Area of the purchaser's opponent is placed on-map. Each such minefield is marked by placing a Minefield counter to reveal its presence but not its strength/type. Each on-map Fortification (i.e., from previous CG scenarios) is controlled by the side (if any) Controlling its Location.

9.608 PRISONERS: Each prisoner guarded by a non-Isolated unit is Eliminated. An Isolated Guard may retain possession of his prisoner(s), freely transfer them to another friendly unit (capable of being a Guard) in the same Isolated Area, or free them. If freed, a prisoner is automatically Retained (by the side friendly to it) into the nearest (in shortest path of contiguous, Enterable Locations) friendly Setup/Eligible-Entry Area (of the Unarmed-unit side's choice if ≥ 2 such Areas are equidistant). An unarmed MMC is Replaced by a Green/Conscript MMC of the same size; a freed SMC is Replaced by the original SMC type.

9.609 EXTINGUISHING FLAMES AND BLAZES: Each building/rubble Location currently marked with a Flame/Blaze counter is considered fully consumed by the fire. Players must remove each Flame/Blaze counter and make the appropriate terrain alterations when performing the following sub-steps (9.6091-9.6093):

9.6091 BURNING WRECK: Each Burning Wreck has its Blaze marker removed [EXC: if that wreck is in a building/rubble non-Bypass Location, move the Blaze marker to the building/rubble so that it is now a terrain Blaze]. Replace the wreck with a Burnt-Out wreck.

9.6092 WOODEN RUBBLE: Remove both the Rubble and Flame/Blaze marker, and place a shellhole counter in the hex. All other previous terrain in the hex is eliminated (each vehicle/wreck in the hex becomes a Burnt-Out wreck).

9.6093 STONE RUBBLE: Remove the Flame/Blaze marker. The stone rubble still exists (each vehicle/wreck in that Location becomes/remains a Burnt-Out wreck), and the Location may catch Fire again in a later scenario.

9.6094 BUILDING: Place the correct Rubble counter in all ground-level Locations of each building that has at least one Flame/Blaze in any of its Locations, removing each Flame/Blaze marker. Such rubble may catch Fire again in a later scenario.

9.6095 ELIMINATIONS: All Fortifications/Equipment in what were (as per 9.6092-9.6094) building/rubble Flame/Blaze Locations (including all building Locations just rubbled as per 9.6094) are Eliminated. All (Burnt-Out) wrecks in buildings just rubbled as per 9.6094 are Eliminated. All Isolated units/Equipment that would have been confined to setting up in Locations (/rubbled-buildings; 9.6094) from which a terrain Flame/Blaze has just been removed are Eliminated.

9.610

9.610 WOUNDED LEADERS AND WALKING WOUNDED MMC

9.6101 WOUNDED LEADERS: Each side makes a dr on the following table for each currently wounded Retained leader:

WOUNDED LEADER TABLE

Final dr	Result
≤ 1	Retained unwounded
2-4	Retained wounded
≥ 5	Eliminated (evacuated)

drm:

- +1 if Isolated
- 1 if Heroic
- 1 if British

9.6102 WALKING WOUNDED MMC: The British player now determines how many (if any) Walking Wounded MMC are recovered as per CG SSR 17. These MMC are placed in any non-Isolated setup area. These MMC count as CVP lost by the British player for purposes of 9.6162.

9.611 RECOMBINING AND BATTLE HARDENING

9.6111 RECOMBINING: All Retained same-class HS with the same Strength Factors (and Walking Wounded status) within the same Setup/Entry Area must now recombine (A1.32) so that no more than one of each HS type is retained in that Area [EXC: each side may retain one HS per SW MTR Retained even if that SW is currently malfunctioned].

9.6112 HEROS & MMC: On each side, each Retained Hero [EXC: Heroic Leader; 9.6113] is Eliminated; however, each such Elimination enables that side to Battle Harden one non-crew MMC of the owner's choice within the same Setup/Entry Area as that hero [EXC: if no MMC are available to Battle Harden the hero is Retained in that Setup/Entry Area]. Elite MMC that Battle Harden become Fanatic (but only for the duration of the next CG Scenario). No MMC may Battle Harden > once per RePh.

9.6113 LEADERS: On each side, each Retained heroic leader Battle Hardens²¹ and loses his heroic status [EXC: a heroic 10-3 loses his heroic status with no additional effect].

9.612 NEW CG DATE AND SAN ADJUSTMENT

9.6121 NEW CG DATE: Each passage of this RePh step represents the start of a new CG Date.

9.6122 SAN ADJUSTMENT: Each side must determine if the SAN of their side must be reduced for the current CG Scenario. A side whose SAN is currently < 2 has it automatically raised to 2 (no FPP expenditure is necessary).

9.61221 BRITISH SAN: If the British SAN is ≥ 4, a SAN adjustment dr must be made with a +drm equal to the current British SAN minus four. A Final dr ≥ 5 immediately reduces the British SAN by two.

9.61222 GERMAN SAN: If the Germans control the building in II13 the German SAN is unadjusted. If the Germans do not control building II13 and the German SAN is ≥ 4, a SAN adjustment dr must be made with a +drm equal to the current German SAN minus four. A Final dr ≥ 5 immediately reduces the German SAN by two.

9.613 SHIFT: A Personnel/Mobile-vehicle unit (or group of such) Retained in a Setup Area may attempt to Shift to another friendly Setup Area, or Eligible Entry Area. A Personnel/Mobile-vehicle unit (or group of such) Retained in an Entry Area may attempt to Shift to the next Eligible Entry Area, or to a non-Isolated friendly Setup Area. A unit/group that wishes to Shift from a Setup Area must be able to trace a path (of any length) of contiguous, Enterable (by all units of the Shifting group), Uncontrolled-Territory/friendly-Setup-Area/Eligible-Entry-Area hexes from any friendly-Controlled hex of that Setup Area to any hex of the Area to which it is attempting to Shift.

Each non-WW MMC may portage ≤ five PP, WW MMC may portage ≤ 3 PP, and each SMC may portage ≤ two PP [EXC: a wounded SMC can portage nothing]. Prior to its possessor's Shift (attempt), each SW may (must, if the unit exceeds its allowed portage limit) be dropped or freely Eliminated/Transferred/dismantled-if-possible. A Gun can not be Shifted. Each squad stacked with a leader may freely Deploy.

Make a separate Secret DR on the following table for each unit/group attempting to Shift [EXC: no DR is required if a unit/group Retained in a Setup Area wishes to Shift to an Eligible Entry Area that is part-of/adjacent-to that Setup Area; i.e., such a Shift is automatically successful]. Only one Shift attempt may be made per unit/group per CG Date, and all units attempting to Shift from the same, and to the same new, Entry or

Setup Area must do so as a single group. A German unit/group that Shifts to an Eligible Entry Area may subsequently enter play at that Entry Area without paying any additional CPP.

SHIFT TABLE

Final DR	Result
≤ 8	Shifted safely
9-10	No Shift*
11	Shifted with Casualties†
≥ 12	All units, Inherent crews and Equipment Eliminated

DRM:

- 1 If that entire path can be traced on road hexes‡
- +1 Per every five Uncontrolled-Territory hexes along that path between the current Setup/Entry Area and the desired new Setup/Entry Area‡

* Unit/group cannot Shift (the orders were not received or could not be carried out). It may not attempt to Shift again until the next CG Date, and must remain in its current Entry Area (if Retained off-map) or Setup Area (if Retained on-map), though it may participate normally in the next CG scenario.

† Each Personnel unit suffers Casualty Reduction on a subsequent dr of ≥ 4. Each vehicle is Eliminated on a subsequent dr of ≥ 4; if it is Eliminated, make a CS DR for its Inherent crew (if any; Casualty Reduction is NA). Roll separately for each unit.

‡ Not applicable to a Shift from one Entry Area to another.

9.6131 VACATED SETUP AREA: If the last unit in a friendly Setup Area is Eliminated or successfully Escapes/Shifts elsewhere, each Location of that Setup Area remains Controlled by the last Controlling (i.e., by the vacating) side.²²

9.614 EQUIPMENT REPAIR AND REPLENISHMENT

9.6141 VEHICLES: Each side performs the applicable step(s) below for each vehicle in a friendly-Setup/Eligible-Entry Area.

- a) **ABANDONED:** Each abandoned vehicle may remain abandoned, or may be remanned and operated (as per A21.22 or D5.42/D6.631) by Personnel Retained within the same Setup Area.
- b) **IMMOBILIZATION REPAIR:** Each non-captured, non-abandoned, immobilized vehicle must make a dr on the following table to determine if the immobilization is repaired:

IMMOBILIZATION REPAIR TABLE

Final dr	Result
≤ 2	Become Mobile*
≥ 3	No change

drm:

- +1 if Isolated
- +1 if only Non-Qualified Use (A21.13) possible
- +1 if in a Front-Line hex

* And is Retained in its current Setup Area.

c) **AFV RECALL:** Each Mobile, non-Isolated Retained AFV under Recall is Eliminated. If Mobile, under Recall, and Isolated, such an AFV begins the next scenario under Recall (as well as suffering Ammunition Storage; A19.131).

d) **STUNNED:** A side Retaining a vehicle suffering the results of a stun (small stun; D5.34) must make a dr on the following table to determine if the vehicle recovers from the stun result:

VEHICLE STUN RECOVER TABLE

Final dr	Result
≤ 2	Recover, remove stun
3-5	Retain stun
≥ 6	Eliminated

drm:

- +1 if Isolated
- +1 if German

Q

9.6142 WEAPON REPAIR: Each side now makes a separate dr on the table below for each malfunctioned, non-captured [EXC: Ox and Bucks may attempt to repair captured SW (see PB SSR 14)], Retained weapon in each friendly Setup/Entry Area that contains Personnel (or, for a vehicular Weapon, an Inherent crew in that vehicle):

WEAPON REPAIR TABLE

Final dr	Result
≤ 1	Repaired
≥ 2	Eliminated *

drm:

- 1 if vehicular-mounted
- x (Weapon Repair Number)
- +1 if only Non-Qualified Use (A21.13) possible
- +1 if Isolated

* If vehicular-mounted, the Weapon is disabled; if MA, the AFV is immediately Recalled (9.6141c applies)

EX: A German HMG which is not Isolated and possessed by a German 4-6-8 repairs on a dr ≤ 4.

9.61421 VEHICULAR-MG EXCHANGE: A disabled, non-captured, vehicular MG may be automatically repaired (even if disabled in step 9.6142) by Eliminating a friendly SW LMG. In all cases, the MG to be Eliminated must be Retained within the same Setup/Entry Area as the AFV.

9.61422 CAPTURED EQUIPMENT: Each side makes a separate dr for each functioning, captured, Retained Weapon in each friendly Setup/Entry area that contains Personnel [EXC: this roll is not necessary if the Weapon was possessed by a member of the Ox and Bucks at the conclusion of the CG Scenario (see SSR PB14)]; if ≥ 4 it is Eliminated (disabled if vehicular). Each already-malfunctioned Captured Weapon is Eliminated (disabled if vehicular). Disablement of MA by either means does not cause Recall. At its captor's option, a captured vehicle may remain in play if it has any functioning Weapon (even if MA is disabled); otherwise it is turned into a (Burnt-Out) wreck as per 9.61423.

9.61423 ABANDONING, SCROUNGING, & REMOVAL: At the Controlling player's option ≥ one non-Recalled vehicle in each friendly Setup Area may be Abandoned and/or turned into a (Burnt-Out) wreck. Likewise, he may attempt to Scrounge ≥ one non-Recalled vehicle/non-Burnt-Out-wreck in each friendly Setup Area. [EXC to all: Such actions are NA unless ≥ one Personnel unit (even an abandoning crew) is Retained in that Setup Area.] All German-colored French vehicles, identified by a "(f)" at the end of the vehicle name, yield a German-colored French LMG if scrounged.

9.61424 SPECIAL AMMO: Each non-captured, non-Isolated weapon which has some form of depleted ammunition type may make a dr on the following table for each type of special ammunition which is depleted in order to attempt to resupply that type of special ammunition for that weapon:

SPECIAL AMMO RESTORATION TABLE

Final dr	Result
≤ 3	Restores special ammunition type
≥ 4	NA, weapon still depleted for next CG Date

drm:

- 1 if British prior to a Night CG Scenario

9.61425 LOW AMMO: Each Low Ammo marker on each non-captured, non-Isolated German vehicle in a German Setup/Entry Area is removed.

9.615 OB-GIVEN REINFORCEMENTS: During the RePh, it is possible that the British will receive OB-Given Reinforcements.²³ These units may enter at a specified Eligible Entry Area or be held off-map.

9.6151 REINFORCEMENT ENTRY AREAS: Each Reinforcement unit listed in 9.6152 also has an Eligible-Entry-Area/Setup-Area listed. The reinforcements entering the map this CG Date must enter/setup via this Entry-Area/Setup-Area. All/some/none may enter on any turn. If reinforcements are remaining off-map at the CG-Scenario End, these units are Retained until the next CG scenario. Regardless of when they actually enter the CG, they

may only enter/set-up as specified.

9.6152 REINFORCEMENT ALLOTMENT: The British Reinforcements for each CG Date are given below:

CG Date	Entry Area	Units
NIGHT II	Note 1,2,4,5	6-4-8, 4-5-8, 2-4-8, 7-0, LMG, 10 FPP
NIGHT III	Note 1,2,4	6-4-8(x18), 10-2, 9-2, 9-1, 8-0(x2), 7-0, LMG(x5), PIAT(x4), 20 FPP
DAWN	Note 1,2,3,4	6-4-8(x4), 8-0, LMG, PIAT, 57L AT(x2), 2-2-8(x2), 15 FPP
Day I	na	15 FPP
Day II	TT14	6-4-8(x15), 10-3, 9-1, 8-1, 8-0(x2), LMG(x4), PIAT(x2), FT, Sherman V (DD), 15 FPP
Day III	na	15 FPP
DUSK	TT14	4-5-8(x10), 4-5-7(x15), 2-2-8, 9-1, 8-1, 8-0, 7-0(x2), dm HMG(x2), dm MMG(x2), LMG(x4), 51 MTR(x2), PIAT(x4), Churchill VII(x6), Stuart V(a)(x3), Carrier C(x3), Carrier 3in, Lloyd Carrier, 57L AT, 10 FPP

Note 1: May set up in any non-Isolated British Setup Area. If the British are unable to set up on-map (due to no eligible non-Isolated Setup Areas), hex Z28 becomes an Eligible Entry Hex.

Note 2: Not received if playing CGII.

Note 3: Guns must set up in non-Isolated British Setup Areas in hexes numbered ≥ 20. If the British are unable to set up on-map (due to no eligible non-Isolated Setup Areas numbered ≥ 20), hex Z28 becomes an eligible Entry Area and the Guns must be Manhandled onto the Map.

Note 4: Non-crew MMC are Airborne MMC (see PB SSR 13 and 15).

Note 5: These units are elements of the Ox and Bucks (see PB SSR 14).

9.6153 REINFORCEMENT WITHDRAWAL: During the RePh following the Day II CG-scenario, the British must remove (does not Retain) any non-crew, non-airborne MMC (and their remaining SW/SMC) on the map.²⁴ For this purpose, it is necessary to note which SW/SMC are not part of a British Airborne formation.

9.616 CPP REPLENISHMENT: German CPP are replenished according to the following formula: the CPP Base # (9.6161) plus CG Scenario Loss Points (9.6162) equals the final amount of CPP replenished.

9.6161 CPP BASE NUMBER: The German's CPP Base # is given below for the current CG Date:

CG Date	CPP Base #
Night II	None
Night III	None
Dawn	25 (begin recording CVP for CG Scenario Loss Points)
Day I	32
Day II	30
Day III	20
Dusk	None

9.6162 CG SCENARIO LOSS POINTS: If the Casualty Victory Points (CVP) lost by the German player for the prior CG scenario (only) are ≥ two times, and ≥ 8 more than, the CVP lost by the British Player [EXC: WW MMC still count as CVP lost in the RePh in which they are received], the German player may make a dr and add this value to the CPP Base Number for the total amount of CPPs replenished. CG Scenario Loss Points are unavailable until the Day I CG Date RePh (i.e., players should begin recording CVP for CG Scenario Loss Points during the Dawn CG scenario.)

9.617 PURCHASING REINFORCEMENT GROUPS: The German player now secretly allots CPP for the purchase of RG [EXC: 9.617 is NA during the three Night CG Dates]. All CPP expended are subtracted from the German's current CPP total. The CPP expended, those remaining, and the RG(s) purchased may all be kept secret. The Germans consult their RG chart for the different types of RG historically available, the CPP cost of each, the number of each that may be purchased during the course of the CG, and any appli-

9.617

cable notes. As each RG is selected, record its ID (and the CPP expended to purchase it) in the "RG Purchased" column on the line for the current CG Scenario on the CG Roster. After all the RG are selected, write the total CPP expended in the "spent" column of the CG Roster for the current CG Date; then write the number of CPP remaining, even if zero, in the "Left" column for the current CG Date. Any CPP remaining may be used to purchase further RG in any subsequent RePh step 9.6171–.6178.

The RG chart contains the following columns:

9.6171 ID: Provides an alphanumeric identification for each RG.

9.6172 GROUP TYPE: Lists the name of the RG. This name and its ID are secretly recorded on the German's RG Purchase Record (9.6178).

9.6173 (FULL/DEPL) UNIT TYPE(S): Lists the type(s) of units that each RG contains.

9.6174 CPP COST: Lists the CPP cost of the RG (regardless of its later-determined Strength). This is the number of CPP that must be subtracted from the German's current CPP total in order to receive that RG.

9.61741 CPP ENTRY COSTS: Each German Entry Arrow has a CPP cost modifier listed in the arrow (from +0 to +6). The German player must add this cost to the base cost of the RG, and by doing so allows the units to enter at the Entry Arrow which he has "paid" to use.

CPP ENTRY COST TABLE

Entry Arrow Hex	Increased CPP Cost (per RG)
A8	+0
A15	+0
J0	+2
U1	+4
KK1	+6

9.6175 CG DATE MAX: Lists the maximum number of RG of this type that may be purchased per CG Date.

9.6176 CG MAXIMUM: Lists the maximum number of RG of this type that may be purchased during the course of the CG. The German must keep a written record (using the 9.6178 RG Purchase Record) of each RG purchased during the CG in order to know if additional RG of that type are still available for purchase. RG given during any CG Scenario never count against this maximum.

9.6177 NOTES: Special restrictions or comments about the RG.

9.6178 RG PURCHASE RECORD: After all RG for the current CG Date have been selected and CPP expended for them, the RG Purchase Record must be updated. One line of this sheet must be filled out for each RG purchased in order to keep track of the number purchased thus far in the CG. If preparing for a CG Initial Scenario, one line is also filled out for each RG given in the Initial Scenario OB (but these latter do not apply towards RG purchase limits; 9.6175–.6176). The following listing explains how each column of the RG Purchase Record is used.

CG Date: The CG scenario the RG is purchased (e.g., NIGHT I).

RG ID: The RG's alphanumeric ID (e.g., V1 for Light Tank Pltn I).

Group Type: The RG's name (e.g., Light Tank Pltn I).

#P (Number Purchased): The total number of friendly RG of this Group Type purchased thus far during the CG.

#R (Number Remaining): The number of this RG Group Type still available for subsequent purchase in the CG. This number is derived by subtracting the number in that RG's #P column from the number listed in the "Maximum" column (for that RG for that CG) in the German's RG Chart.

Str: The RG's strength, as determined in RePh step 9.6181. Record "F" for a Full, "D" for a Depleted, RG.

Units: The number of units received in that RG of the Unit Type listed in the respective RG Chart (e.g., "3" for a Full Strength Garrison Pltn), and the unit type.

SW Received: As each SW for that RG is determined (RePh step 9.6182), record the number of each Weapon type received.

Pltn Leader: As each eligible RG's (armor) leader(s) is determined (RePh step 9.6183) record his A10.7/D3.4 Strength Factor.

Setup/Entry Area ID: On its CG Date of purchase, each RG [EXC: RG M1] must have a friendly, non-Isolated Setup Area or Eligible Entry Area recorded for it. Use the hex coordinate of each Entry Area's center (arrow) hex as the ID for that Area.

GERMAN REINFORCEMENT GROUP CHART

ID	Group Type	F/D	Unit Type(s)	CPP Cost	CG Date Max.	CG Max.	Notes
I1	Garrison Pltn	3/2	4-3-6	N/A	N/A	NA	a, e
I2	PzPionier Pltn	4/-	4-4-7	N/A	N/A	N/A	a, e
I3	PzPionier Coy	12/9	4-4-7	N/A	N/A	NA	a, b, e
I4	PzGrenadier Pltn	2/2	4-6-7	5	2	3	
		2/1	4-6-8				
I5	PzGrenadier Coy	12/9	4-6-7	13	1	4	b, d
V1	Lt Tank Pltn I	2/1	FT-17 730(f)	3	2	2	
		1/1	FT-17 730m(f)				
V2	Lt Tank Pltn II	3/2	38H 735(f)	6	1	1	c
		1/1	35-S 739(f)				
V3	Med Tank Pltn	3/2	PzKpfw IVH	14	2	3	d
V4	TD Pltn I	3/2	SPW S307(f)	5	1	2

V11	AAtr Pltn	2/1	3.7cm FlaK LKW	4	2	2	
		2/1	2cm FlaK LKW				
M1	Fortifications	15 FPP		1	2	10	

Notes:

- a) This RG cannot be purchased, but instead is on-map for an Initial Scenario.
- b) May attempt two Leader Allotment DR (9.6183).
- c) One RG of this type begins CG I on-map, a second may be purchased.
- d) Receives a -1 DRM on the Leader Allotment DR (9.6183).
- e) This RG does not roll for depletion, it is specified by the Initial OB.

9.618 RG STRENGTH, WEAPONS & LEADERS

9.6181 GERMAN RG STRENGTH: Each RG is eligible for Depletion [EXC: RGs I1, I2, and I3 are designated as Depleted or Full as part of an Initial CG OB, so no RG Strength DR is made for these RG; M1 is always 15 FPP]. For each such RG the German player has just purchased (as well as for each such RG he receives in an Initial-Scenario or during a RePh without purchasing), he must make one DR on the RG Strength Table to determine whether it is received at Full or Depleted Strength. A Full-Strength RG receives the number of specified units to the left of the "F", a Depleted RG receives the number of specified units to the right of the "F".

RG STRENGTH TABLE

Final DR	Result
≤ 9	Full
≥ 10	Depleted

9.6182 GERMAN SUPPORT WEAPON ALLOTMENT: Determine the number of SW received by each infantry-type RG listed in the following "Infantry-Type SW Chart." A Full Strength RG automatically receives all SW listed by a number not in parentheses; for those SW listed by a number in parentheses, one is received by making a dr less than or equal to that number. A Depleted RG must make a dr ≤ 4 to receive each SW not listed in parentheses; for those SW listed by a number in parentheses, one is received by making a dr less than that number. Record each SW received in its appropriate column on the RG Purchase Record on that RG's line. See CG SSR6.

Q

INFANTRY-TYPE SW CHART

RG	HMG	MMG	LMG	LT.MTR
Garrison Pltn	-	(2)	1	-
PzPionier Pltn	-	(2)	1	-
PzPionier Coy	(2)	1	1	-
PzGren Pltn	-	(2)	1	(2)
PzGren Coy	(3)	1	2	1

Ex: The German player purchases a PzGren Pltn. If the Pltn strength is FULL, he must roll ≤ 2 to receive a MMG, he automatically receives one LMG, and must roll ≤ 2 to receive a 50* MTR. Had this Pltn been depleted, the German player would receive a LMG on a dr ≤ 4 , a MMG on a dr ≤ 2 , and a 50* MTR on a dr ≤ 2 .

9.6183 LEADER ALLOTMENT: For each purchased/OB-Given "I" or "V" - type RG [EXC: V10, V11], make one Secret DR [EXC: "I" type COY make two Secret DR] on the appropriate column of the following leader tables to determine the type of leader received by that RG. Each leader must set-up/enter with a unit of his respective RG during the first (only) CG Scenario in which he participates [EXC: if Retained off-map for an entire CG Scenario].

LEADER TABLES

Final DR	Personnel Leader	Armor Leader
1	10-2, 8-1	10-2
2	10-2, 7-0	9-2
3	9-2	9-1
4	9-1	8-1
5-6	8-1	-
7-8	8-0	-
9-10	7-0	-
11-12	6+1	-
13+	-	-

LEADER TABLES DRM:

Garrison Pltn	+2
PzPionier Pltn	+1
Depleted RG	+1
PzGrenadier Coy	-1
Med Tank Pltn	-1

9.619 PURCHASING FORTIFICATIONS: Fortifications (and Sniper/Starshell Increases), which are obtained by spending FPP, may be purchased on each CG Date if the player has the requisite FPP (either given as a reinforcement in 9.6152 or purchased in 9.617). All FPP unspent upon completion of this step are forfeit. As Fortifications are selected, the specific type (and strength, if mines) must be recorded in the "FORTIFICATIONS" area of the CG Roster.

FORTIFICATION PURCHASE TABLE

Fortification Type	FPP Cost
Foxhole	3/2/1(d)
A-P Mine Factor (British Only (f))	1.5 per factor
A-T Mine Factor (British Only (a,f))	3 per factor
"P"	1
HIP (b,c,h)	5/3/2/1
SAN Increase (e)	10
Starshell Increase (g)	10

a) Duisy Chain NA.

b) Listed Cost is per 5/8" Counter/Squad/HS/SMC. SW may set-up with HIP unit up to the legal IPC of that unit (leaders may lend their IPC to a MMC) or one 50* MTR SW per MMC.

c) No more than 10% (FRU) of a side's Retained (not only purchased) Infantry squads may use HIP in a daytime Scenario.

d) 3S/2S/1S Foxhole costs.

e) May only purchase 1 SAN Increase per RePh.

f) May not be setup in an Isolated Location.

g) -1 drm to all British Leader Starshell dr for duration of CG Scenario.

h) HIP may not be purchased, nor used, by any German unit in the Dusk CG scenario.

9.620 SCENARIO COMMENCEMENT

9.6201 CG SCENARIO VICTORY CONDITIONS: In PB, each individual CG Scenario does not have Victory Conditions. The CG Scenarios serve instead to position the players for the overall CG Victory Conditions. Neither side "wins" or "loses" a CG scenario, only the CG itself.

9.6202 UNIT SETUP

9.62021 ISOLATED UNIT SETUP: The side that sets up first (9.62023) in a given CG scenario now sets up all of its Retained units, Equipment, and new Fortifications which will go into an isolated Location, after which the other side does likewise. Each Isolated unit/Equipment piece may be set up only in its current Setup Area [EXC: in its current Location and VCA, if an Immobile vehicle; 9.6071]. Each unit/Equipment piece set up in an Isolated Location is affected by Ammunition Shortages (A19.131) for the duration of the CG scenario. These units should be recorded to distinguish them from others not suffering the same penalties.

9.62022 NON-ISOLATED UNIT SETUP: The side which sets up first now sets up the remainder of its Retained units, Equipment, and new Fortifications in eligible Locations of the Setup Area each is Retained in [EXC: each Immobile vehicle must remain in its current Location and VCA (9.6071)]. Record the hex coordinates of new Fortification setup Locations on the CG Roster, in the appropriate line(s) and column(s) under "FORTIFICATIONS." See also SSR CG6-11, SSR PB2, and SSR PB7. Once the side setting up first has completed its setup, the other side follows the same (9.62022) procedure.

9.62023 SETUP/MOVE TABLE

NIGHT I	Germans Set Up First; British Move First
NIGHT II	Germans Set Up First; Germans Move First
NIGHT III	Germans Set Up First; British Move First
DAWN	British Set Up First; Germans Move First
DAY I	British Set Up First; Germans Move First
DAY II	Germans Set Up First; British Move First
DAY III	Germans Set Up First; British Move First
DUSK	Germans Set Up First; British Move First

FOOTNOTES

FOOTNOTES

1. 1.1 IRRIGATION DITCHES: There were many irrigation and drainage ditches in the fields near Pegasus Bridge, varying in size from small ones which would be of little impact in battle to ones almost gully-sized. It was decided early on that a generic representation of the average ditch was required. An average ditch is several feet across, and at least several feet deep, often with small footpaths crossing it. A wheeled vehicle would have little chance of crossing this ditch, while even tracked vehicles could get mired in the larger ditches. Moving infantry could cross this ditch with little or no delay, or they could slosh through it, receiving cover from incoming fire.

2. 1.43 VEHICULAR MOVEMENT THROUGH AN IRRIGATION DITCH: During playtesting, a vehicle would often enter an irrigation ditch hex along a road hexside and then exit the hex via a non-road hexside with no penalty. This struck many as incongruous. The solution was to require the MF and Bog penalties for non-road movement to be paid upon *either* entrance or exit. It didn't seem worthwhile to add another counter just to show whether or not a vehicle had entered an Irrigation Ditch hex via a road, although a side note of this status might be useful if the game is paused.

3. 2.1 PARTIAL ORCHARDS: The roads along the Canal de Caen at Benouville (as well as some of the other roads in the area) had trees lining only one side of the road. The obvious parallel was to the Orchard Road (B14.6); ultimately, adapting the Orchard rules worked best for simulating this terrain feature. Some thought was given to trying to adapt Hedges (B9.) for this purpose, but that concept didn't work out well.

4. 2.2 LOS: The number of hindrances for a sharply angled shot along a road lined with Partial Orchards can seem high, but in reality such a LOS can indeed be blocked. One playtest group suggested that the number of hindrances should equal the number of Partial Orchard hexsides crossed divided by two (FRD). In practice, this seemed more trouble than it was worth, so the simpler method won out. If during play you find the hindrances to be too high, use the above as a house rule for a more intricate simulation.

5. 3.1 SLOPE HEXSIDES, 4.1 VILLAGE TERRAIN, & 7.1 BARBED-WIRE FENCES: These are essentially reprints of the Slope Hexside (P2.), Village Terrain (P5.), and Barbed-Wire Fences (P3.) rules in *KAMPFGRUPPE PEIPER*. They are reprinted in *PB* so that *KGP* need not be a prerequisite for this module. Although *PB* does not have the wide range of elevations that *KGP* does, the additional flexibility provided by the slope rules in overcoming the plateau effect made it much easier to represent the actual terrain.

6. 3.3 SLOPE LOS & ELEVATION ADVANTAGE: Giving an Up-Slope unit a 3/4-level elevation advantage may seem overly complicated, but it in effect allows the unit to see over half-level-yet not over full-level-obstacles/Hindrances rising from the same Base Level as that unit. The "half-level" Hindrances referred to are brush, bridge, grain, marsh, crag and AFV/wrecks.

7. 3.53 CREST-LINE SLOPES: The presence of a slope along a Crest-Line hexside sometimes also represents an embankment. These often occurred along the roads, some of which were cut far enough into the hillside that the high-side embankment completely blocked vehicular movement. Since the two embankments along the opposite sides of such a road usually differed significantly in height/steepness, it could not be considered a true sunken road.

8. 4.1 NARROW STREETS: The local villages and hamlets had quite a number of narrow streets, which are represented on the *PB* map by "hexside roads". Such streets were notorious for restricting the maneuverability of even average-size vehicles.

9. 4.11 ONE-LANE: Here "road" is defined to mean a string of $\geq$ one contiguous Narrow Street hexside between the two vertices/hexsides where that string either ends (EX: vertex PBDD10-DD11-EE11), joins with two other Narrow Street hexsides (EX: vertex K12-K13-L12), or becomes a non-hexside road (EX: vertex J12-K12-K13). Hence, each of the following constitutes a separate "road" for one-lane purposes: hexsides K9-L9 and K10-L9; hexsides K13-L12 and L13-L12; and single hexsides B16-C16; P12-P13; K12-K13; K12-L12- and so on.

10. 4.11 DASHING/ROUTING: Dashing across/along a Narrow Street is NA mainly to prevent any conflict between the rules for First Fire vs a Dashing unit and those for Snap Shots. Routing along a Narrow Street is NA because a routing unit may not Bypass (A4.3).

11. 5.5 BUILDING-ROAD: The Gondree Cafe (hex PBX18) is less than 10 meters from the canal, with the tow-path road running in between. Although the building-road hex was designed reluctantly to simulate this terrain, in practice the concept worked out well.

12. 6.1 TOWERS: The Towers represent the water towers scattered throughout rural France, as well as other types of unenclosed towers and observation platforms. Clock towers and other substantial enclosed structures will be better represented by normal buildings (B23.), perhaps in combination with Steeples (4.2). Towers can also be depicted, via an SSR, by on-map buildings. The definition of Towers in these rules was left somewhat open; the rules were given "plug in" characteristics with the intent that scenario designers adapt them to their own specific situations.

13. 7. BARBED-WIRE FENCES: Barbed-wire fences enclosed some of the small fields and orchards depicted on the *PB* map and, in such areas, had a definite impact on infantry and vehicular movement. In game terms, it was decided not to allow the elimination of barbed-wire-fence hexsides because otherwise the map could become cluttered with the counters needed to mark such hexsides.

14. 8.1 HILLSIDE WALLS & HEDGES: These are essentially reprints of the Hillside Walls & Hedges (F10.) rules in *WEST OF ALAMEIN*. They are reprinted here so that only the counters from *WOA* are a prerequisite for this module.

15. 9.4 CG12 GERMAN PANZERFAUST: During the playtest, German players ahistorically overused PF vs Infantry, since they knew the British would receive no armor until late in the CG. Reducing the number of PF available simulates the German Infantry's historical reluctance to use its limited anti-tank resources vs Infantry targets.

16. 9.4 CG13 SNIPERS: Sniper fire, especially from the church steeple in Le Port, harassed the British all day long, making control of the steeple a priority for the bridge defenders. This provision also serves as an incentive to the British player not to ignore Le Port until the end-game. Unlike the other HASL modules, *PB* requires the use of two Sniper counters even though only one map is used. Since the battle tends to break down into two separate conflicts (one for Le Port and one for Benouville), the usually random aspect of Snipers could be manipulated by setting up a solitary Sniper counter so that it never moved too far from one half of the battle. Two randomly activated Sniper counters help remove this control from the players.

17. 9.4 CG17 WALKING WOUNDED (WW) MMC: There were many instances of men from the 7th Battalion or from the Ox and Bucks staying in the fight despite suffering severe wounds; there was no where to retreat to but into the arms of the Germans. Only the most seriously wounded were moved several hundred yards to the rear of the "front lines" to where a surgeon of the Ox and Bucks treated them.

18. 9.51-52: *PB CAMPAIGN GAME I* & *PB CAMPAIGN GAME II*: The Victory Conditions are designed to prevent the British player from merely huddling around the bridge, while at the same time giving the German player a powerful incentive to take back the bridge from the British. Also, Lord Lovatt's (non-Airborne) commandos were desperately needed in Ranville. Delaying a significant portion of them in Benouville would surely have allowed the 21st Panzer Division to break through in that sector—victory enough for the Germans. Capture of the Orne River Bridge (500 meters east of the canal) was just as important to the Allied effort as Pegasus Bridge, but historically the river bridge fell to the Ox and Bucks without a shot being fired, and no fighting occurred around it. Early renditions of the map included the river bridge, but, unlike the western edge of the map, it never came into play.

19. 9.52 *PB CAMPAIGN GAME II*: The second CG allows players to enjoy simulating the battle without having to use the night/glider rules. Although almost anything can happen by the time dawn arrives in the first CG, the second represents the rough historical disposition of troops after the Germans withdrew from their night attacks. Players will probably notice that the first CG plays considerably different from this second, as the British losses inflicted by the Germans at night are often much more than occurred historically. A third CG involving only the three night scenarios is in the works and may appear in some future edition of the *ASL Annual*.

20. 9.602f MARKER REMOVAL: Each unit still hidden at scenario end is placed on-map concealed (in its respective setup Location) so that it cannot "magically" escape from an Isolated Area, and for use in determining Controlled Strategic Locations. As a house rule, such a unit could be kept off-map unless in danger of being Isolated or needed to verify Control of Strategic Terrain. However, if such a unit's Location is later determined to be Isolated or part of an enemy Setup Area, it must immediately be placed on-

Q

map concealed in that Location.

21. 9.6113 BATTLE HARDENING LEADERS: Given that the entire "campaign" lasts less than 24 hours, certain features of earlier HASL Campaign Games *RED BARRICADES* and *KGP* were not appropriate for *PB*, e.g., Battle Hardening during the RePh of retained MMC in the absence of a Hero and of non-heroic Leaders, removal of fortifications and wrecks during the RePh, "resupply" of Isolated units during a scenario, provisions for random weather, etc.

22. 9.6131 VACATED SETUP AREA: Due to the confused nature of the battle lines and the short time span represented by the RePh, the enemy is assumed not to have noticed that all friendly units have vacated their positions, or to have been unable to react to the situation.

23. 9.615 OB-GIVEN REINFORCEMENTS: In such a short, focused "campaign," balancing the historical flow of the battle with allowing the British player to choose from Reinforcement Groups just wasn't feasible. The Allied commanders didn't have the luxury of choosing which units to commit to battle or when to do so. Instead of RG, the British receive reinforcements on a set timetable. (Random reinforcements were found to affect play balance too much.) British reinforcements received for Night II represent the rest of the Ox and Bucks who landed at the Orne River bridge; those received for Night III and Dawn represent paratroopers making their way up from the area around Ranville; the Day II reinforcements are Lord Lovatt's commandos, striking towards Ranville to reinforce the paratroopers there; and the Dusk reinforcements are the Royal Warwickshires, attacking from Sword Beach with armor support. See the *PB* scenarios for more details.

24. 9.6153 REINFORCEMENT WITHDRAWAL: Lord Lovatt's commandos were desperately needed in Ranville and fought around Pegasus Bridge

FOOTNOTES

only long enough to ensure their passage through to the south. Simulating this in the CG was one of the trickier aspects of designing *PB*. The Sherman DD tank, however, did stay behind at the bridge and fought in Benouville.

25. SSR PB6 HEDGES: The hedges around Benouville verge upon becoming bocage. The Bog Check that all vehicles must take in the hex being exited when crossing a hedge helps simulate this.

26. SSR PB14 OX AND BUCKS: The Ox and Bucks had trained together long hours under Major Howard in preparation for capturing the bridges over the Orne river and the Canal de Caen at Benouville. They practiced night tactics via repeated assaults on mock-ups of the actual terrain and were more familiar with the area around the bridges than were the German defenders to the point where consideration was given to exempting them from paying the extra MF for Concealment Terrain at night (E1.151). This was felt to be too powerful, however, so they were limited to the benefits of being Stealthy at night. They also trained extensively on various German small arms and machine guns and had developed a high regard for the latter. When they captured a cache of ammunition near the bridge, many men dumped their Sten guns for German machine pistols and the sought-after MG34 machine gun.

27. SSR PB19 STARSHELLS: The German forces were not well-prepared for night combat, while the Ox and Bucks were planning on using the cover of darkness to capture the bridge and Benouville. This is represented by limiting starshell usage to Leaders and AFV. The +2 drm for British leaders represents both the limited resources of the Ox and Bucks and their reluctance to light up the night, as well as helping to offset the higher number of Leaders the British get.

Use this illustration, along with the one on page Q10, for the examples on pages Q10 and Q11.

NVR CHANGE (E1.12)

NVR

6 cd

- No change First Player Turn
- One hex unless Scattered Clouds
- Minimum NVR is 0, maximum NVR is 6
- [EXC: 2 and 9 for Ground/Deep Snow]
- Wind Change DR:

cd = 6 & wdr

3: Lowers NVR

= 4: Increases NVR [EXC: no change after Starshell/IR placed]
 > 5: Increases NVR

DEFENSE (E1.16-21)

Scenario Defender:

- 25% (FRU) of squad equivalents (incl. HS/Japanese-crews) set up HIP
- Fortifications set up and remain HIP until TEM used, or extra MP paid to enter/exit in LOS of enemy, or Location entered by enemy unit
- SMC/SW HIP when set up with MMC
- All units set up concealed
- Concealment and HIP in non-Concealment Terrain
- One dummy counter per squad equivalent (incl. HS/Japanese-crews)
- All units lack Freedom of Movement

NIGHT (E1.1)

FREEDOM OF MOVEMENT (E1.21)

GAINED IF:

- LOS to Known enemy unit
- Attacked by enemy [EXC: OBA/ Sniper]
- Stacked with Good Order SMC with Freedom of Movement at beginning of unit's MP
- Best leader if dr < ELR at start of Movement Phase (after any attack by Scenario Attacker)

NO
MOVE
E1.21

COMBAT (E1.7-88)

- Multi-Location FG NA
- Acquisition in Illuminated Locations only
- +1 Night LV Hindrance [EXC: NA with HA TEM or target terrain > 1 Level higher than tier]
- Gunflash placed in any Location where:
 - A unit fires [EXC: MOL/PIAT does not leave in own Location]
 - A Melee exists
 - A unit becomes broken/immobile/Reduced/eliminated by mine attack
 - Location attacked by MOLFT
 - DC detonates
 - ATMM damages a vehicle
 - HE FFE Blast Area (SR can be seen by Observer only)

LINE OF SIGHT (E1.1-15)

LOS from non-Illuminated Location to:

- Within NVR (NVR halved [FRD] from BU AFV)
- Illuminated Locations
- Moving vehicles (1.5x NVR [FRU] or 2x if tracked)
- Gunflashes (treated as a concealed unit if beyond NVR)
- LOS from Illuminated Location to:
 - Illuminated Locations
 - Gunflashes (treated as a concealed unit)

STARSHELLS/IR (E1.92-93)

First time (during PFPn, MPn, DRPn) if:

- LOS to enemy unit
- Moving enemy vehicle within 16 hexes (no friendly vehicles on board)
- Friendly Gunflash
- Enemy FFE

During subsequent Player Turns only at beginning [EXC: A leader may place Starshells at any time during Phase] of:

- PFPn (ATTACKER)
- MPn (DEFENDER Starshells)
- DRPn (DEFENDER IR)

Usage of:

- < 4: Leader/CE-armor-leader, mortar IR
- < 2: MMC, CE AFV crew

PLACEMENT

Placement methods:

1. In hex (Starshells only): one hex drift.
 2. Along LOS to Known enemy unit (must be < 9 hexes for Starshell); drift 1/2 dr (FRU).
 3. At 3 (multiple of 6 for IR) hexes; drift 1 full dr.
- Successful Starshell placement does not limit the placer's actions; place a Gunflash, or cause concealment loss, but does cause loss of HIP/Concealed status.
 - Successful IR placement uses the mortar's entire FOF and places a Gunflash.

STRAYING (E1.53; 1.55)

Straying NA if:

- LOS to Known enemy unit, or Beach/Ocean
- On or ADJACENT to road, gully, stream, path, river bank, or Illuminated Location
- Moving within same hex; entering sewer/tunnel
- IN cave/cave-complex

Movement DR:

cd = 6 & wdr = 5-6: Stealthy Strays
 = 3-6: Normal Strays
 = 1-6: Lax Strays

Subsequent Straying DR (cd) determines direction (Litter Fire on doubles after first attack)

- Move "as far as possible"
- T1 if:
 - Cannot move one hex without Double Time, Minimum Move, or ESB scaling, or swimming, moving closer to a Known enemy unit, or offboard; entering an Illuminated Location
 - Gains LOS to Beach/Ocean hex

MOVEMENT PHASE (E1.5)

- Cavalry/non-Cooked Infantry pay 1 MF extra in Concealment Terrain
- Vehicles pay 1 MF extra per hexside
- If NVR is 0, Double Time, Infantry road bonus (B3.4), Gallop, and expending MP while BU [EXC: to Stop] are NA
- +1 DRM to Failing DR
- Five Lane beyond NVR; special Five Lane at Bore Sighted Location
- +1 Recovery drm

ROUTING (E1.54)

- DM until Original Rally
- DR < morale
- No elimination for Failure to Rout
- Low Crawl only (toward any terrain type)
- Can Low Crawl ADJACENT to enemy (but not toward)

CONCEALMENT/CLOAKING (E1.3-43)

CONCEALMENT GAIN:

- Automatic when dr needed during day

CONCEALMENT LOSS:

- Non-Assault Movement: Only when entering Illuminated/enemy-unit's Location
- Assault Movement: Only when entering enemy unit's Location, within 16 hexes and LOS of enemy ground unit.
- Firing: Only when in Illuminated-Location/enemy-NVR

CLOAKING:

- One Cloaking counter per squad equivalent (incl. HS/Japanese-crews)
- Six MF: road or ski bonus only; no Double Time
- No extra MF costs for Concealment Terrain

CLOAKING LOST:

- As if concealment
- For making an attack [EXC: successful Ambush]
- For successfully placing a Starshell
- Suffers Sniper attack (all units placed onboard unconcealed)

CLOSE COMBAT (E1.77)

ATTACKER gains Ambush with dr 2 less than DEFENDER in non-Illuminated Locations

FIRES (E1.94)

BLAZE: Illuminated Zone equals 2 times number of blazing levels
 FLAME: Illuminates own Location

MISTAKEN FIRE (E1.76)

- SAN 2 greater than printed value
- Captured MG use causes automatic SAN dr

R

R. A BRIDGE TOO FAR

1.13

ORDER OF PRESENTATION:

1. ARNHEM BRIDGE
2. THE RAMP
3. FACTORIES
4. CELLARS
5. THE BLOCKHOUSE
6. UNIT REPLACEMENT
7. WIDE CITY BOULEVARDS
8. PARTIAL ORCHARDS
9. A BRIDGE TOO FAR CAMPAIGN GAMES

R.1 ROAD-NEGATING TERRAIN (B3.4; B24.121): Infantry may not claim the extra-MF road bonus during a MPH in which they expend extra MF to derive the protection of shellholes—nor may they claim it if they choose the non-Open Ground cover of an Orchard in preference to the Open Ground of a road. A road covered by rubble is treated as non-existent [EXC: for Street Fighting purposes (A11.8); if Cleared (B24.71)]. Therefore, Dash (A4.63), road bonus (B3.4) and the 1/2-MP road rate are not allowed in a road hex covered by rubble.

R.2 WALL ADVANTAGE AND FORTIFIED BUILDINGS (B9.32; B23.93): A Gun in a Fortified Building Location may never claim Wall Advantage. Its manning Infantry could claim it only by first dropping possession of the Gun. Such a Gun can, however, have a LOS to non-adjacent same-level Locations over the wall hexside(s).

R.3 FACTORY MOVEMENT (B23.742): A vehicle that changes its VCA in any Factory Location is subject to Bog. A vehicle that becomes immobile in a Vehicular-Sized Entrance (3.2; B23.742) does not negate Entrance benefits. Any unit may use the Open Ground entrance benefits of a Vehicular-Sized Entrance—but only when entering

it from outside that Factory. Such use of OG entrance benefits does not negate that hex's Factory TEM.

R.3A FACTORY TEM/HINDRANCE (B23.741): Normal building TEM (usually +3) applies to Indirect Fire vs a non-Rooftop Factory Location. The extra +1 TEM for a Fortified Factory Location does not apply vs Indirect Fire. For Sniper Target Selection (A14.21) a unit in a stone Factory is considered to have a +3 TEM (+4 TEM if Fortified). Factory Hindrance is half-Level LOS Hindrance.

R.3B FACTORY ROOFTOP ACCESS POINTS (B23.742; B23.8): Aside from Scaling (B23.424), a Factory Rooftop can be reached from ground level only via a non-rubbed Factory Rooftop Access Point; i.e., a printed stairwell or a Location of the Factory that contains a road hexside. A Factory that contains neither of these Rooftop Access Points must have at least one such point designated by SSR if its Rooftop is to be usable. The ground and Rooftop Levels of a Factory Rooftop Access Point hex are ADJACENT; intermediate vertical Levels do not exist [EXC: for MF-expenditure, LOF and Residual-FP purposes; R.3C]. Infantry expend two MF to ascend to the Rooftop and vice versa.

R.3C ATTACK EFFECTS (B23.8): Infantry changing Levels via a Factory Rooftop Access Point may be attacked at ground level (if descending) and/or Rooftop Level (if ascending) in the normal manner. However, they may also be attacked at the first-Level "quasi-Location" of that hex by a unit that has LOS to that quasi-Location. Such a quasi-Location is not considered Open Ground, but such an attack vs it receives no TEM [EXC: non-Fortified building TEM applies if firing from outside the Factory] or Factory Hindrance DRM. The target is assumed to expend one MF per Level changed; if pinned or broken while at that quasi-Location it reverts to the Level it was attempting to leave (and may be attacked by any Residual FP at that Level as it re-enters it). The Residual FP left by an attack vs such a quasi-Location remains at that Level (place the Residual FP counter on the appropriate Level counter) to attack each unit subsequently entering that Level in that hex during the same MPH. A unit at Rooftop Level in a Factory Rooftop Access Point hex being attacked by a same-hex, ground-level unit receives the Height Advantage +1 TEM (B23.81), while the ground-level unit receives Factory TEM (and no additional TEM for a Fortified Building Location) if attacked by that Rooftop unit. Both units may use PBF (since they are ADJACENT; A7.21).

R.4 ROOFTOPS (B23.82): A Rooftop Location is Concealment Terrain only for setup purposes. Once the first RPh has been completed, B23.82 comes into effect. A Rooftop Location is not considered a building Location for rout, rally, and/or Victory purposes. A Gun may never be Emplaced (C11.2) on a Rooftop.

R.5 ENTRENCHMENTS (B27.): A trench may not occupy the same Location as a foxhole.

1. THE ARNHEM BRIDGE¹

1.1 The Arnhem Bridge is represented by the contiguous row of hexes R15 – R23 (inclusive). Each such hex contains a Level 1 Location as well as a Level 0 Location. Unless noted otherwise, Arnhem Bridge hexes are treated as two lane stone bridge hexes (B6.1–43) [EXC: Arnhem Bridge hexes may not be destroyed or damaged during play; MP penalties and VCA limitations of B6.43 are NA while on (not beneath) the Bridge/Ramp; Arnhem Bridge hexes are Inherent Terrain (B.6); units occupying Level 1 Locations in an Arnhem Bridge hex have no LOS to any units occupying Level 0 Locations in Arnhem Bridge hexes]. Arnhem Bridge hexes may be Scaled (B23.424) by British Commando units.

1.11 The Pillar artwork (EX: R18/R19/Q19 vertex) has been added for aesthetic purposes and only serves to denote those hexsides which are rowhouse hexsides (1.12, B27.31). The Pillars have no other game effects.

1.12 Hexsides containing Pillar artwork on each end (EX: R17/R18) contain rowhouse hexsides (B23.71) which extend the entire length of the hexside, thus bypass movement (B23.71) is not possible around the vertex while moving beneath the bridge. Infantry bypass movement in hexes adjacent to the bridge is not affected by these rowhouse hexsides in any way. These rowhouse hexsides may not be breached (B23.711) nor are they affected by rubble in either/both hexes sharing the hexside.

EX: The 6-4-8 in R18 cannot directly enter hex R17 (as illustrated by the red arrows) without first moving through hexes Q18 or S18. Bypass movement "around" the R17/R18/Q18 and R17/R18/S18 vertices is possible but only by doing so "in" hexes Q18 or S18 (as illustrated by the blue arrows in Q18). In this case, the 6-4-8 would be considered to be moving in Q18 for all purposes (minefield attack, Residual FP/Fire Lane, defensive fire, etc.) and LOS would be drawn to the appropriate bypass vertices. Note that the rowhouse hexside R17/R18 blocks LOS between the 6-4-8 in R18 and the 5-4-8 in Q17.

1.13 Hexsides Q15/R15 and S15/R15 are Hillside Walls (F10) and Cliffs (B11) [EXC: these hexsides may be crossed only via Scaling (B23.424)].

1.2

1.2 Level 1 Locations in Arnhem Bridge hexes are wide city boulevards (B7) [EXC: -1 TEM of B7.3 is NA vs same or lower-elevation fire if the target otherwise qualifies for Bridge TEM; B6.31]. Hex R23 is considered to be a Level 2 terrain feature for the purposes of E1.7 (Night LV modifier). Any unit entering hex R23 from off map is considered to have spent ≥ 4 MP in LOS of any viewing unit (assuming LOS exists at all).

1.21 PBF and Case L TH DRM are NA vs targets occupying Level 1 Locations in Arnhem Bridge hexes from fire originating from any lower elevation.

1.22 While occupying Level 1 Locations in Arnhem Bridge hexes which are also adjacent to ≥ 1 Level 1 building Location, OT AFV are always considered vulnerable (A7.211) to PBF small arms fire provided all firing unit(s) occupy adjacent building (or rooftop) Locations $\geq$ Level 1. Additionally, the normal CE DRM is reduced by 1 (to a minimum of +1) for such fire.³

EX: A German SPW 250/1 HT, with a 3-4-8 HS as a Passenger, moves on the bridge, entering hex R17. The PRC are BU. A British 6-4-8 at Level 1 in hex Q17 fires at the SPW 250/1. Since the HT occupies a Level 1 Location adjacent to a Level 1 building Location, the special provisions of 2.4 apply. Thus the PRC are vulnerable to fire even though they are BU. Additionally, since the CE DRM is reduced (by 2.4), the HT is considered unarmored (D5.311) to this fire.

1.3 Ground-level Locations in Arnhem Bridge hexes are one level Hindrances with a +1 TEM. These Locations are Inherent Terrain (B.6) and Concealment Terrain. Unless using the road hex (e.g., entering R15 from S16), Infantry enters such Locations at a cost of 2 MF, tracked vehicles do so at a cost of 3 MP, and non-tracked vehicles do so at a cost of 5 MP [EXC to all: all units pay normal MF/MP costs for rubble Locations beneath the bridge]. These Locations are not Burnable (B25.1).

1.31 Falling rubble (B24.12) can exist beneath the Bridge. Contrary to B24.121, falling rubble has no effect on the Bridge itself. Such rubble exists at ground level only. Falling rubble does not negate the Hindrance/Concealment-Terrain status of any ground-level Locations beneath the Arnhem Bridge.

EX: See the 1.22 example. The German player successfully places a DC in the ground-level Location of hex Q17. The Original Resolution DR is a 3 resulting in possible rubble Creation (B24.11). A subsequent dr of 1 places a stone rubble counter at ground level in Q17 and allows for the possibility of falling rubble (B24.12). The falling rubble Final colored dr is a 7 (white dr of 2), causing rubble to fall into hex R16. This falling rubble is placed at ground level (i.e., beneath the bridge). This rubble blocks LOS from Q16 to the ground level of T16, affects COT and Bog, but has no effect on the Level 1 Location of R16 or on the +1 Hindrance for LOS from Q16 to Level 1 of T16.

1.4 PEDESTRIAN ACCESS POINTS:² Units in R20 can move/advance to/from Level 1 as if using a stairwell (though no LOS exists; 1.1); B23.4.

2. THE RAMP⁴

2.1 The Ramp consists of the contiguous row of hexes R5–R14. The Ramp varies in height from Level 0 (R5 and R6) to Level 1 (R11–R14). Hexes R7–R10 are equivalent to Hillocks (F6.4 – 6.53) for purposes of LOS/LOF, elevation and MF/MP costs [EXC: Road MF/MP costs apply when crossing road hexsides in these hexes]. The Hillock effects begin with the artwork in hex R7 (i.e., hexside R6/R7 is at Level 0) and extend to the R10/R11 hexside (inclusive) (i.e., the R10/R11 hexside is a hillock hexside; the Crest Line for hex R11 is considered to lie at south edge of the R10/R11 hexside).

2.2 LOS: Units on the Ramp have no LOS to any Locations under the bridge. In season Orchards are an LOS obstacle between a unit on a Hillock and a unit at ground level (or $\geq$ Level one). Units in Bridge/Ramp Locations are treated as being at the same level as one another for all LOS between them.

2.3 MF/MP: Normal road MF/MP costs apply to movement along the ramp and/or bridge provided the units cross road hexsides. Additional MF/MP costs for changing elevations (A4.133, C10.4) are NA while crossing road hexsides on the Ramp and/or Arnhem Bridge.

2.4 All hexes of the Ramp are wide city boulevards (B7).

R

3. FACTORIES⁵

3.1 Each building on the *A Bridge Too Far* map that has ≥ 1 one road entering it is a Factory. Normal Factory (B23.74) rules apply to all ABtF Factories except as amended below.

EX: Building EE20 is a Factory due to having a road enter it in hex FF20. Building GG15 is a Factory due to having a road enter it in hexes HH14 and FF14.

3.2 VEHICULAR-SIZED ENTRANCE: A non-rubbled ABtF Factory Location that has a road entering it (EX: FF11) is considered a Vehicular-Sized Entrance (B23.742; see also R.3–R.3C).

3.3 FACTORY INTERIOR WALLS: A thick black bar covering a hexside (EX: EE11) or partial hexside (EX: BB17) in the interior of some ABtF Factories represents a massive interior wall similar to the black-bar hexsides of a Rowhouse (B23.71). It is considered to extend from the Base Level of the Location to the underside of the roof (even if, because of rubble, the roof itself does not exist).

EX: The Factory Interior Walls of a 1 1/2-Level Factory are 1 1/2 Levels high.

3.31 LOS: The black-bar depiction as well as the hexside itself (inclusive of vertices) lying within the building depiction, represents the Factory Interior Wall and blocks all LOS along/through it unless the viewing/viewed unit is at a Level $\geq$ the top of the Factory Interior Wall [EXC: Breach, 3.33; if rubbled, 3.34].

3.311 FACTORY NVR: In a Night scenario, a (non-rooftop) unit in a Factory tracing its LOS completely within that Factory building's depiction always has its NVR to Locations of that building limited to the first Location its LOS enters.

3.32 MOVEMENT: A ground-level unit may move/rout/advance/Withdraw-from-Melee across a Factory Interior Wall only via "bypass" (as per B23.71) along an exterior vertex (i.e., one "outside" the Factory building depiction) or via a Breach (3.33).

3.33 BREACH: A Factory Interior Wall, even if part of a Fortified Building Location, may be Breached by a DC as per B23.711, or by any AFV using the mechanics of B9.541.

3.331 EFFECTS: Once a Factory Interior Wall has been Breached, that hexside's effects remain unchanged except as follows:

- units may move/rout/advance/Withdraw-from-Melee and same-level (only) LOS may be drawn, across it as if it were a wall (exclusive of its vertices, whose status remains unchanged by the breach);
- the Inherent FP (only) of a unit/FG firing through such a Breached hexside is halved as Area Fire if the total US# of the unit(s) currently firing (a Leader directing fire through a Breach does not add his US# for this calculation) is ≥ 3 ; only one Gun (whether vehicular or not) per Location may fire through such a Breached hexside per Game Turn;
- such a Breached hexside may be crossed only if the total US# of all units that have crossed it during the current phase, plus the US# of the unit currently wishing to cross it, is ≤ 5 .

3.332 OB/CG SCENARIO PURCHASE:⁶ The British player may purchase Breaches using available FPP during the RePh. Such Breaches (or ones listed as part of the British initial OB during ABtF scenarios) may be set up in Front Line Locations, including Rowhouse hexsides, are secretly recorded, and are revealed as if they were tunnels (B8.61).

3.34 RUBBLE: Rubble has no effect on a Factory Interior Wall black bar unless both hexes sharing the hexside are rubbled, in which case the Factory Interior Wall ceases to exist along that hexside.

3.4 GUNS: All categories (C2.2) of Guns may set up in an ABtF Factory. A Gun may enter/exit an ABtF Factory via a Vehicular-Sized Entrance (using the Entrance's movement benefits) or via another non-Interior hex of that Factory [EXC: B23.93]. However, entry/exit via a non-Vehicular-Sized Entrance is allowed only if being pushed (C10.3), in which case both normal building-entry Infantry MF costs and that Factory hex's TEM apply as Manhandling DRM, even if exiting that Factory.

R

5.3

4. CELLARS⁷

4.1 All multi-hex, non-Factory buildings depicted on the *ABtF* map contain a Cellar Location beneath their ground-level Location (i.e., at *building Level -1*). A Cellar Location is considered the equivalent of another non-rooftop building Location in that hex (even for falling rubble [B24.12] and Victory Condition purposes) except as specified otherwise. The Cellar Level is ignored when determining the Base Level of a building hex.

4.11 TEM: Cellar Locations have a TEM of +3. Cellar Locations may be Fortified. Cellar Locations are ignored for the purposes of B23.912 (i.e., the Cellar need not be fortified to fortify the ground-level Location).

4.12 STACKING: A Cellar Location has a normal stacking limit (A5.1) of two squad-equivalents (A5.5) plus up to four SMC. Overstacking may occur [EXC: NA during setup (A5.1); see also 9.6214], but no unbroken, armed unit/stack may enter an already overstacked Cellar Location if its entry would increase the squad-equivalency therein.

4.2 ENTRY: Only Infantry/SW may set-up-in/enter a Cellar, and their presence therein is indicated by placing them beneath a Cellar counter. Infantry may enter/exit the Cellar level only via a Stairwell or a "connecting" Trench. Infantry already in a Cellar may directly enter an adjacent Cellar Location only if the two hexes involved share a common non-Rowhouse [EXC: unless Breached; B23.711] *building* hexside.

4.21 All Trench "connections" (see SSR ABtF 17) "open into" the Cellar Level if it exists in that hex [EXC: if the ground level above the Cellar has been rubbled; 4.6]; otherwise Trench rules apply unchanged.

4.3 LOS: Infantry in a Cellar tracing LOS *outside* of their building to a non-ADJACENT Location do so as if entrenched at ground level (B9.21), and trace LOS to an ADJACENT Location in the normal manner (B23.25, B8.2). There is no LOS between adjacent Cellar Locations across a Rowhouse black bar hexside [EXC: if Breached; B23.711]. For the purposes of Height Advantage TEM (B10.31) and Night LV (E1.7) applicability, Cellar Locations are considered to be at Level 0.

4.4 FIRE EFFECTS: The *Inherent* FP of a unit/FG in a Cellar is halved as Area Fire if the LOF leaves their building's depiction and is *not* traced to an ADJACENT Cellar Location, and the US# of the unit(s) *currently* using such Inherent FP is ≥ 3 (A Leader directing fire from a Cellar Location does not add his US# for this calculation). Otherwise, a Cellar Location has no effect on the use of SW/Inherent-FP other than those normally caused by being fired from within a building. A DC may be Thrown from a Cellar Location only to an ADJACENT Location.

4.41 SMOKE: SMOKE at ground level in a Cellar hex affects different-level fire to/from the Cellar Location normally. The extra +1 Hindrance for outgoing fire (A24.8) is NA and fire between ADJACENT Cellar Locations is unaffected.

4.5 BLAZE SPREAD: A Blaze may spread to/from a Cellar Location only from/to an ADJACENT Location.

4.6 RUBBLE: A Cellar Location can be rubbled like any other building Location. If a Cellar Location is rubbled, it and all other building Locations in the hex cease to exist and the appropriate rubble counter is placed at *ground level* in that hex. All occupants and weapons are eliminated, as is its Fortified Building status (if any), and an AFV can no longer fall into it (4.62, B24.4). If the ground-level Location above a Cellar is rubbled, the appropriate rubble counter is placed at ground level on top of a Cellar counter. The Cellar Location beneath such still exists, but all LOS out of that Location across a non-building hexside is blocked. Trenches no longer "connect" to a Cellar Location if the ground-level Location above it has been rubbled.

4.61 Stairwell: A stairwell between the Cellar level and ground level is affected in the normal manner if that ground-level Location is rubbled (B24.4).

4.62 COLLAPSE: The B23.41 cellar rules apply unchanged to a Cellar [EXC: an AFV falls into a Cellar if the Original colored dr of the Bog Check is ≥ 5]. If the crew of such an AFV survives, it may immediately attempt to Scrounge the AFV and the crew is then placed in the Cellar Location instead of at ground level (even if its placement would cause the Cellar Location to be overstacked). In all cases the AFV is eliminated and leaves no wreck. Each Infantry unit in such a Cellar Location must take an immediate NMC; if it fails this NMC a dr (Δ) must then be made for each SW it possesses; a 6 eliminates that SW and 4-5 malfunctions it. The removal of an AFV for falling into a cellar in a single hex building does not create a Cellar in that hex.

4.7 ENCIRCLEMENT: The principles of A7.72 (Upper Level Encirclement) do not apply to Cellar Locations; i.e., a unit in a Cellar is not Encircled merely by having no exit to ground level.

5. THE BLOCKHOUSE⁸

5.1 Hex R21 ordinarily contains a Blockhouse counter at Level 1. The Blockhouse is the equivalent of a standard 2+5+7 Pillbox except as indicated. The Blockhouse has a 360° CA. Units in the Blockhouse have LOS to lower elevations only through the R21/R20, R21/Q21 and R21/Q22 hex-

sides. Units in the Blockhouse have LOS to units in the same hex. The Blockhouse is considered a valid Friendly Setup Area to the side which Controls it (see 9.6052). This pillbox and its contents would never be automatically HIP (though HIP for its contents could be purchased during a CG Scenario via FPP).

5.2 RUBBLE: If destroyed (B30.92), replace the Blockhouse counter with a stone rubble counter at Level 1 in hex R21. Such rubble exists *only* on the Bridge (i.e., at Level 1) and does not "fall" to ground level. Falling rubble (B24.12--121) from the Blockhouse is NA. Once this rubble is placed, the Level 1 Location in hex R21 is considered fallen rubble for all purposes [EXC: 5.21 Movement Effects] and no hexside of the Level 1 Location of R21 is considered a Road hexside until cleared. Rubble from the destroyed Blockhouse is a half-level obstacle to any LOS/LOF which lies within the bridge artwork in hex R21 and may be cleared (B24.71) with an additional cumulative -1 DRM. Once a TB exists across the R20/R21 and R21/R22 hexsides, remove the rubble counter completely. From that point on, hex R21 is considered a normal Arnhem Bridge hex (i.e., the Blockhouse no longer exists) [EXC: Movement effects; 5.21].

EX: Assuming rubble from the Blockhouse is in hex R21, a unit on the roof in hex Q20 has clear LOS to a unit on the bridge in hex R22, since the unit can see "over" the rubble. However, the same unit on Level 1 in Q20 would not have LOS to the Level 1 Location of hex R22 since the LOS crosses through the bridge artwork in hex R21. Thus the rubble serves as a half-level LOS obstacle.

5.21 MOVEMENT: Once rubble has been placed on the bridge from the destruction of the Blockhouse (even if subsequently cleared), Infantry units may enter the Level 1 Location of R21 at a cost of 2 MF [EXC: rubble has no additional effect on units Scaling any vertex of hex R21; B23.424]. Fully tracked vehicles enter at a cost of 3 MP while other vehicles pay 1/2 of their printed MP Allotment. The D2.11 and D3.51 doubling for TCA/VCA changes are NA and no Bog Checks are required for movement or VCA changes.

5.22 Hidden mines may be placed at Level 1 in hex R21 while rubble exists from the destroyed Blockhouse. Should the rubble be cleared (5.2) while there are hidden mines, place a Known Minefield counter of the appropriate type and strength in the Level 1 Location of R21. Such mines are then treated as Known (F.7) for all purposes [EXC: Dummy minefields are NA; F.7B].

5.3 TEM: The CA TEM of the Blockhouse applies to all Direct Fire attacks [EXC: FT, AP Ammunition; B30.35]. Indirect Fire attacks use the NCA TEM. Once destroyed, normal stone rubble TEM applies until cleared.

EX: A German 150mm FFE scores a CH (C3.7) vs the Blockhouse. Since the OBA is ≥ 100 mm, the Blockhouse is eliminated (B30.92). A stone rubble counter is placed in hex R21. This rubble exists only "on" the bridge (not under it). Assuming the British player Controlled the Location at the end of the CG Scenario, he could set up hidden mines (if otherwise allowed by RePh Setup restrictions) at Level 1 in hex R21. Clearing the rubble is possible as normal except that a cumulative -1 DRM applies and only a single successful clearance attempt is required to completely remove the rubble counter (B24.71). Should the rubble be cleared, any mines previously set up in the bridge Location of R21 are immediately placed onboard as a Known minefield. From the point of clearance on, R21 is considered a standard Arnhem Bridge hex and the Blockhouse, except for movement effects (5.21), is considered to have never existed.

5.3

6. UNIT REPLACEMENT⁹

6.1 Due to the unique unit structure and experience levels of the troops that fought in Arnhem, special unit replacement applies for MMC of both sides. A19 is modified as follows for all non-crew MMC. Assault Engineer (H1.22) ELR is always 5 [EXC: E1.22] and their Morale Number is always considered underlined.

6.2 SS UNIT REPLACEMENT: The progression for all SS MMC subject to Replacement is shown below. The Morale Number of SS MMC is never considered underlined for any purpose [EXC: Assault Engineers; 6.1]. All German non-crew MMC that Battle Harden follow the reverse of this order.

6.21 SS 4-4-7s/2-3-7s are considered Elite (A1.25). Any SS MMC Replaced with a conscript MMC is considered Inexperienced (A19.3) for all purposes and is no longer considered SS (A25.11). All German 4-3-6s/2-2-6s become SS 4-4-7s/2-3-7s when they Battle Harden.

6.3 BRITISH UNIT REPLACEMENT: All British MMC are considered to have an underlined Morale Number (A1.23) until such time that the British ELR drops below 5 [EXC: Assault Engineers; 6.1]. During any scenario (or portion thereof) in which the British ELR is not 5, treat all non-crew British MMC [EXC: Assault Engineers; 6.1] as having a non-underlined Morale Number and apply the illustrated progression to British MMC subject to Replacement. British 4-4-7s/2-3-7s which Battle Harden always improve to 4-5-8s/2-4-8s (which Replace normally).

6.31 COMMANDO REPLACEMENT: British Commando MMC (9.617; H1.24) which suffer Replacement while the British ELR is < 5 (i.e., Replaced by a 4-4-7/2-3-7) are no longer considered Commando for any purpose (even if subsequently subject to a Battle Harden result).

EX: A German stack consisting of a 9-1, a 4-4-7, and a 4-3-6 is fired on by a British 6-4-8 and 4-4-7 resulting in a 1MC. The German ELR is 2. The 9-1 passes the 1MC with a DR of 5. The 4-4-7 fails its 1MC with an original DR of 11 and is Replaced with a broken 4-3-6. This 4-3-6 is no longer considered to be an SS squad. The remaining 4-3-6 rolls an original 2 DR and thus is subject to HOB. The 4-3-6 HOB DRM is +1 for being inexperienced. The final HOB DR is an 8 resulting in the 4-3-6 Battle Hardening to a 4-4-7 SS MMC. Note that the resultant 4-4-7 is now an SS squad (even if it was not so originally).

The German return fire results in a 3MC. The British ELR is 4. The 6-4-8 fails with an Original 11 MC DR. The 6-4-8 is Replaced with a broken 4-4-7 (had the 6-4-8 been an Assault Engineer squad, or had the British ELR been 5, it would instead have been Replaced by two 3-3-8 HSs). The original MC DR for the 4-4-7 is a 2, resulting in HOB. The 4-4-7 Battle Hardens and is replaced with a 4-5-8.

R

7. WIDE CITY BOULEVARDS¹⁰

7.1 Any road hex containing a slightly enlarged, black center dot (EX: F12) is a wide city boulevard (B7). All rules for wide city boulevards apply unchanged in these hexes. Street Fighting (A11.8) and Dash (A4.63) are NA "across" a wide city boulevard.

8. PARTIAL ORCHARDS

8.1 Partial Orchards allow for tree-lined roads (akin to B14.6) to exist, but with the trees generally on only one side of the road. Any whole hex containing only two round, green orchard symbols is a Partial Orchard hex. Hex M15 is an example of a Partial Orchard hex. All rules pertaining to Orchards apply to Partial Orchards unless otherwise stated.

8.2 LOS: The orchard obstacle/hindrance of a Partial Orchard hex is not Inherent Terrain. A Partial Orchard's effect on LOS/LOF is determined by which of the Partial Orchard's hexsides/vertices are crossed by that LOS/LOF. The three contiguous hexsides closest to the hex's orchard symbols (including the two vertices joining them together) are termed Orchard Hexsides; the three hexsides farthest from the hex's orchard symbols (including their four vertices) are termed Open Ground Hexsides. If a LOS crosses one or more of the Partial Orchard hex's Orchard Hexsides, that hex is treated as an orchard hex; for LOS crossing only one or more Open Ground Hexsides, that hex is treated as an Open Ground hex.

8.21 Since Partial Orchard hexes are not Inherent Terrain, the orchard obstacle/hindrance in them is treated as Inherent Terrain for LOS along a hexside that is common to two Partial Orchard hexes only if that hexside is an Orchard Hexside for both of those hexes.

8.3 MOVEMENT: For movement purposes when entering a Partial Orchard hex, units are considered to be entering an Orchard hex if they cross an Orchard Hexside, and entering an Open Ground hex if they cross an Open Ground hexside [EXC: OBA, Residual FP and TPBF are resolved as though any target was entering an Open Ground hex regardless of hexside crossed].

8.31 RIDERS: AFV Riders may only enter/exit a Partial Orchard hex across an Open Ground hexside [EXC: if crossing a road hexside; D6.21].

8.4 Partial Orchard hexes are not considered Concealment Terrain for any purpose.

9. A BRIDGE TOO FAR CAMPAIGN GAMES

9.1 INTRODUCTION: A Bridge Too Far Campaign Games offer two or more players a series of interrelated scenarios pertaining to the 2nd Parachute Battalion's grim struggle during September of 1944 in the area surrounding the main road bridge in Arnhem, Holland. Up to four scenarios may be played per "day" with CG Victory determined only at CG end [EXC: Sudden Death Victory; 9.6212] by how well the players fared during this variable number of scenarios.

9.11 BETWEEN SCENARIOS: Between Campaign Game (CG) Scenarios, players make use of a special CG phase called the Refit Phase (RePh), wherein each side takes stock of what has happened and prepares for further combat in the next CG Scenario. In the RePh, the players may receive reinforcements, while they may also purchase Reinforcement Groups (RG) using Campaign Purchase Points (CPP). Reinforcement Groups in the form of infantry platoons (and sections), AFV platoons, OBA modules, and gun batteries—to name a few—may be selected by the players.

9.12 CASUALTIES: Casualties suffered in a CG-Scenario/its-subsequent-RePh must be placed aside since their Casualty VP (A26.2) total is used to determine a DRM for ELR Loss/Gain (and possibly CG Victory Conditions). The Casualty VP value of a unit unable to be removed (e.g., wrecked AFV) should be noted on scrap paper.

R

9.13 TEAM PLAY: The CGs herein (9.51–.53) are easily adapted—indeed, recommended—for team play (EX: one player commands all of the British forces and the others command the various German KG elements, etc.). If desired, an overall commander may determine which RG his subordinate players will receive, assigning each to the one who requires it most.

9.14 CG ROSTER & RG PURCHASE RECORD: The enclosed printed copies of the “CG Roster” and “RG Purchase Record” should be photocopied and used by CG players to record important CG information. See RePh step 9.617 for information on updating the CG Roster; see 9.618 for specifics on the RG Purchase Record.

9.15 CHAPTER R DIVIDER: The Chapter R divider provides a handy reference for Block Locations and designations. Additionally, holding boxes are provided for Retained units of both sides as well as a casualty box for the British Walking Wounded.

9.2 DEFINITIONS & ABBREVIATIONS: The following glossary explains abbreviations and important terms used frequently in *ABtF* Campaign Games.

ABtF: A *Bridge Too Far* ASL Module.

Block: All Locations contained entirely within a series of adjacent map-edge/river-bank hexes and/or road hexes sharing a road hexside. The Chapter R Divider contains a reduced size map indicating the various Blocks and their boundaries. Players are encouraged to refer to this diagram when determining Setup Areas during the RePh (9.605).

Campaign Exhaustion DRM: Abstract DRM (9.6162) for RG Strength (9.6181), ELR Loss/Gain (9.6202), and British Ammunition Shortage (9.6201) determination.

CG: Campaign Game

CG Date: Each CG Date consists of the calendar date plus a Dawn (AM), Afternoon (PM), Evening (Eve), or Night (N) reference (e.g., “18 Eve”). One CG Scenario may be played per CG Date—hence up to four CG scenarios may be played per calendar day: one at dawn (AM), one in the afternoon (PM), one in the early evening (Eve) and one at night (N).

CG End: The CG Scenario End (see CG Scenario End definition below) that occurs on the final CG Date listed in 9.51 – .53 for that CG is also the CG End (i.e., is the end of the CG). If one side concedes CG victory, the CG Scenario End that occurs at the conclusion of the final CG Scenario played in that CG is also the CG End. CG Victory is determined at CG End unless already decided by Sudden Death Victory (9.6212).

CG Night Scenario: Any CG Scenario taking place on a CG Date with an “N” in the CG Date (EX: 19N).

CG Roster: The sheet used to record information for each CG Date. One line is filled out for each CG Date. Players are urged to photocopy the facsimile provided herein.

CG Scenario End: Occurs when both the CG scenario being played and the ensuing RePh step 9.603 have been completed.

CPP (Campaign Purchase Points): Used to buy RG in RePh step 9.617.

Depleted: A RG not received at Full Strength.

Eliminated: Units/Equipment “Eliminated” in a CG are removed from that side’s OB.

Enemy Setup Area: All Locations in ≥ 1 enemy Controlled Block(s) (see also 5.1).

Enterable: A hex/Location that the unit in question could enter (disregarding its occupation by a Fortification/enemy-unit) during a hypothetical MPh/APh. If defined in relation to a Setup/Entry Area (or to a “path” of hexes drawn to/from/between such), the hex/Location must be Enterable along that path. Terrain-Blaze Locations and river Locations are not considered Enterable.

Entry Area: Each map-edge hex that contains a large arrow with a red, grey, grey and black, or black background color, plus each mapedge hex within four hexes of that hex [EXC: KG Graebner’s Entry Area is limited to hex R23].

Equipment: Any (non-inherent) SW/Gun/Vehicle/Daisy-Chain that can be part of a side’s OB. Any counter that can be Portaged/driven/Manhandled about on the map.

Escape: The process (9.6054) by which a unit attempts to leave an Isolated area (9.6053).

FPP (Fortification Purchase Points): Used to purchase Fortifications in RePh step 9.619.

Friendly Setup Area: All Locations in ≥ 1 friendly Controlled Block(s) (see also 5.1).

Front Line Location: Any road hex adjacent to both a Friendly Setup Area and an Enemy Setup Area, or any Location in a Friendly Setup Area adjacent to one/more Front Line road hexes [EXC: the Blockhouse (or the resultant rubble if destroyed; 5.2) is never considered a Front Line Location].

Full Strength: A RG received *in toto*.

Initial Scenario: The first scenario of a CG (see 9.5). A CG’s Initial Scenario gives each side’s setup/entry restrictions, starting OB (including certain predetermined

RG and a pool of CPP to spend on additional RG), and any SSR applicable only to that Initial Scenario.

Idle Date: A CG Date in which both sides have picked an Idle chit (meaning that no scenario is played); 9.62132.

Kampfgruppe (KG): A German unit organization. There are four German KGs in *ABtF*: Harder (H), Knaust (K), Brinkmann (B), and Graebner (G).

OB (Order Of Battle): All the units, Equipment and Fortifications of a side that are eligible to participate in the next CG Scenario. Includes all Retained units and Equipment, plus all RG purchased since the last CG Scenario.

Pltn (platoon): A CG Infantry or AFV RG organization type.

RePh (Refit Phase): The series of steps performed between CG Scenarios. All Chapter R rules beginning with “9.6” are *ABtF* CG RePh rules/steps.

Retained: All units/Equipment in a side’s OB that are available for on-map/off-map setup in the next CG scenario; i.e., all that remain available from the last CG scenario, all RG purchased since the last CG Scenario but prior to the current CG Scenario, and all CG designated reinforcements (including Walking Wounded; SSR CG 19).

RG (Reinforcement Group): Usually a number of units/Equipment purchased, as a group, for use in the CG as additions to a side’s OB. Also includes FPP, SAN increase, OBA, Pre-Registration, and Offboard Observers.

RG Purchase Record: The sheet used to record the units-in/information-for each CG RG type. One line is filled out for each RG purchased. Players are urged to photocopy the facsimile provided herein.

Sect (Section): A CG RG organization type.

Setup Area: Each Location within a Block Controlled by a side. Road hexes [EXC: The Blockhouse; 5.1] and Uncontrolled Territory are never considered part of a Setup Area though some units may be permitted (or required; 9.6053) to set up in such Locations; 9.6214.

Shift: The RePh process by which a Retained unit attempts to transfer from its current Setup Area to another Friendly Setup Area or Eligible Entry Area; 9.613.

Strategic Location: Each (non-rooftop) building/rubble/Entrenchment Location and each Location that is occupied by an unhooked, non-malfunctioned, unlimbered Gun, is a Strategic Location. If an unhooked, non-malfunctioned, unlimbered Gun is used to declare a Location as a Strategic Location (when that Location would not otherwise be so), that Gun (owner’s choice if more than one is present) must be manned by a (fully qualified; A21.13) crew and must set up in that Location for the next CG Scenario. Strategic Location Control is important for Block Control and Setup Area determination (9.605).

Strength: An Infantry RG is received either at Full or Depleted Strength.

Uncontrolled Territory: All Locations not contained within a Friendly or Enemy Setup Area.

Weapon: Any SW/Gun/Vehicular-armament/Daisy-Chain using the IFT/TH table(s) to cause damage to the opponent.

9.3 THE CG SCENARIOS: The parameters of the Initial Scenario for each CG are given in 9.51–9.53. Additional scenarios for that CG are generated in a special between-CG Scenario sequence called the Refit Phase (RePh); 9.6. The CG continues until the specific CG Victory Conditions are fulfilled by one side or the completion of the last CG Scenario of that CG, whichever comes first. The “start lines” (or, Setup Areas, to use the game term) in a CG scenario are determined by Locations Controlled by both sides at the end of the last-completed CG Scenario (thus determining the Blocks they Control during the RePh).

9.31 CG BALANCE PROVISIONS: Should each player wish to play the same side (A26.5) the following Balance is used:

German: Each German Personnel counter possessing a FT/DC or manning a Gun is Fanatic.

British: Each British Infantry unit in a Fortified Building Location is Fanatic.

9.4 CAMPAIGN GAME SPECIAL RULES: All *ABtF* CG SSR below apply in all CG scenarios.

CG1. MAP: The entire *ABtF* map is used in all CG Scenarios.

CG2. ABtF SSR: All *ABtF* SSR are in effect except as amended below.

CG3. WEATHER: EC, Weather, and Wind Force (and direction, if necessary) for each CG Scenario are determined in RePh step 9.6216 [EXC: for each Initial Scenario they are listed in that scenario’s specific SSR].

CG4. GAME END: The Turn Record Chart for all CG scenarios is located in the river portion of the *ABtF* map (the southwest corner). All CG Scenarios have a variable game length. At the end of Game Turn 5, and at the end of each Game Turn thereafter, the British player makes a Game End dr: if it is $\leq$ the circled number in the current turn’s box on the *ABtF* CG Turn Record Chart, the scenario ends immediately (e.g., at the end of Game Turn 6 a day scenario will end on a Game End dr of ≤ 3). There

CG 4

is a +2 dr to this dr during CG Night Scenarios. Additionally, a CG Scenario ends immediately if both the ATTACKER and DEFENDER agree to end the scenario.

CG5. GUNS: A Gun set up in a Pillbox or Fortified Building Location may never be moved during the course of that CG [EXC: if dm/eliminated]. Such a Gun, once revealed, may never again set up hidden, but may be set up concealed. Otherwise, provided it sets up within a Friendly Setup Area, an Emplaced Gun (only) may set up hidden (at no cost in FPP) in CG Scenarios. Each non-vehicular Gun that ended the last CG scenario on-map must set up within three hexes of the Location in which it ended that scenario [EXC: within two hexes if it sets up in Uncontrolled Territory; 9.6214] unless it meets one or more of the following criteria (in which case it may set up in any enterable Location in a Friendly Setup Area):

- If it is a dm MTR
- If it begins the CG Scenario hooked up to a Mobile vehicle
- If an Idle Date has been generated since the last CG Scenario played

Each Gun in a Setup Area that contains Personnel may be set up (un)hooked/(un)limbered/(non-)dm unless otherwise prohibited.

EX: Assuming Block H was under friendly Control, a Gun which ended a CG Scenario in O5 could set up anywhere within Block H which was also within three hexes of O5. The Gun could also set up in the hexes marked with a blue "X" (provided the hexes were Uncontrolled Territory). Note: should the Gun set up in any of these hexes, it could not do so using HIP since none of these hexes are within a Friendly Setup Area. The Gun could not set up in the hexes marked with a red "X" as it could not be Emplaced in these hexes (see 9.6214). A mobile vehicle in O5 could also set up in hexes marked with a red "X".

CG6. OBA: The Germans are limited to using a maximum of two OBA modules per CG Scenario. The British are limited to three OBA modules per calendar day (i.e., no more than a total of 3 modules over the 4 CG Dates of a calendar day) with no more than 1 module per CG Scenario. "Usage" of a module is defined as having a radio, field phone, or Offboard Observer in play at any time during a CG Scenario. A radio/field-phone counter (and its associated OBA module) is immediately Eliminated when its OBA is exhausted, or in the RePh if its OBA was "used" as per SSR CG 10 in the previous scenario. On an OBA RGs CG Date of purchase, its radio or field phone is placed with Personnel in any Friendly

R

Setup/Entry Area [EXC: field phones may be used only by the German player, and only if they set up on-map]. Each field phone's Security Area (C1.23) must comprise Enterable (by Infantry) Locations that are not within an Enemy Setup Area, and must be drawn to a Friendly Entry Area. A new Security Area may be recorded for each CG Scenario. If no legal Security Area can be traced during setup, that field phone is Eliminated but the player may immediately add a new radio or field phone (for the Eliminated phone's OBA module) to some other Friendly Setup (or, for the radio, Eligible Entry) Area.

CG7. TERRAIN CHANGES: During the course of the same CG, alterations of printed mapsheet terrain are bound to occur, all of which become "permanent" (barring subsequent Clearance/Removal if applicable). All counters for Fortifications, rubble, Breaches, TB, shellholes and wrecks are left on-map from scenario to scenario. Any terrain Blaze at scenario end is resolved as per RePh 9.609. A wreck in a non-building terrain Blaze is not removed from play; instead, it remains on-map (still treated as a LOS Hindrance) and in step 9.6095 of the next RePh will become a Burnt-out Wreck (see SSR ABtF 14).

CG8. SNIPERS: Due to the widespread sniper activity, each side must place two Sniper counters on the map at the start of each CG Scenario. Both friendly Snipers must set up as per the first two sentences of A14.2, with ≥ 12 hexes between them (or as far apart as possible if they cannot set up 12 hexes apart). When a Sniper attack can occur, make a dr to randomly determine which one actually attacks (assign numbers so that each has an equal chance). This procedure is also used when resolving Civilian Interrogation (see SSR ABtF 7). The SAN is never altered by the presence of two friendly Snipers in play simultaneously. Any result (e.g., Pin) affecting a Sniper counter affects both friendly Snipers simultaneously.

CG9. REINFORCEMENTS: All Infantry/AFV RG purchased for the current CG Scenario [EXC: those allowed to set up on map], as well as all units currently Retained off-map, must enter on/after Turn 1 [EXC: CG Night Scenarios; SSR CG 24] during the first non-Idle CG Date following their purchase (or, for units that are Retained off map, the CG-Scenario/RePh during which they exited the map). Some, all or none (including individual RG units) may enter on each turn but any failing to do so prior to the end of the CG Scenario are considered Eliminated with full CVP awarded.¹¹

BRITISH INFANTRY/AFV RG: Enter at any red Entry Area (centered on hexes A6 and A18).

GERMAN INFANTRY/AFV RG: RGs from KG Harder enter at any grey entry area (centered on hexes A5 and A17). RGs from KG Knaust enter at any grey and black entry area (centered on hexes F0, M1, V0, and GG1). RGs from KG Brinkmann enter at any black entry area (centered on hexes JJ4, JJ15, and JJ20). Units of KG Graebner enter from the south edge on Hex R23 (only).

CG10. RETAINED RG: Each purchased RG, or part thereof (including any Pre-Registered-hex(es)/Offboard Observer assigned to an OBA RG), is Retained until Eliminated/Recalled in a CG Scenario or its subsequent RePh. For purposes of this rule, an OBA RG is considered "used" if $\geq$ one FFE:1 counter from that module was placed during the last scenario. A Retained OBA module's Draw Pile (C1.211) is restored to the number of red and black chits it had at the start of the previous scenario, and its radio or field phone is restored if it was Eliminated. During the RePh, each radio/field-phone may be freely relocated within its present Setup Area, or Shifted (9.613), and each Pre-Registered hex of a Retained OBA module may have its hex coordinate changed to that of a legal new hex.

CG11. MAP EXIT: No units may exit the map during play [EXC: Recall (SSR ABtF 15); German Guards (A20.5) may exit with their prisoners along the north, east, west map edges, or at hex R23 and are Retained in any Entry Area on that map edge].

CG12. CONCEALMENT: The following CG SSR replaces SSR ABtF 1. All Infantry (and their possessed Weapon[s]) setting up in Concealment Terrain may do so concealed, regardless of LOS. Such concealment need not be purchased; i.e., they are placed freely. Otherwise, A12.12 and A12.34 apply. The side setting up first may conceal all eligible units before the other side views its setup; likewise, the side setting up second may conceal all eligible units before his opponent views that setup. Concealment counters purchased in the RePh (9.619) are intended for use as Dummies.

CG13. MISCELLANEOUS: A 5/8" counter set up beneath a Trench counter (as per B27.51) may never be removed from below that counter unless dm [EXC: if Eliminated]. Exchange of Fortified Locations for tunnels is NA.

CG14. SELF RALLY: Each side may attempt to Self Rally two (not just one) non-Disrupted, broken MMC provided (as per A18.11) both attempts are carried out before other friendly MMC Rally attempts.

CG15. OPTIONAL VEHICULAR EQUIPMENT: All desired optional armament (e.g., AAMG, Sz) must be rolled for individually (H1.41). Consult the applicable Vehicle Note(s). If so equipped, no additional CPP cost is assessed.

R

CG16. WEAPON REMOVAL: A Retained/Purchased vehicle may begin (i.e., set-up/enter) a CG Scenario with any/all eligible armament Removed (D6.631).

CG17. BRITISH AMMUNITION SHORTAGE: The British suffer an increasing shortage of ammunition. The starting level of shortage is designated by SSR. The levels and penalties are shown in the chart below. These penalties apply only to British Retained/Purchased SW/Guns excluding all radio, DC/FT, and captured equipment and are cumulative with A21-21.22 as applicable.

AMMUNITION SHORTAGE CHART

LEVEL	ORIGINAL DR FOR UNIT SUBSTITUTION (A19.131)	B#†	ELR LOSS DRM (9.6202)
One	12	0	+1
Two	12	-1	+2
Three	≥ 11	-1	+3
Four	≥ 11	-2*	+4
Five	≥ 10	**	+5

† SW/Vehicle/Gun B#s reduced by the indicated amount per A19.131

* No British SW/Gun repair attempts may be made during the CG Scenario (but may be done normally in the RePh). British may not use Intensive or Sustained Fire [EXC: OVR Prevention/FPF; C5.64, A8.31]. ATMM Check dr (see SSR ABtF 6) receive an additional +1 drm.

** All SW/Guns automatically malfunction after their first use. No British SW/Gun repair attempts may be made during the CG Scenario (but may be done normally in the RePh). British may not use Intensive or Sustained Fire [EXC: OVR Prevention/FPF; C5.64, A8.31]. ATMM Check dr (see SSR ABtF 6) receive an additional +2 drm.

EX: Assume Ammunition Shortage Level Two is in effect. A British PIAT will malfunction on an original TH DR of 9 and be permanently removed on an original TH DR of ≥ 10 (A.11). A British 6pdr AT Gun has a circled B# of 11 and will likewise be permanently removed on an original TH DR of 12 (A.11). A captured German DC would malfunction on an original 10-12 (A21.11) but is not otherwise subject to the CG 17 penalties.

CG18. STATUS MARKERS: During its Setup, each side may opt to secretly record the BU, CE, TCA, Bogged, immobilized, Abandoned, malfunctioned, and/or disabled status of its vehicles/Guns in lieu of placing the appropriate marker(s) on them. Place the actual marker(s) when the piece is non-concealed and within 16 hexes of any enemy ground unit which has LOS to it.

CG19. WALKING WOUNDED (WW) MMC:¹² Each RePh, the British player may replace a portion of Eliminated British MMC with Walking Wounded MMC. During play, each British MMC, regardless of type [EXC: WW MMC], removed due to "Double Break" (A10.3), Casualty MC (A10.31), or Fate (A10.64) should be placed in the WW box on the Chapter R Divider. In RePh step 9.6102, for each squad-equivalent (FRD) in the WW box, the British player receives one 4-4-7 MMC in any Friendly Setup Area(s) (unused MMC are discarded and may not be accumulated from one CG Date to the next). Each such 4-4-7 should be marked with a "Walking Wounded" counter to reflect its status. A WW MMC has a 3 MF allotment which cannot be increased for any reason, including while Routing or Berserk [EXC: while being carried by any form of conveyance], its IPC is reduced to 2, and it receives a +1 DRM for all CC attacks it makes while all CC attacks made against it receive a -1 DRM. Under no circumstances may a WW MMC become unwounded. A HS created from a WW squad is marked with a Walking Wounded MMC counter and suffers all the penalties associated with that status. A SMC created by a WW MMC is not considered WW. Two WW HS may Recombine into a WW squad per A1.32. If a non-Wounded HS and a WW HS Recombine, the resulting squad is considered WW and is marked as such. HoB (A15) and Substitution (A19) are handled normally for WW MMC (see also 6.3). WW effects are cumulative with Ammunition Shortage (CG SSR 17) and Water Shortage (CG SSR 21). WW Morale Numbers are never considered underlined (A1.23).

EX: The British player has two 6-4-8s, a 4-5-8, a 2-4-8, and two 3-3-8s in the WW box during the RePh. He may now place four 4-4-7s, each marked with a WW counter, in any Friendly Setup Area(s). The remaining HS in the WW Box is removed from play (no CVP are awarded when this MMC is "discarded" as its CVP was tallied during play).

CG20. DAWN/DUSK: A +1 LV Hindrance applies to all non-CC attacks for the first three Game Turns of any Dawn (AM) CG Date and during Turns 4-7 (as applicable) of any Evening (Eve) CG Date.

CG21. BRITISH WATER SHORTAGES:¹³ The British troops suffered a critical shortage of fresh drinking water. Beginning on the 20AM CG Date and each CG Date thereafter, the following restrictions apply to all British Personnel units [EXC: during any CG Scenario in which rainfall occurs (E3.51) for 3 or more consecutive Player Turns, Water Shortage restrictions are removed for the remainder of that CG Scenario and the immediately following CG Date (only); if an Idle CG Date is generated during RePh Step 9.62132 for this CG Date, the Water Shortage Penalties resume with the next non-Idle CG Date]; no units may use Double Time movement and all Personnel have their Broken Morale Level reduced by one.

CG22. GERMAN ATTACK COORDINATION:¹⁴ Each CG Date, the German player may purchase no more than one "I" type RG and one "A" type RG from any single KG unless he has purchased a minimum of one "I" type RG and one "A" type RG from ≥ 3 of his 4 available KGs [EXC: if any KG has reached its CG Maximum for all I and/or A type RGs, that RG type may be ignored for purposes of this rule (i.e., consider it to have met the minimum purchase requirements for the now unavailable type(s))]. Gun and General RGs ("G," "O," "M," and "T" types) may always be purchased (up to the CG Scenario and CG Maximums) regardless of the KG Purchase status.

EX: The German player has 38 CPP available. He elects to purchase nothing for KG Graebner: an I1 RG (5 CPP) and an A3 RG (7 CPP) for KG Knaust; an I2 RG (7 CPP) and an A4 RG (5 CPP) for KG Brinkmann; and an I6 RG (3 CPP), an I7 RG (4 CPP) and an A5 RG (4 CPP) for KG Harder; for a grand total of 35 CPP. Had he elected not to purchase either of the RGs from KG Knaust or Brinkmann, he would have been unable to purchase the second "I" type RG for KG Harder.

EX: The German player has 36 CPP available. He elects to purchase nothing for KG Graebner. For KG Knaust, he purchases an I1 RG (5 CPP) and an A4 RG (5 CPP). For KG Brinkmann he purchases an I2 RG (7 CPP) and an A3 RG (7 CPP). KG Harder has no I Type RG remaining (having all been purchased in prior CG Dates) so the German player elects to purchase an A6 RG (4 CPP) and thus fulfills the Attack Coordination Requirement. The German player is free to expend the remaining CPP on KGs as he sees fit.

CG23. BRITISH FANATICISM: Immediately prior to setup for the 18AM CG Date, the British player must secretly designate one multi-hex building he currently Controls as the British Headquarters. To be eligible for use as the Headquarters, ≥ 1 Location of this building (including Rooftop Locations) must have LOS to ≥ one Level 1 Location on/between R15 and R23. All British Infantry is Fanatic (A10.8) while in this building. This SSR supersedes SSR ABtF 8 (i.e., British units may be Fanatic in building S11 if the British player so selects that building, but are not automatically so). The identity of the British Headquarters is immediately revealed when any unit uses the Fanaticism benefit gained by this SSR.

CG24. CG NIGHT SCENARIOS: The NVR of a CG Night scenario (identified by an "N" in the CG Date) is determined in RePh step 9.6214. The side(s) selecting the Attack chit in a night scenario is considered the Scenario Attacker (E1.4; despite usually having units available to set up on-map); a side selecting an Idle chit is the Scenario Defender (E1.2). The Scenario Defender in a CG Night Scenario has automatic Freedom of Movement (following any enemy attack other than a successful Ambush; E1.21) for his two best Leaders. Scenario Attacker(s) units use Cloaking (E1.4-43), even if they set up on-map [EXC: if < 1 squad-equivalent is available in any particular Setup Area or Entry Area, the units within this Area receive no Cloaking counters (but may set-up/enter concealed if otherwise eligible)]. Cloaking counter HIP is NA. Each Friendly Setup Area is considered separately for the purposes of Scenario Defender HIP (E1.2) and Cloaking (E1.4). On-map Cloaked SW need not be dm. German Scenario Defender reinforcements Purchased/Retained-off-map may enter at an Eligible Entry Area only following a reinforcement dr < the current Game Turn number (one dr, made during step 1.11A in the RPh, applies to all RG/Units, regardless of Entry Area; units "freed" by this dr may enter on/after the current turn), or automatically once any Scenario Defender unit has been attacked by other than OBA/Sniper or has seen a Known enemy unit. All such reinforcements have automatic Freedom of Movement (E1.21). A reinforcing vehicle with a radio releases other friendly on map vehicle(s) with radios as per E1.21.

9.5 INITIAL SCENARIO: First select one of the CGs listed below. Included there is the information needed to play that CG's Initial Scenario. For the Initial Scenario, players begin with RePh step 9.617 (Purchase Reinforcement Groups) and complete RePh steps 9.617-9.621 (i.e., all steps preceded by a "+" in the RePh Sequence listing; 9.6). For each Initial Scenario, the actual Strength of each OB-given and purchased (RePh step 9.617) RG must still be determined normally (RePh step 9.6181). Leaders received, if any, are determined in RePh steps 9.6183. In the Initial Scenario of CGs I and III, the Germans set up first and the British move first. Furthermore, in these CGs the British player is assumed to have selected an "Attack" Initiative chit and the German player an "Idle" chit (9.62132) for purposes of 9.620. In the Initial Scenario of CG II, the British set up first and the Germans move first. The German player is assumed to have selected an "Attack" Initiative chit and the British player an "Idle" chit (9.62132) for purposes of 9.620. Some Strategic Locations (and Blocks) may be identified as either British Controlled, German Controlled, or Uncontrolled at CG Start. If not otherwise designated, all Locations outside the initial setup areas designated by the Initial Scenario are not Controlled by either side.

9.51

R

**9.51 ABTF CAMPAIGN GAME I: BLOCK BY BLOODY BLOCK**

The main force of the British 1st Airborne began landing amid confusion west of Arnhem after midday on the 17th of September. Major delays were experienced organizing and taking inventory of the men and equipment which had landed safely. Communication was limited to a few nearly useless, low power wireless sets. Nonetheless, the advance elements, including the majority of the 2nd Parachute Battalion, set off in three pincers for the bridge.

CG LENGTH: This CG covers all CG Dates from 17N–19AM (6 CG Scenarios)

CG VICTORY CONDITIONS: Provided they Control 4 of the following 5 Blocks, the British win at the end of the CG if they have amassed CVP ≥ 3 times the CVP they have lost.

VICTORY BLOCKS: H, I, J, K, L (see the reduced-size map on the reverse of the Chapter R Divider).

CHIT LIMITS: British — 5 Attack, 5 Idle
German — 4 Attack, 5 Idle

**INITIAL GERMAN OB****[ELR 3]: {SAN 3}****Elements Stadtkommandant Arnhem Security Force:**

INITIAL SCENARIO SPECIAL RULES

1. EC are Moderate, with no wind at start. See ABTF SSR. Night Rules are in effect. Base NVR is 3 hexes with No Moon and Scattered Clouds.

2. For RePh purposes, the initial German ELR is 4. It is reduced for the initial scenario per E1.22. The British are the Scenario Attacker and the Germans are the Scenario Defender. Majority Squad Type for the British is Stealthy, that of the Germans is Lax. Neither side may purchase a SAN Increase RG. The “?” counters in the initial German OB are in addition to those normally granted by E1.2.

3. Wire and/or mines may not be placed on Arnhem Bridge hexes or Ramp hexes (R5-R23). Wire may not be placed on the S1-T2-S4-P2-P13-M15-L15-G18-D19-A21 road.

4. Contrary to SSR CG 24 (CG Night Scenarios), all initial forces (including RGs purchased) must enter on the indicated turn (no dr is required). See 9.6151 for units/weapons not entering as indicated. All Purchased German RGs must enter on/east of hexrow V. RGs from KG Harder may be purchased but may not enter play during 17N (contrary to SSR CG 9, they will be Retained off-map for use on 18AM).

5. The German Turn 1 reinforcements must move as a Convoy (E11.) following the S1-T2-S4-P2-P13-M15-L15-G18-D19-A21 road and attempt to exit along the west edge from hex A21. All personnel units/Weapons must enter (and remain) as Passengers. Cloaking is NA. The Convoy may only cross road hexsides and must move as far as possible each turn. Once the requirements of E11.251 are met, the German player is freed of this requirement and the PRC may (un)load normally. Any unit(s) exiting via hex A21 (whether still in Convoy or not) are Retained into either German west edge Entry Area (German player's choice). See also SSR CG 11.

6. All Strategic Locations on/east of hexrow N are under German Control at the start of the CG. All other Strategic Locations are Uncontrolled.

Aftermath: The British ran into stiff resistance almost immediately. The northern and center pincers were stopped near Oosterbeek. The southern pincer made steady but slow progress to the river and began to work its way eastward. There was a railway bridge just over a mile west of the main road bridge that was a key secondary objective. This railway bridge was demolished as the British approached. Turning their attention to the main road bridge, just visible in fading twilight, the men of the 2nd Para crept through the narrow streets toward the bridge. In the gathering darkness, an armored column sped south across the bridge (this was Captain Graebner's 9th SS Recon unit heading toward Nijmegen). After the column had passed, the Paras used a wide staircase as cover and assaulted the blockhouse several times before finally destroying it with a combination of PIAT, FT, and small arms fire. Ambushing a convoy of trucks heading west, they quickly set up a HQ position on the far side of the ramp, not realizing that they had chosen a building within 50 meters of the SS Police HQ. A bitter fight over these buildings ensued, with the British withdrawing to more secure positions adjacent to both sides of the bridge as daylight approached. At about 9am, Capt. Graebner's force returned and boldly attempted to force its way into Arnhem. From their positions on the upper floors and on the rooftops of the buildings, the British laid down murderous fire from their PIATs, a pair of 6-pounder anti-tank guns, mortars, small arms, grenades and gammon bombs. Expecting only a small holding force of less than 100 men, Graebner's unit was caught completely unawares by the response of the nearly 300 well armed and determined paratroopers. By the end of the day, September 18th, there were some 700 British Paratroopers hiding in the buildings near the Arnhem Road Bridge. But it became increasingly clear to Col. Frost that the situation was extremely grave. Commenting to his aide on the plans for defense of the bridge, Col. Frost stated, “We'll make them dig us out block by bloody block.”

**9.52 ABTF CAMPAIGN GAME II: A DARK AND FATEFUL DAY**

Colonel Frost's Parachute Battalion had solidified its perimeter near the Arnhem Road Bridge. The 700 men that had managed to reach the bridge were concentrated in a tight knot near the ramp. Some units had moved east in an effort to scout the German strength. These units were returning with alarming reports of heavy German troop concentrations as well as the presence of large numbers of tanks and self-propelled guns. The intelligence reports of only a minor German presence in and around the city of Arnhem seemed, to Col. Frost, to be "painfully reminiscent of a child's fairytale."

CG LENGTH: This CG covers all CG Dates from 19AM – 21AM (9 CG Scenarios)

CG VICTORY CONDITIONS: The Germans win at the end of any CG Scenario if they Control Block H (see the reduced-size map on the reverse of the Chapter R Divider), or at CG end if they Control the British Headquarters (see SSR CG 23) and there are no Good Order British MMC in any Strategic Location on/east of hexrow J.

CHIT LIMITS: British — 2 Attack, 8 Idle
German — 8 Attack, 3 Idle

enter on/after Turn 1:
25 CPP

INITIAL SCENARIO SPECIAL RULES

1. EC are Moderate, with no wind at start. See ABTF SSR.
2. The British begin the CG at Ammunition Shortage Level One (SSR CG 17).
3. The British Control the following Blocks at CG Start: C, D, F, G, H, I, J, K, L, P, R, S, and T. For the purposes of 9.620, the British have previously selected four Attack Chits since the last Idle CG Date.
4. The Germans Control the following Blocks at CG Start: A, B, E, M, N, Q, U, V, W, X, Y, and Z. Block O and the Blockhouse (hex R21) are uncontrolled. The OB Designated Reinforcements listed in 9.615 have already been included in the At Start German OB. For the purposes of 9.620, the Germans have previously selected two Attack Chits since the last Idle CG Date.
5. The British player must select any 3 SMC from his at start OB (after Leader Determination; 9.6183). These SMC begin the CG Wounded.
6. The British receive one module of 80+mm OBA with Scarce Ammunition (C1.211). Place its radio with any British SMC. The Germans receive one module of 120+mm OBA (HE only) with Plentiful Ammunition (C1.211) directed by an Offboard Observer (C1.63) at Level 2 in any hex along the east edge (secretly recorded prior to British setup) and one Pre-Registered Hex (C1.73) (secretly recorded prior to British setup).
7. Make the following terrain changes prior to setup: place stone rubble at ground level in hexes T8, T9, T11, and V16; place shellholes in hexes K21, M15, M21, O15, P12, Q12, Q15, and Q21; place 2 Burnt-out Wrecks at Level 1 in hexes R16, R17, R18, R19, and R20; place a single Burnt-out Wreck in hexes N14, O14, P13, Q16, S12, and U12.
8. The Blockhouse has been destroyed (5.2). Place stone rubble on the bridge (i.e., at Level 1) in hex R21 as per 5.2. Place a 2 factor Known A-T Minefield at Level 1 in hex R21.
9. The British player secretly records his Headquarters prior to setup (see SSR CG 23).

Aftermath: First to feel the full brunt of the German response was Platoon Number 8 which had spread out through the industrial park to the east of the bridge. Under heavy assault from tanks and infantry, Platoon No. 8 was completely overrun and decimated. Captain Mackay and his Royal Engineers were likewise engaged in a grim struggle for the School House. The Germans assaulted this mini-fortress a number of times before the beleaguered engineers were finally forced to split up into pairs to attempt an escape to the main British perimeter. But the Germans still did not control the approaches to the bridge and thus no armor could be sent south to reinforce Nijmegen. Determined to drive the British out of their defenses, the Germans used concentrated artillery fire to turn the buildings to rubble and white phosphorous ammunition to set them alight. Captain Knaust kept up the pressure and gradually reduced the British pocket. The coup de grace came on the afternoon and evening of September 20th as a relentless German assault finally overcame the British defenses. Colonel Frost was wounded and captured. The remainder of the British withdrew to the burnt-out remains of the city near the river and later straggled back to the British defensive perimeter near Oosterbeek. Maj. Gen. Urquhart would later comment that when he realized, about midday on the 19th, that Col. Frost's men were cut off and could not be reinforced, "It was a dark and fateful day indeed."

9.53

9.53 ABTF CAMPAIGN GAME III: A BRIDGE TOO FAR

CG LENGTH: This CG covers all CG Dates from 17N – 21EVE (16 CG Scenarios)

CG VICTORY CONDITIONS: The Germans win at the end of any CG Date by Controlling all stone-building/stone-rubble Locations on the map. See also 9.6212.

CHIT LIMITS: British — 6 Attack, 13 Idle

German — 13 Attack, 9 Idle

All initial scenario OBs and SSR are as in CGI, Block by Bloody Block.

9.6 REFIT PHASE:

The following steps (9.601–.62164) are performed simultaneously by each side during the RePh, which occurs after each CG Scenario. Each step (and sub-step) must be carried out in the numbered/lettered order given; those not applicable to the current situation may be omitted (e.g., if there are no Flames/Blazes on the map, skip RePh step 9.609). Those steps listed below preceded by a “†” are the only steps to be completed before setting up to play a CG Initial Scenario. Those preceded by a “+” are the only steps necessary to achieve CG Scenario End after the last Player Turn CCPh.

RePh Sequence

†9.601 Conclusion of Melee

†9.602 Marker Removal

†9.603 Rally and Unloading

9.604 Encirclement, Minefields, Bog, and Shock

9.605 Setup Area Determination

9.606 Encircled-Marker Removal

9.607 Equipment Possession and Hidden Fortifications

9.608 Prisoners

9.609 Extinguishing Flames and Blazes

9.610 Wounded Leaders and Walking Wounded MMC

9.611 Recombining and Battle Hardening

9.612 New CG Date and SAN Adjustment

9.613 Shift

9.614 Equipment Repair and Replenishment

9.615 OB-Given Reinforcements

9.616 CPP Replenishment

†9.617 Purchasing Reinforcement Groups

†9.618 RG Strength, Weapons, Leaders, and Composition

†9.619 Purchasing Fortifications

†9.620 Ammunition Shortage and ELR Loss/Gain Determination

†9.621 Scenario Commencement

9.601 CONCLUSION OF MELEE: First, each unit currently on a Climb marker must be placed in either the Location it was attempting to reach or the Location it left when it began to climb, at the owner's choice. If the Location the unit is placed in contains an enemy unit(s), mark them all with a Melee counter. All opposing units in the same

Locations are now assumed to be in Melee, and must undergo an (unlimited) number of Melee rounds until no more CC attacks can be made. Such units are free to perform any/all normal CCPh activities associated with Melee (i.e., attack, Capture, Withdrawal, etc.). Consider the side that moved first in that scenario to be the AT-TACKER. Following the conclusion of the first round of RePh Melee in a Location, each still-concealed unit therein is revealed, each pinned unit therein becomes unpinned, each CX counter is removed, each vehicle currently in Motion therein has its Motion counter removed, and each Stun counter on a vehicle therein is flipped over to its “+ 1” side (the vehicle is still subject to Recall, if applicable, and may be marked as CE if so desired).

9.6011 ORDER OF RESOLUTION: Resolve all Melees in alphanumeric sequence (e.g., A1, then B16, then B17, then C19, etc.).

9.602 MARKER REMOVAL: All hidden/Cloaked units, Entrenchments and Equipment are placed on-map in their present Location [EXC: still-hidden Observers, Emplaced Guns, and Fortifications other than Entrenchments, need not be revealed provided they set up in their current Location for the next CG scenario; such units/Fortifications may set up HIP for the next CG Scenario at no cost in FPP]. All markers/counters listed below are removed from the map at this time (Right of Inspection does not apply to revealed stacks):

a. SR and FFE counters

b. SMOKE counters, Sniper counters

c. Acquired counters

d. DM, Disrupted, Fanatic, Berserk, Wall Advantage, HD markers, Dummy Stacks, Dummy Cloaking Counters, and “?”

e. CX, Motion, CE, BU, and Labor markers

9.603 RALLY AND UNLOADING: All currently broken units of both sides automatically rally, even if Disrupted. No DR are made. All Passenger/Rider Personnel and Equipment are then unloaded/unhooked into their vehicle's Location (a unit unloading into an A-P minefield is not immediately attacked, but 9.6042 will apply). When step 9.603 has been completed, CG Scenario End has occurred. Each player should note the final CVP tally from the scenario just completed (and should also note those CVP gained/lost during the RePh) for CG Victory Determination (9.51) and ELR Loss/Gain (9.6202)

9.604 ENCIRCLEMENT, MINEFIELDS, BOG, AND SHOCK

9.6041 ENCIRCLEMENT: Each Encircled unit [EXC: prisoner] must take a separate ITC (Leadership DRM may apply if present and at owner's choice). If it passes its ITC, it remains in the present Location (Encircled markers are not removed until 9.606). Failing the ITC results in the unit's immediate Elimination [EXC: Encircled Vulnerable PRC of an immobile vehicle are Eliminated, leaving the vehicle Abandoned]. CVP are awarded normally. British units failing this TC are not placed in the Walking Wounded Box. Each prisoner that an Eliminated Encircled unit was Guarding must, if possible, be claimed by another unit in that Location friendly to the Eliminated unit. If the prisoner is not claimed, it is considered Rearmed (A20.551) and may automatically possess any Equipment dropped by its Eliminated Guard. Otherwise, any Equipment that an Eliminated Encircled unit possessed is left in the Location unpossessed.

9.6042 MINEFIELDS: Each Mobile vehicle (and its Vulnerable Inherent crew, if required; B28.43) in any type of minefield undergoes the appropriate type(s) of mine attack(s), fully resolved in the normal manner, as if it is attempting to exit the minefield Location [EXC: if the Inherent crew of such a vehicle breaks, it is unloaded in Good Order into the minefield's Location]. Each Infantry unit in an A-P minefield hex (including a previously Inherent crew that just unloaded due to a minefield attack) Must take a NTC (Leadership DRM can apply); failure of the TC causes Casualty Reduction. [EXC to both: A unit theoretically able to exit the minefield hex without being attacked by the mines and without having to enter a minefield/enemy-Controlled Location need not take the NTC.] In all cases, each surviving unit must remain in its respective Location in that minefield hex until its Setup Area is determined in 9.605. CVP for eliminated units are awarded normally.

9.6043 BOG: Each non-Abandoned, Bugged/Mired vehicle must undergo consecutive Bog Removal attempts (D8.3) until it is either unbogged or immobilized (MP expenditure is immaterial). For a British Jeep(a), or if German Vehicle Note L applies to the vehicle, one squad-equivalent (as explained in the Note) in its Setup Area may be used to claim the -2 (-1 per crew or HS) drm to the colored dr of its Bog Removal DR.

9.6044 SHOCK/UK: Each Shocked/UK AFV must undergo consecutive recuperation attempts (C7.42) until either the marker is removed or the AFV is Eliminated. CVP are awarded normally.

9.605 SETUP AREA DETERMINATION:¹⁵ Each side now determines its Setup Area(s) for the next CG Scenario. Setup areas are determined by Control of city blocks. Each side may at any time during/after a CG Scenario place a friendly Location Control marker (supplied in the ABTF counter mix) in a Strategic Location that it currently Controls, especially if that Location's Control might become disputed at some later point. Additionally, during this RePh step (only) Block Control Markers are placed in any convenient area of the map to indicate that a side Controls that Block. Once Control of a Block is gained, by simultaneously Controlling all Strategic Locations within that Block during this step of the RePh, a side retains Control until such time as the opposing side has simultaneous Control of all Strategic Locations within the Block during this step of the RePh. Some Blocks may contain no Strategic Locations. These Blocks are never Controlled. However, Strategic Locations can be created during play. In such cases, these Blocks can then be Controlled and are treated as all other Blocks (so long as at least one Strategic Location remains within the Block). A Location Control marker must be removed (or flipped over) if the Controlling side loses Control of that Location. A non-Strategic Location may still be Controlled (as per A26.11–.12), but does not receive a Control marker. A Setup Area may currently contain no units, but can still have friendly units Shifted into it unless otherwise prohibited (9.613). Block Control is determined (and can change) only as a result of this step [EXC: Block Control Forfeiture; 9.6051]. The Blockhouse is always a valid Friendly Setup Area for the side that controls it (even if it has been destroyed, but not once its Rubble has been cleared; 5.2–.22).

9.6051 BLOCK CONTROL FORFEITURE: If at any point in the RePh armed, non-crew MMC of one side occupy one or more Strategic Locations within a Block while there are no armed, enemy, non-crew MMC within that Block (in any Loca-

R

9.608

tions, Strategic or otherwise), Control of that Block immediately switches to (or remains with) the side occupying the Block. The Block (and all Locations within it) is now considered Controlled by that side. Thus in such a case the requirements of 9.6053–.6054 will be NA. Units within the boundaries of that Block now consider it to be a valid Setup Area.

9.6052 UNCONTROLLED TERRITORY: As each side determines its Setup Area(s), there will be portions of the map that are not bounded by either side's setup area. These will primarily be road hexes and those areas not containing any Strategic Locations. No Units may set up in these hexes [EXC: Initial CG Scenario; Vehicles and Emplaced Guns may do so, provided the Location is within 2 hexes of a Friendly Setup Area; The Blockhouse]. Uncontrolled Territory may contain one or more Strategic Locations under certain conditions.

9.6053 ISOLATED UNIT: An Isolated unit/Weapon is one in a Location not contained within the boundaries of a Block Controlled by that side. Each Isolated Personnel/Mobile-vehicle unit (and its portaged/possessed/towed Equipment [EXC: non-dm Guns]) at scenario end is Retained into the nearest (along the shortest path of contiguous, Enterable, Uncontrolled Territory hexes) Friendly Setup Area or Eligible Entry Area; unit's owner's choice of Area if equidistant. Each SW/Gun may be freely (un)hooked/Eliminated/Transferred/dismantled. Each Personnel/Mobile-vehicle unit unable to trace such a path is required to attempt Escape. Each immobile vehicle becomes Abandoned, and its crew (if any) is then either Retained (if it can trace such a path) or required to attempt Escape [EXC: If the immobile vehicle is in Uncontrolled Territory, it remains in its current Location and VCA. It may, at the owner's option, be Abandoned (and turned into a (Burnt-out) wreck and may be Scrounged) and the crew is then Retained]. Emplaced guns in Uncontrolled Territory may remain in their current Location provided that Location is ≤ 2 hexes from any hex within a Friendly Setup Area. Non-dm Guns in an Enemy Setup Area, or in Uncontrolled Territory ≥ 3 hexes from a Friendly Setup Area, are left unpossessed in their current Location and the crew is then either Retained or must attempt escape.

EX: Block C is currently under British Control. At the end of the 18N CG Scenario, the German player has managed to take Control of all Locations within this Block with the exception of that occupied by the British 3-3-8 and wounded 7-0 leader in hex F2. Since the German does not Control all Strategic Locations within the Block, the German units are Retained into a Friendly Setup Area and are removed from the Block. The immobilized PzKpfw III must be Abandoned, but the crew will be Retained. None of these units will be required to Escape since they will be able to trace a path of Uncontrolled Territory hexes to a Friendly Setup (or Entry) Area along the road. The British player retains Control of the Block and regains Control of all Locations within it.

9.6054 ESCAPE: Each still-Isolated unit must now attempt Escape. If > one Personnel unit in the same Location wishes to Escape, they may combine into one or more stacks; each stack then makes its own DR on the Escape table. All such stacks must be predesignated prior to making any Escape DR for that Location. Each squad stacked with a Leader may freely Deploy. Prior to its possessor's Escape attempt, each SW/Gun may be dropped or freely (un)hooked/Eliminated/Transferred/dismantled. A non-dm Gun can never Escape [EXC: if hooked up to a mobile vehicle which successfully escapes].

9.60541 ESCAPE RESULTS: If a unit survives the Escape attempt, it and all Equipment it took with it are Retained into a Friendly Setup Area or off-map at an Eligible Entry Area—whichever is nearest in a path of contiguous, Enterable, Uncontrolled-Territory/Enemy-Setup-Area hexes (Escapee's choice if two such Areas are equidistant). If a unit is Eliminated (via Replacement/Casualty-Reduction) while es-

ESCAPE TABLE

Final DR	Infantry	Mobile Vehicle
≤ 8	Escapes ¹	Escapes
9	Escapes, Replaced ^{2,3}	Abandoned ^{4,5} ; crew (if any) Escapes
10	Escapes, Casualty Reduced ³	Eliminated ⁶ ; crew (if any) Escapes
11	Escapes, Replaced ^{2,3} , then Casualty Reduced	Abandoned ⁵ ; crew (if any) Eliminated
≥ 12	All units/weapons Eliminated	Eliminated; crew (if any) Eliminated

¹ An Original 2 DR results in Escape and Heat of Battle for an eligible unit (A15); use Random Selection to determine the unit(s) affected in a stack [EXC: any result other than Hero-Creation or Battle-Hardening (i.e., Berserk/Surrender) results in the unit(s) Elimination].

² A crew, or unit which would otherwise become Disrupted, is Eliminated instead.

³ Use Random Selection for a stack.

⁴ The surviving crew may turn the vehicle into a (Burnt-out) wreck.

⁵ In its current hex and VCA; the surviving crew may attempt to Scrounge the vehicle/wreck.

⁶ The surviving crew may attempt to Scrounge the vehicle *prior* to its Elimination.

DRM:

-1	lone, unwounded SMC
-1	Vehicle other than a CT AFV
-1	just completed CG Date was Night (N)
-2	CT AFV
+x	(Armor)/Leader/Hero DRM (NA to Leader/Hero escaping alone)
+1	per multiple of two Uncontrolled-Territory/Enemy-Setup-Area hexes required to reach a Friendly Setup Area (FRU)
+1	per HS-equivalent >1 HS escaping with the same DR [†]
+1	per PP > IPC carried (the unit carrying the most excess PP determines DRM for a stack; a Leader may combine with an MMC to increase that MMC's IPC provided the Leader and the MMC escape using the same DR) [†]
+1	unarmed [†] , wounded [†] , Walking Wounded [†] , captured vehicle (each occurrence)
+2	Encircled [†]
†	NA to vehicle Escape attempt

caping., all Equipment it took with it is Eliminated on a subsequent dr of 4–6; on a dr of 1–3 the Equipment is left in the Eliminated unit's last-occupied Location. CVP for eliminated units are awarded normally.

9.6055 MARKING THE MAP: Included in the ABIF module is a reduced-size map. Each side should now record its Setup Area(s) on a new photocopy of the reduced-size map. Both sides outline (using different color pens, but on the same photocopy) each Block Controlled by them, removing the Retained units contained in each (taking care to not mix units from different Setup Areas). Once all Blocks have been indicated, mark all Uncontrolled Territory hexes using another color (suggestion: a yellow "highlighter"). Once all Setup Areas have been correctly marked, they remain thus until the start of the next CG scenario.

9.606 ENCIRCLED-MARKER REMOVAL: All Encircled markers are now removed.

9.607 EQUIPMENT POSSESSION AND HIDDEN FORTIFICATIONS

9.6071 IN SETUP AREA: Each piece of Equipment in a Setup Area is Retained (as Captured, if applicable) therein by the side Controlling that Setup Area. At its (new) owner's option, each such piece may be Eliminated by any Personnel (even an Abandoning crew) Retained in that Setup Area, and each such vehicle may be Abandoned, etc. exactly as per 9.6053. Each unpossessed/Abandoned Equipment piece in a Setup Area may remain unpossessed/Abandoned (in which case it retains its present CA), or may be automatically repossessed/remanned and operated (as per A21.11–13, A21.21–22, D5.42 or D6.631) by Personnel Retained in that Setup Area. Each immobile vehicle must remain in its present Location and VCA until such time as it becomes Mobile.

9.6072 NOT IN SETUP AREA: All unpossessed/Abandoned Equipment in Uncontrolled Territory must remain in its present Location (and vehicle/Gun CA) until Eliminated or repossessed/remanned in (or after; 9.6071) a subsequent scenario. Each immobile vehicle must remain in its present Location and VCA until such time as it becomes Mobile.

9.6073 HIDDEN FORTIFICATIONS: Each still-hidden Fortification within a Setup Area of the purchaser's opponent is placed on-map. Each such minefield is marked by placing a Minefield counter to reveal its presence but not its strength/type. Each on-map Fortification (i.e., from previous CG Scenarios) is Controlled by the side (if any) Controlling its Location.

9.609

9.608 PRISONERS: Each prisoner unit is now removed from play. No additional CVP are awarded. Each unarmed unit not currently assigned to a Guard is Rearmed (A20.551) and Retained into any Friendly Setup Area (no Escape DR is necessary).

9.609 EXTINGUISHING FLAMES AND BLAZES: Each building/rubble Location currently marked with a Flame/Blaze counter is considered fully consumed by the fire. Players must remove each Flame/Blaze counter and make the appropriate terrain alterations when performing the following sub-steps (9.6091–6095):

9.6091 BURNING WRECK: Each Burning Wreck has its Blaze marker removed [EXC: if that wreck is in Rubble or IN (not bypassing) a building/woods obstacle, move the Blaze marker to the building/rubble/ woods so that it is now a terrain Blaze and mark it with a Pin counter to show that the Location begins the next CG Date with this terrain Blaze in place]. Replace the wreck with a Burnt-out Wreck.

9.6092 WOODEN RUBBLE, ORCHARD, WOODS: Remove the Flame/Blaze (and rubble if applicable), and place a shellhole counter in the hex. All other previous terrain in the hex is eliminated (each vehicle/wreck in the hex becomes a Burnt-out Wreck).

9.6093 STONE RUBBLE: Remove the Flame/Blaze marker. The stone rubble still exists (each vehicle/wreck in that Location becomes/remains a Burnt-out Wreck), and the Location may catch Fire again in a later scenario.

9.6094 BUILDING: Place the correct rubble counter at ground-level in each building hex that has at least one Flame/Blaze in any of its Locations, removing each Flame/Blaze marker. Any Cellar Location in the hex no longer exists. Such rubble may catch Fire again in a later scenario.

9.6095 ELIMINATIONS: All Fortifications/Equipment in what were (as per 9.6092–6094) building/rubble Flame/Blaze Locations (including all building Locations just rubbled as per 9.6094) are Eliminated. All (Burnt-out) wrecks in buildings just rubbled as per 9.6094 are Eliminated.

WOUNDED LEADER TABLE

Final dr	Result
≤ 1	Retained unwounded
2–4	Retained wounded
≥ 5	Eliminated

drm:

-1 British -1 Heroic

9.610 WOUNDED LEADERS AND WALKING WOUNDED MMC

9.6101 WOUNDED LEADERS: Each side makes a dr on the following table for each currently wounded Retained leader:

9.6102 WALKING WOUNDED MMC: The British player now determines how many (if any) Walking Wounded MMC are recovered as per CG SSR 19. These MMC are placed in any Friendly Setup Area(s).

9.611 RECOMBINING AND BATTLE HARDENING

9.6111 RECOMBINING: All Retained same-class and—for Commandos and Engineers—same type HS with identical Strength Factors (and Walking Wounded status) within the same Setup/Entry Area must now recombine (A1.32) so that no more than one of each HS type is retained in that Area [EXC: each side may retain one HS per SW MTR/PSK/PIAT Retained even if that SW is currently malfunctioned].

9.6112 HEROS & MMC: On each side, each Retained hero [EXC: Leader; 9.6113] is Eliminated; however, each such Elimination enables that side to Battle Harden one non-crew MMC of the owner's choice within the same Setup/Entry Area as that hero [EXC: if no MMC are available to Battle Harden the Hero is Retained in that Setup/Entry Area]. Elite MMC that Battle Harden become Fanatic (but only for the duration of the next CG Scenario). No MMC may Battle Harden > once per RePh.

9.6113 LEADERS: On each side, each Retained heroic Leader Battle Hardens and loses his heroic status [EXC: a heroic 10:3 loses his heroic status with no additional effect].

9.612 NEW CG DATE AND SAN ADJUSTMENT

9.6121 NEW CG DATE: Each passage of this RePh step represents the start of a new CG Date.

9.6122 SAN ADJUSTMENT: Each side must determine if the SAN of their side must be reduced for the current CG Scenario. A side whose SAN is currently < 2 has it automatically raised to 2 (no CPP expenditure is necessary).

9.61221 BRITISH SAN: If the British SAN is ≥ 4, a SAN adjustment dr must be made with a +drm equal to the current British SAN minus four. A Final dr ≥ 4 immediately reduces the British SAN by two.

9.61222 GERMAN SAN: If the German SAN is ≥ 5, a SAN adjustment dr must be made with a +drm equal to the current German SAN minus five. A Final dr ≥ 4 immediately reduces the German SAN by two.

R

9.613 SHIFT: A Personnel/Mobile-vehicle unit (or group of such) Retained in a Setup Area may attempt to Shift to another Friendly Setup Area (or—if German—to an Eligible Entry Area). A unit/group that wishes to Shift from a Setup Area must be able to trace a path (of any length) of contiguous Enterable (by all units of the Shifting group), Uncontrolled-Territory/Friendly-Setup-Area/Eligible-Entry-Area hexes from any friendly-Controlled hex of that Setup Area to any hex of the Area to which it is attempting to Shift. A unit/group may not Shift from an Entry Area. Each non-WW MMC may portage ≤ five PP, WW MMC may portage ≤ 3 PP, and each SMC may portage ≤ two PP [EXC: a wounded SMC can portage nothing]. Prior to its possessor's Shift (attempt), each SW/Gun may be dropped or freely (un)hooked/Eliminated/Transferred/dismantled. A non-dm Gun can not be Shifted [EXC: if hooked up to a mobile vehicle which successfully Shifts]. For each Leader attempting to shift, 3 squads may automatically deploy. Make a separate Secret DR on the following table for each unit/group attempting to Shift. Only one Shift attempt may be made per unit/group per CG Date, and all units attempting to Shift from the same, and to the same new, Entry or Setup Area must do so as a single group. A German unit/group that Shifts to an Eligible Entry Area may subsequently enter play at that Entry Area.

SHIFT TABLE

Final DR	Result
≤ 8	Successful Shift
9–10	Failed attempt ¹
11	Successful Shift, Casualty Reduction ²
≥ 12	Failed attempt, all units/Weapons Eliminated ³

- Unit/group cannot Shift (the orders were not received or could not be carried out). Unit(s) may not attempt to Shift again until the next RePh, and must remain in its current Friendly Setup Area, though it may participate normally in the next CG Scenario.
- Each Personnel unit suffers Casualty Reduction on a subsequent dr ≥ 4. Each vehicle is Eliminated on a subsequent dr ≥ 4; if Eliminated, make a CS DR for its Inherent crew (Casualty Reduction for surviving crews is NA) and remove the vehicle from play (no wreck is placed). Scrounging is NA. Roll separately for each unit. Equipment which becomes unpossessed as a result of Casualty Reduction of its possessor is Eliminated.
- Enemy units detect the attempt and set up an ambush. Crew Survival and wreck placement for eliminated vehicles is NA.

drm:

- 1 Previous CG Date was Idle (British only)
- 2 British
- +1 Per multiple of two Uncontrolled Territory hexes along the path between the current Setup/Entry Area and the desired Area (FRD)

9.6131 VACATED SETUP AREA: If the last unit in a Friendly Setup Area is Eliminated or successfully Shifts elsewhere, each Location of that Setup Area remains Controlled by the last Controlling (i.e., by the vacating) side.

9.614 EQUIPMENT REPAIR AND REPLENISHMENT

9.6141 VEHICLES: Each side performs the applicable step(s) below for each friendly vehicle. CVP for Eliminated units are awarded normally.

a) **ABANDONED:** Each Abandoned vehicle in a Friendly-Setup/Eligible-Entry Area may remain Abandoned, or may be remanned and operated (as per A21.22 or D5.42/D6.631) by Personnel Retained within the same Setup Area. Abandoned vehicles in Uncontrolled Territory (including Front Line road hexes) remain Abandoned and may be captured (and remanned) only during play.

b) **IMMOBILIZATION REPAIR:** Each non-captured, non-Abandoned, immobilized vehicle must make a dr on the following table to determine if the immobilization is repaired:

IMMOBILIZATION REPAIR TABLE

Final dr	Result
1–2	Vehicle becomes mobile*
≥ 3	No effect

* and is Retained in its current (or nearest) Friendly Setup Area

drm:

- +1 Only Non-Qualified Use (A21.13) possible
- +1 Vehicle is in a Front Line Location/Uncontrolled Territory
- +x Armor Leader

c) **AFV RECALL:** Each Mobile, Retained AFV under Recall is removed from play. CVP for Recalled AFV which ended the CG Scenario on map are awarded normally. No CVP are awarded for Recalled AFV which exited the map during play.

R

d) STUNNED: A side Retaining a vehicle suffering the results of a stun (small stun; D5.34) must make a dr on the following table to determine if the vehicle recovers from the stun result:

VEHICLE STUN RECOVERY TABLE

Final dr	Result
1 - 2	Recovers; remove stun
3 - 5	Retain stun
6	Eliminated†

† Full CVP awarded; wreck placement and Crew Survival are NA

9.6142 WEAPON REPAIR: Each side now makes a separate dr on the table below for each malfunctioned, non-captured, Retained weapon in each Friendly Setup/Entry Area that contains Personnel (or, for a vehicular Weapon, an Inherent crew in that vehicle):

WEAPON REPAIR TABLE

Final dr	Result
≤ 1	Repaired
≥ 2	Eliminated*

* If vehicular mounted, the Weapon is disabled (and if MA, the vehicle is immediately Recalled; place a RECALL +1 counter on the vehicle, 9.6141c applies (i.e., reperform 9.6141c; the vehicle is assumed to have ended the scenario on-map); if a Gun, the Gun is Eliminated with full CVP awarded.

drm:

- 1 vehicular-mounted
- x Weapon Repair Number
- y Armor Leader Leadership Rating (if vehicular mounted and the Armor Leader begins the next CG Scenario manning this vehicle)
- +1 only Non-Qualified Use (A21.12) is possible

EX: A German Panther MA repairs on an original dr of ≤ 3. If the German player had a Retained 9-2 Armor Leader (and that Armor Leader was assigned to that Panther for the upcoming CG Scenario), the MA would repair on any original dr other than 6.

9.61421 VEHICULAR-MG EXCHANGE: A disabled, non-captured, German vehicular MG may be automatically repaired (even if disabled in step 9.6142) by Eliminating a friendly SW LMG. In all cases, the MG to be Eliminated must be Retained within the same Setup/Entry Area as the AFV.

9.61422 ABANDONING, SCROUNGING & REMOVAL: At the Controlling player's option, any non-Recalled vehicle in each Friendly Setup Area may be Abandoned and/or turned into a (Burnt-out) wreck. Likewise, he may attempt to Scrounge any Abandoned-vehicle/non-Burnt-out-Wreck in each Friendly Setup Area. [EXC to all: Such actions are NA unless one Personnel unit (even an Abandoning crew) is Retained in that Setup Area.]

9.6143 CAPTURED EQUIPMENT: The German player (only) now makes a separate dr for each of his functioning, captured, Retained Weapons in each Friendly Setup/Entry Area that contains Personnel; if ≥ 4 it is Eliminated (disabled if vehicular). Each already-malfunctioned captured Weapon Retained by either side is Eliminated (disabled if vehicular). MA disabled by either of these means does not cause Recall. At its captor's option, a captured vehicle may remain in play if it has any functioning Weapon (even if MA is disabled); otherwise it is replaced with a Burnt-out Wreck. No CVP are awarded for Eliminated Weapons.

9.6144 SPECIAL AMMO: Each non-captured Weapon which has some form of depleted ammunition type may make a dr on the following table for each type of special ammunition which is depleted in order to attempt to resupply that type of special ammunition for that Weapon:

SPECIAL AMMO RESTORATION TABLE

Final dr	Result
≤ 3	Restore special ammunition type
≥ 4	Ammo remains depleted

drm:

- +x current level of Ammunition Shortage (SSR CG 17) (British only)
- 1 German

9.615 OB-GIVEN REINFORCEMENTS: During the RePh, it is possible that one/both sides will receive OB-given Reinforcements. These units may enter/setup as specified below and are in addition to the CG (Date) Maximums listed in the RG

9.6173

Charts. Strength, Leaders, and SW-Allotment are determined normally. See RG Chart notes.

9.6152 REINFORCEMENT SCHEDULE

CG Date	British	German
18AM	I1 ¹ , I2 ¹ , SAN +2 ⁴	20 FPP ² , SAN -1 ⁵
18PM	G1 ^{1,2} , A1 ¹ , SAN -1 ⁵	SAN +2 ⁴
19AM		I1 ³ , I2 ³
20AM		SAN +1 ⁴

- 1 Enters on/after Turn 1 from any British Entry Area
- 2 Available for on-map setup
- 3 Enters on/after Turn 1 from any German Entry Area
- 4 SAN 7 maximum (effective at start of scenario)
- 5 SAN 2 minimum (effective at start of scenario)

9.6151 REINFORCEMENT ENTRY AREAS: Each Reinforcement unit listed in 9.6152 will be assigned an Eligible Entry Area or will be specified for on-map setup. The reinforcements entering the map this CG Date must enter/setup as listed. All/some/none may enter on any turn but those failing to enter/setup during the next non-Idle CG Scenario are Eliminated. Normal CVP are awarded for such units. These reinforcements are in addition to those listed in the RG Charts and never count against the CG Date or CG Maximums.

9.616 CPP REPLENISHMENT: CPP are replenished according to the following formula: the CPP Base # (9.6161) plus CG CPP Variable Arrival Points (9.6162) equals the final amount of CPP replenished.

9.6161 CPP BASE NUMBER: The CPP Base #s for the current CG Date is indicated in the CPP Base Number Chart.

9.6162 CG CPP VARIABLE ARRIVAL POINTS: Both players make a secret DR and add the DR to the CPP Base # to determine the total CPP received for the current CG Date.

CPP BASE NUMBER CHART

CG DATE	BRITISH	GERMAN	CAMPAIGN EXHAUSTION DRM
17N	—	—	0
18AM	20	15	0
18PM	25	15	0
18EVE	15	20	+1
18N	5	20	+1
19AM	5	25	+1
19PM	0	25	+1
19EVE	0	30	+2
19N	0	30	+2
20AM	0	25	+2
20PM	0	20	+2
20EVE	0	20	+3
20N	0	10	+3
21AM	0	10	+3
21PM	0	10	+3
21EVE	0	10	+4

9.617 PURCHASING REINFORCEMENT GROUPS: Both players now secretly allot CPP for the purchase of RG. All CPP expended are subtracted from the current CPP total. CPP not spent are divided by two (FRU) and recorded on the CG Roster in the "Left" column. The CPP expended, those remaining, and the RG(s) purchased may all be kept secret. The players consult their RG chart for the different types of RG historically available, the CPP cost of each, the number of each that may be purchased during the course of the CG, and any applicable notes. As each RG is selected, record its ID (and the CPP expended to purchase it) in the "RG Purchased" column on the line for the current CG Date on the CG Roster. After all the RG are selected, write the total CPP expended in the "Spent" column of the CG Roster for the current CG Date; then write the number of CPP remaining (after the above modification), even if zero, in the "Left" column for the current CG Date. These CPP may be used to purchase further RG in step 9.617 of any subsequent RePh.

The RG charts contain the following information:

9.6171 ID: Provides an alphanumeric identification for each RG.

9.6172 GROUP TYPE: Lists the name of the RG. This name and its ID are secretly recorded on the RG Purchase Record (9.6178). The British player should secretly record the ID of Commando/Engineer MMC.¹⁶

R

9.6174

9.6173 CPP COST: Lists the CPP cost of the RG (regardless of its later-determined Strength). This is the number of CPP that must be subtracted from the current CPP total in order to receive that RG.

9.6174 UNITS REC'D FULL/DEPL: Lists the type(s) and quantity of units that each RG contains.

9.6175 CG DATE MAX: Lists the maximum number of RG of this type that may be purchased per CG Date (note that these limits are per CG Date and not calendar date).

9.6176 CG MAXIMUM: Lists the maximum number of RG of this type that may be purchased during the course of the CG. The players must keep a written record (using the 9.6178 RG Purchase Record) of each RG purchased during the CG in order to know if additional RG of that type are still available for purchase. RG listed as reinforcements during any CG Scenario never count against this maximum.

9.6177 NOTES: Special restrictions or comments about the RG.

9.6178 RG PURCHASE RECORD: After all RG for the current CG Date have been selected and CPP expended for them, the RG Purchase Record must be updated. One line of this sheet must be filled out for each RG purchased in order to keep track of the number purchased thus far in the CG. If preparing for a CG Initial Scenario, one line is also filled out for each RG given in the Initial Scenario OB (but these latter do not apply towards RG purchase limits). The following listing ex-

plains how each column of the RG Purchase Record is used.

CG Date: The CG Date the RG is purchased (e.g., 18PM).

RG ID: The RG's alphanumeric ID and KG from which it was purchased (German Only) (e.g., I1(K) for a German SS Infantry Platoon from KG Knaust).

Group Type: The RG's name (e.g., Para Pltn).

#P (Number Purchased): The total number of friendly RG of this Group Type purchased thus far during the CG.

#R (Number Remaining): The number of this RG Group Type still available for subsequent purchase in the CG. This number is derived by subtracting the number in that RG's #P column from the number listed in the "Maximum" column (for that RG for that CG) in the RG Chart.

Str: The RG's strength, as determined in RePh step 9.6181. Record "F" for a Full, "D" for a Depleted, RG.

Units: The number of units received in that RG of the Unit Type listed in the respective RG Chart (e.g., "3" for a Full Strength Commando Pltn), and the unit type.

SW Received: As each SW for that RG is determined (RePh step 9.6182), record the number and type of each Weapon received.

Leader: As each eligible RG's (Armor)Leader(s) is determined (RePh step 9.6183) record his A10.7/D3.4 Strength Factor.

BRITISH REINFORCEMENT GROUP CHART

GERMAN NOTES

a Assault Engineers (H1.22) and Sappers (H1.23)

c Each Weapon is accompanied by a 2-2-8 Infantry crew

d Check for Depletion (9.6181). The 4-4-7s in RG I3 are non-SS.

f Purchase specific fortifications per 9.619

h HE only

i Determine (Armor) Leaders per 9.6183

m Determine OBA Ammunition as follows:

dr	Result	drm: +1 Heavy Arty
1	Scarce	
2-5	Normal	
6+	Plentiful	

o Available for on map setup on the CG Date of purchase

p May purchase ≤ 2 Pre-registered hexes per module at a cost of 1 CPP per module per hex. Barrage is NA. Pre-Registered hexes may not be purchased for Retained (or Initial Scenario) OBA modules. See SSR CG10.

q May be directed by an Offboard Observer (C1.63) at an increased cost of 1 CPP per module. The specific hex is recorded prior to setup and may be selected from any of the following criteria as applicable ¹⁷

CG Date	Level	Edge
Any	2	North or East
18Eve - 19N	4	West
20PM - 21Eve	4	West

Only one Observer may be chosen for any particular map edge per CG Date. Any Observer selected for the west edge must be used on the CG Date of purchase or be Eliminated. In such a case, the module (if Retained) receives a radio as per note **r** for the following CG Date. Offboard Observers may not be purchased for Retained (or Initial Scenario OB) OBA modules.

r For each module [EXC: Offboard Observer], the player may freely select either a radio or a field phone (see SSR CG6) which must set up possessed by a SMC in any Friendly Setup Area or enter possessed by a SMC via any Eligible Entry Area.

s May fire HE and Smoke

t All Retained or just-Purchased MMC are considered Fanatic (A10.8) for the duration of the next non-Idle CG Date (only)

v Receives AFV as indicated

ID	VEHICLES RECEIVED	
I4	SPW 251/1 x3	
I6	SPW 250/10 x1, SPW 250/1 x3	
I7	SPW 250/sMG x2, SPW250/7 x1	(No additional HSs accompany the SPW 250/sMG)

w Determine SW Allotment per 9.6182

x May not be purchased prior to 18AM

y May not be purchased prior to 19AM

z Directed by an Offboard Observer at Level 0 (at no additional cost in CPP) in any hex along the south edge of the playing area (recorded prior to British setup)²⁰

9.618 RG STRENGTH, WEAPONS, LEADERS and COMPOSITION

9.6181 RG STRENGTH: For each RG eligible for Depletion that was just purchased (as well as for each such RG received in an Initial-Scenario or during a RePh without purchase), make one secret DR on the RG Strength Table to determine whether it is received at Full or Depleted Strength. A Full Strength RG receives the number of specified units to the left of the "I", a Depleted RG receives the number of specified units to the right of the "I".

RG STRENGTH TABLE

FINAL DR	RESULT	DRM
≤ 9	Full	-2 British
≥ 10	Depleted	+1 German VG Pltn
		+x/2 Campaign Exhaustion DRM (FRD)

9.6182 SUPPORT WEAPON ALLOTMENT: Determine the number of SW received by each Infantry-type RG listed on the appropriate "Infantry-Type SW Chart." A Full Strength RG automatically receives all SW indicated. A Depleted RG must make a secret dr ≤ the number listed in parentheses for each indicated SW in order to receive it. Record each SW received in its appropriate column on the RG Purchase Record on that RG's line. Each SW must set-up/enter with a unit of its RG.

BRITISH INFANTRY-TYPE SW CHART

RG	LMG	PIAT	FT	DC	Lt. Mtr ^a
I1	1(5)	1(3)			
I2	1(5)				1(3)
I3	1(5)	1(3)		1(3)	
I4	1(5)		1(2)	2(3)	

^a The light mortars are standard (i.e., non-airborne) versions of the OML 2-in Mortar

GERMAN INFANTRY-TYPE SW CHART

RG	LMG	PSK/Lt. Mtr	FT	DC
I1	1(3)	* (2)		
I2			1(2)	2(3)
I3	1(1)			

* Make a secret dr; 1-2 RG receives a Lt. Mtr, 3-6 RG receives a Psk

EX: The German player purchases 2 SS Rifle Pltns (one depleted) and a full strength Volksgrenadier Pltn. The full strength SS Rifle Pltn receives a LMG and either a Lt. Mortar (with a subsequent dr of 1-2) or a PSK (subsequent dr of 3-6). The Volksgrenadier Pltn receives one LMG. The depleted SS Rifle Pltn makes a dr to determine which SW (PSK or Lt Mtr) is available. Assume a 4 was rolled (making a PSK available). He then makes a dr for each possible SW. The LMG will be received if its dr is ≤ 3 while the PSK will be received if its dr is ≤ 2.

9.6183 LEADER ALLOTMENT: For each indicated purchased/OB-Given "I" or "A" type RG, make one secret DR on the appropriate column of the following Leader Table to determine the type of Leader received with that RG. Each newly-received Leader must setup/enter with a unit of his respective RG.

LEADER TABLE

Final DR	British	German	(Armor)
< 2	10-3	10-2	(10-2)
2	10-2	10-2	(9-2)
3	9-2	9-2	(9-1)
4	9-2	9-1	(9-1)
5	9-1	9-1	(8-1)†
6	9-1	8-1	
7	9-1	8-1	
8	8-1	8-0	
9	8-1	8-0	
10	8-0	7-0	
≥ 11	7-0	6+1	

[†] If selected for a Hvy Tank Pltn, replace with a 9-1 A.L.

9.6183

LEADER TABLE DRM

BRITISH	GERMAN

3-4	SdKfz 7/1	x1
	SdKfz 6/2	x2
5	SPW 250/9	x1
	SdKfz 6.2	x1
	SdKfz 10/4	x1
6	SdKfz 10/4	x1
	SdKfz 7/1	x1
	SdKfz 6/2	x1

A2		
dr	Vehicles	
1	PzKpfw VG	x2
2-3	PzKpfw IVJ	x2
4-6	PzKpfw VG	x1
	PzKpfw IVJ	x1

9.619 PURCHASING FORTIFICATIONS: Fortifications, which are obtained by spending FPP, may be purchased on each CG Date if the player has the requisite FPP (either given as a reinforcement in the initial CG Scenario or as per 9.615, or purchased). All FPP unspent upon completion of this step are forfeit. As Fortifications are selected, the specific type (and strength, if mines) must be recorded in the "FORTIFICATIONS" area of the CG Roster.

FORTIFICATION PURCHASE TABLE

FORTIFICATION TYPE	FPP	NOTES
Trench	6	—
Foxhole	3/2/1	1, F
A-P minefield factor	3/6	2
A-T Mine factor (British Only)	4	2, 3
Wire (German Only)	10	7
Fortified Location	10	4, F
Breach	5	B, F
HIP	3/2/1/1	5, F
"?"	1	6, F

1 For 3-, 2- and 1-squad capacity respectively.

2 German/British FPP cost respectively. Each side may purchase no more than 12 A-P minefield factors (and, for the British, 2 A-T Mines) per CG Date. The British may not purchase more than 8 A-T Mines during any CG. During setup, the strength of friendly-Controlled, pre-existing minefields may be increased by adding extra A-P/A-T mine factors to them (though only in allowed increments and to allowed maximums). Minefields may not be decreased in this manner. Minefield factors purchased on the above Table may never be exchanged for Boobytrap capability (B28.9). Exchanging A-P minefield factors for A-T Mines (B28.5) is NA.

3 Includes Daisy Chain.

4 Per building Location; tunnels are NA.

5 Squad/HS/crew/SMC cost respectively. No more than 10% (FRU) of a side's Retained/Just-Purchased Infantry squads (plus all SW/SMC set up with them in the same Location) may set up using HIP in a daytime scenario. The 25% allocation for a Scenario Defender at night (E1.2) costs no FPP. AFV HIP is NA. Guns, and their manning crew may set up using HIP per SSR CG5. In all cases, the allowable percentage is calculated separately for each Setup Area.

6 See SSR CG12.

7 HIP NA [EXC: Night CG Scenario]

F Only those Fortifications marked with a "F" may be set up in a Front Line Location [EXC: neither the Blockhouse nor the rubble from its destruction (5.2) is ever considered a Front Line Location for purposes of this note].

R

9.620 AMMUNITION SHORTAGE AND ELR LOSS/GAIN DETERMINATION.

9.6201 BRITISH AMMUNITION SHORTAGE DETERMINATION: Commencing on the 19AM CG Date (and every CG Date thereafter) the British player makes a DR on the following table to determine the Level of ammunition shortage (CG SSR 17) suffered for the current CG Date [EXC: This step is not performed if the previous CG Date was Idle; 9.62132].

AMMUNITION SHORTAGE LEVEL CHANGE

FINAL DR	RESULT
≤ 9	No Change
≥ 10	Shortage increases one Level

DRM:

+x Campaign Exhaustion DRM

+(y-1) Number of British Attack Chits selected during this CG (minimum of 0) (see 9.5, 9.52 SSR 3, 9.62132)

9.6202 ELR LOSS/GAIN: Each player makes a DR on the following table to determine the effects (if any) on his side's ELR for the current CG Date.

ELR LOSS/GAIN CHART

FINAL DR	RESULT
≤ 2	ELR +1
3-12	No Change
≥ 13	ELR -1

DRM

-1 Per 30 CVP (FRD) of enemy units Eliminated during the last CG Scenario (including CVP awarded thus far during this RePh)

-3 Per Idle CG Date since the last CG Scenario

+1 Per CG Scenario since the last Idle CG Date

+1 Per Attack Chit selected by that side since the last Idle CG Date

+x Campaign Exhaustion DRM (British Only)

+y/2 Campaign Exhaustion DRM (FRD) (German Only)

+z British Ammunition Shortage Level DRM (British Only)

EX: It is the 21PM CG Date. The British player chose an Attack Chit on 21AM and inflicted 42 CVP on the Germans. There was an idle CG Date on 20N. The British are under Ammunition Shortage Level 2. The British player's DRM total will be +7 (-1 for CVP, +1 for the 21AM CG Scenario, +1 for the Attack Chit used on 21AM, +4 for Campaign Exhaustion, and +2 for British Ammunition Shortage). The German player inflicted 38 CVP and also selected an Attack Chit on 21AM. The German player's DRM will be +3 (-1 for CVP, +1 for the 21AM CG Scenario, +1 for the Attack Chit used on 21AM, and +2 for Campaign Exhaustion).

9.621 SCENARIO COMMENCEMENT

9.6211 CG SCENARIO VICTORY CONDITIONS: In ABIF, the individual CG Scenarios have no specific Victory Conditions. A player does not "win" or "lose" a CG Scenario. Rather, the CG Scenarios are intended to position the players for the overall CG Victory Conditions.

9.6212 SUDDEN DEATH VICTORY: The Germans win any CG at the end of any CG Scenario Game Turn by Controlling all Strategic Locations within Block H (see the Chapter R Divider).

9.6213 INITIATIVE DETERMINATION: Each side selects its Initiative for the current CG Date, either to "Attack" or stand "Idle", representing its desired tactical plans.

9.62131 CHIT LIMITS: Each CG (9.51 - .53) lists the maximum number of Attack and Idle Chits (9.62132) each side may select during the course of that CG. There is no limit otherwise on selecting Attack/Idle Chits on consecutive CG Dates.

9.62132 PROCEDURE: Each side takes its respective Initiative Chit and secretly places it on the playing area, hidden from the opponent's view, with the chit's face-up side displaying the side's Initiative selection (i.e., either an Attack Chit or an Idle Chit) for the next CG Scenario. The counters are then revealed simultaneously and cross-indexed on the following matrix to determine if a new CG Scenario is

INITIATIVE MATRIX

CHITS SELECTED	BRITISH ATTACK	BRITISH IDLE
GERMAN ATTACK	Dual Assault ¹	German Assault ¹
GERMAN IDLE	British Assault ¹	Idle CG Date ²

1 Scenario generated; consult proper scenario type below for further information

2 No scenario generated for this CG Date; each side repeats RePh steps 9.612-.620

R

generated and, if so, what type it will be. Both players should note on a side record the chit selected and the total of each type used thus far in the CG for Ammunition Shortage (9.6201) and ELR Loss/Gain (9.6202) purposes.

9.62133 SCENARIO TYPES

- a) Dual Attack—Represents a CG Date when both sides have planned offensive action. The German player makes a dr to determine which side sets up first: if ≤ 3 the British does; otherwise the German does. The side moving first (see 9.6215), however, is not determined until after all setup is complete (see also SSR CG 24).
- b) German Assault—Represents a planned assault on the British positions. The British player sets up first and the German player moves first (see also SSR CG 24).
- c) British Assault—This represents a local counterattack by British units. The German player sets up first and the British player moves first (see also SSR CG 24).

9.6214 UNIT SETUP: The side that sets up first (9.62133) in a given CG Scenario now sets up all of its Retained units, Equipment, and new Fortifications, after which the other side does likewise. Each unit/Equipment piece may be set up only in its current Setup Area [EXC: in its current Location and VCA, if an Immobile vehicle; 9.6071]. Emplaced Guns and mobile Vehicles may also set up in Uncontrolled Territory that is ≤ 2 hexes from a Friendly Setup Area (see also SSR CG 5). Record the hex coordinates of new Fortification setup Locations on the CG Roster, in the appropriate line(s) and column(s) under "FORTIFICATIONS". As an exception to A2.9, units may set up overstacked if every Location within the Friendly Setup Area currently contains the maximum allowed by normal stacking limits (A5). Following this, the side setting up second does likewise. Units may not set up in enemy occupied Locations.

9.6215 FIRST MOVE DETERMINATION:¹⁸ For British or German Assaults, see 9.62133. For Dual Assaults, the German player now makes a dr. On a dr ≤ 4 , the German moves first. On a dr ≥ 5 , the British moves first.

9.6216 WEATHER DETERMINATION: The weather, NVR (if required), EC, and Wind Force (including direction if necessary) are now determined.

9.62161 WEATHER: The British player makes a DR and consults the table below to determine the weather for the upcoming CG.

WEATHER TABLE

DR	RESULT	DRM
≤ 2	Mist	-2 Previous CG Scenario was Mist
3-5	Overcast	-1 Previous CG Scenario was Overcast
6-10	Clear	-1 Night Scenario
≥ 11	Clear & Gusty	+1 Previous CG Scenario was Clear & Gusty

9.62162 NVR: For all CG Night Scenarios there is no Moon and Scattered Clouds. Determine Base NVR per E1.11.

9.62163 EC: The British player makes a dr and consults the following table to determine the EC for the upcoming CG Scenario.

dr	RESULT	drm
≤ 1	Wet	-1 Previous CG Scenario was Wet or Moist
2	Moist	-1 Night Scenario
3-5	Moderate	+1 Previous CG Scenario was Dry
≥ 6	Dry	

9.62164 WIND FORCE (AND DIRECTION): The British player makes a dr and consults the following table to determine the wind force for the upcoming CG Scenario.

WIND FORCE TABLE

dr	RESULT	drm
1-3	No Wind	-1 Night Scenario
4-6	Mild Breeze ¹	+2 Weather is Overcast
≥ 7	Heavy Wind ¹	+1 Previous CG Scenario was Clear & Gusty

¹ Determine Wind Direction per B26.52

Footnotes

FOOTNOTES:

1. 1. THE ARNHEM BRIDGE: The Arnhem Bridge was a dominating structure. Built circa 1930, it was a major accomplishment in the field of civil engineering. Spanning an elevated distance of over 400 meters and sporting 4 paved lanes as well as a wide sidewalk on both sides of the surface, it was the standard for highway bridges for some time. The entire underside of the bridge was interwoven with steel beams and there were concrete supports nearly 6 feet thick at varied intervals as well. Movement beneath the bridge was possible but difficult, particularly for vehicular traffic. Two separate underpasses (hexes R15 and R21) were available to facilitate vehicles. Paths along the sides of the bridge allowed sheltered travel for pedestrians.

2. 1.4 PEDESTRIAN ACCESS POINTS: There were two concrete enclosed staircases on either side of the bridge just north of the blockhouse. These were used by pedestrians to access the elevated portion of the bridge in order to cross the river. They were nearly entirely enclosed except for access ports allowing sunlight to illuminate the steps and opened into an area on the walk above with benches surrounded by a low wall.

3. 1.22 OT VEHICLE VULNERABILITY ON THE RAMP/BRIDGE: The buildings along the east and west sides of the bridge had been built up and expanded since the bridge's completion. Many of these structures were within 12 feet of the sidewalks on the span itself. British paratroopers were able to actually see into the open topped armored vehicles, allowing them to easily shoot the driver and assistant driver as the vehicles passed. Additionally, the paratroopers were able to throw grenades and gammon bombs into the passenger compartments from their vantage points in the upper floors and on rooftops. These rules attempt to simulate the extreme vulnerability of open-topped vehicles in this confined space.

4. 2. THE RAMP: The Ramp was a manmade structure of earth and concrete gradually rising in height from ground level to the level of the bridge. The slope was gradual but increased as one neared the top of the span (best available data places the grade varying from 0.5% near the base in hex R5 to 3.5% near the center of the span off the south edge of the map). Vision was clear from the peak of the bridge span (near the center of the river) all the way down the ramp to its base. The LOS mechanics of ASL make this difficult to portray. These LOS rules are an effort to simulate the gradual change in elevation from the top of the bridge to its base.

5. 3. FACTORIES: Players familiar with Red Barricades will note a few differences between the Chapter R Factory rules and those presented in Chapter O. The main differences are simply omissions of those circumstances which will not occur in ABIF. These mainly involve roofless factory hexes and their effects on play, particularly where combination roofless and roofed hexes would exist in the same factory. That will not occur in ABIF as the factory hexes will be either rubble or roofed.

6. 3.332 OB/CG-PURCHASE OF BREACHES: The ability to "buy" breaches represents the use of "mouseholes" by the British troops. These were small openings bored through the walls of neighboring rowhouses to provide limited movement between the structures. These often came as a nasty surprise to the Germans who frequently found themselves in the middle of a British stronghold where only a small outpost was suspected.

7. 4. CELLARS: Owners of Red Barricades will note two primary differences between the Cellar rules in Chapter O and the ones presented here. The cellars in Arnhem were for the most part simple fruit cellars and/or storage areas. Though they were primarily constructed of wood with some brick and mortar added for support, with the exception of their subterranean nature, they were much less sturdy than their Stalingrad counterparts. Additionally, most of these cellars had standard doorway openings and thus were easily accessible. The decision not to make them automatically fortified simulates the necessity of defenders to secure these accesses from entry. The lower stacking limit takes into account the predominant use of these areas, by both sides, to house the wounded and prisoners.

8. 5. THE BLOCKHOUSE: The blockhouses were pillbox type structures located at each end of the bridge. These were used by the German garrison and security troops to control the flow of traffic across the bridge. A small wooden shed was located behind the northern blockhouse. This was the main ammunition storage for the Arnhem garrison and was destroyed in a terrific explosion when hit by a flamethrower on the night of September 17th. The wooden shed is not depicted here as its effect on play was found to be minimal. When the northern blockhouse was finally destroyed by a combination of PIATs, small arms fire and a flamethrower, the resultant rubble inhibited movement down the bridge, though not to an extreme extent. The British did take the opportunity to hide a few anti-tank mines near the blockhouse using planks and other items of debris to conceal their location.

9. 6. UNIT REPLACEMENT: Much has been made about the elan and spirit of the British 1st Airborne, particularly in Arnhem. The truth of the matter is that only about half of the British troops had any battle experience at all. Those with experience were veterans of Tunisia and Sicily and were definitely no strangers to close quarter fighting. Though they had been fighting in mountain passes and rocky crags, these buildings at Arnhem were little different. This is reflected in game terms by the initial British forces having a morale of 8 and an ELR of 5. The staying power of these troops will dwindle away as the CG progresses, simulating the loss of the combat experienced men throughout the British units. Their German counterparts were a mixed group of veterans, old men and teenagers. Though nearly replenished to about one-half of their D-Day manpower strengths—at least on paper—the 9th and 10th SS Divisions were barely a shadow of their true TO&E. Much of their equipment and veteran cadre had been lost in the retreat from Cambrai. However, a pool of trained replacements was readily available. In many cases a veteran platoon would be broken down with its core distributed to several sections. This formed a section with 2 or 3 veterans surrounded by a balance of inexperienced troops. The result was a highly aggressive squad that was also very fragile. These rules simulate the nature of the forces battling in and around Arnhem. For the British, the troops lose their ability to fight for a number of reasons—wounds, exhaustion, lack of water and ammunition not the least among them. The Germans lose their ability to continue the fight due their rapidly depleting pool of experienced, fit fighting men. The Campaign Exhaustion DRM is an abstraction of these factors as well.

10. 7. WIDE BOULEVARDS AND NARROW STREETS: Arnhem was a maze of narrow streets. The buildings were often so close to the streets that no sidewalks were available (see SSR ABIF 5).

Footnotes

Contrasting that sharply were the areas of wide open paved surfaces surrounding the industrial areas to the east of the bridge and the numerous parks throughout the town. The varied mix of these terrain types provides a fascinating tactical puzzle for attacker and defender alike.

11. CG9 REINFORCEMENTS: Though seemingly harsh at first glance, any reinforcements not entering play when "first available" are assumed to have been put to use elsewhere. Players will quickly find that the nature (and relatively small number) of unused reinforcements will render this effect minimal.

12. CG19 WALKING WOUNDED: The British troops at Arnhem were faced with a difficult position. Unable to evacuate their wounded, the British command reorganized those wounded that still retained some fighting ability into functional combat units. The seriously wounded or incapacitated were stripped of equipment and moved to cellars where they could be monitored.

13. CG21 BRITISH WATER SHORTAGES: The British briefings for Operation Market-Garden included a strict prohibition against using the Lower Rhine as a fresh water source. Chief among the concerns was the threat of dysentery. North Africa and Tunisia had taught tough lessons on the debilitating, long term effects of dysentery and had made the British commanders somewhat overly sensitive. Considering the expected short duration of the operation, it is unclear why the river was not utilized. Nonetheless, the troops in Arnhem did not do so. As a result, severe water shortages occurred during some of the heaviest fighting. Two short rain showers helped alleviate this shortage, but only temporarily. German sources following the battle commented on the curiously levels of dehydration suffered by those British captured after the evacuation.

14. CG22 GERMAN ATTACK COORDINATION: The situation on and near the Bridge was confused to say the least. With two separate divisions and a number of unattached Corps assets in the area, the command structure was very cloudy. Second only to the difficulty in locating the British was the problem of coordinating strikes from the separate elements assigned the task of retaking the bridge and opening the roadway to Nijmegen. These rules force the German player to dilute his efforts to help recreate the feel of frustration at not being able to bring his whole force to bear in one fell swoop.

15. 9.605 BLOCK CONTROL: The control of the city blocks in Arnhem was a top priority for both attacker and defender—more so than in nearly any other single battle. The British defenses were designed with control of blocks of terrain in mind (as opposed to controlling single buildings) and the German attacks were likewise targeted at isolating and recapturing one or more city blocks. Past HASL modules have endeavored to provide a RePh process which emphasized localization of forces while still allowing for some movement between scenarios (limited as an abstraction of the time frame between CG Scenarios). These rules are designed to force the players to think (and conduct the battle) in terms of controlling city blocks instead of individual buildings or locations.

16. 9.6172 BRITISH TROOP TYPES: The Elite 6-4-8/3-3-8 counters provided have the "winged parachute" symbol of the 1st Airborne Division in place of the standard MMC class designation. Players may wish to use these counters for normal 6-4-8s/3-3-8s, use the *West of Alamein* 6-4-8/3-3-8 counters with the "E" designation for Commandos, and use the *Pegasus Bridge* 6-4-8/3-3-8 counters with the "Rider-upon-Pegasus" symbol for Engineers.

17. GERMAN RG CHART NOTE q OFFBOARD OBSERVERS AND SAN VALUES: There were two primary sources of German off-map fire direction. The first was from direct fire of large caliber artillery from the south bank of the river. Numerous heavy artillery pieces and flak guns were deployed along the south bank. These fired over open sights into the buildings along the bank and later over the resulting rubble to the upper floors beyond. The south edge observers are an abstraction of these guns. Though not indirect fire per se, the prolonged shelling from these guns fits the ASL OBA engine quite nicely. Second, there is a large church located just off the northwest edge of the playing area. This church had a steeple over 300 feet high. From this point, almost any movement within the Arnhem town proper was easily observed. Additionally, this position was an excellent spot for snipers. The availability dates reflect the changes in possession of this key position throughout the battle. The changes in both players' SAN values likewise reflect the control of this position.

18. 9.6215 DUAL ASSAULT INITIATIVE: The German "advantage" of moving first more often than the British in Dual Assaults is not a reflection of any lack of initiative on the part of the British. Rather it represents a higher level of British surveillance and intelligence and a general desire to react to the Germans rather than to be preemptive.

19. SSR ABTF 1 CONCEALMENT: One of the biggest obstacles to the German forces was their inability to pin down the precise locations and numbers of British troops. Using the close proximity of the buildings and cover from the smoke and haze from the burning and rubble buildings, the British were able to continually frustrate German attempts to locate them until it was often too late. Even at the end of the battle, German estimates of British forces arrayed in and near Arnhem were wildly inaccurate. The conclusions varied by as much as 300% from the actual troop strengths seen. It was only well after the war that official records were updated to reflect reality.

20. SSR ABTF 4 NO QUARTER: The battle of Arnhem was a hard fought affair. Quarter was seldom asked or given. Still, each side took large numbers of prisoners. The majority of these were severely wounded and infirmed. In many cases, soldiers of each side commented on the humane treatment by their captives.

21. SSR ABTF 7 DUTCH UNDERGROUND: The British commanders were cautioned against the use of information supplied by the Dutch Underground. The main reasons for this are unclear but seem to be centered around a baseless fear of Nazi collaborators within the ranks of the Dutch Resistance Movement. Little could have been farther from the truth. The Dutch Underground was composed of some of the bravest men and women in Europe and the information and intelligence they had obtained could easily have changed the entire course of the battle. Nonetheless, the British command climate severely hampered their usefulness. The designation of Holland as a "neutral country" in game terms reflects not upon the general posture of the Dutch, but rather serves to limit the amount of useful information that the British player in *ABtF* will gain from the Civilian Interrogation rules.

22. SSR ABTF 13 KINDLING: The Germans quickly realized that the best way to find the British was to set fire to their buildings. The structures in Arnhem were mostly old, wood framed

houses with brick and stone interspersed between the frames. The results were very sturdy structures which were also highly susceptible to fires.

23. SSR ABTF 18 WHITE PHOSPHOROUS: The German forces in Arnhem made widespread use of the available white phosphorous ammunition. Though normally prohibited from using WP in ASL terms, the Germans at Arnhem enjoyed an availability which justifies its use here. The tendency of the buildings to catch fire easily from the heat of a WP grenade and/or shell is well chronicled. These rules simulate the availability of WP to the Germans, the susceptibility of the buildings, and the resultant fires.

APPENDIX A: USE OF OPTIONAL BLACK GERMAN COUNTERS

A Bridge Too Far includes a German OB, in reduced numbers in most instances, as a throwback to the old *Squad Leader* Series. As they are printed on a black background, some concessions to the existing *ASL* symbology were necessary to retain the detail of the artwork while not lessening the functionality of the counter. Generally, all the black text/marks on a counter become white (with some noted exceptions). Experienced players will quickly recognize these changes and will experience minimal impact on play. For those less familiar with the *ASL* system, the following example counters and explanations are provided:

INFANTRY/SW:

The only significant change to the Infantry/SW counters are that the malfunction "X" is now gray instead of white. There is no change in the meaning of the "X".

ORDNANCE:

This is a Small Target and suffers the (Un)Hooking penalty. The ring is slightly larger than the Target Size circle to assist in identification.

Similar to vehicles, the 360° symbol is gray instead of white to show up on the black background. The meaning doesn't change.

VEHICLES:

The biggest difference, **CYAN MP**, it means the vehicle is open-topped.

Gray turret symbols replace white, they mean the same thing (1MT in this case).

Unarmored vehicles. White outline stars (shown) represent solid black stars (ie., the vehicle is unarmored), solid white stars are small (or double small) targets, solid red stars are large (or double large) targets.

AMMUNITION SHORTAGE CHART (SSR CG 17)			
ORIGINAL DR FOR UNIT SUBSTITUTION LEVEL (A19.131)	B# [†]	ELR LOSS DRM (9.6202)	
One	12	0	+1
Two	12	-1	+2
Three	≥ 11	-1	+3
Four	≥ 11	-2*	+4
Five	≥ 10	**	+5

† SW/Vehicle/Gun B#s reduced by the indicated amount per A19.131

* No British SW/Gun repair attempts may be made during the CG Scenario (but may be done normally in the RePh). British may not use Intensive or Sustained Fire [EXC: OVR Prevention/PPF; C5.64, A8.31]. ATMM Check dr (see SSR ABF 6) receive an additional +1 drm.

** All SW/Guns automatically malfunction after their first use. No British SW/Gun repair attempts may be made during the CG Scenario (but may be done normally in the RePh). British may not use Intensive or Sustained Fire [EXC: OVR Prevention/PPF; C5.64, A8.31]. ATMM Check dr (see SSR ABF 6) receive an additional +2 drm.

14. Victory Point Objectives
15. FRIENDLY Units
16. FRIENDLY Command Control
17. Solitaire Campaign
18. Campaign Companies

INTRODUCTION: Solitaire ASL (SASL) is played in Missions (12.). FRIENDLY forces generally consist of about a company of infantry, derived by the DYO method (15.1) or by a Campaign Game company (18.1). ENEMY forces are entirely unknown

and are generated during play (5.). Game length is usually variable, depending on the Mission being played. Victory Conditions depend on gaining points (VP) during play, according to each Mission's "Victory Point Schedule".

Terrain is generated randomly by the system (13.), and, in some Missions, is subject to expansion during play. Frequently, certain terrain features are designated as Victory Point Objectives (VPO; 14.), final Control of which contributes to victory determination. The player is free to select an historical time period (12.2; 17.21), and may choose to employ most optional rules [EXC: Battlefield Integrity and Interrogation should not be used]. EC, wind force, weather and ELR are determined using the DYO method (12.3-4).

Random Events (RE) for either side are generated by the game system and are triggered by an appropriate Wind Change DR (2.). It is by such RE that random reinforcements (for either side) become available.

When the FRIENDLY side is advancing, likely Locations of ENEMY presence are determined during setup (although more can appear during play) (4.1). Such a Location is marked with a "S?" (Suspect) counter (3.). During Missions in which the FRIENDLY side is defending, ENEMY S? units usually enter from off-board (4.2) and attempt to close with FRIENDLY units. Such moving ("Advance Attitude") S? must be of a different background color from any non-moving ("Hold Attitude") S? concurrently in play, due to the different Actions that apply.

Whether a S? represents a real ENEMY unit(s), or is merely a dummy, is determined in play by the Activation process (5.). If successfully Activated, the content of the S? is individually generated by the various ENEMY Generation Tables (5.7). Once

SOLITAIRE ASL TERMS & DEFINITIONS: The game terms below are used extensively in Solitaire ASL. Each term preceded by the "☞" symbol is especially important and should be thoroughly understood.

AC (Activation Check): A (dr) procedure to determine if a S? Activates as a real, or dummy, unit. (5.1)

AC# (Activation Check Number): The Final AC dr must be ≤ this number in order for the AC to be successful. If the Final AC dr is > this number the S? ("Suspect ?"; 3.1) is a dummy and removed, having no further effect on play. (5.1)

Action: One of four acts (Panic, Move, Fire or Entrench) that an ENEMY unit can be instructed to attempt during its Player Turn by an Action DR (A2a-b). (6.1)

Action DR: The DR (A2) used to determine the Action of an ENEMY unit/stack for the current Player Turn. (6.1-2)

Activated ENEMY unit: An ENEMY unit which is not a S?; one which has been generated from a S? or due to a RE.

Activation: The process of removing a S? and revealing its contents, if any. (5.7)

Attitude: An ENEMY unit is either in Advance or Hold Attitude. (3.2)

Automatic Action: A predetermined Action for an ENEMY unit, mandated by its current situation. (6.3-317)

Built-Up Map: Any standard ASL mapboard with ≥ 19 building hexes. (4.12)

CG (Campaign Game): Of, or pertaining to, the SASL Campaign Game. (17.)

CMD#: The number a FRIENDLY unit must roll ≤ in order to be in Command Control. (16.2)

CMD DR: A FRIENDLY unit must pass a Command DR (CMD DR) or be within the Command Influence range of a FRIENDLY leader that has passed his CMD DR in order to be in Command Control. (16.3-4)

Command Influence: Each FRIENDLY leader that has passed his CMD DR (or is within the Command Influence range of a better-rated FRIENDLY leader) has a Command Influence range of two hexes. (16.4)

Directly Attached: A unit/Weapon that is part of the FRIENDLY CG company. (17.131)

☞ **ENEMY:** Having to do with the nationality being controlled by the solitaire "system".

☞ **EBE (ENEMY Board Edge):** ENEMY units usually enter along the EBE, the mapboard configuration's edge opposite the FBE. For the sake of convenience, the EBE is always considered the east edge of the mapboard configuration.

Fire Command: A Priority List used to determine the Fire Action of an ENEMY unit. (8.1)

☞ **FRIENDLY:** Having to do with the nationality controlled by the player.

☞ **FBE (FRIENDLY Board Edge):** The mapboard configuration's edge along which FRIENDLY units normally enter; the player should be seated with this edge nearest to him. For the sake of convenience, the FBE is always considered the west edge of the mapboard configuration.

HW (Heavy Weapon): Each SW that is ≥ 3 PP (when assembled), or a Gun. An ENEMY unit possessing a HW will usually have an Automatic Action. (6.313)

IP (Improved Position): Each Entrenchment, Pillbox, Fortified Building, Gun Emplacement, or VPO Location. An ENEMY unit in an IP will usually have an Automatic Action. (6.312)

Letter Chit: One of 33 chits, lettered A through GG, provided in the SASL module. A Letter Chit, when drawn blindly from an opaque container, is used to randomly determine a like-lettered mapboard hexrow. See 4.1c or 4.21 for Letter Chit usage.

Mission: An SASL "scenario". (12.)

Move Command: A Priority List used to determine the Move Action of an ENEMY unit. (9.2)

MSR (Mission Special Rule(s)): The set of special rules, given at the end of each Mission, pertaining only to the play of that Mission. (12.1)

Panic: A non-Good Order (solitaire-only) condition affecting a FRIENDLY or Activated ENEMY unit, restricting its ability to act. (6.21-213, 16.3)

Prevailing Attitude: The Attitude listed for the ENEMY in each Mission's "Prevailing Attitude" section which largely determines the way an ENEMY units moves. This Attitude is in effect at Mission start and remains so until otherwise changed (e.g., an MSR or RE dictates a change). (3.2)

☞ **Priority List:** A list of options used to determine, by the process of elimination, the precise action taken by an ENEMY unit; e.g., each Fire Command contains a Priority List used to select the Target when > one Target exists. Each item in the list is used to progressively narrow down the unit's options. If, by the end of the List, a decision has not been reached make a Random dr for selection. See 6.311/7.1/8.12/9.22 for EX of Priority Lists.

Prohibited Location: A Location which an ENEMY unit/Weapon cannot enter/set-up-in due (usually) to terrain restrictions. (S?; 3.323; ENEMY Activated unit: 5.61, 9.26)

☞ **Random dr:** Used to select a single option/unit; there can be no "ties" (i.e., unlike a Random Selection dr).

Random Event: see RE.

RAS ("Roll At Start"): Part of a SASL Move Command. (9.23)

RE (Random Event): An occurrence for the current ATTACKER used to randomly alter the present game conditions, possibly by the addition of reinforcements. (2.)

REH ("Roll Each Hex"): Part of a SASL Move Command. (9.24)

RE Numbers: A pair of consecutive numbers from 2 to 7 (e.g., 4/5) that, if either is rolled as the Wind Change DR, determine whether the ATTACKER will have a RE occur during that Player Turn.

Retained: Each FRIENDLY unit/Weapon in a CG company's OB that is available for the next CG Mission.

Road Network: A MSR-required continuous path of road hexes from one board edge to another. (13.231)

SASL: Pertaining to the Solitaire ASL system.

☞ **S? ("Suspect ?"):** A non-Activated ENEMY unit, the actual identity of which is not known until an AC is made for the S?. A S? is *not* considered a Known unit. (3.1)

☞ **Target:** An in-LOS, non-HIP FRIENDLY unit (non-abandoned if vehicular) or Gun that is within (long) range of an ENEMY unit that *can be affected* by any non-CH attack from that ENEMY unit/its-functioning-possessed-Weapon. The range of the ENEMY unit can be extended by any manned, functioning Weapon possessed-by/carried-onboard it. A FRIENDLY unit(s) in a Melee Location can only be considered a valid Target if the ENEMY attack into the Location would not affect the ENEMY unit(s) therein.

Temporarily Attached: A FRIENDLY unit/Weapon reinforcement granted (via MSR/RE) to a CG company for use during the current Mission (only). (17.132)

VP: victory point.

VPO (Victory Point Objective): An important tactical terrain Location (or group of Locations) designated by the player to aid in victory determination in some Missions. (14.)

Weapon: Any SW/Gun/Vehicular-armament/Daisy-Chain/MOL using the IFT/TK table to cause damage to the opponent.

INTRODUCTION

Activated, an ENEMY unit will move/fire according to the Action assigned to it (6.), which may be random or Automatic (6.3). The nature of the Mission, the Attitude of the ENEMY, and the Location of the ENEMY (among other things) all affect the type of Action the ENEMY unit takes.

In SASL, FRIENDLY units (only) are subject to mandatory Command Control rules (16.). Furthermore, units of both sides are subject to Panic (6.211), a new (solitaire-only) non-Good Order status applicable for the length of a Player Turn (or until broken). Panicked units cannot move, and may only fire using FPF or Intensive Fire.

SASL provides you with an integrated Campaign Game (CG) system (17.), allowing you to select your FRIENDLY nationality and play one Mission per month of the war on that front, following the progress of your "historical" company (18.) through those long and grueling years. Your CG company's OB is determined by your surviving units and any replacements received. Leader "promotion", squad "Battle Hardening" and Weapon replacement (on an historical schedule) are all possible. In a CG Mission it is especially important for you to decide when victory in the dangerous predicament you may find yourself in is worth the price you may be forced to pay—or whether it might be better to withdraw, hopefully extricating most of your command to fight again on another day.

No matter how the system is played, it can be a useful training device. It is an ideal tool for simply "boring up" on seldom-used rules and a good way to test new tactics for your next face-to-face engagement. However, in its own right, SASL is a unique gaming experience; indeed, the "Fog of War" is more prevalent in a SASL Mission than a standard ASL scenario—a SASL Mission is full of surprises (sometimes nasty) and you never know what you'll be facing until the enemy is engaged. Being solitaire, however, you have no opponent to "keep you honest". Therefore, you should always be very unforgiving of yourself when forgetting to perform an action at the proper time, or if you suddenly find the Location a FRIENDLY unit just entered "generates" a nasty surprise. Once you have performed (or have forgotten to perform) an action, it is too late to backtrack.

S.1 SOLITAIRE TABLES: There are many different tables necessary to play Solitaire ASL (SASL). The tables are organized into two general types: Basic Tables (used by all nationalities whether FRIENDLY or ENEMY) and specific Nationality Tables used to generate units specific to that nationality. Each Nationality Table has an ID code in the form of one or more letters and a number. Some tables have an additional lower-case letter (e.g., a, b, or c) following the table's primary letter-number ID code; this tertiary ID character denotes a further division of that table into several sub-tables.

S.1A BASIC TABLES: A table applicable to all nationalities is prefixed by the ID letter "A", followed by the table's number code.

EX: Table A1 is the ENEMY Activation Table which is used by all ENEMY nationalities.

S.1B NATIONALITY TABLES: Each nationality has its own unique set of solitaire tables for randomly generating the forces for that nationality. Each nationality's set of tables is preceded by a single capital letter denoting that nationality (as per the following chart). Additionally, whenever the lower-case letter "x" is a prefix to a table reference (i.e., "table x6") the rules are referring to any nationality's table with that ID number (but never to a Basic Table; S.1A).

NATIONALITY ID CODE LETTERS:

Letter	Nationality*	Letter	Nationality*
B	British	M	U.S. Marines
C	Chinese	N	Finnish
F	French	P	Partisan (French/Russian)
G	German	R	Russian
I	Italian	U	U.S. (ETO only)
J	Japanese	X	Axis Minor
L	Allied Minor		

EX: Table R2 is the Russian Squad Generation Table; table G2 is the German Squad Generation Table; table x2 is the squad generation table of any nationality (Russian, German, U.S., British, etc.).

*NOTE: Only the nationality tables for the German, Russian, U.S. and Partisan (as well as the Basic Tables card) are included in this module. Other nationality tables may become available in the future.

S.1C BRACED TABLE REFERENCES: If a table's ID code appears in braces (e.g., "[A6e]") the player is being instructed to refer to (and possibly make a DR [or dr, as necessary] on) the table noted.

S.1D BRACKETED dr NUMBERS: Some generation tables contain bracketed numbers within that table indicating that a subsequent dr is necessary to fully determine the unit being generated.

EX: The Mission date is August 1941. The player has made a DR of "4" on the "1941" column of the Russian Standard AFV Generation table (R6), giving the result of "KV-2 [1-3]; KV-1 M39/40 [4-6]". The bracketed numbers indicate the player must now make a dr to determine which type of AFV is generated from among the listed types. A subsequent dr of "5" results in a KV-1 M39/40 being generated.

S.2 FREE LOS CHECK: Even before firing/making-an-AC, an ENEMY unit(s) is allowed a free LOS check when the LOS is questionable.

1. INTRODUCTION

1.1 NATIONALITIES: SASL puts the player in command of German, Russian or U.S. units (see 15.1); "generation" tables for other nationalities may be available later. Note that this system does not provide a method to play traditional ASL scenarios solitaire, but rather a means to "roll up" and play an endless variety of new, purely solitaire scenarios, or Missions (to use the game term). In addition, individual Missions may be linked together to form a comprehensive campaign with the SASL Campaign Game rules (17.).

1.2 SIDES: "ENEMY" units are controlled by the game system (you should, but do not have to, select an opposing side that would be historically accurate); you, the player, are responsible for "FRIENDLY" units (the units of your chosen nationality).

2. RANDOM EVENTS

2.1 RANDOM EVENT NUMBERS TABLE: Each Mission has one (or one for each side, depending on the Mission) Random Event (RE) Numbers Table used to determine the starting RE Numbers for each side for that Mission. When determining the parameters of the Mission, make a separate dr for each side on the RE Numbers Table. Each dr results in a pair of consecutive numbers (e.g., 5/6), hereafter called RE Numbers.

2.1.1 MARKING THE RE NUMBERS: Use the respective "RE #s" marker to record the current RE numbers of each side on the "FRIENDLY/ENEMY RE# Track" (found on the Chapter S divider). Position the marker so that the two RE Numbers for that side are visible on either side of that marker.¹

2.2 RANDOM EVENT OCCURRENCE: The Wind Change DR is also the RE DR for the current ATTACKER. If the Wind Change DR is equal to either of the ATTACKER's current RE Numbers (2.1) a subsequent DR is made on the pertinent RE Table to determine the specific RE. The ENEMY nationality always uses table A11 [EXC: Partisan ENEMY; 12.213]; the FRIENDLY nationality uses its specific "(FRIENDLY nationality) Random Event Table" {x9}. A RE, for either side, can occur only if ≥ one Activated ENEMY unit has been in play.

EX: It is the start of the German Player Turn of Game Turn two in a Mission where the German is the FRIENDLY side and an ENEMY unit has already been Activated. The German RE Numbers are 2/3. The wind change DR is a two, resulting in both a possible wind change and a German RE occurrence. A subsequent dr is made for the wind change (B25.65), followed by a RE DR on the German "German Random Event Table" {G9}.

2.3 RE TABLE DR: When making a DR on a RE Table {A11/x9} always use one colored die and one white die. The colored dr (of the RE DR) is always read as the "10's", the white as the "1's", thus producing an Original result from 11 to 66. Only the colored dr (of the RE DR) is subject to modification (+1 or -1), as specified by the Mission being played.

EX: To roll an Original RE DR of 36 requires a three on the colored die and a six on the white die. If there is a +1 dr (to the colored dr of that DR) the result will be a Final 46.

2.3.1 RE OCCURRENCE LIMITS: Each RE preceded by an "s" on a RE Table can only occur once during a Mission. When such a RE originally occurs, record its number (e.g., "ENEMY RE 64-65") in the box labeled "Non-repeatable REs" (found beneath the RE Track) on a photocopy of the Chapter S divider. If the same RE is subsequently determined, reroll for another RE.

2.4 MAXIMUM/MINIMUM: The RE Numbers of either side are subject to change (due to a RE occurrence or as per Mission instructions) during the course of a Mission. The maximum RE Numbers for either side are 6/7; the minimum are 2/3. Any instruction to change the RE Numbers above/below these numbers (respectively) is ignored; in such a case follow the provided alternate instruction instead.

2.5 RE NUMBERS CHANGE: If a side's RE Numbers are to increase, add one to each current number (e.g., 5/6 would become 6/7). If a side's RE Numbers are to decrease, subtract one from each current number (e.g., 5/6 would become 4/5).

2.6 ENEMY RE UNIT ENTRY: The player must enter each ENEMY RE unit during the Mph of the ENEMY Player Turn it becomes available. Each

S

such unit enters along the EBE unless noted otherwise in its RE. FRIENDLY RE units enter as per 15.5 and 16.33.

3. S? AND ENEMY ATTITUDE

3.1 SUSPECT ?: Most Activated ENEMY units appear on the mapboard due to the successful Activation of S? units. Some Missions (in which FRIENDLY units are attacking) begin with S? setup on the map; others (usually when FRIENDLY units are in a defensive posture) begin with S? entering from offboard along the EBE. Consult the specific Mission being played for the placement/entry of S?. In an SASL Mission the ENEMY has two potential types of "concealment":

- a normal "?" that functions as a standard concealment marker (placed on Activated ENEMY units to Conceal them, as per A12.) and
- a "Suspect ?" (S? hereafter) that represents a potential ENEMY unit(s) yet to be Activated and, as such, is considered a non-Activated, Good Order, unbroken Enemy unit. Each attack vs a S? is resolved as Area Fire (A12.13).

3.11 STACKING: Prior to Activation, a S? is considered as one squad for stacking purposes [EXC: if in Human Wave; 4.3].

3.2 PREVAILING ATTITUDE: There are two Attitudes that help determine the Actions (6.) of ENEMY units: "Hold" or "Advance". Each Mission lists the ENEMY's Prevailing Attitude which is the Attitude in effect at the start of that Mission for each S? setting-up/entering due to that Mission's "S? PLACEMENT/ENTRY" instructions. The Prevailing Attitude of the ENEMY determines his basic tactical stance: whether his units will attempt to close with your forces (Advance Attitude) or maintain their current positions (Hold Attitude). Due to RE occurrence, it is possible to have some reinforcing ENEMY units/S? in Advance Attitude even when the Prevailing Attitude is Hold. In such a case, reinforcing S? (or any S? governed by a special generation procedure; e.g. RE 36 or 54 [A11]) must have a different background color from other S? in play that are governed by a different Prevailing-Attitude/exit-edge/generation-procedure. Use a black-background S? marker for each S? in the Prevailing Attitude and other, different-colored S? markers for additional S?, as needed.

EX: When playing the "Cautious Advance" Mission with the Germans as the FRIENDLY nationality on the East Front, the player uses the (most-numerous) black-background S? for all S? initially set up on-board, as well as for any subsequently appearing S? that have the (same) Prevailing Attitude (e.g., due to ENEMY RE 06 [A11], "ENEMY Infiltration"). Then, on turn four ENEMY RE 34 occurs ("ENEMY Reinforcements"). Different-colored (e.g., grey-background) S? must be used for each such Advance-Attitude ENEMY S? subsequently entering the map due to this RE occurrence. If, on the next turn, RE 54 were to occur (granting the ENEMY Russians ≥ 1 Human Wave), yet another different, yellow-background S? are used for each Advance Attitude Human Wave S?, as such are governed by a different generation procedure (4.34) than the other Advance Attitude S? that entered on the previous turn.

3.3 S? CONDUCT & ACTIVATION: A S? is checked for Activation² immediately when one of the following (3.31-32) conditions is met (depending upon that S?'s Attitude):

3.31 HOLD ATTITUDE: A S? in Hold Attitude will *never* move/advance. It remains in its current Location until Activated, at which time any ENEMY unit(s) successfully Activated from it is subject to normal Actions (6.). A S? in Hold Attitude can be Activated in any of the following ways:

- the S? is attacked resulting in a concealment-loss result on the IFT [EXC: a S? is an ineligible target for a Sniper attack (A14.22)], or
- by the proximity and net IFT DRM (including LV) of a moving/routing/advancing FRIENDLY Target* [EXC: 8.61], or
- if the Location of the S? is successfully Searched (A12.152) or Mopped Up (A12.153; see also 15.8-9), or
- if a Flame appears in its Location (a Blaze eliminates a S?), or
- whenever the conditions of Long Range Activation (5.32) are met [EXC: 8.61], or
- due to Mopping Up (15.9).

* Each nationality's table x1 lists the ranges (from the S? to the moving/routing/advancing FRIENDLY unit) and corresponding net IFT DRM applicable to that in-LOS moving/routing/advancing unit to determine when the S? is eligible for Activation (i.e., to have its Activation Check dr performed; 5.1). Note that the FFM/FFNM DRM do not apply to a routing/advancing unit's net IFT DRM.

3.32 ADVANCE ATTITUDE: A S? in Advance Attitude can be Activated in the same ways as a S? in Hold Attitude. Additionally, because each S? in Advance Attitude is eligible to move (indeed, must move in its MPH/APH), such a S? is also eligible for Activation whenever it is within 16 hexes and in LOS of a non-broken/stunned/shocked FRIENDLY ground unit, and the S?:

- moves/advances in such a manner that would normally result in its

Concealment loss (A12.14) as if it were an Infantry unit, or

- enters a Location ADJACENT to a FRIENDLY ground unit (regardless of the TEM of the S?'s Location). The ENEMY unit(s) generated therefrom may retain concealment unless performing a concealment-loss activity when Activated.

3.321 MOVEMENT OF S?: A S? in Advance Attitude moves along a (Alternate; as per E12.11, with the same coordinate number) Hex Grain toward the opposite board edge from the edge entered (S? placed directly on-board due to RE are considered to have entered the EBE for purposes of this rule). Each S? always has 6 MF [EXC: eight MF if in Human Wave [4.321]; +1 MF if road bonus applies], never uses Assault Movement, Double Time, nor Bypass movement, pays Infantry Movement costs for all Locations entered and is never subject to CX penalties (even if using Minimum Move or advancing into difficult terrain). A S? ceases movement if unable to enter the next Location (3.323).

Each ENEMY Infantry unit Activated from an Advance-Attitude S? during the ENEMY MPH ceases movement (i.e., ends its MPH, but is still subject to FFM/FFMO) when Activated (5.1) [EXC: if in Human Wave; 4.34]. Each ENEMY vehicular unit Activated from an Advance-Attitude S? during the ENEMY MPH ends its MPH when Activated but remains in Motion; for FRIENDLY Defensive Fire purposes, it is considered to have expended the minimal amount of MP required to enter the Location [EXC: Bog terrain; 5.712] (no Bounding First Fire is allowed). During following turns, each such unit performs Actions (6.) normally, dependant upon its Prevailing Attitude and unit type.

3.322 S? ADVANCE: In the APH a S? in Advance Attitude makes a dr and consults the applicable hex rosette [A4b] (depending on the map configuration) to determine the Location it advances into. A S? IN a Depression Location may instead claim Crest status (B20.9) in that Location (player's discretion). If unable to enter the determined Location (3.323), determine a different Location for the S? to enter (either roll again, or use Random dr, from among the eligible Locations, as necessary). See 11.1-4 to determine the advance of an Activated ENEMY unit.

A4b ADVANCE ATTITUDE
ENEMY Infantry Movement Table
Random Move Hex Rosettes

EX: It is the APH in a Mission in which the German is the FRIENDLY side. The north edge of the map is to the left (i.e., the FBE is toward the bottom of this illustration), hence the hex rosette on the right is used, at its configuration aligns with the map's hexgrid. In the illustration above, each of the Advance-Attitude ENEMY S? is now to have its advance determined. The dr for the S? in 37BB3 is a "6"; it therefore advances into hex CC4. The S? in CC4 advances into BB4 (no dr is necessary, as no other advance is possible; it cannot cross the CC4-CC5 hexside nor enter the DD4 Marsh Location in the APH). The S? in DD3 however could advance into CC4 or EE4, therefore the player makes a Random dr to determine its advance, mentally noting that on a roll of ≤ 3 it will advance into CC4 (hence giving the S? equal odds to enter either CC4 or EE4). The advance dr is a "4", however, so it enters EE4. Finally, the S? already in EE4 must have its advance dr made. The dr is a "1"; however, since it too cannot enter the DD4 marsh in the APH, a subsequent dr is made. This time the dr is a "3", resulting in the S? advancing into EE5.

3.323 PROHIBITED LOCATION: A S? will not enter a Location that is/contains:

- a FFE blast area;
- a Known Minefield (15.21) [EXC: if the Minefield is in/ADJACENT-to a FRIENDLY-Controlled VPO Location];
- ≥ 2 ENEMY units;
- ≥ 4 Residual/Fire-Lane FP [EXC: if such FP is in/ADJACENT-to a FRIENDLY-Controlled VPO Location];
- a Water Obstacle
- Offboard [EXC: FBE; unless so directed by its MSR/RE instructions]; see also 9.4.

Furthermore, a S? may not enter a Location which an Infantry unit cannot enter during the current phase (e.g., a Marsh Location in the Aph), nor cross (climb) a cliff hexside. It will instead attempt to move around such a Location/hexside, taking the shortest route toward the FBE (in hexes).

4. S? PLACEMENT AND ENTRY

4.1 S? PLACEMENT: The "S? Placement/Entry" section of each SASL Mission states the method that S? are setup-on/enter the mapboard configuration. If S? are to begin the Mission setup on the map, the player will be instructed to set up S? according to one or more of the following cases (a-e, following). Use a black-background S? marker for each initially placed/entering S? (as well as for subsequently appearing S? of the same Attitude and governed by the same generation procedures as initially placed/entering S?; 3.2). Refer to each Mission's section on "S? PLACEMENT/ENTRY" for more specific instructions on initial placement/entry of S? for that Mission. A maximum of two S? may be initially placed per on-board Location [EXC: 4.1e].

(a) One S? in each building/rubble/lumberyard Location [EXC: 4.11-.13].

(b) One S? in each woods/brush Location that has an odd or even coordinate (as determined by a single at-start odd or even dr for the each mapboard of the configuration; consider a coordinate of "0" as even) and is either part of $\geq$ three connected woods/brush Locations (i.e., the woods/brush depiction extends across a hexside(s) "connecting" to the woods/brush depiction in the ADJACENT Location) or is such a Location that is connected to the EBE in a Mission in which that edge may have additional mapboards activated along it [EXC: 4.11-.13].

EX: Before beginning the "Bunker Busting" Mission the player must place S? according to 4.1's cases a and b. Two mapboards have been determined. As per case a, one S? is placed in each building/lumberyard Location (at each level) on both maps that is not within three hexes of a whole off-board hex along the FBE. Next, the player makes a dr for each map to determine S? Locations for case b. Both dr are even, therefore he now places one S? in each woods/brush Location on each map, providing that Location is a part of a group of three or more connected woods/brush hexes. Note however, since no additional maps may be activated during this particular Mission, a woods/brush Location that is along (or connected to) the FBE is not eligible (unless it is part of a group of three or more connected woods/brush hexes).

(c) One S? in each VPO Location (including each non-Rooftop/Sewer Location of a VPO building) regardless of terrain [EXC: a S? is not placed on a multi-hex bridge unless the Location is Accessible to a land hex], as well as each Concealment Terrain Location ADJACENT to each VPO Location [EXC: 4.11-.13].

(d) One S? in each VPO Location (including each non-Rooftop/Sewer Location of a VPO building) regardless of terrain [EXC: a S? is not placed on a multi-hex bridge unless the Location is Accessible to a land hex], as well as each Concealment Terrain Location within two hexes of each VPO Location [EXC: 4.11-.13].

(e) For each just-placed mapboard, make a dr [A6d] to determine the number of Letter Chits to be drawn. Draw all Letter Chits (each chit drawn determines a hexrow of the mapboard); after all Letter Chits are drawn make a subsequent dr+2 (resulting in a Final number ranging from 3 to 8) for each chit selected. This dr+2 determines the coordinate number of the hexrow determined by the Letter Chit, thus determining a "placement hex". Then make a dr [A6f] for a radius, in hexes, that S? are to be placed from the "placement hex". Place one S? in each eligible Concealment Terrain Location [EXC: 4.11-.13] within the determined hex-radius of each placement hex (including any such Location[s] in the "placement hex" itself). A maximum of one S? may be placed per Location using this method, even if a hex is within the radius > one "placement hex". An OG Location is considered Concealment Terrain for purposes of this S? placement method if a theoretical line of fire (regardless of whether such a LOS actually exists) from any level of (any of) the nearest off-board whole hex(es) of the FBE would cross a wall/hedge/bocage hexside of that Location and an ENEMY unit therein could gain wall advantage along such a hexside. Once all such S? are placed on a mapboard, return all Letter Chits to their opaque container, and repeat the procedure (as necessary) for each remaining mapboard.

NOTE: If $\leq$ two S? are placed for a Letter Chit repeat the procedure (remove the just-placed S? [if any], draw a new Letter Chit and make a new placement dr).

EX: S? are to be placed on mapboard 33 according to 4.1e. The FBE is from A1 to GG1. The player's dr on Table A6d is a 3, giving a result of "2". Therefore, two Letter Chits are drawn, with the letters Q and S being displayed (thereby determining hexrows Q and S on board 33). Next, the player makes one "dr+2" for each letter chit selected. An Original dr of 4 for chit Q becomes 6, thereby determining hex 33Q6 as a placement hex. The "dr+2" for chit S is a 6, determining S8 as the other placement hex. Next, the player must make a dr for each placement hex, and consult Table A6f to determine the radius (in hexes) that S? are to be placed in Concealment Terrain Locations from each placement hex. The dr [A6f] for placement hex Q6 is 6, thus giving a result of "1". One S? is placed in P5, P6 and each level of building hex R6. A S? is also placed in Q7 "behind" the Q6-Q7 wall hexside, as the LOF from the nearest offboard whole hex (offmap in hexrow Q in this case) would cross the Q6-Q7 wall hexside. Next, the "radius" dr [A6f] for placement hex S8 is a 4, thus giving a result of "2". Therefore, one S? is placed in each level of building hex R7, and at ground level in hexes R8 and S8. A S? is placed in U8 "behind" the U7-U8 hedge hexside) and in U9 "behind" the U8-U9 hedge hexside), as the LOF from the nearest offboard whole hex would cross those hedge hexsides (respectively). Too, if Grain is in season, a S? would be placed in Grain hexes T6 and U7, as both are within two hexes of placement hex S8. Note that only one S? is placed in each Location of Q7 and R6 despite those Locations being within the determined radius of both placement hexes.

If the FBE instead ran from A10 to GG10, S? could not be initially placed in P8, R8, S8, U8 or U9, as all of these hexes are within three hexes of a whole offboard hex along the FBE (4.11). However, a S? would now be placed in U7 (regardless of season) due to the U7-U8 hedge hexside.

4.11 PROXIMITY TO FBE: Regardless of the method used to place S?, a S? may never be initially setup within 3 hexes of any whole offboard hex along the FBE.

EX: S? are to be placed on board 4 according to 4.1a (only). The mapboard has been aligned such that the FBE extends from A1 to GG1 (the board's number is toward the south). Buildings P1, S2 and X1 may not have S? setup in them due to their proximity to the FBE. A S? is setup in T3, however, since it is not within 3 hexes of any whole offboard hex along the FBE (i.e., it is not within three hexes of whole offboard hex "S0" or "T0").

4.12 S? PLACEMENT ON BUILT-UP MAPBOARDS: Table A9e is used to determine S? setup (non-rooftop/non-sewer) Locations of each building/rubble hex on a mapboard with $\geq$ 19 rubble-Locations/buildings (even if the entire mapboard is not in play). No S? is placed in that hex if none of the determined Location(s) exist in that hex (e.g., a Final dr of 3 ["none"] or 5 ["Second Level"]) (A9e) would have no effect for a Single Story House) [EXC: if such a hex is a VPO reroll until $\geq$ one S? is placed]. For purposes of this rule, each rowhouse hex is considered a separate building.

4.13 WOODS MAPBOARD: A S? is placed in a woods whole/half hex of a Woods mapboard (marked with the "w" prefix on Table A9) only following an Original odd placement dr (roll for each S? placement Location separately).

4.14 S? IN CREST STATUS: A S? setting up in a Depression Location is placed in Crest status (B20.9) so that the unit's LOS toward the FBE crosses as many crest hexsides as possible.

4.2 MAPBOARD ENTRY OF S?: ENEMY S? [EXC: if in Human Wave; 4.3] enter in one of two methods, dependant upon the mapboard configuration's alignment. If the determined entry hex is illegal/NA, repeat the procedure for that S?.

4.21 S? ENTRY ALONG THE LENGTH OF A MAPBOARD: Draw one Letter Chit for each Advance Attitude S? scheduled to enter along the length (i.e., the 22" side) of a mapboard. The ID of the Letter Chit determines the hexrow along that edge the S? will enter. Set up the entering S? in the RPh just offboard, next to that hexrow [EXC: if Overstacked (3.11), or Prohibited (3.323), pick a new Letter Chit]. Return each Letter Chit to the cup after placing its determined S?, before the next chit is drawn.

S

3	2	
		8L

N

EX: Seven S? are scheduled to enter on the EBE of the board configuration shown at left. The player now randomly draws one Letter Chit from the opaque cup for the first S? to be placed. Since this Letter Chit has the ID letter "G" he sets up the first S? just off the east edge opposite hex 18G10, then returns the Letter Chit to the cup. He repeats this process six more times, once for each S? scheduled to enter on that turn. It is possible to have > one S? enter along the same (Alternate) Hex Grain.

4.22 S? ENTRY ALONG THE WIDTH OF A MAPBOARD(S): For each Advance Attitude S? scheduled to enter along the width of $\geq$ two mapboard(s) (depending upon the number of mapboards presently in the mapboard configuration or as per special entry instructions, if any) the player makes a DR in the RPh of the turn of entry. (If the S? are eligible to enter only along the width of a single mapboard, only a dr is necessary.) Disallow any river mapboard from the selection process. The colored dr (of the DR) is used to randomly determine the mapboard (of a multi-mapboard configuration) that the S? will enter. The player mentally assigns each eligible mapboard a number(s) from 1 to 6 so that each eligible mapboard of the configuration has equal odds of being selected (e.g., if two mapboards are eligible S? entry maps, one mapboard is assigned the numbers 1, 2 and 3 while the other is assigned the numbers 4, 5 and 6). The white dr (of the DR), modified by +2, determines the hex coordinate number of the mapboard that the S? will enter. Place each S? just offboard, adjacent to the hex it is to enter [EXC: if Overstacked (3.11), or Prohibited Location (3.323), make a new placement DR].

EX: Using the mapboard configuration pictured in the 4.21 EX, the player is to enter five S? in a "flank attack" along the north edge of the configuration. All mapboards are eligible entry boards. The player assigns the numbers one and two to board 3, three and four to board 2 and five and six to board 18. His first DR is a red 5 and a white 2. Therefore, he places a S? next to hex 18GG4, just off the north edge. The next DR is a red 2 and a white 6. The player places the next S? adjacent to hex 3AS just off the north edge. This process is repeated until all S? scheduled to enter that turn are placed.

4.3 SASL HUMAN WAVE S?: A Russian Human Wave may occur due to a RE, or as a standard part of Mission 14. All ASL Human Wave rules (A25.23-231) apply except as amended below. Each SASL Human Wave S? should be a different color from all non-Human-Wave S? since a SASL Human Wave S? (even if not currently part of a Human Wave) always uses the Human Wave Generation table [R10] when rolling for generation. Each unit engaging in a SASL Human Wave receives the ML increase regardless of the Player Turn. Each Human Wave S? is considered as two squads for stacking/VP purposes.

4.31 ENTRY: Each turn a SASL Human Wave is to enter randomly determine two hexes along the EBE. Use either 4.21 or 4.22 to determine the hexes, depending on the edge being entered. Each of the two hexes thusly determined, and each hex between them, is an entrance hex for one SASL Human Wave S? [EXC: repeat the procedure if the two determined hexes have $\leq$ 2 hexes, or $\geq$ 11 hexes, between them].

EX: A SASL Human Wave is to enter along the length of board 19. Using the method stated in 4.21, the player draws two Letter Chits from their opaque container, resulting in hexrows "B" and "E" being specified. However, this would not be legal, as "the two determined hexes have $\leq$ 2 hexes...between them". Therefore, the two chits are returned to the cup, and the player repeats the process. This time chits "F" and "T" are drawn. Unfortunately, this is also not legal, as hexrows F and T have thirteen other hexrows between them. Therefore, these Letter Chits are also returned to the cup, and two more chits are selected. The third draw results in chits "N" and "X". This is legal since hexrows N and X have nine hexrows between them.

4.32 ACTIONS: Each Activated ENEMY unit that is part of a SASL Human Wave automatically has a Move Action (6.305) and is never subject to Panic during its Player Turn [EXC: leader; 6.317]. A SASL Human Wave unit always moves/advances toward the FBE. During movement, however, Human Wave units should attempt to Control any FRIENDLY-Controlled VPO when such is possible during their movement toward the FBE. See also 4.323.

4.321 MPH: SASL Human Wave units move as per A25.231 except that LOS to a FRIENDLY unit within eight hexes is not required (indeed, when entering from offboard such LOS is not possible), nor is it necessary to have a leader present in the Human Wave. A SASL Human Wave unit has 8 MF and moves before all other non-Human-Wave units [EXC: if berserk; 6.301].

4.322 APh: The APh should be used to close any gaps (or as many as possible) occurring in a SASL Human Wave (due to FRIENDLY defensive fire or movement around obstacles). If all such gaps cannot be closed, the player should instead attempt to close as many as possible in order to have the most units eligible to use Human Wave movement subsequently. If gaps do not need to be closed, SASL Human Wave units advance toward the nearest Target(s), and in so doing strive to avoid creating gaps.

4.323 SUBSEQUENT TURNS: Each ENEMY unit in a SASL Human Wave continues Human Wave movement in subsequent turns until it has entered a Location occupied by a Known opposing unit(s), is broken, eliminated, has exited off the FBE, or has been released from Human Wave movement due to obstacle interference (4.33). In order for an ENEMY unit to use Human Wave movement on a subsequent turn there must still be ENEMY MMC in a chain of $\geq$ 3 contiguous hexes with an average of $\geq$ 2 such MMC per hex (A25.23); however, the presence of an ENEMY leader is not necessary. Other Activated ENEMY Infantry units must be added to the Human Wave [EXC: if possessing functioning HW], provided such is in proper position at the start of its MPH.

4.324 MULTIPLE WAVES PRESENT: If multiple (on/off-board) Human Waves are present, the wave with the unit that is closest to the FBE moves first.

4.33 RELEASE: If a SASL Human Wave (or portions thereof) runs into an obstacle which cannot be negotiated via Human Wave movement (such as a Water Obstacle, cliffs, rowhouse walls, etc.) those portions of the Human Wave immediately end their MPH, allowing the remainder of their wave (if any) to continue movement (alternately, you may wish to allow such a unit to delay, then follow in the tracks of an adjacent unit). Such a S? no longer able to continue Human Wave movement maintains Advance Attitude and use Table R10 for Activation. However, such already-Activated former Human Wave units unable to continue in the formation assume the Prevailing Attitude.

4.34 GENERATION: Whenever a SASL Human Wave S? is Activated (3.32), make a dr on the "Human Wave Unit Generation" table (R10) to determine the units generated. No AC dr (5.1) is required for Activation of a Human Wave S? (even if that S? is no longer using Human Wave movement). A Human Wave S? can never be a dummy. SASL Human Wave units (only) may continue movement after Activation, MF permitting.

4.35 LEADER GENERATION DRM: There is a +1 DRM on the Leader Generation table (R3) per leader/Commissar currently part of that Human Wave formation. There is a -1 DRM on the Leader Generation table (R3) if no leader/Commissar is currently part of that Human Wave.

4.36 HUMAN WAVE FG: A SASL Human Wave unit(s) will First Fire in the FRIENDLY MPH vs a Target as per 8.61-612; in the AFPh/DFPh Human Wave units should form the largest FG possible in order to attack using the following:

Priority List: closest Good Order Target in least TEM; closest Target in least TEM.

4.37 RECOVERY: An ENEMY Human Wave MMC will only attempt Recovery of a SW of $\leq$ 2PP; an ENEMY Human Wave SMC will never attempt Recovery.

5. ACTIVATION AND GENERATION OF S?

5.1 ACTIVATION CHECK: When a S? is eligible for Activation (see 3.31-32) the player makes an Activation Check (hereafter AC) dr [x1]. If the Final AC dr is $\leq$ the current ENEMY AC# (as determined in the Mission's ENEMY AC# table) the S? is successfully Activated. Apply drm as listed on the Chapter S divider. When a S? is successfully Activated the S? is removed, and a subsequent DR is required [A1] [EXC: 4.34] to determine what unit(s)/Weapon(s)/fortification replaces it (if any). If the Final AC dr is $>$ the current AC# the AC is unsuccessful and the S? is removed (it was, in effect, a dummy). [EXC: An Original AC dr of 1 is always a successful Activation; an Original AC dr of 6 always results in a dummy, or unsuccessful Activation.] Once a successful Activation has occurred see 5.6-7 for Activation and generation procedures [EXC: 5.32].

5.11 MARKING THE AC#: Each SASL Mission has a table used to determine the starting ENEMY AC#. Use the AC# marker to record this initially determined number on the ENEMY AC# Track (found on the Chapter S divider). The AC# is subject to change during a Mission due to RE occurrence.

5.2 MULTIPLE S? ELIGIBLE FOR ACTIVATION: When $>$ one S? is eligible for Activation, the S? that is most likely to result in a successful Activation, after applying all possible AC Cumulative drm, has its AC made first. If $>$ one such S? is still eligible, the S? closest to the FRIENDLY unit(s) causing the AC is checked for Activation first. Otherwise determine by a Random dr [EXC: if $\geq$ two S? in the same Location are eligible for Activation each is rolled for Activation separately; however, for FG potential (8.5), all such are Activated before another fires]. During the

5.2

FRIENDLY AFV each eligible S? is checked for Activation (with the order determined as per above).

5.3 MANDATORY ENEMY ATTACK: Each ENEMY unit Activated during the FRIENDLY MPh immediately First Fires (as a FG if possible; 8.53) on the FRIENDLY unit(s) causing the AC, providing the moving unit(s) is a Target for the just-Activated unit(s)/its-possessed-Weapon(s). Panic is not possible for such a just-Activated unit. If the FRIENDLY unit(s) is a Target for only one (or some) ENEMY unit(s)/Weapon(s) in a Location with multiple ENEMY units/weapons, only that unit(s)/Weapon(s) fires; each non-firing unit remains concealed. If the Activated unit has > one Weapon that can be fired at the Target the player should fire such in the relative order of effectiveness vs that Target, or as a FG (player's discretion). If the moving Target expended ≥ 2 MP/MP to enter the Location Subsequent-FF/ROF attacks are conducted as possible until that Target loses its Good Order status (or is eliminated if berserk). See also 5.31-32 and 8.13.

EX: In the illustration it is the German MPh in an East Front, August 1941 Mission with clear weather; the Russian side is the ENEMY. The current ENEMY AC# is 3 (5.1). German squad V uses Assault Movement to enter K6, making both S? in O6 eligible for Activation (case C of table R1: range = four; Final IFT DRM = 0). The player must first make the AC for the S? most likely to Activate. Since the Russian S? on the first level has a -1 AC dr (-1 per level above the hex's Base Level) its AC is rolled first. Rolling an Original dr of 5 [R1], modified to 4, nothing is Activated (as four is not ≤ 3 , the current AC#) and the S? on the first level of O6 is removed (it was a dummy). The player then makes an AC dr [R1] for the S? at ground level in O6. Rolling an Original dr of 2 (no dr apply) results in a successful AC. The player then makes a DR [A1] to determine what unit(s), if any, are Activated. Unless the Final DR is a 7 (which would result in a dummy) the Activated unit(s) will First Fire (5.3) at the Target causing its AC (squad V, in this case).

Next, squad W uses Assault Movement to enter O9. The S? in P8 and on the first level in P6 are both eligible for Activation (the former because the opposing unit is ADJACENT, case F of table R1; the latter because an opposing Infantry unit is at a range of ≤ 4 hexes with a Final IFT DRM of ≤ 0 , table R1's case C). Again, the S? in the upper level must have its AC performed first. An Original AC dr of 6 [A1] results in no Activation (5.1). The player then makes an AC for the S? in P8, rolling an Original dr of 1 [A1], resulting in an automatic Activation. He then makes a DR [A1] to determine the unit(s) Activated, if any. Each unit Activated in the FRIENDLY MPh fires at the unit causing its AC if such unit is a Target for it.

5.31 CONTINUING ATTACKS: If an attack (as per 5.3) fails to cause the opposing moving unit(s) to lose its Good Order status (or eliminate a berserk unit) the next eligible S? must be checked for Activation, and so on, until either the opposing unit(s) loses its Good Order status (eliminated if berserk) or all S? eligible for Activation by that moving unit in its current Location have been checked for Activation.

5.32 LONG RANGE ACTIVATION: A S? is eligible for Activation during the FRIENDLY MPh as soon as all of the following conditions are met:

- the moving unit(s) is non-vehicular,
- if fired upon from the S?'s Location, the moving unit(s) would have a Final IFT DRM of ≤ -2 , and
- the S? is ≤ 16 hexes from the moving unit(s), but is otherwise ineligible for Activation due to it being beyond the range listed in case A of the ENEMY's AC table [x1].

When a S? so qualifies, make a DR. An Original DR of "2" results in the S? automatically Activating; if the Activation DR is ≥ 3 no Activation occurs but (unlike normal Activation, 5.1) the S? is not removed.

Each S? Activating due to Long Range Activation automatically gener-

ates one squad [x2] possessing a HMG [EXC: 50c. HMG on Subsequent dr of 1 if such is available for the ENEMY nationality] (any HMG Activated due to Long Range AC is never dm) and one leader [x3; a special -1 Cumulative DRM applies; reroll until a leader is determined]; if the S?'s Attitude was HOLD a dr [A5] is also made for possible fortification. Only one such Long Range Activation DR can be made per moving unit/stack regardless of the number of Locations traversed by the unit(s). Furthermore, only one such S? can be Activated per moving unit/stack. Activate the closest eligible S? to the moving unit(s) if > one S? qualifies; otherwise determine the S? Activated by a Random dr. The just-generated squad must First Fire the HMG (using the leader's direction and its own FP, if applicable) at the moving Target(s) as per 5.3 and 8.13.

EX: The FRIENDLY side is the German; the Russians are ENEMY. The player wishes to move his FRIENDLY 4-6-8 Infantry squad and a 9-2 leader from 33B5 into the woods in 33E2, via hexes B4, B3, C3 and D2. There are no ENEMY units with LOS to the Locations the FRIENDLY units will enter except for a S? in 33N9 and another S? in 33O9. However, since both of these S? are beyond the longest range given in Table R1 (i.e., case A's 8-hex range), the player decides to chance the maneuver, knowing that the only danger to the units would be due to Long Range Activation. Feeling confident, the squad and leader use non-Assault Movement to enter the woods in B4, and then the OG in B3. At this point, the player must make a Long Range Activation DR as both S? are eligible for Long Range Activation. The player's worst fears are realized, however, as the DR is an Original "2", resulting in the closest eligible S? (in N9) Activating. The player thus makes a DR (R2) for squad type, and generates a 4-5-8. His DR for leader generation is equally ominous, resulting in a 9-2 leader. A subsequent dr for HMG type must also be made, since a Russian 50c. HMG is possible. Fortunately, this dr is a "4", and a standard "6-12" HMG is generated. These just-generated ENEMY units must now conduct First Fire vs their Targets in B3. The player cringes as he rolls the dice for the "6 minus 4" attack. To his wild delight, however, a 12 is rolled, breaking the HMG! The FRIENDLY squad and leader can now proceed to E2 safely, since only one S? may be Activated due to Long Range Activation per moving unit/stack. Assume now, however, that another FRIENDLY squad (also starting its MPh in 33B5) follows in the tracks of the previous German units. When this unit enters OG hex B3 the remaining S? in 33O9 now checks for Long Range Activation. This time the Long Range AC DR is a "9". The S? does not Activate and the German squad continues on its way toward E2. Note that the S? in O9 is not removed, and can again be checked for (Long Range) Activation should yet another FRIENDLY unit(s) move.

5.4 CA SELECTION: Whenever an ENEMY AFV/Gun/fortification (that must have its CA determined) is Activated a CA must be selected for it (MA if armed vehicle) that includes the FRIENDLY unit causing its AC, and as many other Targets as possible.

5.5 ACTIVATION BY FRIENDLY DEFENSIVE FIRE: An ENEMY unit Activated by FRIENDLY Defensive fire will use its AFPh to fire. Perform an Action DR (6.2) during the ENEMY AFPh for each such ENEMY unit. Barring Panic, each such unit with a Target automatically receives a Fire Command [A3].

5.6 ACTIVATION PROCEDURE: Each successful AC (5.1) requires a subsequent DR on the ENEMY Activation Table [A1] [EXC: 5.32]. Apply DRM as necessary, depending on the Mission being played (see MSR). The Final DR on this Table indicates the type of ENEMY unit(s) being Activated [EXC: a Final DR of seven results in nothing being Activated]. A non-dummy result lists if an AFV, squad (S), half squad (HS), leader (L), fortification (F), support weapon (SW) and/or Gun is Activated.

Further DR (or dr, as necessary) are then necessary to determine the specific unit(s)/Weapon(s)/fortification Activated. Each such Activated item is generated in the order presented in the table A1 result. Generation tables are found on the ENEMY nationality's "Generation Tables" card [EXC: fortifications {A5}]. See the following list for explanations of the various abbreviations used in table A1 and what subsequent generation table(s) is necessary to determine each unit Activated. See also the 5.752 EX.

Term	Game piece represented	Subsequent Table necessary
S	Squad Table	x2
HS	Half Squad Table	x2
L	Leader Table	x3
SW	Support Weapon Table	x4
Gun	Gun Table	x5
AFV	Standard AFV Table	x6
SPG	Self-Propelled Gun Table	x6a
F	Fortification Table	A5

5.61 ACTIVATION IN PROHIBITED LOCATION: A unit/Weapon/fortification to be Activated in a Location it is not allowed to set up in or enter is forfeit (e.g., a vehicle in a crag, marsh or upper-building-level Location or in Crest status; a non-fully-tracked vehicle in a building Location or in Crest status; non-MTR Gun or Trench/Foxhole/Pillbox in crag or marsh). See also 5.712, 5.742, 5.753 and 5.761.

5.7 GENERATION PROCEDURE: When a S? is Activated (and usually when a RE dictates that a side receives non-S? reinforcements from off-board) the player must use the proper generation table for that nationality to determine the precise unit(s)/Weapon(s) Activated [EXC: 5.32]. If your

S

countermix does not contain enough of a specific unit or Weapon thusly determined, reroll on the same generation table until a different unit or Weapon is Activated that is available [EXC: If you are out of squads of an MMC type when all MMC of a group of S? are to be that certain type (e.g., all are supposed to be SS or 7-4-7; see 12.22), substitute two HS of that same type]. All generation tables for a specific nationality can be found on that nationality's "Generation Tables" card.

5.71 AFV/VEHICLE GENERATION: Make one DR (no DRM apply) on the ENEMY's AFV Generation Table {x6} for an "AFV" listed in the A1 table result. Each ENEMY vehicle is CE (if applicable) when initially entered/Activated [EXC: each 1MT or RST tank Activated from a S? is BU initially]. See also 3.321.

5.711 AFV CREW QUALITY: Make a DR on that nationality's Leader Generation Table {x3}, using the "Armor Leader" column (applying applicable DRM), for each group of three armed AFV (or fraction thereof) received by either side due to RE or (if FRIENDLY) allowed by MSR. If > one AFV is entering, an ENEMY armor leader should be placed with the best armed/armored (player's discretion) AFV entering. If the result is "Inexp. Crew", each AFV normally required to enter using platoon movement has an Inexperienced Crew (D3.45).

5.712 IN BOG TERRAIN: A vehicle may be Activated in a Location which would normally require it to make a Bog DR (D8.2) after entrance. The (otherwise necessary) Bog DR is considered to have been passed [EXC: if the S? the vehicle was Activated from was in Advance Attitude an immediate Bog check is made; such a vehicle is considered to have entered the Location using its entire MP allotment (including one to stop)]. If applicable, place a partial TB across the hexside entered (use a Random dr, of the eligible RVCA hexsides, if such cannot be determined/remembered).

5.713 OPTIONAL ARMAMENT & EQUIPMENT: Make an Availability DR (as per H1.41-42) to determine the presence of any optional armament/Schuerzen/Gyrostabilizer on each such eligible FRIENDLY/ENEMY AFV activated/received. No "points" need be expended.

5.72 MMC GENERATION: Make one DR (apply applicable DRM) on the ENEMY's Squad Generation table {x2} for each "S" listed in the A1 table result. Likewise, if "HS" was listed make a DR on the same table to determine the squad type, but a HS is Activated rather than a squad. [EXC: If the ENEMY nationality is not normally allowed to Deploy, a "HS" result is considered to be an "S" result.] See the 5.752 EX.

5.73 LEADER GENERATION: Make one DR (apply applicable DRM) on the ENEMY's Leader Generation table {x3} for an "L" listed in the A1 table result.

5.74 FORTIFICATION GENERATION/SMOKE: If the Prevailing Attitude is Hold, make a dr on the Fortification Table {A5} if an "F" is listed in the A1 table result. The squad stacking capacity of such a fortification must be the same as the number of MMC Activated with it [EXC: 5.743]. The additional TEM of a just-Activated fortification might render the PTC (causing the Activation) ineffective or reduce the effect of other IFT results, or even turn a hit into a miss. In such a case the unit(s) and fortification are still Activated but are placed under a concealment marker if a PTC or hit was nullified, or suffer a less-severe IFT result, as applicable. [EXC: if Activation of a fortification causes a unit that will be in that fortification to lose its LOS to ≥ one FRIENDLY unit (e.g., an Foxhole Activated "behind" a wall), the fortification result is ignored.]

If the Prevailing Attitude is Advance, an "F" result during the ENEMY MP (only) is treated as an automatic same-hex Smoke placement [EXC: wind force or terrain's Location prohibit such] after each FRIENDLY unit has been given a chance to conduct defensive fire, providing the just-Activated ENEMY unit has a Smoke Placement Exponent or (if AFV) has Smoke Dischargers. No placement attempt dr is necessary, nor is any entry/placement MF/MP expenditure required.

5.741 GUN IN TRENCH: If a Gun is also to be Activated in the Location (Final result of 14 {A1}) a fortification result of "entrenchment" {A5} is automatically a Trench.

5.742 FORTIFIED BUILDING LOCATION: If a fortification Activation occurs in a building Location and the dr {A5} results in a successful fortification generation (Final dr ≤ 4) that building Location (and each such level beneath it) is henceforth Fortified (B23.9), even if such fortification would have altered/disallowed a previous action/result (e.g., PTC/MC/entry/kindling/flame-spread, etc.). Activation of an upper-level

Fortified Building Location allows a Gun to possibly be Activated therein.

5.743 SUBSTITUTION: If the player does not have the necessary fortification counter type in his counter mix [EXC: Fortified Building Location] an appropriate substitution is made, in the following order:

- substitute a same-type counter with a greater squad stacking capacity, or
- if a pillbox, substitute one with a different TEM but same stacking capacity, or
- substitute a trench for a pillbox or foxhole, or
- substitute a foxhole.

5.75 SW GENERATION: Make one DR (no DRM apply) on the ENEMY's SW Generation table {x4} for a "SW" listed in the A1 table result.

5.751 If a SW and ≥ two ENEMY MMC are Activated from the same S?, that SW must be possessed by the MMC with the greatest BPV just Activated. If ≥ two such MMC exist determine the possessor by Random dr.

5.752 Each SW Activated from an Advance-Attitude/Paratropping S? must be dm if possible [EXC: 5.32].

EX: A Russian S? has had a successful AC (5.1). The player now consults table A1, rolling an Original DR of 4. Because he is playing the "ENEMY Offensive" Mission there is a -1 DRM, giving a Final DR of 3, resulting in "S, S, L, F, SW". The player now performs two separate DR (R2) to determine the two squad types. He rolls Original DR of 2 and 9, both of which are modified by +2 since the date is August 1941. Thus a 4-5-8 elite squad and a 4-2-6 Conscript squad are Activated (Final DR of 4 and 11, respectively). Because a leader may also be Activated (the "L" in the A1 Table result) the player makes another DR {R3}. An Original DR of 6 results in a Final DR of 6 (as the +1 date DRM and the -1 DRM for "Any accompanying MMC is elite" cancel out), resulting in an 8-0 leader being Activated. However, since the date is prior to 10/42, it is possible the 8-0 leader is replaced by a 9-0 Commissar. The player rolls a subsequent dr of 4, resulting in the 8-0 being received after all. The "F" result (for Fortification) is ignored since the Activated unit has no Smoke making ability (5.74). Lastly, since a SW may be Activated with one of the MMC (the "SW" in the result), the player makes a DR {R4} using the appropriate (i.e., "1941") column (no DRM apply). His DR of 3 results in a dm light mortar being Activated (dm because the Russian is in Advance Attitude: 5.752), and possessed by the best-class MMC in the Location (5.751), in this case the 4-5-8 squad. Thus an 8-0 leader, a 4-5-8 squad possessing a dm light mortar, and a 4-2-6 squad are Activated.

5.753 MORTAR: A mortar of ≤ 60mm Activated in a building/bunker Location is replaced by a MMG; if ≥ 70mm a HMG is instead Activated.

5.754 BAZ/PSK BACKBLAST: Each SW generation result of "BAZ" or "PSK" in a non-factory-building or pillbox Location is rerolled {x4} until a different result occurs.⁴

5.76 GUN GENERATION: Make one DR (no DRM apply) on the ENEMY's Gun Generation table {x5} for a "Gun" listed in the A1 table result. Each ENEMY Gun Activated is automatically manned by an Infantry Crew (A1.123) of that nationality [EXC: Partisans use (Russian) 1-2-7 crews].

5.761 INSIDE/OUTSIDE: The Location the Gun is Activated in determines the column {x5} which must be used. If Activated in a building or pillbox Location the "Inside" column must be used; otherwise use the "Outside" column. If the Gun is Activated in an upper building level and a fortification is successfully Activated, that building Location (and each such level beneath it) is henceforth Fortified (B23.9), even if such fortification would have altered/disallowed a previous action/result (e.g., PTC/MC/entry/kindling/flame-spread, etc.; see 5.74-742).

EX: The player controls the Germans in an August 1941 "Bunker Busting" Mission on the Eastern Front. FRIENDLY units have just fired on a S? on the first level of a Two Story House, achieving a PTC. The AC dr is successful, requiring a subsequent DR on table A1 (5.1). The Original DR is a 12 (a +2 DRM applies since the Mission is "Bunker Busting") resulting in a Final DR of 14. The {A1} result is "S, F, Gun". First the ENEMY MMC is determined {R2}. Next, an Original dr of 4 is made {A5}, modified to a Final dr of 3 due to MSR dr, resulting in a successful fortification Activation. Since the fortification is occurring in a building, the Location (as well as the ground-level Location beneath the Activation Location) is automatically Fortified (5.742). Finally, a DR is made {R5} using the 1941 "inside" column (since the Gun is being generated in a building Location). The {R5} DR is a 5 (no DRM apply), resulting in the generation of a 451. AT Gun with a manning 2-2-8 (infantry) crew (5.76), which must now undergo a PTC.

If the S? had instead been in a Location in which such a Gun cannot enter or set up (e.g., in a crag or marsh Location, or at crest status in a gully), the Gun and its manning crew would instead be forfeit (5.61). Note, however, that in such a case a MTR and crew can Activate in a crag, or a dm MTR can Activate in a marsh or at crest in a gully.

5.762 EMBLACEMENT: A Gun Activated from a S? in Hold Attitude is automatically Emplaced [EXC: in Prohibited terrain]. If in Advance Attitude such is never emplaced and must be Limbered when Activated [EXC: QSU Gun].

6.

6. ENEMY ACTIONS

6.1 ORDER OF DETERMINATION: Regardless of the ENEMY nationality, the appropriate ENEMY Action Table (A2a-b) (depending on the unit's Attitude) is used to determine what Action each *onboard*, *Good Order*, *Activated* ENEMY unit will attempt during the current Player Turn [EXC: if under Recall]. When rolling for ENEMY units' Actions during the PFP, begin on the north edge of the mapboard configuration and work toward the south, hexrow by hexrow. If a hexrow has multiple ENEMY-occupied hexes, roll for the ENEMY-occupied hex nearest to the FBE first, then the second nearest, and so on. If a hex has multiple ENEMY-occupied Locations in it roll for the highest ENEMY-occupied level first and work toward the base level. If a Location has multiple units that must have separate Actions determined, use the following to determine the order:

Priority List: Infantry possessing functioning Gun; Infantry possessing functioning HW; all other Infantry units; AFV with functioning armament; other AFV; other vehicle.

An offboard Activated ENEMY unit is never subject to Actions on its turn of entry (9.32).

6.11 ENEMY PLAYER TURN: At the start of the ENEMY PFP make a DR [A2] (hereafter called an Action DR) for each Location containing $\geq$ one Good Order Activated ENEMY ground unit [EXC: vehicle/Gun (6.13); Human Wave (4.32)]. The Action DR determines the general Action (i.e., Panic, Fire, Move, or Entrench) that the ENEMY unit/stack will conduct during the current Player Turn [EXC: 6.3-3175].

The unit/stack immediately performs any specified PFP Action (i.e., Fire or Entrench) unless it Panics (6.21; in which case it is immediately marked with a Panic counter) before rolling the Action DR for the next eligible unit/stack. If the [A2] result is "Fire", immediately determine the unit/stack's specific Fire Command [A3a-d] (6.23) [EXC: if only one Target is available, the unit simply fires at that Target]. If the [A2] result is "Move", mark the Location with a MOVE counter, in which case its specific Move Command is determined (A4a-c) and performed in the upcoming ENEMY MPh (6.22).

6.12 FRIENDLY PLAYER TURN: During the FRIENDLY Player Turn the appropriate Action Table [A2] is used only to determine if an Activated ENEMY unit Panics [EXC: 5.3]. On any result other than Panic it will conduct Defensive First/Final Fire at a Target(s) (8.6). Make a separate Action DR [A2] for each Location with $\geq$ one unbroken Activated ENEMY unit with a Target [EXC: each unshocked/unstunned ENEMY AFV/Gun must have a separate Action DR made for it; 6.13] when required to conduct Defensive (First) Fire. Regardless of the number of times a DEFENDER ENEMY unit fires during a Player Turn, only one Action DR is made for it per that Player Turn.

6.13 ARMED VEHICLE OR GUN: A separate Action DR [A2] is made for each unshocked/unstunned ENEMY armed-vehicle [EXC: one Action DR is made for each ENEMY AFV platoon; if such a vehicle has no functioning armament ignore a Fire Command and perform the alternate Action] and each manned ENEMY Gun. A Good Order ENEMY crew stays with a malfunctioned ENEMY Gun and attempts repair (7.4).

6.2 ENEMY ACTION TABLES: The appropriate Action Table [A2a-b] (depending on the Attitude of the specific ENEMY unit being rolled for) is used to determine the Action of each Activated ENEMY unit/stack eligible for Actions [EXC: if an Automatic Action takes precedence; 6.3]. See 6.21-24 for Action explanations. If the assigned Action is not applicable to the assignee, consult that Action's footnote to determine an alternate Action.

EX: During the ENEMY PFP an ENEMY Infantry unit in Hold Attitude (with no applicable Automatic Action) has been given the "Fire" Action (A2b). If the unit has no Target available it instead attempts to Entrench. If in a Location in which entrenchment is not possible (or if it is already entrenched/emplaced) the unit does nothing. If the ENEMY unit is an armed vehicle it would instead be given a "Move" Action (but the specific Move Command [A4c] is not determined until the upcoming MPh; 9.2).

6.21 PANIC: Each Original doubles DR on an ENEMY Action Table [A2a-b] is a potential Panic result, depending on the Class of the unit(s) involved. An elite unit or an AFV with functioning MA [EXC: Inexperienced Crew] Panics on each doubles DR $\geq$ 10; a first-line unit Panics on doubles DR $\geq$ 6; a second-line or Partisan unit and all other vehicle types [EXC: Inexperienced Crew] Panics on each doubles DR $\geq$ 4; a conscript or green MMC unit or a vehicle with an Inexperienced Crew Panics on all doubles DR.

6.211 CONSEQUENCE: Each unit that Panics (whether FRIENDLY [16.3] or ENEMY) is immediately marked with a Panic marker for the balance of the current Player Turn or until broken or the unit becomes berserk/Battle-

Hardens (whichever occurs first). All penalties of being TI apply (A4.8); see also 6.212-213. A Motion vehicle that Panics immediately loses Motion status (paying 1 MP to stop if during its MPh). A Panicked unit is never in Good Order. Panic does not cause loss of concealment.

6.212 MANDATORY PANIC ATTACK: Each Panicked DEFENDER is assumed to be marked with a Final Fire counter. Such an Infantry unit must use FPF whenever possible vs an ADJACENT or same-Location moving Target(s). Such an armed vehicular unit must use Intensive (or Sustained) Fire whenever possible vs an ADJACENT or same-Location moving Target(s) (for the purposes of this rule, consider an eligible ENEMY unit as a Target for a Panicked FRIENDLY DEFENDER unit).

6.213 PANIC AMBUSH/CC: A Panicked unit/stack has a +2 drm to its Ambush dr. A Panicked unit may attack/defend in CC if attacked. Any attacks by it have a +1 DRM to the CC resolution DR; each attack against it qualifies for a -1 DRM to the CC resolution DR.

6.22 MOVE: Each ENEMY unit given a Move Action [A2] will move in its (the ENEMY's) MPh [EXC: if non-Mobile]. During the ENEMY MPh a DR is made on the appropriate ENEMY Movement Table [A4a-c], depending on the unit's current Attitude/unit-type. See 9.1-4 for details on ENEMY movement procedures.

6.221 ASSAULT MOVEMENT: Regardless of whether an Infantry unit's Move Command instructs use of Assault Movement, it is assumed that if it only moves to an Accessible Location that Assault Movement is used [EXC: if Minimum Move is required].

6.222 DOUBLE TIME: If an Infantry unit's Move Command instructs it to use Double Time movement when such is impossible (for whatever reason), or not necessary (given other move instructions), the unit uses normal or Assault Movement instead.

6.223 ENEMY OVERSTACKING: A Good Order Activated ENEMY unit/stack will never purposefully enter a Location if in doing so that Location would become Overstacked [EXC: if moving unit(s) is part of a Human Wave]. An Overstacked Location (or one already stacked to capacity with Infantry; A5.1) is considered a Prohibited Location for an ENEMY unit to enter [EXC: if no other rout path is available]; 9.26. If Activation of a S? causes its Location to become Overstacked the Activation is still performed, but the Overstacking must be alleviated as soon as possible; see 6.307.

6.23 FIRE: Each ENEMY unit given a Fire Action [A2] will fire at a Target(s) [EXC: no Target available]. Make an immediate subsequent DR on the appropriate ENEMY Attack Table [A3a-d], depending on the type of unit(s) firing and Target type(s), to randomly determine the firing unit's Fire Command. If no Target is available consult the applicable footnote [A2] for an alternate Action. See 8.1-9 for details on ENEMY fire attacks.

6.24 ENTRENCH: Only Infantry MMC may conduct this Action. The MMC must be in a Location in which entrenchment is possible (B27.1). If entrenching is attempted place TI/Labor counters as necessary (B27.11). If entrenchment is not possible consult the applicable footnote [A2] for an alternate Action.

6.241 RESTRICTED LOS: An ENEMY unit conducts its alternate Action (6.2) if instructed to Entrench when all LOS to Target unit(s) is across wall/hedge/bocage hexside(s).

6.3 AUTOMATIC ACTIONS: Each Activated ENEMY unit that is eligible for $\geq$ one Automatic Action has its Action for that Player Turn predetermined. Such a unit must still make an Action DR [A2] [EXC: 4.32], but, barring Panic, the unit will carry out its designated Automatic Action. Some Automatic Actions occur only during the MPh, depending on a unit's move or the current situation (i.e., 6.315-317).

If a unit has $\geq$ one Automatic Action applicable, the Automatic Action with the lowest rule number (6.301-3175) takes precedence. It is possible that a unit must perform $>$ one Automatic Move/Fire Action.

6.301 BERSERK CHARGE: Each berserk ENEMY unit uses A15.43 to determine its charge. Should $>$ one "charge target" exist the berserker charges the Location with the least number of Target unit(s) (in US#); in the greatest TEM.

6.302 UNARMED MMC: A Good Order unarmed ENEMY MMC should take the safest route (player's discretion) in an attempt to exit off the EBE.

6.303 ENEMY GUARD: A Good Order ENEMY SMC Guarding a prisoner

S

will Transfer it to the first eligible ENEMY MMC in the same Location. A Good Order ENEMY squad Guarding a prisoner will automatically Deploy (A20.5) at the moment of Transfer. A Good Order ENEMY HS/crew with a prisoner will attempt to exit off the EBE. The player should move such a HS/crew toward the EBE taking the safest route (player's discretion) to insure the exit of the units. Use Assault Movement if moving into a Location in a FRIENDLY unit's range and LOS, or Double Time if no such Location will be entered in that MPh. ENEMY Guards always use the APH to continue progress towards/off the EBE.

6.304 IN FLAME LOCATION: A Good Order ENEMY unit in a Flame Location receives an Automatic Move Command {A4}.

6.305 HUMAN WAVE: ENEMY Infantry in a Human Wave receive an Automatic Move Command (4.321, 4.323-33).

6.306 ENEMY FT UNIT: A Good Order ENEMY unit armed with a FT (even if vehicular-mounted) without a Target automatically receives a Move Command until it has a Target within the FT's (long) range. Such an Infantry unit with a FT SW uses Assault Movement into best cover when entering a Location in LOS and range of a FRIENDLY unit/its-possessed-functioning-Weapon, otherwise it rolls for a Move Command {A4b}.

A Good Order ENEMY unit armed with a functioning FT that has a Target for such automatically receives a Fire Command with the following priorities:

Priority List: Target in FT's normal range; Target in VPO Location; Location with most Known Infantry Targets; easiest-to-kill vehicular Target.

6.307 OVERSTACKED LOCATION: Use a Random dr (among all Good Order Overstacked units [EXC: MMC possessing a functioning and assembled HW]) to determine the unit(s) that must leave the Location in the next ENEMY MPh {A4a-b} or APH (whichever occurs first) in order to alleviate the Overstacked situation.

6.308 VEHICLE IN MELEE: A Good Order Mobile ENEMY vehicle in a Melee Location automatically receives a Move Command {A4c}.

6.309 MOTION VEHICLE: Each Good Order ENEMY vehicle/platoon in Motion automatically receives a Move Command {A4c} [EXC: if Panicked, in which case each such vehicle expends a MP to stop as its first (and only) Action of the MPh].

6.310 GUN/VEHICULAR CREW: A Good Order ENEMY crew not currently possessing a HW will move/advance to Recover any unpossessed Gun providing one exists within six hexes of that crew's hex. If $\geq$ one Gun is eligible the nearest functioning ENEMY unit takes priority; otherwise, the crew should attempt to Recover any unpossessed HW (ENEMY takes priority over FRIENDLY). [EXC: An ENEMY vehicular crew will always attempt to re-man any Abandoned ENEMY vehicle within six hexes; player's choice as to which if $\geq$ one such vehicle within range.]

6.311 SELF PRESERVATION: A Good Order, armed and Activated ENEMY unit(s) has an automatic Fire Command {A2} at an ADJACENT or same-Location Target [EXC: ADJACENT Target is in Melee, in which case the firer rolls for Actions normally]. If $\geq$ two Targets are available use the following Priority List to determine the Target. Use Spraying Fire vs Point-Blank Targets, if possible.

Priority List: Good Order Target; Acquired Target of the firer; Location with the most Known Targets (in US#); Location with the most Targets in-lowest-TEM/easiest-TH; Target in VPO Location; Location with the most Known Target SMC; Location with the most FRIENDLY-possessed Weapons.

6.312 IMPROVED POSITIONS: A Good Order Activated ENEMY Infantry unit in an IP with a Target automatically has a Fire Command as its Action. If no Target exists, such a unit in Hold Attitude does nothing; if in Advance Attitude the unit rolls for an Action normally {A2a}.

6.3121 ENTERING IP: If an Activated ENEMY unit is in the same Location as an IP, but not currently receiving its protective TEM, the unit uses Assault Movement (or advance) to enter the IP's protective TEM providing its stacking capacity is not exceeded and a Target will be available. Otherwise, the unit performs other Actions normally.

6.313 HEAVY WEAPONS: In any fire phase in which an ENEMY unit possessing a HW is eligible to fire the unit will either:

- assemble the HW if it is currently dm and a Target is available, or

- fire a functioning HW at a Target, or
- if neither of the above apply the unit performs Actions normally for that Player Turn, as determined by its previous Action DR.

6.3131 RESTRICTED TERRAIN: An ENEMY unit possessing a HW will not enter a Location from which that HW is prohibited from firing (e.g., MTR in a building/bunker/Crest-status Location).

6.314 ACQUIRED TARGET: A non-Panicked ENEMY unit possessing a Weapon with an Acquired Target (whether a FRIENDLY unit or a FRIENDLY-occupied Location/hex) automatically receives a Fire Command to fire at its Acquired Target [EXC: 6.3141-.3142]. If such a Target becomes/is eliminated/Shocked the Weapon is assigned a new Target (8.2). A Coaxial MG is restricted to firing at the Target acquired by the vehicle's MA (if any) unless it has a Target with a net IFT DRM of ≤ -2 .

6.3141 VEHICULAR-MOUNTED ORDNANCE: An armed ENEMY vehicle still has an Action DR performed for it in its Player Turn but, if instructed to Fire, an Acquired Target takes priority over all but a same-Location Target [EXC: 6.3142].

6.3142 VEHICULAR/GUN TARGET: A Good Order FRIENDLY armed-vehicular Target takes priority over an already-Acquired non-vehicular (or non-armed vehicular) Target if such is an eligible Target (considering the Target's armor and its current TCA/VCA) for that ENEMY firer. If no such vehicular Target exists the Ordnance Weapon attacks an Infantry Target with the following priorities:

Priority List: Infantry possessing functioning Gun with highest TK#; Infantry possessing (inherent) in-range LATW; Acquired Infantry Target; Target in VPO Location; otherwise roll to determine a Target {A3d}.

6.31433 TRACKING: A Good Order ENEMY unit will "track" (C6.51) a Target it has acquired if that Target enters a new Location in the tracker's LOS [EXC: if $\geq$ two Acquired Targets exist in a Location the ENEMY unit "tracks" the target with the largest US#; if $\geq$ two such units exist, use a Random dr to determine the unit "tracked" when the first such unit exits the Location].

6.315 RECOVERY/ENTRY: A moving Good Order non-SASL-Human-Wave ENEMY Infantry unit will attempt to Recover an unpossessed, same-Location Weapon as per 7.3, MF permitting. An ENEMY MMC (crew if possible) in an abandoned vehicle's Location attempts to re-enter such a vehicle (D5.42). See also 6.310.

6.316 INFANTRY SMOKE GRENADES: If a Good Order ENEMY MMC with a SMOKE Placement Exponent (A24.1) is ordered by a Move Command to enter an OG Location in LOS and range of an armed FRIENDLY unit where FFMO would apply, it should attempt to place Smoke Grenades to cover its movement into the Location (even if this would negate the use of Assault Movement). The player should use his discretion as to which adjacent Location such SMOKE should be placed. See also 5.74.

6.317 ENEMY LEADER ACTIONS: A Good Order ENEMY leader (even if heroic/Human-Waving) that is not currently in a Location with a broken ENEMY unit with no Self Rally capability ("Self Rally capability", in this case, being defined as having a boxed broken morale or being in the same Location as a non-Disrupted ENEMY leader) will use his MPh/APH (as necessary) to move-closer-to/enter a Location containing such a broken ENEMY unit, providing the broken unit is within five hexes of the leader's current Location [EXC: the leader does not move if such a broken unit will potentially enter his Location in the next RPh, or if another ENEMY leader has already entered, or is already moving toward, that broken unit].

6.3171 DIRECTION: The ENEMY leader should take the safest route available to reach his destination (as per 6.317); it is largely up to the player to determine this. Double Time should be used (if available) if it will allow the leader to reach the Location by the end of the current (ENEMY) Player Turn's APH, otherwise use Assault Movement or non-Double-Time-movement, as necessary. If his destination is an ADJACENT Location the leader enters it in the APH (thus allowing him to possibly direct fire in the interim).

6.3172 If $\geq$ two such Locations exist use the following Priority List to determine the Location the leader will attempt to reach.

Priority List: in the leader's LOS; within the same building as the leader; closest Location (in MF); Location with the most (in US#) broken non-Self-Rallyable ENEMY units; Location that is out of all FRIENDLY LOS or beyond range of all FRIENDLY non-malfunctioned weapons; Location with the highest in-hex TEM.

S

6.3173

6.3173 APH: Even if a Good Order ENEMY leader is already in a Location with such a broken ENEMY unit (6.317), he will use his APH to enter an Accessible Location if that Location has more (in US#) such broken units than his present Location.

6.3174 FIRE DIRECTION: If there is no eligible broken ENEMY unit for the leader to move toward, use his fire-direction capabilities (A7.53-.531; A7.9) for any same-Location ENEMY units receiving a Fire Command. If this is not applicable, a leader with a "-" modifier will attempt to move toward the closest Location (using 6.3171) in which his fire-direction capabilities can be utilized. See also 8.3.

6.3175 NO ACTIONS: If none of the preceding Automatic Actions are currently applicable, a leader does nothing until some such Action becomes mandatory [EXC: such a leader in Advance Attitude remains stacked with any same-Location ENEMY Infantry MMC (if ENEMY Infantry units "split up", the leader should remain stacked with the best-class unit possessing a HW, or possessing any SW). Otherwise he automatically receives Move Command 6 of Table A4b].

7. RPh

7.1 ENEMY SELF RALLY: During the ENEMY RPh the player should attempt to Self Rally the two ENEMY MMC without a boxed broken morale that have the best chances of rallying. If $\geq$ three such exist use the following Priority List.

Priority List: in VPO Location; closest (in hexes) to a FRIENDLY-Controlled VPO Location; possessing any HW; closest to the FBE; Highest US#.

7.2 DM REMOVAL: A broken ENEMY unit with a DM marker that may be optionally removed (A10.62) has the marker left on in order to allow the unit to continue its rout, providing a rally bonus terrain Location can be entered by that unit in the next RPh. Where necessary, the player should use his judgement to determine what is in the best interest of the ENEMY unit.

7.3 RECOVERY: A Good Order Activated ENEMY Infantry MMC will attempt to Recover a same-Location unpossessed ENEMY SW [EXC: 4.37]. Such a unit will only attempt to Recover an ENEMY Gun if it is functioning and would have a Target available from that Location [EXC: an ENEMY crew will always attempt to Recover an ENEMY Gun]. Such a unit will only attempt to Recover a FRIENDLY SW/Gun if that Weapon is functioning and (if a Gun) a Target will be available.

If $>$ one such unit is available for Recovery, the best-class/smallest-US# unit should attempt Recovery; otherwise determine by Random dr. If $>$ one such SW is available, attempt to Recover the SW with the greatest FP.

7.4 REPAIR: A Good Order Activated ENEMY unit possessing a malfunctioned ENEMY Weapon will attempt to repair that Weapon whenever possible.

7.5 RECOMBINING: If an ENEMY leader has no other RPh activity he will Recombine any two same-Location eligible HS (A1.32), with the two HS able to form the best-Class squad taking priority.

8. ENEMY ATTACKS

8.1 FIRE COMMAND: Most ENEMY attacks are determined by the Fire Command randomly assigned to the ENEMY unit(s) eligible to fire [EXC: automatic Fire Command (6.306; 6.311; 6.314-.3142); ENEMY First Fire (8.61-.612); ENEMY artillery strike (8.7); ENEMY sniper attack (8.8)]. Only an unbroken Activated ENEMY unit with a Target may be given a Fire Command. When such a unit is to have its Fire Command determined (as per 6.23) the player makes a DR on the applicable ENEMY Attack Table (A3a-d) (8.11) to determine the Fire Command. Once determined, that unit's Fire Command must be performed before another unit's Action occurs [EXC: FG possible; 8.5]. See also 8.13.

8.11 ENEMY ATTACK TABLES: The specific ENEMY Attack Table (A3a-d) used to determine an ENEMY unit's Fire Command depends on the unit/Weapon firing and the available Target(s). The title of each ENEMY Attack Table indicates the type of attack it is used for; i.e., Ordnance firing at a vehicular Target uses table A3c; IFT attacks vs Infantry/PRC use table A3a, etc.

8.12 PRIORITY LIST: Each Fire Command is given in the form of a Priority List in order to determine the Target(s) when $>$ one exists. The player

consults the Fire Command's Priority List to select the Target. If the Target is still undetermined by the end of the Priority List the player should make a Random dr (from among the Targets the Fire Command has narrowed it down to thus far) to determine the Target.

SAMPLE FIRE COMMAND: The following is a Fire Command (#10) from the "IFT ATTACKS vs INFANTRY/PRC" (A3a) table:

10 Fire Inherent FP at closest Known Target; most Known Targets; least TEM; most Good Order Targets; most Weapons; most Target SMC. If no Known Target exists fire at concealed Target with same priorities.

SW: Fire SW at Target in least TEM; closest; Location with the most Targets; most Target SMC. Combine with Inherent FP if necessary.

EX: It is the ENEMY PFP and an ENEMY squad with a functioning LMG has been assigned the above Fire Command. It is instructed to fire its "Inherent FP at closest Known Target". If there are $\geq$ two such Target Locations the player then reads the second listing which, in this case, instructs the unit to fire at the Location with "most Known Targets". If $\geq$ two such Locations still exist the player proceeds to the next listing (in this case the Location with the "least TEM"), and so on until a Target Location for the unit's Inherent FP attack is determined. Since this Fire Command has a separate "SW" listing (and since the firing unit in this case possesses a functioning SW) the player uses the SW Priority List to determine the LMG's Target. In this case, the LMG is to fire at the "Target in least TEM"; if $>$ one such Target exists the SW fires at the closest Target in the least TEM; if $>$ one such equidistant Target in least TEM exists the LMG fires at the Location (from among the previously determined ones) that contains the most Targets, etc.

8.13 ROF: An ENEMY Weapon maintaining its ROF continues attacking its Target until that Target loses its Good Order status (eliminated if berserk), at which point a new Target is determined using a new Fire Command. See also 5.3 and 8.61.

8.2 ORDNANCE: An ENEMY Ordnance Weapon attacks a vehicular Target (A3c) if such is available [EXC: Mandatory Attack (5.3); a mortar of $\leq$ 60mm attacks an Infantry Target (A3a)]. Use IFE, if available, vs an Infantry Target. See also 6.314-.3143 for Automatic Actions concerning Acquired/Vehicular/Gun Targets, and 8.61-.612 for First Fire guidelines.

8.21 ENEMY INTENSIVE FIRE: An ENEMY unit possessing an Ordnance Weapon will, if possible, Intensive Fire that Weapon only vs an ADJACENT Target, and then only if that Target is an unbroken MMC (if Infantry) or (if vehicular) unshocked and with functioning armament capable of destroying the ENEMY firer with a non-CH in its current CA. Use the following Priority List if $\geq$ two such Targets exist.

Priority List: armed vehicle; Acquired; easiest To Hit; easiest To Kill; Location with most Targets (in US#).

8.22 ORDNANCE SW: ENEMY Ordnance SW (e.g., ATR, Light Mortar, PIAT, Bazooka, etc.) firing separately from its possessor's Inherent FP should fire before such Inherent FP (in order to avoid the SW from being prohibited from firing due to Covering).

8.23 ENEMY PANZERFAUST: A Good Order ENEMY unit with Inherent PF capability will attempt to fire such (C13.31-.34) at a FRIENDLY AFV Target within range for that type and year of PF, provided the Final To Hit roll needed is $\geq$ 4. The player need not keep track (C13.31) of ENEMY PF usage (as the number of ENEMY squads is not known).

8.24 DELIBERATE IMMOBILIZATION ATTEMPT: An ENEMY Ordnance Weapon will attempt Deliberate Immobilization vs a FRIENDLY AFV (if qualified; C5.71) providing that AFV can only be affected by a Final TK DR of $\leq$ 4.

8.25 SPECIAL AMMUNITION: ENEMY use of special ammo types (APCR/APDS/HEAT/SMOKE), Canister, Smoke Dispensers, and AP/HE Limited Stowage ammo types (C8.8) is best left to the player's discretion. Use such special ammo/capabilities to the best advantage of the ENEMY. Such ammo depletes normally (C8.).

8.3 LEADER DIRECTION: The best Good Order ENEMY leader (even if heroic) in the same Location as a firing ENEMY unit(s) will direct that fire if he has no other Automatic Action to perform (6.317) [EXC: Leader direction is not used if the Final leader direction DRM would be positive; e.g., due to the cumulative effects of wound/heroic/personal-DRM]. Leader direction of a non-Indirect-fire SW (with the SW with the highest ROF taking priority) takes precedence over direction of an Indirect-fire SW.

8.4 HEROES: An ENEMY hero not stacked with a Good Order ENEMY MMC Infantry unit will perform Actions as if he were an ENEMY MMC. If he is in the same Location as $\geq$ one same-side Infantry MMC capable of utilizing his FP/Heroic-DRM he will perform Actions with that unit(s). If with a stack of moving Infantry the hero will move with the largest (in US#); best-class; with HW; with other (longest range) SW. When possible, an ENEMY hero should attempt to stack with Good Order ENEMY MMC.

S

8.5 ENEMY FIRE GROUPS: ENEMY units fire as a FG as follows.

8.51 PFPPh: Each Good Order ENEMY Infantry unit in the same Location that has a Fire Action must fire in its PFPPh as a FG if possible [EXC: if Ordnance]. The player makes one DR on the applicable ENEMY Attack Table [A3a] to determine the Target. If all FP of the FG cannot be concentrated vs that Target (e.g., due to range limitations) any unused FP should be used vs another Target(s), using the Priority List of that same Fire Command. Otherwise reroll for a new Fire Command for any still unused FP.

8.52 AFPh: Multi-Location FG should be formed in the ENEMY AFPh so to maximize FP. Make a DR [A3] for each such FG to determine the Target (no Action DR is necessary as such was made for the unit[s] during the PFPPh). If necessary, use your discretion to limit the size of the FG or to determine its Target. See 4.36 for Human Wave FG.

8.53 DEFENSIVE FIRE: Only same-Location FG are allowed during any type of ENEMY defensive fire [EXC: Human Wave FG; 4.36]. Such a FG fires as per 8.51.

8.6 ENEMY DEFENSIVE FIRE: ENEMY units conduct Defensive (First) Fire as follows.

8.61 FIRST FIRE VS NON-VEHICULAR TARGETS: Each Good Order Activated ENEMY unit/Weapon conducts defensive fire at a moving non-vehicular FRIENDLY Target during the FRIENDLY MPh if the movement of such a Target would cause a hypothetical S? in the Activated unit's Location to be checked for Activation (5.1) (i.e., apply the AC drm of the ENEMY's table x1 as if the Activated ENEMY unit were still a S?; no AC dr is required, as the ENEMY unit is already Activated) [EXC: 8.611]. The ENEMY unit must First-/Subsequent-First-/Final-Protective Fire (as appropriate) at the moving non-vehicular Target if an AC dr would otherwise be necessary (even if 6.311 applies) [EXC: 8.613; also, if the ENEMY unit is a $\frac{1}{2}$ " Ordnance with an Acquired Target that would have to change its CA]. ENEMY leadership DRM, if any, apply. An Action DR [A2] must still be made for each firing unit(s) (6.12-2) [EXC: 5.3]; however, barring Panic, that unit(s) will conduct immediate Defensive Fire at the moving Target.

If a S? is also eligible for Activation (3.31b/e), the AC for such is made {x1} only after the fire resolution of any/all already-Activated unit(s) eligible to fire, and then only if the Target is still eligible (as per 5.31).

If the moving Target(s) expended ≥ 2 MF/MP in the Location, subsequent attacks are conducted by that/other-eligible unit(s) until the Target loses its Good Order status (eliminated if berserk) or such attacks are no longer possible.

8.611 LONG RANGE HW FIRST FIRE: A Good Order ENEMY unit possessing a functioning (and assembled) HW must First/Subsequent-First Fire that Weapon at a Known moving Target that has a net IFT/TH DRM of ≤ 0 within the Weapon's (long) range.

8.612 FIRST FIRE VS VEHICLE: During First Fire an ENEMY Ordnance Weapon should fire, at the player's discretion, before a moving vehicular Target has a chance to leave the Weapon's LOS; otherwise it should wait for the best possible shot (depending on range/Target-facing). See also 8.2-25. ENEMY Infantry will attempt (CC) Reaction Fire or Street Fighting whenever possible.

8.613 FINAL PROTECTIVE FIRE: An ENEMY unit eligible for PFP vs an ADJACENT Target uses such only if it passes a NTC, using the Target's TEM and any FFMO/FFNAM modifiers as TC DRM [EXC: if Panicked; 6.212].

EX: A FRIENDLY non-bersek squad uses non-Assault Movement to enter a wooden building Location ADJACENT to an ENEMY squad marked with CX and First-Fire markers. The ENEMY squad must conduct Final Fire at the FRIENDLY squad (8.61). If this attack fails to cause the FRIENDLY unit to lose its Good Order status the ENEMY squad then takes a TC in order to make a PFP attack (since the Target used two MF to enter the ADJACENT building Location), with a +1 DRM to its TC (+2 building TEM; -1 FFNAM; the +1 for CX does not apply as it is not a TEM). Failure of the PFP TC has no effect other than to disallow the PFP attack by that ENEMY unit vs that specific Target.

8.62 FINAL FIRE: A Good Order Activated ENEMY unit eligible to Final Fire will do so if it has a Target. Make a DR on the applicable ENEMY Attack Table [A3] to determine the Final Fire Target (or performs an Automatic Action, if applicable; 6.3).

8.7 ENEMY ARTILLERY STRIKE: The standard (C1.) OBA rules are generally NA to ENEMY OBA. Instead, use the following procedure whenever a RE or Mission MSR calls for an ENEMY Artillery Strike.

8.71 PLACEMENT: The number of ENEMY FFEs received is as specified by the RE or MSR (using a specified Random Number table [A6]). Place

a FFE:1 in the hex containing the FRIENDLY stack/unit with a minimum US# of three that is closest to the EBE [EXC: on a subsequent dr of ≥ 4 the FFE:1 is instead placed in the hex containing a FRIENDLY stack possessing a non-malfunctioned HW that has fired during this or the preceding Game Turn]. If > 1 such hex qualifies place the FFE as per the following:

Priority List: VPO Location; in the hex containing the stack with most FRIENDLY units; on the stack/unit with the most FRIENDLY units within one hex of that stack/unit; on the stack/unit with the most FRIENDLY units within two hexes of that stack/unit, etc.

If > 1 FFE is received on the same turn, place each subsequent FFE on the next applicable stack (respectively) (e.g., if three ENEMY FFEs are received on the same Player Turn the third FFE placed would be on the FRIENDLY stack third-closest to the EBE with a minimum US# of three). After initial placement of each FFE, perform a Correction DR for each (identical to the C1.31 "Direction/Extent of Error DR"); no DRM apply.

8.711 INELIGIBLE UNITS: A FRIENDLY subterranean/aerial/HIP unit is never considered for ENEMY OBA FFE placement or continuation.

8.72 TYPE & RESOLUTION: After each FFE has been placed (8.71), its strength (FP) and type (ART, MTR or RCT) is determined by a DR on the ENEMY nationality's Chapter H "OBA Availability Chart" (using the correct column depending on the date). Multiple FFEs received on the same turn are always the same type. Resolve each FFE in the first eligible Fire Phase (usually the ENEMY PFPPh).

8.721 SMOKE FFE: An ENEMY FFE:1 is placed as a SMOKE FFE if it has no FRIENDLY unit(s) in its Blast Area, providing the nationality and mm-size of the FFE permit and if the Prevailing Attitude is Advance. Additionally, the player may opt to have an ENEMY FFE:1 placed as a WP FFE (nationality and mm-size permitting) even with ENEMY units in its Blast Area.

8.73 AUTOMATIC CANCELLATION: An ENEMY FFE [EXC: Creeping Barrage] is automatically cancelled before resolution (even if just corrected; 8.74) if the US# sum of ENEMY units within its Blast Area is $>$ the US# sum of FRIENDLY units.

8.74 AUTOMATIC RANDOM CORRECTION: Unless the ENEMY FFE currently has ≥ 1 FRIENDLY unit and no ENEMY unit(s) in its Blast Area, the FFE is automatically subject to correction before its next resolution [EXC: if RCT OBA it is removed instead]. Before resolving an FFE:2, or an FFE:1 that has been continued, the player must make a Random Correction DR (exactly as if placing an off-target SR; C1.31) to determine its new Blast Area. No DRM/LOS-restrictions apply.

8.75 FFE:C CONTINUATION: Make a dr for each non-RCT FFE:C that is eligible for continuation. On a Final continuation dr of ≤ 2 replace the FFE:C with an FFE:1 and, if necessary, perform the Automatic Random Correction procedure (8.74). If the Final continuation dr is ≥ 3 the FFE is immediately cancelled. There is a -1 drm for each non-hidden FRIENDLY unit in the FFE's Blast Area.

8.8 ENEMY SNIPER ATTACK: When > 1 Target Location is eligible for an ENEMY sniper attack (as per A14.21, last sentence), use the following Priority List to determine the Location attacked.

Priority List: Target in VPO Location; Location with the best Known FRIENDLY leader; with FRIENDLY CE AFV; highest FRIENDLY stack (excluding "system" markers); with the most Known FRIENDLY-possessed, functioning HW; with the most Known FRIENDLY leaders; with most Known SW.

8.81 ENEMY SNIPER CHECK: Unless the player considers it useless, an eligible ENEMY unit(s) will Check for FRIENDLY Sniper (A14.4) (even if the unit(s) is marked to Move but not yet moved).

8.9 ENEMY AIR SUPPORT: An ENEMY RE may grant Air Support to the ENEMY. The number, type and entry of such is as per the RE instructions. An ENEMY attack aircraft unit automatically has a Fire Action (6.2) during the FRIENDLY Player Turn when it is eligible for Actions; an Action DR [A2] is not made and thus it cannot Panic.

8.91 FRIENDLY MPh ATTACK: An ENEMY aircraft attacks (as First Fire) a moving Infantry Target using non-Assault Movement in an OG Location [EXC: if ≥ 1 Known vehicular Target is onboard, the aircraft attacks such a vehicle that it has best chance of destroying instead of attacking moving Infantry]. Only one ENEMY air attack is allowed vs each such Infantry unit/stack per MPh.

8.92 FRIENDLY DFPPh ATTACK: Each ENEMY aircraft still able to attack

8.92

in the (FRIENDLY Player Turn's) DFPh will do so using the following Priority List. If $\geq$ two Targets exist under the same Priority the Target easiest to conduct a successful STC on is selected. Otherwise choose the hex with the most Known Target units in US#.

Priority List: Target AFV with the highest AF; Target armed vehicle; Target vehicle; Known Target Gun; Known Target Infantry possessing a HW; Target in OG Location.

8.93 STRAFING VS POINT ATTACKS: The player should select the type of attack (Strafing Run or Point Attack; E7.401-402) that can potentially harm the most FRIENDLY units. If unable to decide make a Random dr.

8.94 FRIENDLY AIRCRAFT'S MISTAKEN ATTACK: If a FRIENDLY aircraft must make a Mistaken Attack (E7.32) use the same guidelines as given in 8.91-93.

8.95 RECALL: An ENEMY aircraft without bombs is automatically Recalled (E7.223) if its MG armament malfunctions.

9. ENEMY MOVEMENT

9.1 ORDER OF MOVEMENT: Each ENEMY berserk unit (if any; 6.301) moves before any other ENEMY unit, then Human Wave units (4.321). Thereafter, carry out Move Commands, and move Advance Attitude S? (3.321), in the same order as given in 6.1 (including each on or offboard unit). If a Location contains multiple ENEMY units that must have separate Move Actions performed use a Random dr to determine which moves first (e.g., a leader/vehicle moving separately from same-Location MMC). If movement for a vehicle is not possible consult footnote 2 [A2] for an alternate Action.

MOVE

9.2 MOVE COMMAND: In SASL, the movement of an Activated non-Immobile ENEMY unit is determined by the Move Command assigned to it [EXC: if an Automatic (Move) Action applies (e.g., 6.301-309, 6.317)]. Only a Good Order Activated non-Immobile ENEMY unit may be given a Move Command and only during the ENEMY MPh when that unit is ready to move. All such Infantry units in Advance Attitude use the same Move Command [A4b] (9.21). If in Hold Attitude, all Infantry in odd-numbered hexes have a Move Command [A4a] (9.21) determined for them, and all Infantry in even-numbered hexes have another Move Command [A4a] (9.21) DR made for them (the same Move Command could possibly be used for all). Regardless of Attitude, each ENEMY non-Immobile vehicle has a Move Command [A4] (9.21) determined for it individually [EXC: all vehicles of the same AFV platoon (D14.) use the same Move Command]. ENEMY Infantry should move in stacks at player's discretion (usually if such movement is relatively free from FRIENDLY Defensive Fire). Remove the Move counter from each unit when its movement is completed.

When a Move Command seems ambiguous, given the moving ENEMY unit and its map position, use your discretion in moving the unit. Attempt to do what is in the best interest of the moving unit considering the Move Command received. When a choice exists, the unit should *usually* take the safest route available, rather than the most direct. An Infantry unit that is unable to perform its Move Command is instead marked with an Opportunity Fire marker.

Each ENEMY Infantry Movement Table (A4a-b) has a "hex rosette" specific to it (found in the upper portion of each table) used to determine the hex entered by a moving unit. Throughout the play of a Mission the player will use either the right or the left (never both) rosette pictured. Use the rosette whose hex configuration aligns with the mapboard's hexgrid.

EX: In the 9.23 illustration north is to the left. In SASL, the FBE is always considered the west edge, which the player should situate closest to him (see FBE definition, S.1); the illustration reflects this by having the west edge aligned toward the bottom, or "closest" to the player. With the map aligned thusly, the player would then use the hex rosette on the far right of each Infantry Movement Table (the one not "X-ed-out" in the inset above the 9.23 illustration). Consider the unit to be moved as being in the hex with the black square, hexes eligible for the unit to enter from its current Location are illustrated with a series of numbers in them which can be used with a dr to determine a unit's move randomly (see 9.23-34).

9.21 ENEMY MOVEMENT TABLES: The specific ENEMY Movement Table [A4a-c] used to determine an ENEMY unit's Move Command depends on the type of unit moving and its current Attitude. The title of each ENEMY Movement Table indicates the type of unit that uses it; e.g., "Hold Attitude ENEMY Infantry Movement Table" [A4a].

9.22 PRIORITY LIST: Most Move Commands are given in the form of a Priority List which provides some "choices" for the unit's move. The player consults that Priority List and selects the first Move Command priority that can be fulfilled. As usual, subsequent instructions of the Priority List can be used to help further define the Move Command, as necessary.

SAMPLE MOVE COMMAND: The following is Move Command (#5) from "A4a HOLD ATTITUDE ENEMY Infantry Movement Table":

5 Assault Move into Location with TEM > TEM of current Location; into Location with any positive inherent/hexside TEM with Target available therefrom; into any Location with positive TEM; random direction.

A4a HOLD ATTITUDE
ENEMY Infantry Movement Table
Random Move Hex Rosettes

EX: The German is the FRIENDLY side, the north edge of the map is to the left (i.e., the FBE is toward the bottom of this illustration). The Hold Attitude ENEMY squad at ground level in the 406 wooden building has just been given Move Command 5 (DR of "5" using Table A4a; see above). Since it cannot Assault Move into a Location that has TEM greater than the TEM of its current Location, the next part of that Move Command's Priority List is checked. This instructs the unit to Assault Move into a "Location with any positive inherent/hexside TEM with Target available therefrom". Using these instructions the player notes that the unit could Assault Move either behind the wall into 407, into the woods in 4N5, or up into the first level of its current hex—as from all of these Locations the Russian squad would have a LOS to the FRIENDLY Targets in 4M8 and 4N9. The player decides to move the 4-4-7 into the first level of 406 as it has better inherent TEM than the woods, and provides an unobstructed view over the N8 Grain field.

SAMPLE MOVE COMMAND: The following is Move Command (#54) from "A4c ALL ATTITUDES ENEMY Vehicle Movement Table":

54 If on road and no Known Target exists move along road toward FBE. Stop (ESB if necessary) when a Known Target exists; otherwise remain CE and in Motion. If on road and Known Target exists see Move Command 5-6. If not on road see Move Command 5-6.

A4c ALL ATTITUDES
ENEMY Vehicle Movement Table
Random Move Hex Rosettes

EX: The Russian is the FRIENDLY side, the north edge of the map is to the left (i.e., the FBE is toward the bottom of this illustration). The Advance Attitude ENEMY vehicle in 33Q9 is to move according to Move Command "54" of the A4c ENEMY Vehicle Movement Table. Since the AFV in Q9 is on a road and no Known Target exists (FRIENDLY squad M. in LOS, is not a Known Target), it enters Q8 along the road (since it is not already CE it does not have to CE now). When it enters Q8, however, a Known Target will exist for it—the FRIENDLY squad in Q8—and the vehicle now Stops. However, before expending a final MP to stop, the AFV changes its VCA to enclose hexes P7/P8, thus bringing its MA to bear on its only Known Target (9.34).

S

9.23 RAS (Roll At Start): Make a dr at the start of the Activated unit's MPH to determine its movement direction. Consult the appropriate hex rosette (printed on each Infantry Movement Table), depending on the Mission's board configuration. The unit moves along the determined Hex Grain throughout the MPH until either Pinned, no longer in Good Order, instructed to stop by its Move Command or further movement in the specified direction is no longer possible (e.g., due to lack of MF/MP, Prohibited Location (9.26), board edge (9.4), or FRIENDLY unit in the next Location to be entered).

SAMPLE "RAS" MOVE COMMAND: The following is Move Command (#10) from "A4b: ADVANCE ATTITUDE ENEMY Infantry Movement Table":

10 If Known Target exists Assault Move into Location with best TEM; with most Targets available therefrom. If no Known Target exists move full MF, RAS; stop upon entering building Location if Known Target exists therefrom.

EX: The German is the FRIENDLY side, the north edge of the map is to the left (i.e., the FBE is toward the bottom of this illustration), hence the hex rosette on the right is used as its configuration aligns with the map's hex-grid. The Advance Attitude ENEMY squads in 4L5 and 4O5 have move Actions assigned [A2a], and have just been given Move Command 10 [A4b] (since they are both in Advance Attitude, they both use the same Move Command; 9.2). The 5-2-7 moves first (9.1; 6.1). Since $\geq$ one Known Target exists, the 5-2-7 must "Assault Move into Location with best TEM". Being in Advance Attitude, the only eligible Locations are K6, L6 and M6, all of which have the same TEM of 0. The 5-2-7 cannot enter M6 and receive the -1 TEM of the AFV as that hex is not enterable by an Advance Attitude Infantry unit. Therefore, the 5-2-7 Assault Moves into the Grain in K6; there's no -1 for moving in OG, and it's toward the FBE. The player declines any First Fire at the moving unit, so it is now time for the 4-4-7's move. Since the 4-4-7 has no Known Target from its current Location, it must "move full MF, RAS; stop upon entering building Location if Known target exists therefrom." First, the player makes a "RAS" dr to determine its general direction of movement. Consulting the hex rosette that matches the mapboard's hex configuration, a RAS dr of "4" has the 4-4-7 entering building Location O6. At this point the 4-4-7 stops moving since it is now in a building Location and has LOS to a Target (the FRIENDLY squad in P8). Note that even though the Russian 4-4-7 could have expended its "Full MF" (as per its Move Command), it is considered to have used Assault Movement (6.221).

9.24 REH (Roll Each Hex): Make a Random dr to determine each hex entered by the unit as it is ready to enter the next Location [EXC: a unit may never reenter the Location just exited, nor a Prohibited Location (9.26); reroll for another hex]. Consult the appropriate random move hex rosette (printed on each Infantry Movement Table) depending on the Mission's board configuration. Continue to make a REH dr for the unit until it is either Pinned, no longer Good Order, or is instructed to stop by its Move Command or by the mapboard edge (9.4).

EX: The German is the FRIENDLY side, the north edge of the map is to the left (i.e., the FBE is at the bottom of this illustration), hence the hex rosette on the right is used as its configuration aligns with the map's hex-grid. The Advance Attitude ENEMY squads in 24AA6 and 24CC5 have Move Actions assigned [A2a], and have just been given Move Command 8 ("Move full MF, REH; stop upon entering a building Location if Target exists therefrom"; [A4b]). The 5-2-7 moves first (9.1; 6.1), and the player makes a "REH" dr of "2"; thus the Russian squad moves into AA7 (1 MF). The next move dr for the 5-2-7 is a "1", so it enters woods hex Z7 (3 MF expended), where it must end its MPH, as none of the other Locations eligible for entry (Y8, Z8 or AA8) cost $\leq$ 1 MF. The 4-4-7 in CC5 moves next. Its first "REH" dr is a "6", thus it moves into the building in DD5. The player notes that even though the unit has entered a building, it has no Target from this vantage point, thus must continue moving. Its next move dr is a "3" and it moves into the road in DD6, having now expended 3 MF. Even though the Russian squad has only 1 MF remaining (it was not instructed to use Double Time movement), it could conceivably enter CC7 on a move dr of "1". Therefore the player makes another "REH" dr. Another "3" is rolled however, instructing the unit to enter hex DD7, but, as this would require the unit to expend > 4 MF, the 4-4-7 ends its MPH in DD6.

9.25 MOVEMENT TOWARD VPO: If a Move Command instructs an ENEMY unit to move/advance toward a VPO Location (regardless of Control) in a Mission that has no designated VPO Location(s) (or when all VPO are currently ENEMY-Controlled), the unit instead moves toward the nearest FRIENDLY unit as per the following:

Priority List: in LOS; not stacked with another FRIENDLY unit; in Good Order; closest.

9.251 IN VPO LOCATION: When an ENEMY unit in a VPO Location is given a Move Command instructing it to move toward a VPO Location it should move toward the closest (in MP) VPO Location, ignoring its own Location, as per the following:

Priority List: FRIENDLY Controlled; containing least amount of FRIENDLY units (in US#); in LOS; Location with highest Inherent TEM.

9.26 PROHIBITED LOCATION: An Activated ENEMY unit will not enter a Location that contains/is:

- a FFE blast area
- a Known Minefield (15.21) [EXC: if the Minefield is in/ADJACENT to a FRIENDLY-Controlled VPO];
- Overstacked (or would become such due to the unit's entry)
- ≥ 4 Residual/Fire-Lane FP (if Infantry) [EXC: if such FP is ADJACENT to a FRIENDLY-Controlled VPO];
- a Water Obstacle,
- Offboard [EXC: FBE; unless so directed by its MSR/RE instructions]; see also 9.4.

Instead, the unit should attempt to move around such a Location, taking the route affording the most cover (if Infantry or Cavalry) or through the least number of Bog Locations (if vehicular).

9.27

9.27 CHANGING BUILDING LEVELS: An ENEMY Infantry unit will use a (Inherent) stairwell to change its Location *within the same building hex* when further movement in its determined direction of movement is only possible by such a move.

9.28 ENEMY IN DEPRESSION: An ENEMY Infantry unit IN a Depression Location with a Move Command instructing it to use Assault Movement and/or instructing it to enter an Accessible Location with better TEM than its present Location will assume Crest status in its hex (if possible) if a Target would exist for it across such a Crest hexside.

9.3 ENEMY VEHICLES: The following rules concerning ENEMY vehicles (9.31-.37) are intended as a general guide for the player to assist in determining specific movement and fire options for ENEMY vehicles. Due to the complicated and varied nature of vehicular movement/fire options in ASL, here (perhaps more than anywhere else in SASL) the player may sometimes have to use his "best judgement" in carrying out a dictated action.⁵

9.31 CE/BU: A CE ENEMY vehicle will BU as soon as possible after it has a LOS to a Known Target within twelve hexes, or whenever it is within the normal range of a Known, fully-manned FRIENDLY-possessed MMG/HMG. Some vehicular Move Commands provide further instructions on when to BU or become CE. Otherwise, a player may always choose to BU/CE an ENEMY AFV if such an action seems in the vehicle's best interest.

9.32 MAPBOARD ENTRY: Each ENEMY vehicle entering the mapboard *due to RE* does so on the EBE road hex that has a contiguous path of connected road hexes toward the FBE. If $\geq$ two such road networks exist the vehicle follows the road with the most direct path (in number of MP; then number of hexes) to the FBE. If no such complete road network exists it enters on the road hex whose road network extends the farthest toward the FBE, and from there takes the path with the least number of bog/obstacle hexes toward that edge after leaving the road (possibly regaining another road later). On its turn of entry each ENEMY vehicle/platoon must attempt to use as many MP as possible without using ESB/becoming-Overstacked and is not subject to Panic. When $>$ one vehicle is to enter at the same Location on the same turn, determine their order of entry randomly.

9.321 ATTITUDE: Each entering ENEMY vehicle maintains Advance Attitude until it (or a member of its platoon) has a Target, at which point it (the platoon) assumes the Prevailing Attitude.

9.33 ENEMY PLATOON MOVEMENT: Each ENEMY vehicle of the same type (only) entering on the same turn must do so using platoon movement (D14.2; regardless of the actual presence or absence of radio) and continue such movement until so released (9.331). When the lead vehicle of a moving ENEMY platoon ends an impulse with a Target in LOS it must stop (ESB if necessary). Each Remaining vehicle of the platoon must continue to expend MP (if such remain available), using the restrictions of platoon movement, in an attempt to bring $\geq$ one Target into its LOS [EXC: such a vehicle will not enter a Location already occupied by $\geq$ one Good Order ENEMY vehicle; it will only enter a Bog Location if that is its only choice]. The Delay MP expended by the stopped unit should be used for it to Bounding First Fire if possible.

9.331 PLATOON RELAXATION: Once an ENEMY vehicle platoon begins its MPH with $\geq$ one Target in its LOS the platoon movement restrictions for those vehicles are relaxed for the duration of the Mission [EXC: if normally required to use platoon movement due to being radioless, in which case such vehicles must continue to use platoon movement as long as possible].

9.332 RADIOLESS VEHICLE: An ENEMY Radioless AFV beginning its MPH not currently in platoon formation (i.e., not adjacent to another such ENEMY AFV) must still take a NTC (D14.23) in order to move by itself.

9.34 CA DETERMINATION: Upon stopping/ending-its-MPH an ENEMY vehicle will bring all possible functioning armament to bear on a Known Target(s), or on a Concealed Target(s) if no Known Target exists. MA/SA will always bear on a vehicular Target(s) (if present), with the nearest such Target with functioning armament capable of destroying that ENEMY vehicle with a non-CH receiving priority. MG should bear on any Target(s) available, using the following Priority List.

Priority List: closest Target possessing functioning in-range A-T Weapon; closest Location with most Infantry/PRC Targets (in US#); unarmored (armed, if available) vehicular Target; Target in a VPO Location; Target in least TEM.

9.341 BOUNDING FIRST FIRE: During its MPH an eligible ENEMY vehicle will attempt to conduct Bounding First Fire at a Known vehicular Target. If $\geq$ two such Targets exist: fire at the

Target with functioning MA that has the greatest TK#; easiest to hit; easiest to kill. See also 9.33.

9.342 BOUNDING FIRE: Each ENEMY vehicle [EXC: with a B"#" $\leq$ 10] capable of conducting AFPh Bounding Fire does so if it has a Target.

9.35 ROAD INTERSECTIONS: Upon reaching a road intersection hex (i.e., a road hex with $\geq$ three road hexsides) an ENEMY vehicle/platoon using the road will select the road with the most direct path (in number of MP; then number of hexes) to the FBE [EXC: as per specific Move Command instructions]. In no case will the vehicle/platoon enter the hex just exited.

9.36 BOG HEX ENTRY: An ENEMY vehicle will only enter a bog hex (any Location requiring a Bog DR to enter/exit it) if it has no alternative non-bog hex that it can enter from its present Location without reentering the hex last exited [EXC: Mud (9.361); or if a Move Command instructs the vehicle to enter such a hex; e.g., in order to OVR].

9.361 SECRET BOG DR: If Mud or Deep Snow is in effect (D8.23) any path not blocked by woods or obstacle hexes is legal, though any paved-road/runway hexes should be used as much as possible. Unless another player is available, the (normally Secret) Bog DR is made at the *conclusion* of any (FRIENDLY or ENEMY) vehicle's movement. If the vehicle Bogs return it to the appropriate Location (if its exact VCA cannot be recalled make a Random dr among the possibilities). Any Defensive OVR/Bounding (First) Fire (or Sniper attacks caused by such) vs that vehicle occurring after the Bog Location is nullified (and considered, for all purposes, not to have occurred).

9.37 BYPASS: An ENEMY vehicle should use Bypass movement to avoid a potential Bog or Prohibited Location in order to complete its Move Command.

9.4 ENEMY EXIT: An ENEMY unit may only exit off the FBE [EXC: A S? in Advance Attitude moves toward (and attempts to exit off) the opposite board edge from the edge it entered; if the unit's specific RE/MSR instructions dictate otherwise; Unarmed MMC (6.302); ENEMY Guard (6.303)]. If an ENEMY unit's Move Command instructs it to exit off an ineligible edge, its move is halted in the last playable (half) hex entered.

9.41 EXIT VP: Each ENEMY unit exited off the FBE is awarded as normal Exit VP (A26.3) to the ENEMY side. Each exited S? counts as two Exit VP [EXC: 4 VP if in Human Wave; 4.323].

10. ENEMY ROUT

10.1 ENEMY ROUT: A broken ENEMY unit uses the standard rout rules (A10.5-.52). As necessary, determine its rout destination as per the following:

Priority List: to a Location containing a Good Order ENEMY leader; out of all FRIENDLY units' LOS; out of all FRIENDLY units' range; into rally bonus terrain Location; into Location with highest TEM; into VPO Location.

10.2 LOW CRAWL: A DM ENEMY unit Low Crawls (A10.52) if its rout would be interdicted.

10.3 NON-MANDATORY ROUT: A DM ENEMY unit that does not have to rout will rout anyway if it can end the RtpH either in/ADJACENT-to a Location containing a Good Order ENEMY leader and/or in a rally bonus terrain Location (farther away from or out of LOS of FRIENDLY unit[s] if possible) without being subject to Interdiction or having to Low Crawl. When in doubt, rout an ENEMY unit to its best advantage.

10.4 LEADER ROUT: An ENEMY Leader routs with a routing ENEMY unit (even if he is in a Human Wave and/or must voluntarily break to do so) [EXC: if he will be subject to Interdiction he will voluntarily break and rout only if there will be no ENEMY MMC remaining in the Location].

10.5 VOLUNTARY BREAK: An ENEMY unit will voluntarily break only when the player considers such an action to be in the obvious best interest of that unit or such improves the chances of the ENEMY side winning the Mission.

11. ENEMY Aph & CCPh

11.1 HOLD ATTITUDE: An eligible Activated ENEMY Infantry unit in Hold Attitude that is *not* Accessible to a Friendly-occupied Location *and* that *currently has a Target*, will only advance into an Accessible Location that has TEM $>$ the TEM of its present Location providing it will still have

a Target and it need not drop-a-HW/leave-a-VPO-Location to do so; otherwise it does not advance. Such a unit that does *not* currently have a Target will advance into an Accessible Location only if that Location has TEM $\geq$ the TEM of its present Location providing it will have a Target from that Location and it need not drop-a-HW/leave-a-VPO-Location to do so; otherwise it does not advance. [EXC: Automatic Action dictates otherwise; e.g., 6.303-307, 6.3121, 6.315, 6.317, 6.3173]. See 6.3173 for leader advance. Use the following to help determine the advance, as necessary:

Priority List: FRIENDLY-Controlled VPO Location; Location with unpossessed HW (functioning if FRIENDLY); highest inherent TEM; highest building Location; Location with Target in least TEM available from it; Location with most Targets available from it.

11.11 S? A S? in Hold Attitude is never eligible for advance (nor movement); 3.31.

11.2 ADVANCE ATTITUDE: An eligible Activated ENEMY Infantry unit in Advance Attitude that is *not* Accessible to a FRIENDLY-occupied Location will advance into an Accessible Location that is closer to the nearest FRIENDLY-Controlled VPO Location (even if such is not toward the FBE) [EXC: if possessing an assembled/functioning HW with a Target; if in a VPO Location 11.1 applies]. Use the following if > one such Location exists:

Priority List: FRIENDLY-Controlled VPO Location; Location with the highest inherent TEM; Location with highest hexside TEM; Location with the most Targets available from it; Location with (most) unpossessed Weapon (functioning if FRIENDLY).

See 9.25 if no VPO Location exists. As necessary, make a dr and consult the hex rosette found on the Advance Attitude "ENEMY Infantry Movement Table" [A4b] to determine the hex entered [EXC: reroll if instructed to enter a Prohibited Location (9.26) or if the unit would exit off an ineligible board edge (9.4)]. See 3.322 for the advance of an Advance Attitude S?; see 6.3173 for leader advance.

EX: The German is the FRIENDLY side, the north edge of the map is to the left (i.e., the FBE is toward the bottom of this illustration), hence the hex rosette on the right would be used (if necessary) to determine a random advance, as its configuration aligns with the map's hexgrid. It is the start of the APb; the player needs to determine the advance maneuvers for the Advance Attitude ENEMY units depicted above. The squad in O7 stays in place as it possesses the Lt Mtr and has a Target. Next, the 5-2-7 in O9 advances into P8 in order to move closer to the FRIENDLY-Controlled VPO (it could also have entered P9, but P8 has higher inherent TEM). The 4-4-7 squad in P6 must also advance toward the R8 VPO Location; the player moves the unit into Q7 (rather than P7, its other choice), as Q7 has higher hexside TEM than its other choice (P7). The Russian 4-4-7 "D" advances into the ground level of R6, as it has higher inherent TEM than Q7 (its other choice), which precedes hexside TEM in the 11.2 Priority List. The units already in the R6 building Location will attempt to enter into CC with the FRIENDLY unit in the S7 foxhole (since it is Accessible to a FRIENDLY-occupied Location) the 11.2 guidelines do not apply (see 11.4; Advance into CC/Melee).

11.3 IN DEPRESSION: An eligible Activated ENEMY Infantry unit IN a Depression Location will use the APb to assume Crest status in that Location if a Target would be available for it from that position. Otherwise the unit advances as per 11.1-2.

CC

11.4 ADVANCE INTO CC/MELEE: Each unpinned, Good Order Activated ENEMY non-crew Infantry [EXC: if possessing a functioning non-Captured HW or in Hold Attitude when in an IP] will attempt to advance into an Accessible FRIENDLY-occupied Location [EXC: 6.223; 11.41]. To do so it must pass a NTC (Leadership applies) using the following applicable DRM (or normal PAATC if advancing into a FRIENDLY AFV's Location). Failure to pass the TC results in the unit instead remaining in its present Location. Take one TC for each such eligible ENEMY unit, (best-class) leader first.

Advance into CC/Melee NTC Cumulative DRM:

- 2 If the FRIENDLY unit(s) is in a VPO Location
- 1 If the ENEMY unit is in Advance Attitude
- 1 If the ENEMY unit is Berserk
- 1 Per pinned/Panicked FRIENDLY unit in the Location
- 1 Per FRIENDLY unit in the Location possessing a HW (even if dismantled)
- 1 Per ENEMY unit already in/entering the Location
- =x DRM of same Location leader that has already passed his NTC
- +2 If any FRIENDLY unit in the Location is concealed

Priority List: FRIENDLY-Controlled VPO Location; Location with FRIENDLY AFV (if $\geq$ one, easiest to kill); Location with smallest (in US#) Known FRIENDLY Infantry unit; Location with FRIENDLY MMC easiest to kill; Location where Ambush is possible; Location with highest inherent TEM.

11.41 SMC RESTRICTIONS: An ENEMY SMC will advance into a CC Location only if accompanying $\geq$ one ENEMY MMC. An ENEMY SMC will reinforce an existing Melee only if he will improve the ENEMY's odds/chances of winning.

EX: See the 11.2 illustration. The unpinned Advance Attitude ENEMY units in the ground level of R6 must attempt to advance into the Accessible FRIENDLY-occupied Location (S7) by passing a NTC (11.4). The 8-4 leader takes his NTC first; a -1 DRM applies as he's in Advance Attitude, and another -1 DRM since the German unit in S7 possesses a HW (even though unattached). The leader easily passes his NTC DR with a "5". Next, the 6-2-8 squad takes its NTC; it also has a -1 DRM due to Advance Attitude, a -1 DRM for the German HW in the Location to be (potentially) advanced into, and (now) a -1 per ENEMY unit already entering the Location (since the leader passed his NTC and is slated to enter). However, even with the Cumulative -3 DRM, it fails the NTC by rolling an Original 12. The leader's advance into CC is now cancelled, however, since he is allowed to advance only if accompanying another ENEMY MMC (11.41).

11.5 ENEMY CCPh ATTACKS: If a Location contains $\geq$ one ENEMY Infantry MMC eligible to attack during the CCPh and $\geq$ two FRIENDLY units, use table A3e to determine the CC Target(s) for those ENEMY units during each CCPh in which Melee exists in the Location. A lone ENEMY SMC attacks the Target with the smallest US#. If the Location contains only one FRIENDLY unit all attacking ENEMY units attack as a FG [EXC: vs vehicle]. If there is a combination of FRIENDLY vehicle and FRIENDLY accompanying personnel units in the Location, ENEMY unit(s) will combine and make its attack using the following:

Priority List: Personnel with smallest inherent FP factor; Personnel with highest morale factor; AFV with functioning armament; vehicle with functioning armament.

11.51 ENEMY WITHDRAWAL: A Good Order unpinned non-berserk ENEMY Infantry unit attacked by an Original CC DR of 12 will Withdraw (A11.22) if the combined US# of all unbroken ENEMY unit(s) in that Location is < the combined US# of all unbroken FRIENDLY Infantry in that Location. The Withdrawing unit enters an eligible Location according to the following:

Priority List: with highest inherent TEM; with ENEMY unit(s); with LOS to FRIENDLY Target; nearest to FBE.

11.6 ENEMY PRISONER ESCAPE ATTEMPTS: An ENEMY prisoner Guarded by a broken FRIENDLY unit will attempt to Escape (A20.55) if there is no Good Order FRIENDLY Infantry unit in the Location.

11.7 CONCEALMENT: Always attempt to place a concealment counter on each eligible ENEMY unit (A12.121).

12. THE MISSIONS

12.1 INTRODUCTION: Each SASL Mission is divided into ten sections, as follows: Briefing, ENEMY Attitude, Mission Tables, Mapboard Selection & Activation, VP Locations, S? Placement/Entry, Sequence, Mission End, VP Schedule, and Mission Special Rules (MSR).

12.2 MISSION SELECTION: Prior to Mission setup the player must first determine the Mission's date. To select a Mission roll on either the "FRIENDLY on Offense" or "FRIENDLY on Defense" column of Table A7 or select any desired Mission [EXC: see 17.21-22 if playing a CG Mission].⁶

12.21

12.21 PARTISAN ENEMY: Each Mission that is marked with a "P" following the Mission's ID number (e.g., Mission 2) may have a Partisan ENEMY if the FRIENDLY side is German and the Mission takes place during 1942-44 in Russia or France. Make a pre-Mission dr to determine the ENEMY nationality; a Final dr of ≤ 1 results in a Partisan ENEMY. Each non-RE S? in a Partisan-ENEMY Mission must have its elements generated using the Partisan Generation Tables.

Cumulative drm:

- 1 if in Russia in 1943
- 1 if previous Mission was vs. Partisan

12.211 PARTISAN ENEMY ATTRIBUTES: An Activated Partisan Infantry unit pays 1 MF to enter a woods Location. Captured-weapon penalties do not apply to Partisans using *Allied* SW/Guns generated from a Partisan generation Table (only). Partisan have MOL capability (A22.6) which should be employed whenever beneficial. Partisans may not Deploy, may not participate in multi-Location FG, and may not make Entrenching Attempts. A Partisan Commissar affects another Partisan unit just as if both were 10/42 Russians [EXC: if he fails to rally a squad it is Replaced by its two HS].

12.212 PARTISAN-ENEMY ACTIVATION TABLE: Reroll each Table A1 result containing "AFV" or "SPG".

12.213 PARTISAN-ENEMY RE TABLE: A RE for a Partisan ENEMY always uses the special Partisan-ENEMY RE Table (found on the Partisan Generation Tables card) *instead of* (ENEMY RE) Table A11 (including any cdr modifier normally applied on Table A11).

12.22 SPECIAL FORCES INTEGRITY: If the first ENEMY MMC generated {G2} from a non-RE S? is an MMC type which (under historical circumstances) would not normally be intermixed with other, different type/class MMC of that nationality (e.g., US paratrooper [7-4-7], German SS [6-5-8] or Assault Engineer [8-3-8] or British Commando [6-4-8]), all subsequent non-RE S? that successfully Activate a MMC can only generate that same MMC type (no roll on Table x2 is required). Conversely, if the first ENEMY MMC generated {G2} from a RE S? is an MMC type which (as per above) would not normally be intermixed with other, different type/class MMC of that nationality, all subsequent S? from that same RE that successfully Activate a MMC can only generate that same MMC type (no roll on Table x2 is required).

EX: If the ENEMY nationality is German and the first MMC generated {G2} from a non-RE S? is an "SS" MMC, all subsequent non-RE S? that successfully Activate a MMC can only generate SS MMC {G2}. Additionally, if the first MMC generated {G2} from a German-ENEMY RE S? is an "SS" MMC, all subsequent S? that successfully Activate occurring due to the same RE can only generate "SS" MMC {G2}.

12.3 EC/WIND/WEATHER: Randomly determine the Mission's EC (B25.5), Wind Force (B25.63) and weather (E3.); or the appropriate weather chart, depending on Theatre).

12.31 WINTER CAMOUFLAGE: In any Mission taking place in any type of snow weather (E3.7) there is a possibility that one or both sides may be Winter Camouflaged (E3.712). Make one dr for each side (applying any applicable drm); on a Final dr of ≤ 2 that side's respective units are considered Winter Camouflaged for the current Mission. If playing a CG, once the FRIENDLY side has gained Winter Camouflage, it automatically has Winter Camouflaged in all other subsequent Missions in which Winter Camouflage would be applicable.

Cumulative drm:

- 1 if the FRIENDLY majority squad type is elite*
- 1 Russian
- +1 1941 German
- +1 for vehicles
- +1 if the FRIENDLY majority squad type is Conscript/Green*

* Applicable to the FRIENDLY side only.

12.32 MISSION TABLES: Tables to determine both sides' SAN and RE #s (2.1), and for determining the starting ENEMY AC# (5.11), are provided in each Mission.

12.4 ELR: Use the appropriate Chapter H ELR chart to determine the ELR of each side's units (e.g., use H1.28 to determine ELR of German/Russian units).

12.5 FRIENDLY WITHDRAWAL: In addition to the method given in the "Mission End" section of each Mission, a Mission also ends immediately upon the exit of the last Mobile/unbroken FRIENDLY unit off the FBE. Each non-Mobile/broken FRIENDLY unit remaining on the map at such a time is considered KIA for (CG) victory condition purposes. Unless a RE

instructs otherwise, any Mission ending thusly is an automatic ENEMY victory.

12.6 MISSION VICTORY CONDITIONS: Unless stated otherwise by the Mission, the FRIENDLY side must score *more* VP than the ENEMY in order to win a SASL Mission. Any other result is an ENEMY win. VP are awarded to each side as per the Mission's VP Schedule. Each Melee existing at Mission end must be carried out until Melee no longer exists. See also 17.1321 if playing a CG.

12.7 MISSION END: SASL Missions do not provide the player with a Turn Record Chart since the turn length of many of them can vary. It is suggested, therefore, that the player use the VP track (of the ASL Scenario Aid Card) as a *de-facto* turn track.

Furthermore, in a Mission where a minimum number of turns that must be played is established at game start, place the "Possible Game End" marker on the number of the first turn that the Mission could possibly end.

13. MAPBOARD SELECTION & FEATURES

13.1 PROCEDURE: The following rules are used to determine each mapboard for a SASL Mission. Consult the Mission's "Mapboard Selection & Activation" section for specifics on when and how each mapboard for that Mission is activated. Some Missions allow additional mapboards to be activated during play, usually due to a FRIENDLY unit entering a new Location near the current EBE.

13.2 SELECTION PROCESS: Perform the following steps (13.21-2312, as necessary) for each mapboard randomly generated:

13.21 DETERMINE TERRAIN COLUMN: Make a DR on the proper subtable (a-e) of Table A8. The result gives a Terrain Column to be used on Table A9. The "Mapboard Selection & Activation" section of each Mission lists the proper subtable of A8 to use for that Mission.

13.22 DETERMINE MAPBOARD: Make a DR {A9} using the Terrain Column determined from Table A8. The result is the board number of the just-activated map. Reroll, as necessary, if the determined mapboard is not available or is currently in play.*

13.23 MAPBOARD ALIGNMENT: Make a random dr to determine each mapboard's alignment. On a dr of ≤ 3 the board number is placed towards the north. If necessary, place S?/VPO-Control markers as dictated by the Mission being played (4.1a-e, 14.1).

13.231 ROAD NETWORK: A MSR may require that the mapboards generated be placed such that a continuous path of "connected" road hexes exists from one board edge to another (usually from the FBE to the [current] EBE). As each mapboard is placed in such a Mission the player must insure that a continuous network of contiguous road hexes exists from/to the specified board edges. Where > one path exists (e.g., due to a "loop", or the road leading off an eligible board edge at > one Location), only the road hexes comprising the *shortest* (measured in contiguous road hexes) path are considered to be part of the Road Network. If an equidistant path is formed all road hexes of each equidistant "branch" are part of the Road Network.

If a path of contiguous road hexes does not exist when a new map is placed, reverse the alignment of the just-placed board. If a Road Network is still not formed discard that board and determine a new one until an acceptable mapboard is placed.

13.2311 ROAD NETWORK BRIDGE: Each single-hex bridge *along the Road Network* is automatically intact (the A9c dr for such is ignored). If a river/canal mapboard is generated (e.g., board 7, 8 or 40) a multi-hex bridge automatically exists along the Road Network (reversing alignment as necessary; or use table A9a if > one hexrow is eligible). Roll for bridge type normally {A9b/c/d}.

13.2312 PLOWED ROADS: A MSR-required Road Network is considered Plowed (E3.723, E3.733-7331) if Deep Snow is present.

13.24 TERRAIN ALTERATIONS: The player is free to use published/home-made terrain overlays, or Broken terrain rules (F13.1) to alter a mapboard's printed features, as desired. Steppe Terrain (F13.2) can also be used with mapboards 26-31 and various desert overlays, at the player's discretion. Use of any overlays may, however, affect both S? placement and the VPO determination processes (14.1).

13.26 FACTORY: Make a dr for each building of ≥ 7 hexes on each "City"

S

mapboard (marked with the "c" prefix on Table A9). An Original dr of ≤ 3 results in the building being a Factory (B23.74).

13.3 DUPLICATION: If a board that is already in play is activated again reroll for a different board using the same [A9] Terrain Column.

13.4 STREAMS AND WATER-OBSTACLES: When a mapboard is activated that has a stream/river present, the proper Chapter B tables (B20.4; B21.121-.122) should be used to determine the water's depth/current. As necessary, make a Random dr to determine the current's direction.

13.5 ONE-HEX BRIDGES: Each one-hex bridge must have a dr made {A9c} to determine if the bridge is intact or destroyed [EXC: 13.2311]. Regardless of the result make a subsequent dr {A9d} to determine the bridge's construction. If the Table A9c result is "destroyed" place the appropriate rubble counter (as necessary; B6.331) at the Depression level of the hex. See also 14.12.

13.6 RIVER BOARD: When a river/canal mapboard (e.g., 7, 8 or 40)⁶ is activated use tables A9a-b to determine the presence and construction of a multi-hex bridge. A dr {A9a} of ≥ 5 results in no bridge being present; you have, in effect, reached a "dead end" [EXC: 13.2311]. If the presence of a bridge is established a subsequent dr is made {A9b} to determine the type of bridge. See also 14.12.

13.61 FRIENDLY RIVER ASSAULT: If a bridgeless river mapboard is the first non-FRIENDLY setup board selected in a Mission in which the ENEMY is in Hold Attitude (and the FBE is along the 22"-length of a mapboard), the FRIENDLY side automatically receives a number of small rafts sufficient to transport his entire OB, including later-arriving {RE} reinforcements. A large raft is granted, as necessary, to transport each eligible FRIENDLY Gun (E5.122). If the FRIENDLY side is German, Assault Boats (E5.11) are received instead of small rafts on a subsequent dr of ≤ 3 . FRIENDLY units are not subject to Command Control while on a boat in a Water Obstacle hex.

14. VICTORY POINT OBJECTIVES

14.1 VPO: Some Missions require the designation of $\geq$ one VPO when a mapboard is initially placed. Consult the Mission's "VPO Locations" section for specifics on VPOs for that Mission. A VPO might be a single Location (e.g., a woods or single-hex building Location) or a group of Locations (e.g., of the same multi-Location building; 14.32) as determined by a separate dr for each VPO required {A10a} (reroll, as necessary, so that each VPO is different). Each VPO should be designated by placement of a VPO marker in a Location of that VPO, with the face-up side of the marker displaying the current Controller. An ENEMY unit in a VPO Location has its movement restricted as if it were in an IP (6.312).

14.11 RESTRICTION: A VPO may not be so designated if any Location of it would be $\leq$ three hexes from any whole offboard hex along the FBE [EXC: multi-hex bridge; 14.12]. Reroll {A10a}, as necessary, for a different VPO. A bridge may be a VPO Location only if it is intact; reroll {A10a} for a different VPO if such a bridge is destroyed.

14.12 MULTI-HEX BRIDGE POTENTIAL: Before determining the VPO Location(s) on any mapboard with the potential of an intact multi-hex bridge, the condition of that bridge must be determined (13.5-.6). If such a bridge exists and ≥ 1 VPO is to be marked, it is automatically the first VPO (and second, if two such bridges are present and ≥ 2 VPO are required) on that mapboard. If two such bridges are present, but only one VPO is to be designated, use the following to determine the VPO:

Priority List: stone construction; two-lane; number of Locations.

If a mapboard has a multi-hex bridge as a VPO all non-water-Obstacle Locations of those bridge hexes, as well as the two ADJACENT land Locations (one at each end of the bridge), are VPO Locations. However, a side can Control a bridge VPO if it currently Controls the two ADJACENT land Locations and no opposing unit is currently on/beneath a bridge Location of that VPO, regardless of what unit last Controlled the Location.

14.13 RIVER MAPBOARD: The VPO for a river mapboard are given in the form *hex/hex*. When such a VPO is to be designated, use only the VPO nearest to the EBE.

EX: When playing the Cautious Advance Mission, mapboard 7 has just been activated, and is aligned (13.23) with its board number to the north. It is then determined that two VPO are present on that mapboard. Consulting table A9a, the player makes a dr of 2, resulting in a multi-hex bridge in hexrow AA spanning the river. After determining the bridge's type (A9b & A9d), it automatically becomes the first such VPO marked (14.12). The second VPO must now be determined. A dr

of 4 {A10a} gives the result of "P2/V9". Since P2 is nearest to the EBE, it becomes the second VPO; V9 is ignored as it is on the river's west side.

14.14 VPO DESTRUCTION: If all Locations of a VPO are rendered inaccessible during play (e.g., due to terrain blaze or collapse of a bridge into a Water Obstacle) the side *not* causing the inaccessibility of the VPO is awarded any VP for Control of such VPO. If neither side can be held responsible (e.g., Blaze spreading from a burning wreck), the last side to have Controlled the majority of the Locations of that VPO is awarded its VPO value.

14.2 VPO DETERMINATION: Make a separate dr {A10a} for each VPO to be designated. If a board is to have $>$ one VPO determined, each must be different; reroll {A10a}, as necessary.

14.3 MULTI-LOCATION VPO: All (non rooftop/aerial/subterranean) Locations of a multi-Location VPO must be FRIENDLY Controlled for the player to claim its VP value for the FRIENDLY side [EXC: 14.12]. If not, such VP are awarded to the ENEMY side. There are four types of multi-Location VPO (14.31-.33):

14.31 TWIN VPO: Some VPO results list two distinct hexes as part of that VPO in the form *hex-hex*.

EX: The determined VPO for board 2 is "V8-W7". Both hexes must be FRIENDLY Controlled at Mission end in order for the player to receive their VP award. Despite that each hex contains a different building, only one VP value dr is made {A10b}, as both comprise but one VPO (14.4).

14.32 MULTI-LOCATION BUILDING: All non-rooftop/non-sewer Locations of a multi-Location VPO building are VPO Locations (all hexes of a rowhouse building are considered one building).

14.33 HILLTOP: When a non-building hilltop hex is a VPO, all Accessible same-level Locations are VPO Locations.

EX: One VPO is to be determined on board 2. The dr of two {A10a} results in "O5" as the VPO. Thus, hexes N5, O5 and P5 are VPO Locations.

14.4 VPO VALUE TABLE: The value of each VPO is determined *only at the conclusion of the Mission*. Make a dr {A10b} for each such VPO, applying drm as applicable. Note that a dr is made per VPO, not per VPO Location.

14.5 KINDLING: A VPO Location may not be voluntarily Kindled.

15. FRIENDLY UNITS

15.1 FRIENDLY UNITS: The FRIENDLY side begins each Mission with 130 BPV (or as specified otherwise in a MSR) with which to purchase Infantry MMC (*only*) of the selected FRIENDLY nationality using the Chapter H DYO method. Such purchases should be made *after* the Mission's parameters have been determined, but before FRIENDLY MSR-given units are determined and before S? are setup [EXC: if playing the SASL CG the player's starting units are determined as per 17.13]. FRIENDLY vehicles and Guns are obtained *only* as per MSR or due to FRIENDLY RE occurrence. FRIENDLY units initially setup-for/enter the Mission as noted in the "Sequence" section of each Mission. To purchase the FRIENDLY force, use only rules H1.2-.26, H1.28, and H1.74-.83.

15.2 FRIENDLY HIP UNIT: Each FRIENDLY HIP unit is never a Target as long as it remains hidden. Such a unit can be placed onboard but should be covered with a $\frac{3}{8}$ " "P" marker; use $\frac{1}{2}$ " "T" markers for all other forms of FRIENDLY concealment during a Solitaire Mission. **NOTE:** the last sentence of A12.3 is disregarded when using this solitaire system.

15.21 FRIENDLY MINEFIELD: During a Mission FRIENDLY minefield Locations may be marked on the mapboard(s) by the appropriate minefield counter placed onboard in the Location. If not yet Known to the ENEMY the counter should *face toward the player*. Once an Activated ENEMY unit has been attacked by the minefield (by any result other than "-" on the IFT) the counter is rotated to face toward the EBE.

15.3 COLUMN/CONVOY: FRIENDLY units may begin a Mission setup in Column/Convoy formation at the player's option. Unless otherwise noted, a Convoy vehicle has full PP capacity in SASL.

15.4 SPECIAL CAPABILITIES: A special capability (i.e., H1.22-.26) bought for a unit(s) of the FRIENDLY OB does not apply to FRIENDLY RE reinforcements unless so specified by RE or MSR.

15.5 FRIENDLY UNIT ENTRY: FRIENDLY units may be kept offboard (indefinitely), even if allowed to initially setup onboard. Each FRIENDLY unit (including each FRIENDLY RE unit [EXC: as per MSR]) entering from offboard must do so along the (current) FBE. Reinforcing

15.5

FRIENDLY units enter, in part or in whole, on/after their initial turn of availability. Each OB-given unit is available at Mission start.

15.6 FRIENDLY UNIT EXIT: A non-prisoner FRIENDLY unit may exit off the FBE during any RtpH or FRIENDLY MPh/APh (whether in Good Order or not). Any such exited unit is not considered eliminated for Casualty-VP/CG purposes but may not reenter the mapboard during that Mission. Each FRIENDLY unit exited off a non-FBE is considered KIA [EXC: as required by a MSR/RE].

15.7 FRIENDLY WEAPON SPIKING: The ENEMY is awarded the Casualty VP value of any FRIENDLY Gun/vehicle intentionally destroyed by a FRIENDLY unit. Each captured FRIENDLY vehicle/Gun, and each FRIENDLY unit taken prisoner, is worth double Casualty VP value at Mission end (A26.21).

15.8 FRIENDLY SEARCH/MOPPING-UP CASUALTIES: Searching by a FRIENDLY unit can only remove ENEMY concealment (it will never reveal an ENEMY HIP unit/Fortification). FRIENDLY casualties due to Search/Mopping-up occur in the normal manner (A12.154; i.e., the Casualty dr must be made by the player in attempt to cause casualties to the FRIENDLY side).

15.9 MOPPING UP ACTIVATION: When a building is Mopped Up (A12.153) by a FRIENDLY unit(s), there is a chance that a HIP ENEMY unit(s) will be Activated [EXC: Prevailing Attitude is Advance]. Make a DR and apply a -1 DRM for each (non-Rooftop) Location of the building in excess of three that has not had a FRIENDLY unit in it. If this Final DR is ≤ 2 a Mop Up Activation occurs. Make a subsequent DR {A1} to determine the unit(s) Activated (if any). Each such Activated unit is placed in the Location of that building that is ADJACENT to the Location containing the most Mopping Up units (Random dr if $\geq$ two such Locations exist). Once all such units are eliminated the building is considered secured.

16. FRIENDLY COMMAND CONTROL

16.1 COMMAND CONTROL: Each FRIENDLY unit, like each ENEMY unit, has the potential to Panic (even if offboard; 16.33) [EXC: 13.61]. The player does not know if a unit will be functional (in Command) for the current (ENEMY or FRIENDLY) Player Turn until its Command DR (CMD DR) is taken. Note that the following Command Control rules are in effect for the FRIENDLY side only; ENEMY Command Control is inherently built into the ENEMY Action Table DR (A2).

16.2 CMD#: A FRIENDLY unit (including offboard/RE reinforcements) must first pass a CMD DR by rolling $\leq$ its Command Number (CMD#) in order to perform any non-RPh/RtPh activities during the current Player Turn [EXC: 16.32]. A unit's CMD# is based on its morale, as per the following listing:

- A leader/crew has a CMD# one > its current Morale Level.
- A squad/HS has a CMD# equal to its current Morale Level.
- A vehicle has a CMD# one > its current Morale Level (D5.1) [EXC: a SMC Rider/Passenger may use his own CMD# if it is greater].

16.3 CMD DR: A CMD DR is made for a unit only when it is ready to perform its first non-RPh action for that Player Turn (see also 16.4.421). Passage of the CMD DR allows that unit to perform actions normally for the remainder of that Player Turn. Failure to pass the CMD DR results in that unit being immediately marked with a Panic marker; 6.211-.213 apply. An Original CMD DR of 12 always results in Panic. A CMD DR does not activate a Sniper (A14.1), nor is it a concealment-loss activity. Note that FRIENDLY and ENEMY units Panic by different methods, but the effects (6.21-.213) are the same.

16.31 DRM: The following Cumulative DRM apply to a unit's CMD DR:

- 1 if in Motion
- 1 if in Convoy/Column/platoon formation
- 1 if the unit has an Acquired Target
- 1 CE AFV
- 1 SMC possessing function radio/field-phone & OBA is available
- 1 U.S. Infantry MMC⁹

16.32 EXCEPTED UNITS: A FRIENDLY unit that is berserk/broken/held-in-Melee/under-Recall/Heroic is never subject to Command Control. A FRIENDLY heroic leader exerts his Command Influence range (16.4) nor-

mally. All units in a Convoy/Column/platoon take a single CMD DR for the entire formation. The CMD# of the best FRIENDLY (armor) leader or Vehicle in that formation is used.

16.33 OFFBOARD PANIC: A FRIENDLY unit that Panics when offboard may not enter during that Player Turn. It must remain in its current (offboard) setup hex until the next FRIENDLY Player Turn, when it may again attempt to enter. All offboard whole-hexes are considered OG for FRIENDLY Command LOS purposes.

16.34 PASSENGERS/RIDERS: A Passenger/Rider is in Command if its transporting vehicle passes its CMD DR. However, if the unit becomes Infantry it must pass a new CMD DR in order to perform further actions in that Player Turn. If a vehicle transporting a Passenger/Rider fails its CMD DR its Passenger/Rider may attempt to pass its own CMD DR, passage of which allows the transported unit to continue actions normally for that Player Turn (e.g., unload; become CE/BU if in an armored halftrack; attack).

16.35 LOADING/UNLOADING: In order to load/unload (or hook/unhook; C10.11-.12), only the Personnel unit(s) wishing to perform such an activity need pass a CMD DR.

16.36 SPOTTED FIRE: If a Spotter (C9.3) passes its CMD DR the unit(s) it is spotting for is also considered in Command, but only for purposes of Spotted fire for that Spotter, otherwise the unit performing Spotted fire must pass its own CMD DR.

16.4 LEADER COMMAND INFLUENCE

RANGE: Each Good Order, unpinned, non-Captured FRIENDLY Personnel (non-armor) leader exerts his Command Influence into all Locations in his LOS within two hexes, as well as the Location he is in, *at the moment his CMD DR is made*. If pinned, such a leader exerts his Command Influence only into his currently-occupied Location. See 16.43 for a (Passenger/Rider) Personnel leader's Command effect on vehicles. A leader may have his CMD DR made as soon as he, or any unit within his Command Influence range, wishes to perform its first action (see also 16.41). Mark each leader that passes his CMD DR with an "In CMD" marker.

Like a FRIENDLY Personnel leader, a FRIENDLY CE armor leader also has a two-hex Command Influence range. However, such a leader can only exert his Command Influence over other FRIENDLY vehicles, and only if all such vehicles are CE, or using platoon/Convoy movement, and within his LOS [EXC: 16.32].

16.41 EFFECTS: Each Good Order FRIENDLY MMC/lower-rated-leader (A10.7) is automatically in Command (i.e., is considered to have passed its CMD DR) if any FRIENDLY leader exerting his Command Influence into its Location passes his CMD DR, even if that leader *subsequently* moves/breaks/pins/is-eliminated, leaving the unit out of his Command Influence range. Once a FRIENDLY leader has passed his CMD DR, each FRIENDLY unit subject to that leader's Command Influence may perform actions, and *at least one such unit must perform an action before another leader's CMD DR is made*. A unit must use a (higher-rated) leader's CMD DR as his own CMD DR if the unit is within that leader's Command Influence range.

If each leader that could exert his Command Influence into a MMC's Location fails his CMD DR, the unit may then, and only then, attempt its own CMD DR.

16.42 MULTIPLE LEADER INFLUENCE: If any one leader exerting his Command Influence over a unit passes his CMD DR, that unit is in Command for that Player Turn. Otherwise it must pass its own CMD DR.

16.421 RANK: A leader cannot exert his Command Influence over a FRIENDLY leader of *equal or higher* type (i.e., with the same or better morale and Leadership DRM). If he is not in Command due to being in the Command Influence range of a higher-rated leader, he must use his own CMD DR.

16.43 VEHICLES AND COMMAND INFLUENCE: A Good Order, FRIENDLY, non-Captured Personnel leader exerts his Command Influence over a vehicle/its-PRC only if he is currently a Passenger or Rider of that vehicle [EXC: Convoy/platoon; 16.32], or if that vehicle/its-PRC is (CE if an AFV and) in the leader's hex and in his LOS. Such a Personnel leader that is a Passenger/Rider on a Motion vehicle exerts his Command Influence only over his transporting vehicle and any other same-vehicle PRC. A leader that is a Passenger/Rider on a stopped vehicle exerts his Command Influence normally [EXC: a Passenger leader in an AFV must be CE in order to exert his Command Influence over any non-Passenger of the same AFV].

EX: In the illustration above the base level of all hexes enclosed by the thick, solid white lines are within the two-hex Command Influence range (16.4) of the FRIENDLY 9-1 leader in 12Z5; each FRIENDLY Infantry unit in such a Location is in Command if the 9-1 passes his CMD DR by rolling ≤ 10 (16.2). The StuG in the 9-1's Location is not subject to his Command Influence since it is BU (16.43), and must therefore pass a CMD DR of its own (CMD DR of ≤ 9 ; 16.2) in order to be in Command during the current Player Turn. The tank in Y6 must also pass its own CMD DR as it is not in the 9-1's Location (16.43). Halfsquad B (in the gully) and squad C (in X4) are not within the 9-1's Command Influence range since they are not in his LOS.

Additionally, all MMC units within the double white lines are in the Command Influence range of the 8-0 in Z3, who is within the Command Influence range of the better-rated 9-1. Note, however, the 10-2 in AA2 leader is not in command, as the 8-0 (a lesser-rated leader) has no effect on him. Thus, if the 9-1 passes his CMD DR, all MMC units (and the 8-0 SMC) in hexes enclosed by all white lines will be in Command. If the 9-1 fails his CMD DR (Original DR ≥ 11) another leader may attempt his CMD DR. If the CMD DR of the 10-2 is successful (Original DR ≤ 11), the 8-0 will automatically be in command. Additionally (if the 8-0 is in command), squad A in Z5 and each MMC enclosed by the double white lines will be in command (but not the 9-1; 16.421). If each FRIENDLY leader fails to pass his CMD DR, each FRIENDLY (non-leader) unit may then attempt its own separate CMD DR. Each such unit must roll $\leq$ its current morale level to be in command. Regardless, halfsquad B in the BB5 gully will have to pass its own separate CMD DR, as it is out of all FRIENDLY leaders' Command Influence range. The FRIENDLY hero in X1 is always in Command (16.32).

17. SOLITAIRE CAMPAIGN

The following Chapter S rules apply only to the SASL Campaign Game.

17.1 INTRODUCTION: In the SASL CG you, the player, assume the role of a commander of a WW2 infantry company. You will play a series of consecutive Missions in which surviving units "Directly Attached" (17.131) to your company form the core of your starting OB for the next Mission. Using this CG system you will have to decide when a Mission has become too costly, in terms of FRIENDLY losses, to justify the continued pursuit of its victory. You must choose when to extricate your troops from potential disaster, or when to "gut it out" in order to (hopefully) achieve that win. In a SASL CG Mission, you may find it more important to survive and lose than to win and be virtually wiped out. To prepare for your first SASL CG Mission consult steps 17.11-22.

17.11 SELECT FRIENDLY NATIONALITY: Depending on the nationality generation tables available (1.1), select a FRIENDLY nationality.

17.12 THEATRE: Depending on the nationality generation tables available (1.1), select a theatre of operations.

17.13 FRIENDLY UNITS: In a SASL CG Mission the player commands an Infantry company (based on historical records and adapted to ASL scale) of the selected FRIENDLY nationality. See 18.5, under the selected nationality, for a listing of all units/Weapons in each full-strength company playable in SASL. HS listed in a company OB represent MG teams.

17.131 DIRECTLY ATTACHED: Each FRIENDLY unit/Weapon listed for a company OB (18.5), as well as each leader Created (A15.21/A18.12) from a Directly Attached unit, is considered Directly Attached to that company. Each such unit/Weapon should have its ID letter/name recorded on the CG Roster in order to distinguish it from all other (i.e., Temporarily Attached; 17.132) FRIENDLY units/Weapons on the mapboard concurrently.¹⁰ Only a Directly Attached unit/Weapon is subject to improvement/replacement (17.7-8). A hero created from a Directly Attached unit (only) is Retained until the completion of step 17.74 [EXC: if eliminated due to wound; 17.621]. When an on-map Directly Attached squad is Deployed, or an on-map Directly Attached Weapon is dismantled, place it in the "Deployed/Dismantled" box of the SASL CG Roster until it is again needed on-map.

17.1311 FRIENDLY EXIT: Each Directly Attached unit/Weapon exited off the FBE (15.6) during a solitaire CG Mission is Retained (available for the next such Mission) [EXC: if eliminated subsequently due to wounds]. If exited off any other edge it is eliminated [EXC: if such exit is required by Mission VP-Schedule/MSR]. Place each unit/Weapon thusly exited in the "Exited off FBE (15.6, 17.1311)" box at the bottom of the SASL CG Roster.

17.132 TEMPORARILY ATTACHED: Also falling under the player's command is each unit/Weapon Temporarily Attached to the FRIENDLY company. Temporarily Attached units/weapons include FRIENDLY forces granted due to MSR, FRIENDLY RE reinforcements and captured equipment. Each surviving Temporarily Attached unit is returned to the counter mix at the conclusion of a Mission (17.61), and is not available for the next CG Mission.

17.1321 VP VALUE: A Temporarily Attached unit(s)/Weapon(s) eliminated/captured by the ENEMY in the previous Mission is worth a number of Casualty VP (A26.2) to the ENEMY equal to 1.5 times its normal VP value (if any) (FRD) [EXC: if Russian].¹¹

17.14 SW TEAM: Each FRIENDLY crew with a 1-PP factor (e.g., German/Russian 1-2-7 crew or U.S. 1-2-6 crew) represents a SW Team. A SW Team is the equivalent of a vehicular crew in all respects [EXC: it is treated as a HS for purposes of manning/firing/driving a crew served weapon (A21.13), armed vehicle or AFV (A21.22)].¹²

17.141 SW USAGE RESTRICTION: A SW Team is the only MMC unit that may fire a FRIENDLY ATR/Lt-MTR/PSK/BAZ without the non-qualified use penalty applying (A21.13) [EXC: FRIENDLY RE/MSR reinforcements]. A full-strength company OB lists one SW Team for each such Weapon in that OB.

17.15 CAMPAIGN ROSTER SHEET: On the back of the Chapter S Divider is the SASL CG Roster Sheet. Photocopies of the sheet may be made to keep a running record of the units/Weapons belonging to the player's company, and other CG related material, for each SASL CG Mission played.

17.2 MISSION-SPECIFIC PARAMETERS: The following rules (17.21-22) replace 12.2 when playing a CG Mission.

17.21 DATE: Determine a starting date (month) for your CG. It is suggested that the first Mission of the CG be the for the first month of hostilities of the two selected nationalities on that front. Each Mission played advances the month by one, so that one Mission is played per month. (If hostilities did not last long [e.g., the German invasion of France] the player may instead wish to play one Mission per week of hostilities.) Alternatively, the player may select a beginning date (e.g., if simulating the campaign of a specific unit use the month that the unit first saw action on that front; a little historical research will be necessary, but the work should be worth the effort). Continue to use 12.3 for EC/wind/weather determination, and 12.4 for ELR. The final Mission of the CG should likewise correspond to the last historical date that the selected unit/nationality engaged in combat on that front (unless, of course, your command is wiped out).

17.22 MISSION SELECTION: Use the Mission Selection Table [A7] to determine the Mission. This table is divided into two subtables, one for when

17.22

the FRIENDLY nationality is attacking, one for when it is in a defensive mode. A little research into the historical situation on that front for the upcoming time period should reveal which chart would be most appropriate.

17.3 COMPANY CASUALTIES: During a CG Mission the player must separate casualties incurred by the FRIENDLY company into two groups:

17.31 RETAINED: Each Directly Attached (17.131) non-prisoner unit eliminated during the previous Mission due to "double break" (an already broken unit that breaks again; A10.3), Casualty MC (A10.31), Fate (A10.64), unarmed unit Casualty Reduction (A20.54), or Extreme Winter (E3.742) is Retained in the FRIENDLY company's OB (in an unbroken state) at the conclusion of the Mission. Also, each Directly Attached Weapon removed during a Mission due to non-deliberate malfunction is Retained. Each Retained unit/Weapon is available for the next Mission played [EXC: as per MSR]. Place each such unit/Weapon thusly removed in the "Eliminated & Retained" box at the bottom of the SASL CG Roster.

17.32 ELIMINATED: Each Directly Attached FRIENDLY unit removed by any other means (e.g., CC, KIA, K/#, Failure to Rout, Commissar rally (A25.222), Capture, Interdiction, Surrender (A15.5), Falling [B11.41], non-Survival [D5.6]; see also 17.43 & 17.621) is eliminated from the company's OB (but is subject to Replacement in step 17.8). Each Directly Attached Weapon unpossessed/Captured at Mission end, eliminated due to Self Destruction (A9.73) or Random Destruction (A9.74) is also removed from the company OB. Place each unit/Weapon thusly eliminated in the "Eliminated from OB" box at the bottom of the SASL CG Roster.

17.4 MISSION END: Upon conclusion of a CG Mission the player must resolve each of the applicable following situations (17.41-44) involving FRIENDLY unit(s). Victory of the Mission (17.5) is not determined until each such necessary step is resolved.

17.41 CLIMBING UNIT: Each FRIENDLY unit on a Climb marker must be placed in either the Location it was attempting to reach or the Location it left when it began to climb (your choice). If the Location the unit is placed in contains an ENEMY unit(s) mark them all with a Melee (not CC) marker.

17.42 IN MELEE: All units in Melee must undergo an (unlimited) number of CC rounds until no Melees exist. Such units are free to perform any/all normal CCPh activities associated with Melee (i.e., Capture attempts, Withdrawal, attack, etc.). Consider the ENEMY side the ATTACKER only if the Prevailing Attitude was Advance in the just-completed Mission. Following the conclusion of the first such post-Mission round of Melee in a Location, each still-concealed unit therein loses its "?" and each vehicle currently in Motion is removed from Melee.

17.43 ENCIRCLED: Each Encircled FRIENDLY unit [EXC: if prisoner] must take a 1TC (leader DRM applies). Each such unit failing the 1TC is considered KIA. Any Weapon that such a unit possessed may be immediately possessed by another FRIENDLY unit in that Location (if any); otherwise such a Weapon is eliminated (17.32). Each such unit that passes its 1TC is considered to have survived the Mission (and Retained if Directly Attached).

17.44 IN MINEFIELD: Each FRIENDLY vehicle/its-PRC in any type of minefield Location undergoes the appropriate type(s) of mine attack(s), fully resolved in the normal manner, as if it were attempting to exit the Location. Each FRIENDLY Infantry unit in an A-P minefield Location (including PRC just-debarked due to a minefield attack) must undergo a mine attack as if attempting to exit the Location; [non-armor] leader DRM applies. Each such surviving unit (even if broken) is considered to have survived the Mission (and Retained if Directly Attached; 17.31).

17.5 VICTORY DETERMINATION: After all surviving FRIENDLY units are determined the player tallies each sides' VP total to determine the Mission victor (12.6).

17.51 UPDATE CG VP: One CG VP is scored for each SASL CG Mission the player wins; one CG VP is lost for each Mission he loses (or one CG VP is deducted from a positive CG VP total). If the FRIENDLY side withdrew during the last Mission (12.5) -2 CG VP are scored [EXC: if dictated by FRIENDLY RE 74]. The player's current CG VP score is used to determine drm for Squad Seasoning (17.74). See also 17.9.

17.52 The player wins the SASL CG if his CG VP score is positive at the end of the last CG Mission to be played. If his CG VP score is negative he has lost the CG.

17.6 FRIENDLY UNIT REMOVAL: At this time the player must separate FRIENDLY units that are Retained in his company's OB from those that are not.

S

17.61 TEMPORARILY ATTACHED: Each surviving Temporarily Attached unit/Weapon (17.132) is returned to the counter mix and is ineligible for any further involvement [EXC: a hero created from a Directly Attached MMC is not eliminated until Squad Seasoning (17.74) is completed].

17.62 DIRECTLY ATTACHED: Each non-prisoner Directly Attached unit remaining on the mapboard at Mission end, as well as each Directly Attached Weapon possessed/portaged by a FRIENDLY unit, is Retained. Each FRIENDLY berserk unit loses its berserk status. Each unpossessed Weapon is forfeit. Additionally, each Directly Attached unit/Weapon exited (as per 15.6) or never entered is Retained. ENEMY Weapons/units can never be Retained. See also 17.31-32.

17.621 WOUNDS: Make a dr for each wounded FRIENDLY SMC; on a dr of ≤ 4 the SMC "recovers" and is Retained (17.31) with all wound effects removed [EXC: if playing a CG with weekly Missions (17.21) he is Retained only on a dr of ≤ 2]. Otherwise the SMC is removed (17.32) from the company OB; such a removed leader SMC is subject to Replacement (17.81). Each still-Retained hero must be eliminated in 17.74.

17.622 WEAPONS: Each Retained broken Weapon is automatically repaired. Each Low/depleted ammunition type is replenished.

17.623 REARMING: Each Retained unarmed MMC is automatically replaced with an equivalent-size FRIENDLY MMC of the same Class and type (A1.25) of MMC it was before it became unarmed. If this cannot be recalled, substitute a Conscript (or Green, depending on nationality) MMC type of the appropriate size.

17.7 COMPANY IMPROVEMENT: At this point the player has determined all of his company's surviving Directly Attached units/Weapons. Perform the following steps (17.71-75) in the order presented to determine units eligible to Battle Harden.

17.71 FANATIC PROMOTION: Each remaining FRIENDLY Fanatic unit now takes a NTC. Passage of the NTC enables that unit to immediately Battle Harden (A15.3); otherwise there is no effect. Regardless of the outcome, each Fanatic marker is now removed.

17.72 HEROIC LEADER PROMOTION: Each remaining heroic leader has his Hero counter removed and is automatically Battle Hardened [EXC: there is no effect if the leader is already the best possible type for that nationality, or is a 10-0 commissar].

17.73 LEADER PROMOTION/DEMOTION: If the FRIENDLY side won the last Mission the player may now determine, by Random Selection (A.9) from among all eligible Retained company leaders (a leader is considered eligible if he can be replaced by a better type leader and he was on-map for $\geq$ one complete Game Turn during the previous Mission), the leader(s) "up for" promotion. Make a Promotion dr for each such selected leader; on a Final dr of ≤ 4 the promotion "comes through" (the leader is immediately Battle Hardened). Reverse the leader's current leadership DRM as a drm for his Promotion dr.

On the other hand, if the FRIENDLY side lost the last Mission due to withdraw (as per 12.5) [EXC: if instructed to by FRIENDLY RE 74], the best rated FRIENDLY leader is "demoted" to the next lowest type on a dr ≥ 4 (only one leader per Mission can be so demoted even if $>$ one leader qualifies as "best"). If all FRIENDLY leaders are already the lowest type there is no effect.

17.74 SQUAD SEASONING: Regardless of which side won the last Mission, the player may now make a dr on the following Squad Seasoning Table to determine if any of his Retained MMC (that entered play in the previous Mission) are Battle Hardened [EXC: no dr is made if all Retained MMC are elite]. The result is the number of non-elite MMC, of the player's choice, that may immediately Battle Harden (A15.3). [A15.3 EXC: In SASL, a Directly-Attached Russian 4-2-6 always Battle Hardens to a 4-4-7, never to a 5-2-7]. Note that each still-Retained hero must be eliminated in this step, but does result in a beneficial drm on the table.

SQUAD SEASONING TABLE

Final dr	Result
≤ 2	2
3-4	1
≥ 5	0

Cumulative drm:

- 1 If FRIENDLY side won the last Mission
- 1 Per hero eliminated during this step
- +1 If CG VP score (17.51) is negative
- +2 If FRIENDLY side withdrew (12.4) during the last Mission [EXC: if dictated by FRIENDLY RE 74; 17.51]

S

17.75 RECOMBINE: Retained same-class HS must now be Recombined (A1.32) so that no > one HS of each class is Retained [EXC: a number of HS may be Retained not to exceed the number listed in the current company's OB; 18.5].

17.8 COMPANY REPLACEMENTS: If the player's company is not currently at full strength (as listed for that nationality and for that company type; 18.) the following steps (17.81-84) are performed in the order presented to determine if any replacement unit(s)/Weapon(s) are received. Each such replacement received becomes Retained in the company's OB.

17.81 COMPANY LEADERS: Make a dr on the following table for each leader the company is missing (this table is also used to generate each original leader for the CG company). Apply dr as applicable. Reroll if such a leader is not available in your countermix.

COMPANY LEADER TYPE

Final dr	Type	Russian dr:	German dr:	U.S. dr:
≤ 0	9-2	-1 1945	-1 1939-42	+1 pre 8/43
1	9-1	+1 1941-9/42	+1 8/44-45	
2-3	8-1*	+2 1939-40		
4-5	8-0*			
6	7-0	"Generic" dr:		
≥ 7	6+1	-1 if Company's Majority Squad Type is elite		
		+1 if Company's Majority Squad Type is conscript/green		

* If the FRIENDLY side is pre-11/42 Russian and if no Commissar is currently Retained, a just-generated 8-1 leader may be immediately exchanged for a 10-0 Commissar (or a just-generated 8-0 may be exchanged for a 9-0 Commissar) on a Subsequent Final DR of ≤ 3. There is a -1 DRM per Retained Conscript squad.

17.82 SQUAD/HS REPLACEMENT: First determine the number of squads that a company of the player's type and nationality should have at full strength (18.2) depending on the date of the next Mission to be played. If the number of Retained squads/HS-equivalents is currently < this number by ≥ one squad make a DR on the following Squad Replacement table to determine if squad/HS replacement(s) are granted. The result is the number of replacement squad/HS unit(s) received. Replacement units in excess of the number needed to bring the company OB up to full strength are forfeit. A HS can be selected in lieu of a squad (and Recombined with an already Retained eligible HS) to complete the company OB. The class/type of each Replacement squad/HS is determined in 17.821.

SQUAD REPLACEMENT TABLE

Final DR	Result
≤ 0	4
1	3
2-3	2
4-5	1
≥ 6	0

Cumulative DRM:

-1 Per full squad (> one) the company OB is short of full strength, for the next Mission's date

17.821 MMC REPLACEMENT CLASS/TYPE: To determine the type of each Replacement Squad/HS granted in 17.82 make a dr on the Line Company MMC-Type Replacement Table (make a separate dr for each MMC):

LINE COMPANY
MMC-TYPE REPLACEMENT TABLES

Final dr	Type
≤ 0	Elite ¹
1-4	First Line ¹
5	Second Line ²
≥ 6	Conscript/Green

Cumulative dr:

-1 If ≥ 50% of Personnel (in US#) of current CG Company OB is elite

-2 If Company is "Elite" type (e.g., Paratrooper, SS, Guards, Ranger)

Russian dr:	German dr:	U.S. dr:
-1 6/44-1945	-2 1939-41	-1 1945
+1 1939 or 1942	-1 1942	+1 1942-43
+2 1941	+1 1945	

¹ Must be the type that a listed MMC of that Company OB would become if it were to BH.

² Must be the same type as listed in that Company's OB.

³ Substitute Conscript or Green MMC (depending on nationality) if Second Line not available.

17.83 SW TEAM REPLACEMENT: Make a dr for each ATR/MTR/PSK/BAZ Retained with no manning SW Team: an Original dr of ≤ 4 results in the SW Team being replaced, otherwise there is no effect [EXC: The SW Team cannot be replaced if that SW is no longer listed in the current company OB]. See also 17.84.

17.84 WEAPON REPLACEMENT: Make a replacement dr for each Weapon the company is missing; compare your Retained company OB to what is listed for a same-type full-strength company of the FRIENDLY nationality (18.2) for the next Mission's date. On an Original dr of ≤ 4 replacement occurs; on an Original dr of ≥ 5 there is no effect. Each ATR/MTR/PSK/BAZ replaced without an already-Retained SW Team to man it automatically receives an accompanying replacement SW Team.

17.9 REST & REFIT: If, after all replacements are received, the player's company is at < 70% (FRD) of its full strength in total US# (A1.6) for the next Mission, the company is temporarily "withdrawn from front-line service" in order to rebuild. The Mission for the next month (week) must be skipped and steps 17.82-9 are repeated until the company is at ≥ 70% strength. Each such repetition of this process is considered the passage of one month (week). To aid in this calculation, each company's full- and 70%-strength US#, respectively, is given in brackets after the company's eligible date period (18.21). For each month (or week) thusly skipped, the FRIENDLY player loses 1 CG VP.¹³

18. FRIENDLY COMPANIES

18.1 CAMPAIGN COMPANIES: In the SASL CG the player assumes the role of "commander" of one of the following basic "Infantry" company types. Each unit/Weapon listed in a company's OB is considered Directly-Attached to that company (17.131). All other FRIENDLY units that enter play during the course of a Mission are Temporarily Attached (17.132) [EXC: a hero/leader created from a Directly Attached unit; 17.131].

18.2 DATE VARIATIONS: During the course of the war the OB of each nationalities' basic Infantry (aka Rifle) Company was at times reorganized, not only due to attrition, or as a response to enemy reorganizations, but also to incorporate new or improved Weapons (and to phase out obsolete ones). Therefore, each nationality has several Infantry/Rifle Companies listed. The proper company to use depends on the date of the current Mission of the CG (17.21).

18.21 US#: Each company's full- and 70%-strength (FRD) US#, respectively, is given in brackets after that company's eligible date period (see 17.9).

18.3 STARTING COMPANY LEADERS: Make a separate dr on the Company Leader Type table (17.81) for each leader listed in a company's OB.

18.4 EXCESS: Units/Weapons in excess of the current full-strength OB (for the next Mission's date) must be eliminated; player's choice.

18.5 CG COMPANY OBs: The following OBs are historical WW2 company OBs specially adapted for the ASL system.¹⁴

GERMAN INFANTRY COMPANY 1939-August 1943 [US#: 55/38]

Leader × 3; 4-6-7 × 12; 2-4-7 × 2; 1-2-7 × 6; HMG; MMG; LMG × 4; 50mm MTR × 3; ATR × 3

GERMAN INFANTRY COMPANY* September 1943-1945 [US#: 42/29]

Leader × 3; 4-6-7 × 9; 2-4-7 × 2; 1-2-7 × 2; 2-2-8 × 2; HMG; MMG; LMG × 4; PSK × 2; 81mm MTR × 2

* Panzerfausts become available in October 1943 (C13.3).

RUSSIAN RIFLE COMPANY 1939-November 1941 [US#: 50/35]

Leader × 2; 4-4-7 × 12; 2-3-7 × 2; 1-2-7 × 4; HMG; MMG; LMG × 4; 50mm MTR × 2; ATR × 2

RUSSIAN RIFLE COMPANY December 1941-June 1942 [US#: 35/24]

Leader × 2; 4-4-7 × 9; 2-3-7; 1-2-7 × 2; MMG; LMG × 4; 50mm MTR; ATR

RUSSIAN RIFLE COMPANY July-November, 1942 [US#: 50/35]

Leader × 2; 4-4-7 × 12; 2-3-7; 1-2-7 × 5; MMG; LMG × 4; 50mm MTR × 3; ATR × 2

18.5

RUSSIAN RIFLE COMPANY* December 1942–1945 [US#: 48/33]
Leader × 2; 4-4-7 × 12; 2-3-7; 1-2-7 × 4; HMG; LMG × 4; 50mm MTR × 2; ATR × 2

* If ≥ 60% of the US# of all Retained MMC of this Company are elite *and* if the player's CG VP score is currently positive (17.51), the company is awarded Guards status for the remainder of the CG. The company's OB is considered to have "2-4-8 × 2" and "HMG × 2" (rather than "2-3-7 × 1" and "HMG × 1", respectively). Furthermore, in the Russian's Squad-Type Replacement Table (17.821), results of "4-4-7" become "4-5-8", and results of "4-2-6" become "4-4-7".

U.S. RIFLE COMPANY 11/1942–1945 [US#: 48/33]
Leader × 3; 6-6-6 × 9; 3-4-6 × 3; 1-2-6 × 6; 50 Cal. HMG; MMG × 2; M2 60mm MTR × 3; BAZ* × 3

* Each Retained bazooka is automatically exchanged for the latest type available.

S

FOOTNOTES:

CHAPTER S FOOTNOTES:

¹ **2.11 MARKING THE RE NUMBERS:** When playing a SASL Mission, it is intended that the Chapter J/K divider's "Scenario Aid Card" be used in conjunction with the Chapter S divider. Place the Chapter J/K divider so that the "ASL Scenario Aid Card" covers the top portion of the Chapter S divider, being careful to keep the RE# and AC# tracks (as well as the boxes labeled "RETAINED" and "ELIMINATED" for storage of SASL CG Directly Attached units) visible.

² **3.3 S? CONDUCT & ACTIVATION:** As each FRIENDLY unit changes Locations (or expends MF/MP within the same Location), it is critical that you, the player, be aware of each S? with a LOS (even if potential; see S.2) to that moving/advancing FRIENDLY unit. It is important to the SASL system that a S? is checked for Activation as soon as it is eligible, but especially so due to the movement/advance of a FRIENDLY unit. Remember, you are also the "eyes" of the ENEMY. However, being human, it is almost inevitable that you will miss a chance for a S? to check for Activation (just consider it one of those fortunate times that your opponent was not paying full attention)...just don't let it happen too often.

³ **4.3 S? ENTRY IN HUMAN WAVE:** The SASL Human Wave rules (4.3-.37) have been printed on a grey background color, as they have limited applicability and need only be read when such a need occurs.

⁴ **5.754 BSK/PSK BACKBLAST:** Any Weapon that can cause a Backblast (including a PF) should rarely be used from a building/bunker Location where its usage could cause harm to ENEMY unit(s) therein.

⁵ **9.3 ENEMY VEHICLES:** If a problem arises concerning an ENEMY vehicle's Move Command the player should improvise (as necessary) to the best advantage of the moving vehicle. However, in doing so, you should still try to carry through with the "intent" of the Move Command.

⁶ **12.2 MISSION SELECTION:** For a more historical game, you are invited to do some research to find out what the selected FRIENDLY nationality (or perhaps the specific unit that your FRIENDLY force is simulating) was historically doing on the selected Front during the current time period. Unit histories of various military formations, available in many public libraries, will prove most useful. Too, new SASL Missions may become available in future Avalon Hill publications.

⁷ **13.22 DETERMINE MAPBOARD:** Keep on the lookout for periodic updates of Table A9 and A10a in the *ASL Annual* as new *ASL* mapboards become available.

⁸ **13.6 RIVER BOARD:** Table A9a will require updating if additional river/canal mapboards become available.

⁹ **16.31 DRM:** U.S. Infantry MMC are given a special -1 drm due to offset their lower morale rating.

¹⁰ **17.131 DIRECTLY ATTACHED:** You may wish to make photocopies of the SASL Campaign Game Roster (found on the Chapter S divider), as it is intended that one will be used for each CG Mission played. In this way you can easily record all FRIENDLY Directly Attached units/Weapons that you begin and end each Mission with, in addition to any replacements received between CG Missions. Instead of recording ID numbers of units, one could alternatively use low-lettered (or single lettered) units for Directly Attached units, and high-lettered (or double-lettered) units for Temporarily Attached units (as long as several letters between the two types are not used).

¹¹ **17.1321 VP VALUE:** Non-Russian Temporarily Attached units/weapons are given an enhanced Casualty VP value so the player does not consider such as unnecessarily "expendable", since they will not return to the company OB even upon survival of the Mission. Conversely, the value of Russian Temporarily Attached units/weapons are not increased due to the Russian philosophy of regarding such units as "expendable".

¹² **17.14 SW TEAM:** A SW team represents a pair (or more) of men who have received special training in operating one of the specified types of SW.

¹³ **17.9 REST & REFIT:** Your company is needed fight every day. Each time it is withdrawn to Rest and Refit, however temporarily, it taxes the resources of your parent division, forcing a reserve unit to take your company's place, or (worse yet) a neighboring unit to spread itself thinner in order to cover your sector.

¹⁴ **18.5 CG COMPANY OBs:** It is anticipated that more historical company OBs will become available at a later date, possibly through the *ASL Annual* or as a separate release.

ENEMY Vehicle Movement Table

DR Move Command

≤ 4 If on road and no Known Target exists move along road toward FBE. Stop (ESB if necessary) when a Known Target exists; otherwise remain CE and in Motion. If on road and Known Target exists see Move Command 5-6. If not on road see Move Command 5-6.

5-6 If no Known Target exists move along road toward FBE; otherwise REH as necessary. Stop when Known Target exists; otherwise remain in Motion. If closest Target is ≥ 7 hexes distant move toward it, stopping (MP permitting) when such is in LOS at ≤ 6 hexes [EXC: if a different Known Target becomes closer during the process of movement, stop and bear on it instead]. If closest Target is at 3-6 hex range move to within 2 hexes of it and stop (MP permitting). If closest Target is ≤ 2 hexes away OVR it (in OG; non-bog terrain; least TEM). If such a Target cannot be OVR select an OVR-able alternate Target and attempt to OVR; if OVR not possible do not move the vehicle (fire in the AFPh).

7 Move toward nearest (in MP) FRIENDLY-Controlled VPO Location; stay on road if applicable. Stop when within 3 hexes of such Location if Target exists in/adjacent to that Location. If already within 3 hexes of such Location continue to move toward that Location, entering it (OVRing if possible) if Bog DR not required; otherwise stop when ADJACENT to it. If already in/ADJACENT to such a Location see Move Command 5-6.

8 If Known Target exists see Move Command 5-6. If no Known Target exists move toward the FBE, expending double the normal MP cost for each hex-entered/hexside-traversed [EXC: if cost is ≥ 3 MP]. Remain on road (if already on such or upon entering a road hex). Stop (ESB if necessary) upon entering Location if Target exists therefrom; otherwise remain in Motion.

9 If on road and no Known Target exists see Move Command 4; if off road and no Known Target exists see Move Command 5-6. If any vehicular Target exists see Move Command 10. If all Targets are non-vehicular conduct OVR (MP permitting) using the following Priority List: closest; least TEM vs OVR; non-Bog Location; Location with most Infantry Targets (in US#). If insufficient MP to conduct OVR see Move Command 5-6.

≥ 10 If no Known Target exists see Move Command 7; if Known non-AFV Target(s) (only) exists see Move Command 5-6. If any AFV Target exists move so as to get a side or rear shot on the nearest such AFV; stop and (if possible) use Bounding First Fire as soon as a side or rear shot is possible; if any AFV Target remains in Good Order start again (MP permitting); attempt to leave all such Targets' LOS; otherwise remain in Motion. If no side/rear shot has been attained after expenditure of last MP remain in Motion. If side/rear shot exists at start of MPh use Bounding First Fire before starting.

Basic Tables

A9a: Multi-Hex Bridge (13.6)

dr	Hexrow Location
1	I/Y/AA* and Q
2	I/Y/AA*
3	I
4	Q
≥ 5	none

* I if board 40; Y if board 8; AA if board 7

A9c: One-Hex Bridge (13.5)

dr	Result
≤ 4	Functioning
≥ 5	Destroyed (B6.331)

A9d: One-Hex Bridge Type (13.5)

Final dr	Result
≤ 2	Two-lane stone
3	One-lane stone (B6.43)
4	Two-lane wooden (B6.42)
≥ 5	One-lane wooden (B6.42-43)

dr: -1 On a village mapboard (19-49 buildings)
-2 On a city mapboard (≥ 50 buildings)

A3: ENEMY Attack Tables (8.1)

A3a: ENEMY IFT Attacks vs Infantry/PRC

DR Fire Command

- ≤ 3 Fire all possible Spray Fire FP at closest Target; least TEM; most Targets; Target(s) possessing most SW/Guns; most Target SMC. Fire any non-Spray FP at Target in least TEM; Location with most Target SMC; closest; most Targets; combine with Spray Fire if necessary. If spray fire not possible (for whatever reason) fire all FP at closest Target; Location with most Targets; most SW; least TEM.
- 4 Fire all FP at closest PRC Target; PRC with least TEM; PRC with most SW. If no PRC Target exist fire all FP at any vehicular Target; otherwise fire inherent FP at closest Target; least TEM; Location with most Targets; most SW; most Good Order Targets.
- SW: Fire any SW at Target in least TEM; Location with most Targets. Combine with inherent FP if necessary.
- 5 Fire all FP at closest Target in VPO Location; at closest Known Target; Location with most Known Targets; least TEM; most Known Target SMC. If no Known Target exists fire at closest concealed Target; least TEM; stack with most Infantry counters.
- 6 Fire all FP at Target in least TEM in maximum (long) range of firer's inherent FP; closest; Location with most Known Targets; most Target leaders; most Weapons; most Good Order Targets.
- 7 Fire all FP at closest Target in VPO Location; at unbroken Target in least TEM in normal range of firer's inherent FP; closest; most SW. If no unbroken Target exists in firer's normal range conduct Fire Command 5.
- 8 Fire all FP at Location with most Targets within normal range of firer's inherent FP; least TEM; most SW. If no such Target exists extend range to firer's maximum (long) range with the same priorities.
- 9 Fire all inherent FP at Location with most Known Targets; least TEM; closest; most Target SMC; most SW; most Good Order Targets.
- SW: Fire SW at Target in least TEM; most Targets; closest. Combine with inherent FP if necessary.
- 10 Fire inherent FP at closest Known Target; most Known Targets; least TEM; most Good Order Targets; most Weapons; most Target SMC. If no Known Target exists fire at concealed Target with same priorities.
- SW: Fire SW at Target in least TEM; closest; Location with most Targets; most Target SMC. Combine with inherent FP if necessary.
- ≥ 11 Fire all FP at closest Target; most Known Targets; most SW; most Target leaders; least TEM.

A3b: ENEMY Infantry with LATW vs Vehicular Target

Use this table to determine a vehicular Target when multiple FRIENDLY vehicles exist for an ENEMY Infantry unit possessing any type of functioning LATW (including a functioning MG with a vehicular Target; A9.6-961). In all cases below, if unable to kill the FRIENDLY vehicle attempt Deliberate Immobilization if possible (8.24); otherwise the LATW does not fire.

DR Fire Command

- ≤ 4 Fire at closest Target vehicle; easiest to kill; easiest to hit.
- 5-6 Fire at easiest to kill Target vehicle; largest; closest.
- 7 Fire at easiest to hit Target vehicle; easiest to kill; closest; largest.
- 8-9 Fire at easiest to kill Target vehicle offering a rear or side shot; closest; easiest to hit.
- ≥ 10 Fire at easiest to hit Target vehicle offering a rear or side shot; easiest to kill; closest; largest.

A3c: ENEMY Ordnance vs Vehicular Target

Use this table to determine the vehicular Target of an ENEMY Ordnance Weapon; make a separate DR for any SA. Unless stated otherwise, Table A3a to determine the Target of any non-Ordnance weapon (i.e., MG armament) of the unit.

DR Fire Command

- ≤ 3 Fire at closest Target vehicle; easiest to kill; largest.
- 4-5 Fire at closest Target vehicle; possessing MA with a mm-size > firer's own; largest; easiest to hit; easiest to kill.
- 6 Fire at closest Target vehicle; easiest to hit; easiest to kill; largest.
- 7-8 Fire at easiest to kill Target vehicle; closest; easiest to hit.
- 9-10 Fire at easiest to hit Target vehicle; easiest to kill; closest.
- ≥ 11 Fire at Target vehicle with any Riders; with any Passengers; with any CE crew; easiest to hit; easiest to kill; largest Target; most Known SMC; most counters (units/Weapons).

A3d: ENEMY Ordnance vs Infantry/PRC Target

Use this table to determine the Infantry/PRC Target of an ENEMY Ordnance Weapon; use Direct Fire if possible. Use Table A3a to determine the Target of any non-Ordnance weapon (i.e., MG armament) of the unit.

DR Fire Command

- ≤ 4 Area Fire at building hex with most Known Targets; easiest to hit; closest; most Known SMC; most Known possessed ATW. If no such building hex available Area Fire at closest Target; least TEM; most Known units; most SMC; most Weapons.
- 5-6 Fire at closest Target in VPO Location; at Location with most Known Targets; most Known SMC; most Known Weapons; easiest to hit. If no Known Target available Area Fire at closest concealed Target; easiest to hit; most counters (units/Weapons).
- 7 Fire at closest Target; easiest to hit; least TEM; most Known units; most Weapons.
- 8-9 Fire at closest Target; most Known units; easiest to hit; most Known Weapons; least TEM.
- ≥ 10 Area Fire at hex with most Targets; closest; least TEM; easiest to hit; most Known Targets; most Known SMC; most counters (units/Weapons).

A3e: ENEMY CC Attack Determination Table (11.5)

dr Target

- ≤ 2 Combine all ENEMY units into one CC attack vs one FRIENDLY unit (use Random dr to select).
- 3-4 Match each ENEMY unit vs one FRIENDLY unit using the following Priority List: best odds; highest FRIENDLY morale (ignore excess FRIENDLY units).
- ≥ 5 Combine all Enemy units into one CC vs all FRIENDLY Personnel units.

A4: ENEMY Movement Tables (9.2)

A4a: Hold Attitude

ENEMY Infantry Movement Table

DR Move Command

- 2 Assault Move toward nearest VPO Location; toward nearest Infantry Target; towards nearest Target.
- 3 Assault Move into higher (building) Location (if possible) if Target exists therefrom; Assault Move toward nearest Target in LOS; into Location with TEM > TEM of current Location; toward nearest building Location in LOS; otherwise see Move Command 7.
- 4 Assault Move toward nearest FRIENDLY-Controlled VPO Location in LOS; toward nearest FRIENDLY-Controlled VPO Location; toward nearest VPO Location; toward FBE; into best TEM.
- 5 Assault Move into Location with TEM > TEM of current Location; into Location with any positive inherent/hexside TEM with Target available therefrom; into any Location with positive TEM; random direction.
- 6 If any Good Order FRIENDLY unit in LOS see Move Command 5; otherwise see Move Command 11.
- 7 Move full MF, RAS. Stop upon entering any Location with positive TEM if a Known Good Order Target exists, or stop upon entering any (previously) FRIENDLY-Controlled VPO Location.
- 8 If in LOS and range of Known Good Order FRIENDLY unit Assault Move into Location with best TEM; any positive TEM; with most Targets available therefrom. If not within a Known Good Order FRIENDLY unit's range and LOS move full MF toward closest building Location in LOS; building Location with best TEM. Stop upon entering any Location with positive TEM if a Known Good Order Target exists, or stop upon entering any (previously) FRIENDLY-Controlled VPO Location.
- 9 Move full MF toward nearest FRIENDLY-Controlled VPO Location in LOS; not in LOS. Stop upon entering a VPO Location or by expenditure of all MF.
- 10 If ≥ 3 Good Order Targets exist Assault Move into Location with best TEM; out of FRIENDLY LOS. If ≤ 2 Good Order Targets exist Assault Move toward closest Target; into best TEM; out of most FRIENDLY units' LOS. If no Good Order Target exists move full MF, RAS. Stop upon entering any Location with positive TEM, or any VPO Location, if a Known Good Order Target exists.
- 11 Move toward nearest FRIENDLY-Controlled VPO Location in LOS; otherwise one not in LOS but closest (in hexes). Double Time if necessary. Stop upon entering a VPO Location or by expenditure of all MF.
- 12 If Known FRIENDLY unit in LOS the unit(s) goes berserk! Immediately invoke all berserk rules; see A15.41 if the unit is a leader. If no Known FRIENDLY unit in LOS see Move Command 10.

A4b: Advance Attitude

ENEMY Infantry Movement Table

DR Move Command

- 2 Assault Move into Location with best TEM; toward nearest FRIENDLY-Controlled VPO Location.
- 3 Assault Move toward nearest (in hexes) FRIENDLY-Controlled VPO Location in LOS; if no such Location in LOS see Move Command 5.
- 4 If ≥ 2 Known Good Order FRIENDLY units in LOS see Move Command 2; otherwise move full MF toward nearest FRIENDLY unit in LOS; if no FRIENDLY unit in LOS move full MF (REH), stop upon entering any Location with inherent TEM of ≥ +1, or any VPO Location.
- 5 If any Known FRIENDLY unit in LOS Assault Move into Location with best TEM; with most Targets available therefrom. If no Known FRIENDLY unit in LOS Double Time (if necessary/possible), RAS; stop upon entering a Location with inherent TEM of ≥ +1 if Known FRIENDLY unit is in LOS.
- 6 Move full MF, RAS.
- 7 Move full MF toward nearest (in hexes) FRIENDLY-Controlled VPO Location; stop upon entering a VPO Location, or any Location with a TEM of ≥ +1, if Target available.
- 8 Move full MF, REH; stop upon entering a building Location if Target available.
- 9 Double Time (if necessary/possible) toward nearest FRIENDLY-Controlled VPO Location. Stop upon entering a VPO Location, or any Location with TEM of ≥ +1, if a Known FRIENDLY unit in LOS.
- 10 If Known Target exists Assault Move into Location with best TEM; with most Targets available therefrom. If no Known Target exists move full MF, RAS; stop upon entering building Location if Known Target exists therefrom.
- 11 Double Time (if possible), REH. Stop upon entering Location with TEM of ≥ +2 if Target available.
- 12 If Known FRIENDLY unit in LOS the unit goes berserk! Immediately invoke all berserk rules; see A15.41 if the unit is a leader. If no Known Target exists see Move Command 10.

German Generation Tables

G1: ACTIVATION CHECK (AC) (5.1)

German-ENEMY S? rolls for Activation if...

- A) FRIENDLY Infantry is in LOS within 12 hexes with a Final IFT DRM of ≤ -2
- B) FRIENDLY Infantry is in LOS within 8 hexes with a Final IFT DRM of ≤ -1
- C) FRIENDLY Infantry is in LOS within 6 hexes with a Final IFT DRM of ≤ 0
- D) FRIENDLY Infantry/Unarmored-vehicle is in LOS within 4 hexes with a Final IFT DRM of ≤ 1
- E) FRIENDLY Infantry/Unarmored-vehicle/CE-AFV is in LOS within 2 hexes with a Final IFT DRM of ≤ 2
- F) Any FRIENDLY unit is ADJACENT

⁷ Substitute late model of this AFV [with "L" suffix to name] on subsequent dr of ≤ 2

G9: GERMAN RANDOM EVENT (2.)

Colored dr drm (2.3):

± x as per MSR

* Each RE preceded by an "*" may occur only once per Mission (2.31).

DR Random Event

*01 Armored Flamethrower detachment arrives! Make a dr {A6e} to determine the number of AFV arriving, then make a dr (if necessary) on the proper table below to determine the unit type (all are of the same type) [EXC: if the date is 4-12/42, conduct German RE 02 instead; each 8-3-8 is Passenger on a 251/1].

6/41-3/42	1-6/43	7/43-12/44	1945
PzKw II(F)	SPW 251/16	PzKw III F1 [1-3] SPW 251/16 [4-6]	JgPz 38(t)F1 [1-2] PzKw III(F) [3-4] SPW 251/16 [5-6]

*02 Pioniere platoon arrives! Three Assault Engineer (H1.22) 8-3-8 squads, equipped with SMC/SW as per standard DYO procedure (H1.8-83), arrive. On a subsequent dr of ≤ 2 each such squad may enter as Passenger of a SPW 251/1; on a subsequent dr of 3 or 4 each such squad may enter as Passenger on an Opel Blitz; otherwise the units enter as Infantry.

*03 Pioniere platoon flank attack! As per German RE 02 except the units must enter on either the north (or south, as per a Random dr) edge of any mapboard (player's choice), providing that mapboard has ≥ one German unit on it.

*04 Each ENEMY dr on the Fortification Generation Table [A5] has a +2 drm for the duration of the Mission.

*05 German Sappers arrive! A number {A6a} of sapper (H1.23) squads are received (see below to determine squad type). Make a DR {G3} for leader possibility. Each sapper squad automatically receives one DC and one LMG.

dr ≤ 2: 8-3-8 dr 3-4: 4-6-8 dr ≥ 5: 5-4-8

*06 Stukas! Stukas arrive during the next ENEMY MPh. Make a dr {A6f} to determine the number available; all are automatically armed with bombs (ignore E7.1-21). Reroll for another RE if conditions prohibit this RE.

*11 Panzer Aufklärungs section arrives! A mix of SPW 250/7/8/9/10 arrive. Make a dr for each such AFV type listed below:

- 250/7: one is received on a dr of ≤ 2
- 250/8: one is received on a dr of ≤ 2
- 250/9: determine the number received as per a dr {A6a}
- 250/10: one is received on a dr of ≤ 4*

* If an armor leader is received (5.711), he must crew this vehicle if such a vehicle is received; otherwise it is the player's choice. No more than one armor leader may be Activated for this RE.

*12 Panzergrenadiers arrive! As per German RE 34-36 except that each such reinforcement unit may enter as a Passenger on a SPW 251/1. A Cumulative -2 DRM {G2} applies due to this RE. Additionally, on a subsequent dr of ≤ 3 one SPW 251/10 is included. Only one armor leader {G3} (5.711) may be Activated with this RE.

*13 Motorized infantry reinforcements! As per German RE 34-36 except that each such reinforcement unit may enter as a Passenger on an Opel Blitz. A Cumulative -1 DRM {G2} applies due to this RE.

*14 A peasant boy is discovered cowering in a root cellar. Upon questioning he reveals useful information. The player may immediately remove a number (as per a dr) of S? that are within the LOS of any one unbroken German Infantry unit. No "free" LOS check(s) allowed before removal.

*15 ENEMY resistance is fading. The player may immediately remove a number of S? (as per a DR). A S? in a VPO Location may only be removed if no other non-VPO-Location S? are present. If no S? are currently onboard reroll for another RE.

*16 Assault Gun section arrives! Determine the number {A6f}, type {G6a} and armor leader {G3}. All are the same type.

*21 Aufklärungs Abteilung arrives! Determine the number {A6c}, type {G6b} and armor leader {G3}. All are the same type.

*22 Aufklärungs Abteilung arrives! Determine the number {A6f}, type {G6b} (make a separate DR for each), and armor leader {G3}. On a subsequent dr of ≤ 2 each such AFV of the RE may enter on the north (or south, as per a Random dr) edge of any mapboard (player's choice), providing that mapboard has ≥ one German unit on it.

*23 Panzers! Determine the number {A6c}, type {G6} and armor leader {G3}. All are the same type.

*24 ENEMY ammunition supplies dwindling! The ENEMY suffers from the effects of Ammunition Shortage (A19.131) for the duration of the Mission.

*25 Gun section arrives! Determine the number {A6f} and type {G5} (use the "Outside" column; all are the same type). Each Gun is crewed by one 2-2-8. At the player's option each such reinforcing Gun may be Manhandled or Towed onboard. If Towed, make a DR {G7} to determine the Transport type (reroll, if necessary, until a vehicle is determined that is able to Tow the Gun type).

*26 Assault Gun section arrives! As per German RE 16 [EXC: on a subsequent dr of ≤ 4 each unit must enter anywhere along the north or south edge (as per a Random dr) of the current mapboard configuration (all enter on the same edge)].

*31-33 Request for artillery support has been granted! Determine OBA type received by a DR on the Chapter H "German OBA Availability Chart" (H1.53). Next make a dr {G8} to determine the ammunition supply. The player may immediately give one German radio to any German leader of his choice [EXC: if the ENEMY is in Advance Attitude the player may instead choose a Field Phone, recording a Security Area as necessary] or an 8-0 leader with radio enters along the FBE mounted on motorcycle or in a Kübelwagen (without AAMG); player's option.

*34-36 Infantry reinforcements! Make two dr {A6b} to determine the number of squads received. Determine the squad type (all are the same) by a DR {G2}. Determine all SMC/SW using H1.8-1.83.

*41 ENEMY AFV is Recalled! Determine the AFV affected by a Random dr (for purposes of this RE an AFV platoon counts as a single AFV) and immediately mark such as Recalled (D5.341). If there is currently no Mobile ENEMY AFV onboard reroll for another RE.

DR Random Event

*42 ENEMY AFV is Immobilized! Determine the AFV affected by a Random dr, and immediately mark such as Immobilized (D8.1). Immobilization TC is not required. If there is currently no Mobile ENEMY AFV onboard reroll for another RE.

*43 ENEMY resistance slackens! The ENEMY AC# decreases by one [EXC: if AC# is already 2 conduct German RE 15 instead].

*44 Make a subsequent dr and perform the indicated RE:

dr ≤ 3: ENEMY RE Numbers decrease by one (2.4) [EXC: if ENEMY RE Numbers are currently 2/3 conduct RE 43 instead]

dr ≥ 4: Rumors of German reinforcements on the way. German RE Numbers increase by one (2.4) [EXC: if German RE Numbers are currently 6/7 reroll for another RE]

*45 German leader turns heroic (A15.21)! Determine affected leader by Random dr among all currently non-Captured, non-Disrupted, non-Heroic on-board non-armor German leaders. If no German leader is eligible reroll for a different RE.

*46 German sniper finds a target! Make a subsequent dr to determine the attack type; perform the attack as the first action of the upcoming PFP:

dr of ≤ 3: conduct a "1" sniper attack (A14.3)

dr of ≥ 4: conduct a "2" sniper attack (A14.3)

*51 Landers stage a flank attack! Determine the number of squads by a DR. Determine the squad type (all are the same) by a DR {G2}. Determine all SMC/SW using H1.8-1.83. Then make a Random dr to determine edge of entry (north or south). All must enter anywhere along the same edge.

*52 Panzers stage a flank attack! Determine the number {A6f}, type {G6} and armor leader {G3}. All are the same type. Then make a Random dr to determine edge of entry (north or south). All must enter anywhere along the same edge.

*53 German combined-arms flank attack! Conduct German REs 51 and 16 [EXC: use Table A6e to determine the number of AFV received]. All units must enter along the same edge.

*54 Medium "tube" section arrives! Make a dr {A6d} to determine the number of dm 81mm MTRs received, each of which has one 2-2-8 crew. On a subsequent dr of ≤ 2 the mortar section is equipped with transport. If so, make a DR {G7} with a +2 DRM. All transport vehicles are the same type; only enough vehicles are received to carry these RE units/weapons. Transport can be refused if so desired.

*55 Airstrike! Determine type, presence of bombs and number entering as per E7.21. Each aircraft is eligible to enter in the next ENEMY MPh. Reroll for another RE if current conditions prohibit air support.

*56 AT Gun section arrives! Determine the number {A6e} and type {G5a} (all are the same type). Each Gun is crewed by one 2-2-8. At the player's option each such reinforcing Gun may be Manhandled or Towed onboard. Determine towing vehicle type {G7} (reroll, if necessary, until a vehicle is determined that is able to Tow the Gun type; all such vehicles are the same type).

*61-62 Artillery support granted! Conduct German RE 31-33 (even if it has previously occurred).

*63 Panatics! One German leader (determine by Random dr from among eligible SMC) immediately turns Panatic (A10.8). Additionally, each eligible German Infantry unit in his Location that passes a NTC also turns Panatic (leadership DRM applies as per A15.41). If no German leader is eligible reroll for a different RE.

*64 Panzers! Determine the number {A6f}, type(s) {G6} and armor leader {G3}. Perform a separate DR {G6} for each AFV received.

*65 Jagdpanzers! Determine the number {A6c}, type {G6c} and armor leader {G3}. All are the same type.

*66 Hero! A Hero is immediately created from the German MMC closest to an ENEMY unbroken/vehicular unit. If no such ENEMY unit onboard reroll for a different RE.

*71 AT Gun section arrives! Conduct German RE 56 [EXC: use Table A6f to determine the number of Guns received].

*72 Jagdpanzers! Determine the number {A6d}, type {G6c} and armor leader {G3}. All are the same type.

*73 Gun section arrives! Determine the number {A6d} and type {G5} (use the "Outside" column; all are the same type). Each Gun is crewed by one 2-2-8. At the player's option each such reinforcing Gun may be Manhandled or Towed onboard. Determine towing vehicle type {G7} (reroll, if necessary, until a vehicle is determined that is able to Tow the Gun type; all such vehicles are the same type).

*74 ENEMY attack called off! The Attitude of all ENEMY units immediately changes to Hold [EXC: if German RE 75-76 has already occurred conduct German RE 46 instead]. All DR on table A1 now have a +1 DRM; all previous negative DRM applicable on this table are immediately cancelled. Additionally, decrease each ENEMY RE# by one.

*75-76 Evacuate! Battalion HQ has ordered your command to evacuate their positions, pulling back toward GERMAN lines [EXC: if German RE 74 has already occurred reroll for a different RE]. Decrease each German RE# by one. The German side receives Exit VP (A26.3) for each German unit exited off the FBE by Mission end. The ENEMY receives Casualty VP (A26.2) for each Encircled German unit remaining onboard at Mission end; double Casualty VP if German unit is Captured/non-Mobile. Otherwise, the Mission-specific VP schedule still applies. The Mission ends automatically in five Game Turns (counting the current Game Turn as the first of those five turns), or when the last Mobile German unit exits the board configuration (whichever occurs first). Ignore the Mission End method given in the Mission being played. Additionally, decrease each FRIENDLY RE# by one.

Partisan Generation Tables

P1: ACTIVATION CHECK (AC) (5.1)

Partisan-ENEMY S? rolls for Activation if...

- A) FRIENDLY Infantry is in LOS within 6 hexes with a Final IFT DRM of ≤ -2
 B) FRIENDLY Infantry is in LOS within 4 hexes with a Final IFT DRM of ≤ -1
 C) FRIENDLY Infantry is in LOS within 3 hexes with a Final IFT DRM of ≤ 0
 D) FRIENDLY Infantry/Unarmored-vehicle is in LOS within 2 hexes with a Final IFT DRM of ≤ 1
 E) Any FRIENDLY unit is ADJACENT

7	7-0
8-10	-
≥ 11	6+1

$\frac{1}{2}$ Replace the noted leader with the proper Commissar type (A25.22) on subsequent dr of ≤ 2 if in pre 1942 Russia.

Partisan-ENEMY RE Table (2.; 12.213)

Colored dr drm (2.3):

$\pm x$ as per MSR

* Each RE preceded by an "m" may occur only once per Mission (2.31).

DR Random Event

***01 Wire!** A line of wire is spotted by the unbroken FRIENDLY unit that is closest to the EBE. The closest Wire counter to the spotter is a number of hexes away (as per a dr) toward the EBE (or along EBE hexes if the dr is > the range to that edge). The line of wire contains a number of Wire counters (as per a DR+2) and is placed in a (Alternate) Hex Grain paralleling the EBE. The first such Wire counter placed must be in the hex of that (Alternate) Hex Grain closest to the spotting unit and in its LOS (if no hex of that [Alternate] Hex Grain is in its LOS move the (Alternate) Hex Grain closer to the spotter until $\geq$ one hex of it is in the spotter's LOS. Place additional Wire counters, one at a time, in eligible Locations of that (Alternate) Hex Grain to either side of the original Wire counter placed (beginning with the lowest-lettered hexrow) until all are placed. Each ENEMY unit in a just-placed Wire Location is beneath the wire; each FRIENDLY unit must be on it.

02-03 Bunker! A 1+3+5 Pillbox has been spotted by the unbroken FRIENDLY unit that is closest to the EBE. To determine the bunker's Location make a dr; place it in the nearest eligible Location (D9.52) in the LOS of the spotting unit that is at least that number of hexes (as per the dr) toward the EBE. Roll below to determine the bunker's contents:

- ≤ 2 One Gun [P5; use the "Inside" column] with crew (5.76)
 3-4 HMG; squad {P2}; leader {P3}
 ≥ 5 MMG; squad {P2}; leader {P3}

04-05 Minefield! The FRIENDLY (non-Melee) Infantry stack(s) in an eligible (non-building) minefield Location (B28.1) [EXC: if on FRIENDLY setup board] and nearest to the EBE, finds it has stumbled into an A-P minefield. Conduct a mine attack vs each such unit as the first event of the upcoming ENEMY PFPh just as if the unit(s) had entered the Location as a stack. Determine the strength of each such A-P minefield by a Random dr (dr of $\leq 2 = 6$; dr of 3-4 = 8; dr of $\geq 5 = 12$). Mark each such Location by the appropriate Minefield counter.

06 Partisans infiltrate! On the mapboard containing the most FRIENDLY units place one Partisan S? in each (non-rooftop, non-sewer) building Location not currently marked with a Partisan S? and not occupied-by/ADJACENT-to a FRIENDLY unit [EXC: 4.12-.13]. Each such Location reverts to ENEMY Control (if previously FRIENDLY Controlled). Each such S? assumes Hold Attitude. Use Partisan Tables (P1/P2/P3/P4/P5) for generation of these S?.

11 A FRIENDLY Infantry unit in a building Location inadvertently upsets a lit kerosene lamp (if no such unit occupies a building Location reroll for a different RE). Place a Pinned (as per B25.15) Flame counter in the Location.

DR Random Event

12 Boobytrap! A FRIENDLY Infantry unit in a building Location touches off a Boobytrap (if no such unit occupies a building Location reroll for a different RE). Determine one Location from all such thusly occupied. All Infantry units in the Location are attacked by the boobytrap as the first attack of the upcoming PFPh. Make a DR to determine the boobytrap's FP, rounding down to the nearest FP column if necessary. When resolving the attack the TEM of the Location is reversed. A CH is possible; random selection if applicable. After attacking the boobytrap is considered disarmed.

13-14 One randomly-determined FRIENDLY Infantry unit in a woods Location (building Location if no such unit occupies a woods Location; otherwise reroll for a different RE) discovers a dangerously beautiful seductress. Determine one Location from all such occupied. Make a dr; if the Final dr is ≤ 4 the unit is eliminated (there is a +1 drm per the US# of the unit, and a +1 drm per other FRIENDLY unit[s] in the same Location). If not eliminated thusly, the FRIENDLY unit instead immediately becomes TI for a number (as per a dr; +1 drm per HS of the unit, if any) of Game Turns (or portions thereof) until the FRIENDLY unit is broken or Captured. Unless broken or Captured, the unit is marked CX when the TI counter is removed.

15-16 Scorched earth! FRIENDLY units discover the mutilated bodies of several comrades. No Quarter rules are automatically invoked. In addition to the normal VP Schedule, the FRIENDLY side gains one VP per building Location (on a mapboard that the FRIENDLY side did not begin the Mission set up on) marked with a Blaze counter at Mission end.

***21 One randomly-determined FRIENDLY Infantry unit in a woods Location discovers a dead Partisan leader (building Location if no such unit occupies a woods Location; otherwise reroll for a different RE). Upon inspecting the body, the unit discovers what it suspects to be important documents and tucks them away (as such, they become an "inherent" part of that unit and such possession can never be Transferred nor dropped). Record the identity of the possessor for later reference. If the possessor is a squad that subsequently suffers Casualty Reduction the papers are permanently lost on a dr ≥ 4 . If the possessor is later Deployed the possessing HS's ID must be recorded. If the possessor survives the Mission determine the FRIENDLY VP value of the papers by making a dr-1 (they might be worthless after all).**

***22 One randomly determined Mobile FRIENDLY AFV is immediately immobilized. If no such AFV is currently on board all non-armored vehicles are eligible. If no mobile FRIENDLY vehicle is onboard reroll for a different RE.**

23 ENEMY resistance stiffens! The ENEMY AC# (5.1) increases by one. If the AC# is already 5 reroll for a different RE.

DR Random Event

24 ENEMY AFV! Determine the number {A6b}, AFV type {R6 if in Russia; U6 if elsewhere} (all are the same type) and armor leader {x3} (5.71-713; 9.3).

25 ENEMY AFV! Determine the number {A6e}, AFV type {R6 if in Russia; U6 if elsewhere} (make a separate DR for each) and armor leader {x3} (5.71-713; 9.3).

26 ENEMY leader Battle Hardens! The best ENEMY leader eligible to Battle Harden (i.e., non-10-3/10-0) is immediately Battle Hardened (A15.3). Use Random dr to determine if $\geq$ two of best type. If broken he is also rallied. If no Activated ENEMY leader is onboard reroll for a different RE.

31-33 Partisans infiltrate! As per ENEMY RE 06 except only VPO Location(s) and each Concealment Terrain Location(s) ADJACENT to such a VPO Location is eligible. If no VPO Locations exist in the Mission (or if each such Location already contains a S?) reroll for a different RE.

***34 Partisans receive support!** A number of S? (as per a DR+2) enter this turn along the EBE. Each such S? is in Advance Attitude until Activated, at which time each unit Activated therefrom assumes the Prevailing Attitude. Use Russian (if in Russia) or U.S. (if elsewhere) Tables to generate each such S? successfully Activated. These S? are in addition to any other S? which might otherwise be entering this turn (4.21-22). Use different colored S? to denote each S? entering due to this RE (3.2).

ADDITIONAL REINFORCEMENTS: During each subsequent Partisan RPh make a Reinforcement dr: if ≤ 2 a number (equal to a DR) of additional S? in Advance Attitude enter during that turn along the EBE; if ≥ 3 no further S? may be entered due to this RE (the Reinforcement dr is no longer made).

***35 ENEMY attack!** As per RE 34 except the initial number of S? is equal to a DR+4.

36 Partisan Flank attack! A number of Partisan S? (equal to a DR+3) enter this turn along one of the board edges (north or south; Random dr to determine) adjacent to the FBE (4.21-22). Each such S? is in Advance Attitude until Activated, at which time each such unit assumes the Prevailing Attitude. Note that, until Activated, these flank-attacking S? move toward the opposite board edge from the edge entered. If other Advance Attitude S? are in play, different-colored S? must be used for these flank-attacking S? (3.2). Use Partisan Tables (P1/P2/P3/P4/P5) for generation of these S?.

ADDITIONAL REINFORCEMENTS: During each subsequent Partisan RPh make a Reinforcement dr (until a Reinforcement dr of ≥ 4 is rolled): if ≤ 3 a number (as per a DR) of additional S? in Advance Attitude enter during that turn along the same "flank" board edge.

41 Partisan goes berserk! The closest eligible (A15.1) Activated Partisan Infantry unit in the LOS of the FRIENDLY unit that is nearest to the EBE immediately goes berserk. Determine the FRIENDLY unit by a Random dr if $>$ one qualifies; if no such ENEMY unit has a LOS to the FRIENDLY unit closest to the EBE, check LOS to the FRIENDLY unit second closest to the EBE, etc., until one is determined. Otherwise reroll for a different RE. Furthermore, each eligible Activated Partisan Infantry unit $\leq$ one hex from this original berserk unit also becomes berserk if it passes a mandatory NTC (failure of which has no effect). A15.41 applies normally (even into an ADJACENT hex).

***42 Storm front moving in.** The weather immediately becomes Overcast (E3.5). If already Overcast consider this as a Wind Change DR of 11 (and additional to this Player Turn's previous Wind Change DR).

***43 Visibility drops as mist settles in.** Mist (E3.32) is in effect for the duration of the Mission. If already in effect Mist thickens to Fog (E3.31); determine Fog's level and density (E3.31 and E3.311, respectively). If Fog is already in effect its density increases by one; if density is already at +3 reroll for another RE.

44-46 Partisan HMG opens up! The S? nearest to the FRIENDLY non-armored unit that is closest to the EBE is immediately Activated (5.752 is NA). If $>$ one S? qualifies select the one in the Location with the highest TEM; greatest elevation. Make a Random dr if $>$ one FRIENDLY unit qualifies; if no S? has a LOS to the FRIENDLY non-armored unit closest to the EBE, check LOS to the FRIENDLY non-armored unit second closest to the EBE, etc., until a FRIENDLY unit is determined. Activate a Partisan 3-3-7 squad, a HMG and an Infantry leader {P3; a Cumulative -1 DRM applies}. If no S? has LOS to such a FRIENDLY unit reroll for a different RE.

DR Random Event

51 Rumors of ENEMY reinforcements abound! Increase the ENEMY RE#s by one (2.5). If ENEMY RE#s are already 6/7 reroll for a different RE.

52 FRIENDLY regimental HQ reports heavy ENEMY attacks on a neighboring battalion. Reduce the FRIENDLY RE#s by one (2.5). If FRIENDLY RE#s are already 2/3 reroll for a different RE.

53-54 Partisan sniper strikes! Make a subsequent dr: on a dr of ≤ 3 conduct an immediate Sniper attack (A14.3) as if a Sniper attack dr of 1 were just rolled; on a dr of ≥ 4 conduct a Sniper attack (A14.3) as if a Sniper attack dr of 2 were just rolled.

55 Revenge! All FRIENDLY units currently held Captive by any one (randomly determined if > 1) Partisan unit are Massacred.

***56 Partisan dispatch rider!** Activate an Partisan 7-0 as a Rider on a SMC bicycle. The unit enters on a randomly-determined EBE road hex that has a contiguous path of connected road hexes exiting off $\geq$ one other randomly-determined non-FBE (if no such Road Network exists on the mapboard's current configuration reroll for another RE). The Rider proceeds along the determined road path towards the exit hex until forced to Bail Out or eliminated. The bicyclist uses all MF available (as per D15.81) as long as he remains mounted. If the Rider is forced to become Infantry he will instead attempt to exit off the nearest non-FBE closest to his current hex (he receives an Automatic Move Command during each ENEMY MPh). If Captured, or if eliminated and his last-entered-Location is successfully Searched by a FRIENDLY Infantry unit, valuable papers are discovered on a dr of ≤ 4 . Record the identity of the FRIENDLY Possessing unit (the dispatch rider's original Guard or successful Searcher) for later reference. If the possessing unit is a squad that subsequently suffers Casualty Reduction the papers are permanently lost on a dr of ≥ 5 . If such a Possessing squad is later Deployed the Possessing HS's ID must be recorded. If the Possessing unit survives the Mission determine the FRIENDLY VP value of the papers by making a dr {A6a}.

***61-64 Partisan reinforcements!** A number of Partisan S? (as per a DR+5) enter this turn along a non-FBE (determine by Random dr). Each such S? generates using the Partisan generation tables (P1/P2/P3/P4/P5) and is in Advance Attitude until Activated, at which time each unit Activated therefrom assumes the Prevailing Attitude. These S? are in addition to any other S? which might otherwise be entering this turn (4.21-22).

ADDITIONAL REINFORCEMENTS: During each subsequent Partisan RPh make a Reinforcement dr: if ≤ 2 a number (equal to a DR) of additional Partisan S? in Advance Attitude enter during that turn along a non-FBE (determine by Random dr; reroll each turn, as necessary); if ≥ 3 no further S? may be entered due to this RE (the Reinforcement dr is no longer made).

***65 ENEMY air support arrives (8.9)!** Determine type, presence of bombs and number entering as per E7.1-21. Each aircraft is eligible to enter in the next FRIENDLY MPh. Reroll for another RE if current conditions prohibit air support.

***66 FRIENDLY AFV Recalled!** One FRIENDLY Mobile AFV is immediately placed under Recall (D5.341); Random dr if $>$ one such AFV is eligible.

71-72 FRIENDLY ammo supplies dwindling. The FRIENDLY side suffers from the effects of Ammunition Shortage (A19.131) for the duration of the Mission.

73-75 Partisan reinforcements! As per RE 34 except the initial number of S? is as per a DR+4.

76 ENEMY AFV! Determine the number {A6a}, AFV type {R6 if in Russia; U6 if elsewhere} (all are the same type) and armor leader {x3} (5.71-713; 9.3).

A11: ENEMY Random Event Table (2.)

Colored dr drm (2.3):

±x as per MSR

* This RE may occur only once per Mission.
Reroll for a different RE as necessary (2.31).

DR Random Event

***01 Wire!** A line of wire is spotted by the unbroken FRIENDLY unit that is closest to the EBE. The closest Wire counter to the spotter is a number of hexes away (as per a dr) toward the EBE (or along EBE hexes if the dr is > the range to that edge). The line of wire contains a number of Wire counters (as per a DR+2) and is placed in a (Alternate) Hex Grain paralleling the EBE. The first such Wire counter placed must be in the hex of that (Alternate) Hex Grain closest to the spotting unit and in its LOS (if no hex of that [Alternate] Hex Grain is in its LOS move the (Alternate) Hex Grain closer to the spotter until ≥ one hex of it is in the spotter's LOS. Place additional Wire counters, one at a time, in eligible Locations of that (Alternate) Hex Grain to either side of the original Wire counter placed (beginning with the lowest-lettered hexrow) until all are placed. Each ENEMY unit in a just-placed Wire Location is beneath the wire; each FRIENDLY unit must be on it.

02 Armored Cupola! An Armored Cupola (D9.5) has been spotted by the unbroken FRIENDLY unit that is closest to the EBE. Determine the armor type {x6}; use the turret armor of that AFV (if a turreted AFV was not rolled, reroll until one is). Use a turret counter to represent the cupola (it is suggested that the AFV's counter be kept offboard near the cupola as a reminder of its armor). To determine the Cupola's Location make a dr: place the cupola in the nearest eligible Location (D9.52) in the LOS of the spotting unit that is at least that number of hexes (as per the dr) toward the EBE.

03-04 Minefield! The FRIENDLY (non-Melee) Infantry stack(s) in an eligible (non-building) minefield Location (B28.1) [EXC: reroll for another RE if only eligible unit is on FRIENDLY setup board or all FRIENDLY units are in ineligible Locations] that is nearest to the EBE, has stumbled into an A-P minefield. Conduct a mine attack vs each such unit as the first event of the upcoming ENEMY PPh just as if the unit(s) had entered the Location as a stack. Determine the strength of each such A-P minefield by a Random dr (dr of ≤ 2 = 6; dr of 3-4 = 8; dr of ≥ 5 = 12). Mark each such Location by the appropriate Minefield counter.

05 Local Counterattack! Each Hold-Attitude S? within five hexes of a hex (as determined by drawing a Letter Chit for the hexrow and making a DR+2 for the coordinate) on the mapboard with the most S? immediately assumes Advance Attitude. Replace each such S? with a different-colored S? (3.2).

06 ENEMY infiltration! On the mapboard containing the most FRIENDLY units place one S? in each (non-rooftop, non-sewer) building Location not currently marked with a S? and not occupied-by/ADJACENT-to a FRIENDLY unit [EXC: use 4.12 as necessary]. Each such Location reverts to ENEMY Control (if previously FRIENDLY Controlled). Each such S? assumes Hold Attitude.

11 If ≥ one Good Order FRIENDLY Infantry unit is in a building Location make a subsequent dr and consult the following respective paragraph. Determine the unit randomly if > one such unit is in a building Location; if no such unit is in a building Location reroll for a different RE.

(dr 1) One randomly-determined Good Order FRIENDLY Infantry unit in the Location discovers a dead ENEMY officer. Upon inspecting the body, the unit discovers what it suspects to be important documents and tucks them away (as such, they become an "inherent" part of that unit and such possession can never be Transferred nor dropped). Record the identity of the possessor for later reference. If the possessor is a squad that subsequently suffers Casualty Reduction the papers are permanently lost on a dr ≥ 4. If the possessor is later Deployed the possessing HS's ID must be recorded. If the possessor survives the Mission determine the FRIENDLY VP value of the papers by making a dr-1 (they might be worthless after all).

(dr 2) One randomly-determined FRIENDLY Infantry unit in the Location discovers a sultry peasant girl. The FRIENDLY unit immediately becomes TI for a number (as per a dr; +1 drm per HS of the unit, if any) of Game Turns (or portions thereof) or until the FRIENDLY unit is broken or Captured. Unless broken or Captured, the unit is marked CX when the TI counter is removed.

(dr 3-4) A FRIENDLY Infantry unit in the Location inadvertently upsets a lit kerosene lamp. Place a Pinned (as per B25.15) Flame counter in the Location.

(dr > 5) Boobytrap! (See ENEMY RE #12 except the Location has already been determined.)

12 Boobytrap! A FRIENDLY Infantry unit in a building Location touches off a Boobytrap (if no such unit occupies a building Location reroll for a different RE). Determine one Location from all such thusly occupied. All Infantry units in the Location are attacked by the boobytrap as the first attack of the upcoming PPh. Make a DR to determine the boobytrap's FP, rounding down to the nearest FP column if necessary. When resolving the attack the TEM of the Location is reversed. A CH is possible; random selection if applicable. After attacking the boobytrap is considered disarmed.

13-14 Minefield! (see ENEMY RE #03-04)

15 ENEMY infiltration! As per ENEMY RE 06 except only VPO Location(s) and each Concealment Terrain Location(s) ADJACENT to such a VPO Location

is eligible. If no VPO Locations exist in the Mission (or if each such Location already contains a S?) reroll for a different RE.

***16 ENEMY convoy!** Convoy vehicles enter along a randomly-determined EBE road hex that has a contiguous path of connected road hexes exiting off ≥ one other randomly-determined non-FBE (if no such Road Network exists on the mapboard's current configuration reroll for another RE). Each vehicle must use Convoy movement (E11.) and continue movement along the road (using all non-ESB MP possible) towards the determined road exit hex until each vehicle of the Convoy is exited [EXC: if released (E11.251; see also below), at which time all units of the (former) Convoy are eligible for normal Actions]. Each exited Convoy vehicle (regardless of its passengers) grants the ENEMY one VP (two VP if towing a Gun).

RELEASED: When released from the Convoy a vehicle transporting a Passenger-S? will immediately stop and attempt to unload as soon as possible (each unloaded S? is in Advance Attitude until Activated or it occupies any Location with a TEM of ≥ +1, at which time it assumes the Prevailing Attitude). Each released vehicle without Passenger-S? attempts to exit off the (previously determined) exit hex [EXC: if such movement would move it closer to a Known FRIENDLY unit(s) it will instead turn around and attempt to retrace its path toward its entry hex. A vehicle towing a Gun (or one that is non-armored but armed) when released from Convoy formation will continue to tow its Gun and individually attempt to exit (as per an unloaded vehicle, above) [EXC: if the Gun is an AT or INF type the vehicle will unload the Gun crew and that crew will attempt to unhook the Gun as soon as possible before the vehicle attempts to exit]. Each AFV released from Convoy formation is subject to normal Actions immediately.

To determine the Convoy's composition make a subsequent dr and consult the following respective paragraph:

(dr 1) Make a dr to determine the number of Transport vehicles. Then make a DR {x7} to determine the Transport vehicle type (all are the same type). On a subsequent dr of ≤ 4 each such vehicle contains one passenger S?.

(dr 2) As per "dr 1" of this table but perform the entire procedure twice [EXC: the dr to determine if the vehicles contain S? is performed only once for the entire Convoy].

(dr 3) Make a dr to determine the number of Transport vehicles, each of which is towing a Gun and has an Infantry crew as Passenger. Next make a DR {x5} to determine the Gun type (all Guns are the same type). Finally, make a DR {x7} to determine the Transport vehicle type (if the determined vehicle is incapable of towing the pre-determined Gun type reroll {x7} until a vehicle that is capable of towing it is determined).

(dr 4) As per "dr 1" except the Convoy is led by a number {A6g} of vehicles {x6} (each the same).

(dr 5) As per "dr 1" of this table except the Convoy is led by a number {A6e}, and trailed by a number {A6g}, of vehicles. Make two separate DR {x6} to determine the leading and trailing vehicle types.

(dr 6) As per "dr 2" of this table except that the Convoy is led by a number {A6d} of vehicles {x6b}, each of which is determined separately.

***21 ENEMY reconnaissance aircraft flies over during this ENEMY RPh.** On a successful STC (E7.3) vs the easiest to spot FRIENDLY unit the ENEMY RE#s increase by one (if RE numbers are already at 6/7 perform ENEMY RE #24 instead). If the STC is unsuccessful there is no further effect. No AA fire is allowed vs the aircraft.

***22 One randomly determined FRIENDLY AFV is immediately immobilized.** If no Mobile AFV is currently on board non-armored vehicles are eligible. If no mobile FRIENDLY vehicle is onboard reroll for a different RE.

23 ENEMY resistance stiffens! The ENEMY AC# (5.1) increases by one. If the AC# is already 5 reroll for a different RE.

24 ENEMY AFV! Determine the number {A6a}, AFV type {x6} (all are the same type) and armor leader {x3} (5.71-.713; 9.3).

25 ENEMY AFV! Determine the number {A6e}, AFV type {x6} (make a separate DR for each) and armor leader {x3} (5.71-.713; 9.3).

26 ENEMY leader Battle Hardens! The best ENEMY leader eligible to Battle Harden (i.e., non-10-3/10-0) is immediately Battle Hardened (A15.3). Use Random dr to determine if ≥ two of best type. If broken he is also rallied. All broken ENEMY units in that Location (if any) are automatically rallied. If no Activated ENEMY leader is onboard reroll for a different RE.

31 ENEMY artillery strike! Determine the number of FFEs by a dr {A6a} (8.7-.75).

32 ENEMY artillery strike! As per ENEMY RE 31 but use Table A6c to determine the number of FFEs.

33 ENEMY Harassing Fire FFE! As per ENEMY RE 31 but use Table A6e to determine the number of FFEs, each of which is resolved as Harassing Fire (C1.72).

***34 ENEMY reinforcements!** A number of S? (as per a DR+2) enter this turn along the EBE. Each such S? is in Advance Attitude until Activated, at which time each unit Activated therefrom assumes the Prevailing Attitude. These S? are in addition to any other S? which might otherwise be entering this turn (4.21-.22).

ADDITIONAL REINFORCEMENTS: During each subsequent ENEMY RPh make a Reinforcement dr: if ≤ 3 a number (equal to a DR) of additional S? in Advance Attitude enter during that turn along the EBE; if ≥ 4 no further S? may be entered due to this RE (the Reinforcement dr is no longer made).

***35 ENEMY SPG!** Determine the number {A6c}, AFV type {x6a} (all are the same type) and armor leader {x3} (5.71-713; 9.3).

36 Flank attack! A number of S? (equal to a DR+4) enter this turn along one of the board edges (north or south; Random dr to determine) adjacent to the FBE (4.21-22). Each such S? is in Advance Attitude until Activated, at which time each such unit assumes the Prevailing Attitude. Note that, until Activated, these flank-attacking S? move toward the opposite board edge from the edge entered. If other Advance Attitude S? are in play, different-colored S? must be used for these flank-attacking S? (3.2).

ADDITIONAL REINFORCEMENTS: During each subsequent ENEMY RPh make a Reinforcement dr (until a Reinforcement dr of ≥ 4 is rolled): if ≤ 3 a number (as per a DR) of additional S? in Advance Attitude enter during that turn along the same "flank" board edge.

41 ENEMY goes berserk! The closest eligible (A15.1) Activated ENEMY Infantry unit in the LOS of the FRIENDLY unit that is nearest to the EBE immediately goes berserk. Determine the FRIENDLY unit by a Random dr if > 1 qualifies; if no such ENEMY unit has a LOS to the FRIENDLY unit closest to the EBE, check LOS to the FRIENDLY unit second closest to the EBE, etc., until one is determined. Otherwise reroll for a different RE. Furthermore, each eligible Activated ENEMY Infantry unit ≤ 1 hex from this original berserk unit also becomes berserk if it passes a mandatory NTC (failure of which has no effect). A15.41 applies normally (even into an ADJACENT Location).

***42 Storm front moving in.** The weather immediately becomes Overcast (E3.5). If already Overcast consider this as a Wind Change DR of 11 (and additional to this Player Turn's previous Wind Change DR). Reroll for another RE if heavy rain is already occurring.

***43 Visibility drops as mist settles in.** Mist (E3.32) is in effect for the duration of the Mission. If already in effect Mist thickens to Fog (E3.31); determine Fog's level and density (E3.31 and E3.311, respectively). If Fog is already in effect its density increases by one; if density is already at +3 reroll for another RE.

44-45 ENEMY HMG opens up! The S? nearest to the FRIENDLY non-armored unit that is closest to the EBE is immediately Activated (5.752 is NA). If > 1 S? qualifies select the one in the Location with the highest TEM; greatest elevation. Make a Random dr if > 1 FRIENDLY unit qualifies; if no S? has a LOS to the FRIENDLY non-armored unit closest to the EBE, check LOS to the FRIENDLY non-armored unit second closest to the EBE, etc., until a FRIENDLY unit is determined. Activate an Elite ENEMY squad (the type with the greatest normal range if > 1 Elite squad type is available), a HMG (.50 caliber on subsequent dr of ≤ 3 , if available) and an Infantry leader {x3; a Cumulative -1 cumulative DRM applies}. If no S? has LOS to such a FRIENDLY unit (or no S? is currently on board) reroll for a different RE.

46 If a S? is ≤ 4 hexes from a FRIENDLY unit, it automatically Activates as an ENEMY elite squad (use the type with the greatest FP factor) and a FT. If no such S? qualifies, conduct RE 44-45 instead. If > 5 S? qualifies, Activate according to the following Priority List:

Priority List: Closest to FRIENDLY unit; closest to FRIENDLY AFV (AFV with best AF).

51 Rumors of ENEMY reinforcements abound! Increase the ENEMY RE#s by one (2.5). If ENEMY RE#s are already 6/7 reroll for a different RE.

52 FRIENDLY regimental HQ reports heavy ENEMY attacks on a neighboring battalion. Reduce the FRIENDLY RE#s by one (2.5). If FRIENDLY RE#s are already 2/3 reroll for a different RE.

53 ENEMY sniper strikes! Make a subsequent dr: on a dr of ≤ 3 conduct an immediate Sniper attack (A14.3) as if a Sniper attack dr of 1 were just rolled; on a dr of ≥ 4 conduct a Sniper attack (A14.3) as if a Sniper attack dr of 2 were just rolled.

54 If the ENEMY nationality is Russian (or Japanese) a Human Wave (Banzai Charge) enters on the EBE (4.3-34); otherwise conduct RE 36.

***55 FRIENDLY AFV Recalled!** One FRIENDLY Mobile AFV is immediately placed under Recall (D5.341); Random dr if > 1 such AFV is eligible. If the determined AFV is radioless and currently part of a radioless AFV platoon its entire platoon is placed under Recall. If no mobile FRIENDLY AFV is onboard reroll for a different RE.

***56 ENEMY dispatch rider!** Activate an ENEMY 8-0 as a Rider on a SMC cycle. The unit's entry and exit hexes are determined as per ENEMY RE 16. The Rider proceeds along the determined road path towards the exit hex until forced to Bail Out or eliminated. The Rider will use only 14 MP per MPH (or as much as possible up to 14) until a Known FRIENDLY unit is in his LOS, at which time he uses all MP possible. If the Rider is forced to become Infantry he will instead attempt to exit off the nearest non-FBE closest to his current hex (he receives an Automatic Move Command during each ENEMY MPH). If Captured, or if eliminated and his last-entered-Location is successfully Searched by a FRIENDLY Infantry unit, valuable papers are discovered on a dr of ≤ 4 . Record the identity of the FRIENDLY Possessing unit (the dispatch rider's orig-

inal Guard or successful Searcher) for later reference. If the possessing unit is a squad that subsequently suffers Casualty Reduction the papers are permanently lost on a dr of ≥ 5 . If such a Possessing squad is later Deployed the Possessing HS's ID must be recorded. If the Possessing unit survives the Mission determine the FRIENDLY VP value of the papers by making a dr {A6a}.

61-62 Infiltrators! Use 4.1e to place S? on the mapboard currently with the most FRIENDLY units [EXC: No S? may be placed in a FRIENDLY-occupied Location]. Only one Letter Chit is drawn. Each thusly-placed S? assumes Hold Attitude until Activated.

***63 ENEMY reinforcements!** As per RE 34 except the initial number of S? is equal to a DR+3.

***64-65 ENEMY air support arrives (8.9)!** Determine type, presence of bombs and number entering as per E7.1-21. Each aircraft is eligible to enter in the next FRIENDLY MPH. Reroll for another RE if current conditions prohibit air support.

66 ENEMY goes berserk! Conduct ENEMY RE 41.

***71 Creeping Barrage!** An ENEMY Creeping Barrage (E12.7) moves towards the FBE from the direction of the EBE (east to west). To determine the Barrage's initial starting hex place an SR on the FRIENDLY unit closest to the EBE (if > 1 qualifies, select the hex with the most FRIENDLY units; otherwise make a Random dr) and make a scatter DR (as per C1.31). The final hex thusly determined is considered the Barrage's Pre-Registered hex (E12.71); the Aiming Hex (E12.71) must be a hex of the FBE along an (Alternate) Hex Grain from its Pre-Registered hex. Next, determine the FP of the Barrage by a DR on the ENEMY nationality's (Chapter H) DYO OBA chart (reroll on the OBA chart until a non-rocket OBA is determined). During Each ENEMY PPh (only) the Barrage is adjusted towards the FBE as per E12.74. The ENEMY Creeping Barrage stays in effect until it can no longer be corrected (E12.74).

72 FRIENDLY ammo supplies dwindling. The FRIENDLY side suffers from the effects of Ammunition Shortage (A19.131) for the duration of the Mission.

73 ENEMY AFV! Determine the number {A6b}, AFV type {x6; all are the same type} and armor leader {x3} (5.71-713; 9.3).

74 ENEMY parachute! [EXC: Reroll for a different RE if weather conditions prohibit such (E9.1) or if the ENEMY nationality is not Russian, German, US or British.] Determine the number of Wings entering {A6b}; each Wing is composed of five Sticks and each Stick consists of one S? (represented by a 5/8" parachute marker until Activated). Determine a separate Drop Point (E9.12) for each Wing by first determining a (non-river) mapboard (of the current configuration) by a Random dr. Next draw a Letter Chit and make a dr+2 to determine the hex coordinate number (disregard the E9.12 restriction on distance between Drop Points). Reroll for each Drop Point within three hexes of any board edge (halfhex). Each Wing now lands on its Drop Point (no dr is made for accuracy; E9.12). Select a Hex Grain for all Wings which will keep most of the Sticks from drifting offboard or into elimination terrain (E9.4).

Immediately before landing each non-German parachuting S? may move one hex (E9.4) using the following Priority List: out of elimination terrain; out of injury terrain (E9.42); toward closest FRIENDLY-Controlled VPO.

In the ENEMY APH each Stick automatically Activates as a "S, L, SW" (no DR on Table A1 is required; each SW generated [normally requiring a separate 1/2" parachute counter] is assumed to have already been Recovered). Determine the squad type on the respective nationality's Parachute Squad Table (see below); determine leader {x3} [EXC: make a subsequent dr; if this dr is ≥ 5 no leader is Activated afterall; assume a leader result of "7-0" or "6-1" as "-"]; determine SW {x4} [EXC: the only SW which may be Activated from a Parachuted S? are LMG/dm-MMG/dm-Lt.-Mtr/PSK/BAZ/ATR; any other determined SW is forfeit]. Each SW must be dm if possible. Each unit Activated from a Parachuted S? assumes the Prevailing Attitude.

Each S? landing/drifted off the current mapboard configuration is forfeit. Neither side receives VP for a S? that landed/drifted offboard.

PARADROP SQUAD TABLE

dr	Russian	German	US
1	4-5-8	8-3-8	6-6-7
2-3	6-2-8	5-4-8	7-4-7
≥ 4	4-5-8	4-6-8	7-4-7

75-76 ENEMY reinforcements! As per RE 34 except the initial number of S? is as per a DR+6.

FRIENDLY CMD# (16.2)

FRIENDLY unit must roll $\leq$ its Command Number.

- A leader/crew has a CMD# one $>$ its current Morale Level.
- A squad/HS has a CMD# equal to its current Morale Level.
- A vehicle has a CMD# one $>$ its current Morale Level (D5.1) [EXC: an SMC Rider/Passenger may use his own CMD# if it is greater].

Cumulative DRM:

- 1 if the unit has an Acquired Target
- 1 if in Motion
- 1 if in Convoy/Column/platoon formation
- 1 if U.S. Infantry MMC
- 1 if CE AFV

^a Reroll if ENEMY is not Russian
^b Possible Partisan ENEMY (12.21)

Possible Partisan ENEMY (12.21)

FRIENDLY side must be German in 1942-44 Russia/France.
Pre-Mission Final dr of ≤ 1 results in Partisan ENEMY.

Cumulative dr: -1 if in Russia in 1943
-1 if previous Mission was vs. Partisan

SQUAD SEASONING TABLE (17.74)

Final dr	Result	Cumulative dr:
≤ 2	2	-1 If FRIENDLY side won the last Mission
3-4	1	-1 Per hero eliminated during this step
≥ 5	0	+1 If CG VP score (17.51) is negative
		+2 If FRIENDLY side withdrew (12.4) during the last Mission [EXC: if dictated by RE]

COMPANY LEADER TYPE (17.81)

Final dr	Type	Russian dr:	German dr:	US dr:
≤ 0	9-2	-1 1945	-1 pre 1943	+1 pre 8/43
1	9-1	+1 1941-42	+1 8/44-45	
2-3	8-1*	+2 1939-40		
4-5	8-0*			
6	7-0			
≥ 7	6+1			

* If the FRIENDLY side is pre-11/42 Russian and if no Commissar is currently Retained, a just-generated 8-1 leader may be immediately exchanged for a 10-0 Commissar (or a just-generated 8-0 may be exchanged for a 9-0 Commissar) on a Subsequent Final DR of ≤ 3. There is a -1 DRM per Retained Conscript squad.

Cumulative DRM:

- 1 Per full squad (> one) the company OB is short of full strength, for the next Mission's date
- 1 If CG VP score is negative (17.51)
- +1 If CG VP score is positive (17.51)

MMC-TYPE REPLACEMENT TABLE (17.821)

Final dr	Type	FOOTNOTES:
≤ 0	Elite ^a	^a Must be the type that a listed MMC of that Company OB would become if it were to BH
1-4	First Line ^b	^b Must be the same type as listed in that Company's OB.
5	Second Line ^c	^c Substitute Conscript or Green MMC (depending on nationality) if Second Line not available.
≥ 6	Conscript/Green	

Cumulative dr:

- 1 If ≥ 50% of Personnel (in US#) of current CG Company OB is elite
- 2 If Company is "Elite" type (e.g., Paratrooper, SS, Guards, Ranger)
- ± nationality date dr (see below)

Russian dr:	German dr:	US dr:
-1 6/44-1945	-2 1939-41	-1 1945
+1 1939 or 1942	-1 1942	+1 1942-43
+2 1941	+1 1945	

SASL Campaign Tables

CAMPAIGN GAME COMPANY REFIT STEPS (17.4-9)

A. At Mission end

1. Resolve Climbing Units
2. Resolve Melees
3. Encircled FRIENDLY units take ITC
4. Resolve Minefield attacks
5. Determine Victory & Update CG VP total

B. FRIENDLY unit removal/repair

1. Remove Temporarily Attached units/weapons
2. Retain Directly Attached units/weapons
3. Wounded SMC survival check
4. Repair Retained weapons

C. Company Improvement

1. Fanatic Promotion
2. Heroic Leader promotion
3. Random Leader promotion/demotion
4. Squad Seasoning
5. Recombine

D. Company Replacements

1. Leader Replacements
2. Squad/HS Replacements
3. MMC Replacement Class/Type
4. SW Crew Replacement
5. Weapon Replacement

E. Rest & Refit check

FRIENDLY CG COMPANIES (18.1)

GERMAN INFANTRY COMPANY 1939-August 1943 [US#: 55/38]

Leader × 3; 4-6-7 × 12; 2-4-7 × 2; 1-2-7 × 6; HMG; MMG; LMG × 4; 50mm MTR × 3; ATR × 3

GERMAN INFANTRY COMPANY September 1943-1945* [US#: 42/29]

Leader × 3; 4-6-7 × 9; 2-4-7 × 2; 1-2-7 × 2; 2-2-8 × 2; HMG; MMG; LMG × 4; PSK × 2; 81mm MTR × 2

* Panzerfausts become available in October 1943 (C14.3)

RUSSIAN RIFLE COMPANY 1939-November 1941 [US#: 50/35]

Leader × 2; 4-4-7 × 12; 2-3-7 × 2; 1-2-7 × 4; HMG; MMG; LMG × 4; 50mm MTR × 2; ATR × 2

RUSSIAN RIFLE COMPANY December 1941-June 1942 [US#: 35/24]

Leader × 2; 4-4-7 × 9; 2-3-7; 1-2-7 × 2; MMG; LMG × 4; 50mm MTR; ATR

RUSSIAN RIFLE COMPANY July - November, 1942 [US#: 50/35]

Leader × 2; 4-4-7 × 12; 2-3-7; 1-2-7 × 5; MMG; LMG × 4; 50mm MTR × 3; ATR × 2

RUSSIAN RIFLE COMPANY December 1942-1945 [US#: 48/33]

Leader × 2; 4-4-7 × 12; 2-3-7; 1-2-7 × 4; HMG*; LMG × 4; 50mm MTR × 2; ATR × 2

* If ≥ 60% of the US# of all Retained MMC of this Company is elite, the unit is given Guards status and has "HMG × 2". Furthermore, in the Russian's Squad-Type Replacement Table (17.821), results of "4-4-7" are considered "4-5-8", and results of "4-2-6" are considered "4-4-7".

US RIFLE COMPANY 1944-1945 [US#: 48/33]

Leader × 3; 6-6-6 × 9; 3-4-6 × 3; 1-2-6 × 6; 50 Cal. HMG; MMG × 2; M2 60mm MTR × 3; BAZ* × 3

* Bazookas are always the latest type available.

R9: RUSSIAN RANDOM EVENT TABLE (2.)

Colored dr drm (2.3):

± x as per MSR

* Each RE preceded by an "*" may occur only once per Mission (2.31).

DR Random Event

*01 Flamethrower tank detachment arrives! Make a dr [A6c] to determine the number of AFV arriving, then make a dr (if necessary) on the proper table below to determine the unit type (all are of the same type).

1939-41	1942-43	1944-45
OT-133	OT-34 [dr ≤ 4] KV-8 [dr ≥ 5]	OT-34

*02 Engineer platoon arrives! Three Assault Engineer (H1.22) 6-2-8 squads, equipped with SMC/SW as per standard DYO procedure (H1.8-83), arrive. On a subsequent dr of ≤ 3 each such squad may enter as Passenger of a GAZ-MM truck; otherwise the units enter as Infantry.

*03 Engineer platoon flank attack! As per Russian RE 02 except the units must enter on either the north (or south, as per a Random dr) edge of any mapboard (player's choice), providing that mapboard has ≥ one Russian unit on it.

*04 Each ENEMY dr on the Fortification Generation Table [A5] has a +2 drm for the duration of the Mission.

*05 Sappers! A number [A6a] of 4-5-8 sapper (H1.23) squads are received. Make a DR [R3] for a leader possibility. Each sapper squad automatically receives one DC and one LMG.

*06 Sturmovik! Russian fighters-bombers arrive during the next ENEMY MPh. Make a dr [A6f] to determine the number available; all are automatically armed with bombs (ignore E7.1-21). Reroll for another RE if conditions prohibit this RE.

*11 Russian recon section arrives! Determine the number [A6c], type [R6b] and armor leader [R3]. All are the same type.

*12 Russian tank-riders! Determine the number of tanks [A6a], the tank type [R6]; reroll as necessary until a tank is determined; all tanks are the same type. Receive one 6-2-8 squad per tank. Determine one Infantry SMC [R3] and one SW [R4]. All Infantry/SW must enter as Riders (D6.2) [EXC: if Riders are currently prohibited (D6.2) enter the squads as Infantry instead, using Armored Assault (D9.31)]. Also roll for armor leader [R3] with a Cumulative -1 DRM due to this RE.

*13 Motorized infantry reinforcements! As per Russian RE 34-36 except each such reinforcement unit enters as a Passenger on a GAZ-MM truck. A Cumulative -2 DRM [R2] applies due to this RE.

*14 A local peasant boy is discovered cowering in a root cellar. Upon questioning he reveals useful information. The player may immediately remove a number (as per a dr) of S? that are within the LOS of any one unbroken Russian Infantry unit. No "free" LOS check(s) allowed before removal.

*15 ENEMY resistance is fading. The player may immediately remove a number of S? (as per a DR). A S? in VPO Location may only be removed if no other non-VPO-Location S? are present. If no S? are currently onboard reroll for another RE.

*16 SPG section arrives! Determine the number [A6f], type [R6a] and armor leader [R3]. All are the same type.

*21 Reconnaissance patrol arrives! Determine the number [A6c], type [R6b] and armor leader [R3]. All are the same type.

*22 Reconnaissance patrol arrives! Determine the number [A6f], type [R6b]; make a separate DR for each, and armor leader [R3]. On a subsequent dr of ≤ 2 these vehicles enter on the north (or south, as per a Random dr) edge of any mapboard (player's choice), providing that mapboard has ≥ one Russian unit on it.

*23 Russian AFV arrive! Determine the number [A6c], type [R6] and armor leader [R3]. All are the same type.

*24 ENEMY ammunition supplies dwindling! The ENEMY suffers from the effects of Ammunition Shortage (A19.131) for the duration of the Mission.

*25 Gun section arrives! Determine the number [A6f] and type [R5] (use the "Outside" column; all are the same type). Each Gun is crewed by one 2-2-8. At the player's option each such reinforcement Gun may be Manhandled or Towed onboard. If Towed, make a DR [R7] to determine the Transport type (reroll, if necessary, until a vehicle is determined that is able to Tow the Gun type).

*26 SPG platoon arrives! As per Russian RE 16 [EXC: on a subsequent dr of ≤ 4 these vehicles enter anywhere along the north or south edge (as per a Random dr) of the current mapboard configuration (all enter on the same edge)].

*31-33 Request for artillery support has been granted! Determine OBA type received by a DR on the Chapter H "Russian OBA Availability Chart" (H1.53). Next make a dr [R8] to determine the ammunition supply. The player may immediately give one Russian radio to any Russian leader of his choice [EXC: if the ENEMY is in Advance Attitude the player may instead choose a Field Phone, recording a Security Area as necessary] or an 8-0 leader with radio enters along the FBE mounted on motorcycle or in a GAZ-67B (player's option).

*34-36 Russian Infantry reinforcements! Make a DR+1 to determine the number of squads received. Determine the squad type (all are the same) by a DR [R2]. Determine all SMC/SW using H1.8-1.83.

*41 ENEMY AFV is Recalled! Determine the AFV affected by a Random dr (for purposes of this RE an AFV platoon counts as a single AFV) and immediately mark such as Recalled (D5.341). If there is currently no Mobile ENEMY AFV onboard reroll for another RE.

*42 ENEMY AFV is Immobilized! Determine the AFV affected by a Random dr, and immediately mark such as Immobilized (D8.1). Immobilization TC is not required. If there is currently no Mobile ENEMY AFV onboard reroll for another RE.

*43 ENEMY resistance slackens! The ENEMY AC# decreases by one [EXC: if AC# is already 2 conduct Russian RE 15 instead].

DR Random Event

44 Make a subsequent dr and perform the indicated RE:

dr ≤ 3: ENEMY RE Numbers decrease by one (2.4) [EXC: if ENEMY RE Numbers are currently 2/3 conduct RE 43 instead].

dr ≥ 4: Rumors of Russian reinforcements on the way. Russian RE Numbers increase by one (2.4) [EXC: if Russian RE Numbers are currently 6/7 reroll for another RE].

45 Russian leader turns heroic (A15.21)! Determine affected leader by Random dr among all currently non-Captured, non-Disrupted, non-Heroic on-board non-armor Russian leaders. If no Russian leader is eligible reroll for a different RE.

46 Russian sniper finds a target! Make a subsequent dr to determine the attack type; perform the attack as the first action of the upcoming PFPPh:

dr of ≤ 3: conduct a "1" sniper attack (A14.3)

dr of ≥ 4: conduct a "2" sniper attack (A14.3)

*51 Russian Infantry stage a flank attack! Determine the number of Russian squads by a DR+2. Determine the squad type (all are the same) by a DR [R2]. Determine all SMC/SW using H1.8-1.83. Then make a Random dr to determine edge of entry (north or south). All must enter anywhere along the same edge.

*52 Tanks stage a flank attack! Determine the number [A6c], type [R6] and armor leader [R3]. All are the same type. Then make a Random dr to determine edge of entry (north or south). All must enter anywhere along the same edge.

*53 Combined-arms flank attack! Conduct Russian REs 51 and 52 [EXC: use Table A6f to determine the number of AFV received]. All units must enter along the same edge; squads enter as Riders if possible (depending on vehicle type and date).

*54 Medium mortar section arrives! Make a dr [A6d] to determine the number of dm 82mm MTRs received, each of which has one 2-2-8 crew. On a subsequent dr of ≤ 2 the mortar section is equipped with transport. If so, make a DR [R7] with a +2 DRM. All transport vehicles are the same type; only enough vehicles are received to carry these RE units/weapons. Transport can be refused if so desired.

*55 FRIENDLY aircraft spotted! Determine type, armament and number entering as per E7.21. Each aircraft is eligible to enter in the next ENEMY MPh. Reroll for another RE if current conditions prohibit air support.

*56 AT section arrives! Determine the number [A6c] and type [R5a] (all are the same type). Each Gun is crewed by one 2-2-8. At the player's option each such reinforcing Gun may be Manhandled or Towed onboard. Determine towing vehicle type [R7] (reroll, if necessary, until a vehicle is determined that is able to Tow the Gun type; all such vehicles are the same type).

*61 Artillery support granted! Conduct Russian RE 31-33 (even if it has previously occurred).

62 Partisan Reinforcements! A number (as per a DR) of Russian partisan 3-3-7 squads enter on the north or south edge (as per a Random dr); all enter on the same edge. Determine one partisan leader using 17.81's "Company Leader Table" (Russian drm apply normally). [Special: if pre 11/42 and if ≥ ten squads are received the leader may be a Commissar; make a subsequent dr: on a dr of one substitute a 10-0; on a dr of 2-3 substitute a 9-0; otherwise a normal partisan leader is received.] Finally, determine if any SW are received: on a Final dr of ≤ 2 one LMG or ATR is received; a -1 drm applies per 5 partisan squads received. Make a separate dr for possible SW.

63 Fanatics! One Russian leader (determine by Random dr from among on-board eligible SMC) immediately turns Fanatic (A10.8). Additionally, each eligible Russian Infantry unit in his Location that passes a NTC also turns Fanatic (leadership DRM applies as per A15.41). If no Russian leader is eligible reroll for a different RE.

64 The clanking of tanks is heard! Determine the number [A6f], type(s) [R6] and armor leader [R3]. Make a separate DR [R6] for each AFV received.

65 Russian SPG platoon arrives! Determine the number [A6b], type [R6a] and armor leader [R3]. All are the same type.

66 Hero! A Hero is immediately created from the Russian MMC closest to an ENEMY unbroken/vehicular unit. If no such ENEMY unit onboard reroll for a different RE.

*71 AT section arrives! Conduct Russian RE 56 [EXC: use Table A6f to determine the number of Guns received].

72 Russian tanks! Determine the number [A6a], type(s) [R6] and armor leader [R3]. If the year is 1939-41 make a separate DR [R6] for each AFV; if 1942-45 all are the same type.

*73 Gun section arrives! Determine the number [A6c] and type [R5] (use the "Outside" column; all are the same type). Each Gun is crewed by one 2-2-8. At the player's option each such reinforcing Gun may be Manhandled or Towed onboard. Determine towing vehicle type [R7] (reroll, if necessary, until a vehicle is determined that is able to Tow the Gun type; all such vehicles are the same type).

*74 ENEMY attack called off! The Attitude of all ENEMY units immediately changes to Hold [EXC: if Russian RE 75-76 has already occurred conduct Russian RE 46 instead]. All DR on table A1 now have a +1 DRM; all previous negative DRM applicable on this table are immediately cancelled. Additionally, decrease each ENEMY RE# by one.

*75-76 Evacuate! Battalion HQ has ordered your command to evacuate their positions, pulling back toward FRIENDLY lines [EXC: if Russian RE 74 has already occurred reroll for a different RE]. Decrease each Russian RE# by one. The Russian side receives Exit VP (A26.3) for each Russian unit exited off the FBE by Mission end. The ENEMY receives Casualty VP (A26.2) for each Encircled Russian unit remaining onboard at Mission end; double Casualty VP if Russian unit is Captured/non-Mobile. Otherwise, the Mission-specific VP schedule still applies. The Mission ends automatically in five Game Turns (counting the current Game Turn as the first of those five turns), or when the last Mobile Russian unit exits the board configuration (whichever occurs first). Ignore the Mission End method given in the Mission being played.

U.S. Generation Tables [EXC: PTO]

U1: ENEMY ACTIVATION CHECK (AC) (5.1)

U.S.-ENEMY S? rolls for Activation if...

- A) FRIENDLY Infantry is in LOS within 12 hexes with a Final IFT DRM of ≤ -2
- B) FRIENDLY Infantry is in LOS within 8 hexes with a Final IFT DRM of ≤ -1
- C) FRIENDLY Infantry is in LOS within 6 hexes with a Final IFT DRM of ≤ 0
- D) FRIENDLY Infantry/Unarmored-vehicle is in LOS within 4 hexes with a Final IFT DRM of ≤ 1
- E) FRIENDLY Infantry/Unarmored-vehicle/CE-AFV is in LOS within 2 hexes with a Final IFT DRM of ≤ 2
- F) Any FRIENDLY unit is ADJACENT

U9: U.S. RANDOM EVENT (2.)

Colored dr drm (2.3):

± x as per MSR

* Each RE preceded by an "mm" may occur only once per Mission (2.31).

DR Random Event

*01 Section of flame-thrower Tanks arrives! Make a dr [A6d] to determine number of AFV arriving, then a dr on the proper table below to determine AFV type (all are the same type). Each AFV received is automatically equipped with a bow-mounted SA FT instead of a BMG as per U.S. Vehicle Note F.

dr	1942	1-5/1943	6/43-12/43	1944-1945
1	M5A1 LT	M4A1 LT	M4 MT*	M4 MT
2	M5A1 LT	M4A1 MT	M4A1 MT	M4A1 MT
3	M5A1 LT	M5A1 LT	M4A1 MT	M4A1 MT
4	M3A1 LT	M5A1 LT	M4A3 MT*	M4A3 MT
5	M3A1 LT	M3A1 LT	M5A1 LT	M4A3(75)W MT
6	M3A1 LT	M3A1 LT	M5A1 LT	M5A1 LT

* Use M4A1 if date is 6/43

*01-02 Combat Engineer platoon arrives! Three Assault Engineer (H1.22) 7-4-7 squads, equipped with SMC/SW as per standard DYO procedure (H1.8-83), arrive. On a subsequent dr of ≤ 2 each such squad may enter as Passenger of a M3 ht; on a subsequent dr of 3 or 4 each such squad may enter as Passenger on a 2½-Ton truck; otherwise the units enter as Infantry.

*03 Combat Engineer platoon flank attack! As per U.S. RE 01-02 except the units must enter on either the north (or south, as per a Random dr) edge of any mapboard (player's choice), providing that mapboard has ≥ one U.S. unit on it.

*04 Each ENEMY dr on the Fortification Generation Table (A5) has a +2 drm for the duration of the Mission.

*05 U.S. Sappers arrive! A number (A6a) of 6-6-7 sapper (H1.23) squads are received. Make a DR (U3) for leader possibility. Each Sapper squad automatically receives one DC. Additionally, one dm MMG and one BAZ (latest type) is received.

*06 Ground support! U.S. Fighter Bombers arrive during the next ENEMY MPh. Make a dr (A6f) to determine the number available; all are automatically armed with bombs (ignore E7.1-21). Reroll for another RE if conditions prohibit this RE.

*11 Recon section arrives! A mix of halftracks arrive. Make a dr for each such AFV type listed below:

M2: determine the number received as per a dr (A6a)

M3(MMG): one is received on a dr of ≤ 2

M3(HMG): one is received on a dr of ≤ 2

M4 MC: one is received on a dr of ≤ 2

12 Armored infantry arrive! As per U.S. RE 35-36 except that each such reinforcement unit may enter as a Passenger on a M3 ht. A Cumulative -2 DRM (U2) applies due to this RE. Additionally, on a subsequent dr of ≤ 2 one M3(MMG) and/or M3(HMG) is included (roll once for each). Only one armor leader (5.711) may be Activated with this RE.

13 Motorized infantry reinforcements! As per U.S. RE 35-36 except that each such reinforcement unit may enter as a Passenger on a 2½-Ton truck. A Cumulative -1 DRM (U2) applies due to this RE.

14 A resistance leader with useful information is encountered. The player may immediately remove a number (as per a dr) of S? that are within the LOS of any one unbroken U.S. Infantry unit. No "free" LOS check(s) allowed before removal.

15 ENEMY resistance is fading. The player may immediately remove a number of S? (as per a DR). A S? in VPO Location may only be removed if no other non-VPO-Location S? are present. If no S? are currently onboard reroll for another RE.

16 SPG section arrives! Determine the number (A6f), type (U6a) and armor leader (U3). All are the same type.

*21 Recce patrol arrives! Determine the number (A6c), type (U6b) and armor leader (U3). All are the same type.

*22 Recce units arrive! Determine the number (A6f), type (U6b) (make a separate DR for each), and armor leader (U3). On a subsequent dr of ≤ 2 each such vehicle of the RE may enter on the north (or south, as per a Random dr) edge of any mapboard (player's choice), providing that mapboard has ≥ one U.S. unit on it.

23 Tanks! Determine the number (A6c), type (U6) and armor leader (U3). All are the same type.

*24 ENEMY ammunition supplies dwindling! The ENEMY suffers from the effects of Ammunition Shortage (A19.131) for the duration of the Mission.

*25 Gun section arrives! Determine the number (A6f) and type (U5) (use the "Outside" column; all are the same type). Each Gun is crewed by one 2-2-7. At the player's option each such reinforcement Gun may be Manhandled or Towed onboard. If Towed, make a DR (U7) to determine the Transport type (reroll, if necessary, until a vehicle is determined that is able to Tow the Gun type).

26 SPG section arrives! As per U.S. RE 16 [EXC: on a subsequent dr of ≤ 4 each unit must enter anywhere along the north or south edge (as per a Random dr) of the current mapboard configuration (all enter on the same edge)].

*31-34 Request for artillery support has been granted! Determine OBA type received by a DR on the Chapter H "U.S. OBA Availability Chart" (H1.53). Next make a dr (U8) to determine the ammunition supply. The player may immediately give one U.S. radio to any U.S. leader of his choice [EXC: if the ENEMY is in Advance Attitude the player may instead choose a Field Phone, recording a Security Area as necessary] or an 8-0 leader with radio enters along the FBE mounted on motorcycle or in a Jeep (without AAMG); player's option.

35-36 Infantry reinforcements! Make two dr (A6b) to determine the number of squads received. Determine the squad type (all are the same) by a DR (U2). Determine all SMC/SW using H1.8-1.83.

DR Random Event

*41 ENEMY AFV is Recalled! Determine the AFV affected by a Random dr (for purposes of this RE an AFV platoon counts as a single AFV) and immediately mark such as Recalled (D5.341). If there is currently no Mobile ENEMY AFV onboard reroll for another RE.

*42 ENEMY AFV is Immobilized! Determine the AFV affected by a Random dr, and immediately mark such as Immobilized (D8.1). Immobilization TC is not required. If there is currently no Mobile ENEMY AFV onboard reroll for another RE.

43 ENEMY resistance slackens! The ENEMY AC# decreases by one [EXC: if AC# is already 2 conduct U.S. RE 15 instead].

44 Make a subsequent dr and perform the indicated RE:

dr ≤ 3: ENEMY RE Numbers decrease by one (2.4) [EXC: if ENEMY RE Numbers are currently 2/3 conduct RE 43 instead]

dr ≤ 4: Rumors of U.S. reinforcements on the way. U.S. RE Numbers increase by one (2.4) [EXC: if U.S. RE Numbers are currently 6/7 reroll for another RE]

45 U.S. leader leader turns heroic (A15.21)! Determine affected leader by Random dr among all currently non-Captured, non-Disrupted, non-Heroic on-board non-armor U.S. leaders. If no U.S. leader is eligible reroll for a different RE.

46 U.S. sniper finds a target! Make a subsequent dr to determine the attack type; perform the attack as the first action of the upcoming PFPB:

dr of ≤ 3: conduct a "1" sniper attack (A14.3)

dr of ≥ 4: conduct a "2" sniper attack (A14.3)

*51 Infantry stage a flank attack! Determine the number of squads by a DR. Determine the squad type (all are the same) by a DR (U2). Determine all SMC/SW using H1.8-1.83. Then make a Random dr to determine edge of entry (north or south). All must enter anywhere along the same edge.

*52 Tanks stage a flank attack! Determine the number (A6b), type (U6) and armor leader (U3). All are the same type. Then make a Random dr to determine edge of entry (north or south). All must enter anywhere along the same edge.

*53 U.S. combined-arms flank attack! Conduct U.S. REs 51 and 52 [EXC: use Table A6c to determine the number of AFV received]. All units must enter along the same edge.

*54 Medium "tube" section arrives! Make a dr (A6d) to determine the number of dm 81mm MTRs received, each of which has one 2-2-7 crew. On a subsequent dr of ≤ 2 the mortar section is equipped with transport. If so, make a DR (U7) with a +2 DRM. All transport vehicles are the same type; only enough vehicles are received to carry these RE units/weapons. Transport can be refused if so desired.

*55 FRIENDLY Airstrike! Determine type, presence of bombs and number entering as per E7.21. Each aircraft is eligible to enter in the next ENEMY MPh. Reroll for another RE if current conditions prohibit air support.

*56 AT Gun section arrives! Determine the number (A6e) and type (U5a) (all are the same type). Each Gun is crewed by one 2-2-7. At the player's option each such reinforcing Gun may be Manhandled or Towed onboard. Determine towing vehicle type (U7) (reroll, if necessary, until a vehicle is determined that is able to Tow the Gun type; all such vehicles are the same type).

*61-62 Artillery support granted! Conduct U.S. RE 31-34 (even if it has previously occurred).

63 Go get 'em, boys! All non-Disrupted broken U.S. MMC in the same Location as an unbroken U.S. leader automatically rally. Reroll for a different RE if no MMC are eligible to thusly rally.

64 Tanks! Determine the number (A6d), type(s) (U6) and armor leader (U3). Perform a separate DR (U6) for each AFV received.

65 Tank Destroyers! Determine the number (A6c), type (U6c) and armor leader (U3). All are the same type.

66 Hero! A Hero is immediately created from the U.S. MMC closest to an ENEMY unbroken/vehicular unit. If no such ENEMY unit onboard reroll for a different RE.

*71 AT Gun section arrives! Conduct U.S. RE 56 [EXC: use Table A6f to determine the number of Guns received].

72 Tank Destroyers! Determine the number (A6b), type (U6c) and armor leader (U3). All are the same type.

*73 Gun section arrives! Determine the number (A6d) and type (U5) (use the "Outside" column; all are the same type). Each Gun is crewed by one 2-2-8. At the player's option each such reinforcing Gun may be Manhandled or Towed onboard. Determine towing vehicle type (U7) (reroll, if necessary, until a vehicle is determined that is able to Tow the Gun type; all such vehicles are the same type). Additionally, decrease each ENEMY RE# by one.

*74 ENEMY attack called off! The Attitude of all ENEMY units immediately changes to Hold [EXC: if U.S. RE 75-76 has already occurred conduct U.S. RE 46 instead]. All DR on table A1 now have a +1 DRM; all previous negative DRM applicable on this table are immediately cancelled.

*75-76 Evacuate! Battalion HQ has ordered your command to evacuate their positions, pulling back toward U.S. lines [EXC: if U.S. RE 74 has already occurred reroll for a different RE]. Decrease each U.S. RE# by one. The U.S. side receives Exit VP (A26.3) for each U.S. unit exited off the FBE by Mission end. The ENEMY receives Casualty VP (A26.2) for each Encircled U.S. unit remaining onboard at Mission end; double Casualty VP if U.S. unit is Captured/non-Mobile. Otherwise, the Mission-specific VP schedule still applies. The Mission ends automatically in five Game Turns (counting the current Game Turn as the first of those five turns), or when the last Mobile U.S. unit exits the board configuration (whichever occurs first). Ignore the Mission End method given in the Mission being played.

Mission 1 [Ⓟ]

Cautious Advance

BRIEFING: Your orders are to advance toward and penetrate the enemy lines. Area reconnaissance has established many suspected enemy positions in your sector which have been indicated on your map. As usual, the strength of the enemy is not known but their positions do not appear to be heavily fortified. Specific objectives have been assigned to your unit which must be captured and held.

PREVAILING ATTITUDE (3.2): Hold [A2b]

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		RE Numbers	
DR	SAN #	DR	SAN #	dr	AC#	dr	RE#s
2	7	≤ 5	4	1	2	≤ 2	5/6
3-4	6	6-10	3	2-5	3	3-4	4/5
5-6	5	≥ 11	2	6	4	≥ 5	3/4
7-9	4						
≥ 10	3						

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8a

INITIAL MAPBOARD: One mapboard is determined [A8a] and placed before FRIENDLY offboard setup.

MAPBOARD ACTIVATION: A maximum of two additional mapboards may be activated (one at a time) during play [EXC: as per MSR 2], but only along the (current) EBE. Make a dr whenever a non-broken FRIENDLY unit(s) enters a Location ≤ 5 hexes from any whole hex of the potential mapboard. If the Final dr is > the unit's range to the nearest whole hex of the potential mapboard an additional map is activated [A8a]. There is a +1 drm for each level of elevation the unit is above level 0. If the Final dr is ≤ the range there is no effect.

Initial
Mapboard
Configuration:

VPO LOCATIONS (14.):

As each mapboard (including the Initial) is placed determine the number [A6c] and placement [A10a] of each ENEMY-Controlled VPO on the new mapboard. The value of each VPO is determined only at Mission end [A10b].

S? PLACEMENT/ENTRY (4.):

Place S? as per 4.1, cases a, b and c, at the start of the Mission (before FRIENDLY forces are set up offboard), and as each additional mapboard is activated, if any.

SEQUENCE:

ENEMY-Controlled VPO are determined [A10a] and S? are set up first on the Initial Mapboard. FRIENDLY units are then set up offboard and may enter anywhere along the FBE on/after Turn 1.

The FRIENDLY side moves first.

MISSION END (see also 12.5):

At the end of Game Turn 10, and at the end of each Game Turn thereafter, perform a dr. If the result is ≤ 2 the Mission ends immediately.

VP SCHEDULE (12.6; 9.41, 17.1321):

- Each side gains VP [A10b] for Control of VPO.
- The ENEMY gains VP for Casualty VP gained.
- The FRIENDLY side gains Casualty VP for each ENEMY AFV/Gun eliminated, or currently Captured, at Mission end.
- The FRIENDLY side gains 3 VP per non-Initial mapboard Activated.

MISSION SPECIAL RULES:

1. There is a +1 DRM to each DR on Table A1, and a -1 drm to the colored die of each DR on Table A11.

2. At the beginning of each ENEMY Player Turn in which there are no (partially/wholly) ENEMY-Controlled VPO make a dr on the following Table:

dr	result
≤ 2	No effect
3-4	ENEMY RE*
≥ 5	New mapboard is Activated [A8a] along the EBE.

* In Addition to any ENEMY RE occurring due to the Wind Change DR.

Mission 2 (P)

Pockets

BRIEFING: Your command has received orders to make contact with and wipe out several isolated enemy pockets of resistance that were bypassed in the earlier advance. The continued presence of these holdouts endangers the divisional supply line and is subsequently delaying reinforcements from reaching the front. You have been informed of the approximate locations of several of the pockets. It is of paramount importance that each is dealt with swiftly and efficiently.

PREVAILING ATTITUDE (3.2): Hold [A2b]

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		ENEMY RE Numbers		FRIENDLY RE Numbers		Boobytrap Level	
DR	SAN#	DR	SAN#	dr	AC#	dr	RE#s	dr	RE#s	dr	Level
2	7	2	4	≤ 4	3	1	5/6	1	5/6	1	A
3-4	6	3-5	3	≥ 5	4	2	4/5	2-3	4/5	2-3	B
5-7	5	≥ 6	2			3-4	3/4	≥ 4	3/4	4	C
≥ 9	4					≥ 5	2/3			≥ 5	—

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8a

INITIAL MAPBOARDS: First, make a Random dr to determine one of the two Mapboard Configurations illustrated below. [EXC to 13.23: if the selected Configuration is B, the board number is placed to the east on a dr ≤ 3.] Two mapboards are determined by a separate DR for each [A8a]. No additional mapboards may be activated during play.

Initial Mapboard Configurations:

VPO LOCATIONS (14.):

There are no VPO in this Mission; see also 9.25.

S? PLACEMENT/ENTRY (4.):

Place S? as per 4.1e [EXC: a *minimum* of 15 S? must be initially placed; if not, repeat the entire S? placement procedure (after removing all previously-placed S?)].

SEQUENCE:

S? are set up first on both mapboards. FRIENDLY units are then set up offboard and may enter anywhere along the FBE on/after Turn 1.

The FRIENDLY side moves first.

MISSION END (see also 12.5):

The minimum number of turns is equal to the sum of all S? initially set up onboard divided by 3 (FRU). At the conclusion of each Player Turn starting on this determined turn, make a dr. On a dr of ≤ 2 the Mission ends immediately.

EX: If 25 S? are set up before play begins the minimum turn length is 9 (25 divided by 3 = 8.3; 8.3 [FRU] is 9). Starting at the end of the FRIENDLY Player Turn of Game Turn 9 the Mission can end on a dr of ≤ 2.

VP SCHEDULE (12.6; 9.41, 17.1321):

- Each side gains VP for Casualty VP earned.
- At Mission end the ENEMY gains 2 VP for each S? still on the map. The ENEMY also gains VP (use the standard Casualty VP value; A26.2) for each ENEMY unit/Gun still on the map whether in Good Order or not [EXC: Each such Gun must be ENEMY-possessed; each such vehicle must be non-shocked and have ≥ one armament still functioning].

MISSION SPECIAL RULES:

1. An Enemy RE can occur even if no ENEMY unit has been Activated.

Mission 3 (P)

Recon

BRIEFING: A recent breach of the enemy lines by your unit's division has created an excellent opportunity for exploitation. Your forces are to act in a reconnaissance role to locate and overcome encountered enemy strongpoints. You are scheduled to be reinforced by a selected force from the division's reconnaissance battalion. Furthermore, the Quartermaster is trying to requisition some transport vehicles to speed your advance. Enemy resistance has not been established but is expected to be rather unorganized and scattered.

PREVAILING ATTITUDE (3.2): Hold [A2b]

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		RE Numbers	
DR	SAN	DR	SAN	dr	AC#	dr	RE#s
≤ 3	7	≤ 4	3	≤ 2	2	≤ 3	4/5
4-5	6	≥ 5	2	≥ 3	3	≥ 4	3/4
6-8	5						
≥ 9	4						

MAPBOARD SELECTION AND ACTIVATION (13.):

MAPBOARD SELECTION TABLE: A8e [EXC: A8a is used to determine the FRIENDLY setup board.]

INITIAL MAPBOARDS: Two mapboards are determined before play begins. Use Table A8a to determine the FRIENDLY setup (western-most) mapboard; use Table A8e to determine all other mapboards.

MAPBOARD ACTIVATION: Several additional mapboards may be activated (one at a time) during play, but only along the (current) EBE. Such an additional mapboard is automatically activated whenever a FRIENDLY unit(s) enters a Location within three hexes of any whole hex of the potential mapboard; LOS to a Location of the potential board is not necessary. Further, due to the potential number of mapboards that can be activated during this Mission, the current western-most mapboard is removed at the end of any Game Turn in which there is no Mobile-FRIENDLY/Activated-ENEMY unit currently on it.* Note that this creates a new FBE each time a map is thusly removed. Each Immobile-vehicle/unpossessed-Weapon on such a removed board is lost from play, but the opposing side is not awarded VP for it; reposition any Sniper counter on such a board according to A14.2. There is no limit to the number of boards which may be activated/removed in this manner.

* Side notes should be made if a removed board has ≥ 1 VPO on it so that its (post-game) value can be assessed [A10b].

**Initial
Mapboard
Configuration:**

VPO LOCATIONS (14.):

Determine the number [A6h], and placement [A10a], of each ENEMY-Controlled VPO on each mapboard [EXC: no VPO are marked on the FRIENDLY setup board]. The value of each VPO is determined only at Mission end [A10b].

S? PLACEMENT/ENTRY (4.):

S? are placed as per 4.1c on each mapboard determined on Table A8e (only).

SEQUENCE:

ENEMY-Controlled VPO are determined and S? are placed. FRIENDLY forces are then set up on the westernmost mapboard. All FRIENDLY units may begin the Mission Concealed.

The FRIENDLY side moves first.

MISSION END (see also 12.5):

At the end of Game Turn 10, and at the end of each even-numbered Game Turn thereafter, perform a dr. A Final dr of ≤ 1 results in the Mission ending immediately. There is a -1 dr for every two boards activated using Table A8e.

VP SCHEDULE (12.6; 9.41, 17.1321):

- Each side gains VP [A10b] for Control of VPO.
- The ENEMY gains VP for Casualty VP earned.
- During the Mission the FRIENDLY side gains VP for the activation of each new mapboard as well as certain ENEMY units/Weapons/fortifications, according to the following schedule:

Activated item	VP award
Each non-Initial Mapboard	2
Each ENEMY AFV/Gun	2
Each Pillbox/Trench/Minefield/fortified-building Location	1

MISSION SPECIAL RULES:

- An ENEMY RE can occur even if no ENEMY unit has been Activated.
- The ENEMY RE#s are subject to increase [EXC: if already 6/7] at the conclusion of each Game Turn divisible by 5 (e.g., Turns 5, 10, 15, etc.). Make a dr: the ENEMY RE#s increase by one if the dr is > the lower of the two current ENEMY RE#s; otherwise there is no effect.

EX: The current ENEMY RE# is 5/6. A dr of 6 will be necessary to increase the ENEMY RE# to 6/7 ("6" is > "5", which is the lower of the two current ENEMY RE numbers).

- Before setup, make a DR [x7] to determine the type of Transport vehicles granted to your unit [EXC: consider a result of "Wagon" as "None"]. Your unit is granted 6 (or less if < 6 are in a standard counter mix) of this vehicle type. Next, make a DR [x6b] to determine the type of Recon vehicle, and a dr [A6f] to determine the number received (all are the same type). No armor leader(s) [x3] may be generated for any vehicles received due to this MSR. Any/all vehicles (Transport/Recon) may be refused after determination.

Mission 4

Bunker Busting

BRIEFING: The expected offensive opens today! Your command has received orders to create a breach in the enemy's forward positions through which follow-up units can advance. Reconnaissance reports indicate that the enemy has fortified his frontline with numerous static positions. To assist you in silencing the strongpoints, your unit has at its disposal a supporting section specially equipped with bunker assaulting capabilities. Naturally, speed is of the essence.

PREVAILING ATTITUDE (3.2): Hold [A2b]

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		ENEMY RE Numbers		FRIENDLY RE Numbers		Boobytrap Level	
DR	SAN #	DR	SAN #	dr	AC#	dr	RE#s	dr	RE#s	dr	Level
≤3	7	≤4	4	≤2	2	1	5/6	≤2	5/6	≤2	A
4-5	6	5-8	3	≥3	3	2-3	4/5	3-4	4/5	3	B
6-7	5	≥9	2			4-5	3/4	≥5	3/4	4	C
8-9	4					6	2/3			≥5	—
≥10	3										

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8c

INITIAL MAPBOARDS: First, make a Random dr to determine one of the two Mapboard Configurations illustrated below. [EXC to 13.23: if the selected configuration is B, the board number is placed to the *east* on a dr ≤ 3.] Next, two mapboards are determined by a separate DR for each [A8c]. No additional mapboards may be activated during play.

Initial Mapboard Configuration:

VPO LOCATIONS (14.):

Each fortification (including a Fortified Building Location; B23.9) *Activated* [A5] during the Mission is a VPO (see Victory Determination for the VP value of each). No other VPO exist.

S? PLACEMENT/ENTRY (4.):

Place S? as per 4.1, cases a and b.

SEQUENCE:

S? are set up first on both mapboards. FRIENDLY units are then set up offboard and may enter anywhere along the FBE on/after Turn 1. The FRIENDLY side moves first.

MISSION END (see also 12.5):

At the end of Game Turn 10, and at the end of each Game Turn thereafter, perform a dr. If the result is ≤ 1 the Mission ends immediately. There is a -1 drm for each Game Turn completed after Game Turn 10.

VP SCHEDULE (12.6; 9.41, 17.1321):

• Each side gains VP for Control of VPO Locations equal to that fortification's highest TEM (for Direct Fire) times its normal Infantry stacking capacity.

EX: A 15 Foxhole is worth two VP (2 x 1); a Fortified stone building Location is worth twelve points (3 x 4); a 2+5+7 bunker is worth fourteen points (7 x 2).

- The ENEMY gains VP for Casualty VP earned.
- The ENEMY automatically gains a number of "pre-game" VP for FRIENDLY reinforcements received due to MSR 3 (if any) equal to that table's reinforcement dr.
- The FRIENDLY side gains Casualty VP for each ENEMY AFV/Gun eliminated, or currently Captured at Mission end.
- The ENEMY gains 1/2 VP per S? remaining onboard at Mission end.

MISSION SPECIAL RULES:

1. There is a +2 DRM to each DR on Table A1, a -1 drm to each dr on Table A5, and a -1 drm to the colored die of each DR on Table A11 and x9.
2. Each Final *even* DR on the ENEMY Activation Table [A1] indicates the possibility of a fortification being Activated (as if "F" were listed in the Table A1 result; 5.74); make a subsequent dr [A5].
3. Before FRIENDLY setup make a dr on the following table to determine FRIENDLY optional reinforcements; after all such reinforcements are determined the player may opt to keep them *as a group* (allowing the ENEMY a pregame VP gain; see VP Schedule) or play the Mission without them.

dr Assault unit reinforcements

- 1 Assault Engineer section¹
- 2 Assault Engineer platoon²
- 3 A number [A6c] of Assault vehicle(s) [x6a]; all are the same type³
- 4 A number [A6f] of Assault vehicle(s) [x6a]; all are the same type³
- 5 As per dr of 2 and 3 of this table
- 6 As per dr of 2 and 4 of this table

¹ Each Assault Engineer section consists of 2 FRIENDLY elite squads (use the type with the highest inherent FP factor); 1 leader (x3; normal DRM apply; reroll, as necessary, until a leader is determined); 2 DC and 1 FT. Each such Combat Engineer squad has a Smoke Exponent factor of 3 (regardless of nationality).

² Each Assault Engineer platoon consists of 3 FRIENDLY elite squads (use the type with the highest inherent FP factor); 1 leader (x3; normal DRM apply; reroll, as necessary, until a leader is determined); 3 DC and 2 FT. Each such Combat Engineer squad has a Smoke Exponent factor of 3 (regardless of nationality).

³ DR [x3] for possible FRIENDLY armor leader is permitted (5.711).

Mission 5 (P)

Take the Highway

BRIEFING: Your unit has been given the important assignment of clearing the road leading eastward out of your sector. As you advance along the road all enemy resistance encountered must be eliminated. You must also take care that the road remains safe and passable to friendly units. Successful completion of the task is vital to the success of a planned assault to be launched imminently by elements now forming to the rear.

PREVAILING ATTITUDE (3.2): Hold (A2b)

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		ENEMY RE Numbers		FRIENDLY RE Numbers	
DR	SAN #	DR	SAN #	dr	AC#	dr	RE#s	dr	RE#s
≤ 3	6	≤ 3	4	≤ 2	2	≤ 3	4/5	1	5/6
4-6	5	4-7	3	≥ 3	3	≥ 4	3/4	2-4	4/5
7-10	4	≥ 8	2					≥ 5	3/4
≥ 11	3								

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8e

INITIAL MAPBOARDS: Three mapboards are determined (A8e) before play begins. Each mapboard must be placed such that a Road Network (13.231) exists from the FBE to the EBE. A -1 DRM applies to each mapboard determination DR (A9). No additional mapboards may be activated during play.

Initial Mapboard Configurations:

VPO LOCATIONS (14.):

There are no VPO in this Mission; see also 9.25.

S? PLACEMENT/ENTRY (4.):

Place one S? in each building/woods Location [EXC: 4.11-13] within a radius {A6f} of hexes of each "Intersection" hex of the Road Network on each mapboard. For purposes of this Mission, an "Intersection" hex is defined as any hex with ≥ 3 road hexsides (i.e., a hexside crossed by a road depiction). Only one S? may be placed per Location if an overlap occurs. If no Concealment Terrain Locations are within that range, no S? are placed. Regardless of the range, a S? is set up in the Intersection hex if such is Concealment Terrain.

SEQUENCE:

S? are set up first on each mapboard. FRIENDLY units are then set up offboard and may enter anywhere along the FBE on/after Turn 1.

The FRIENDLY side moves first.

MISSION END (see also 12.5):

The minimum number of turns is equal to the length of the shortest (if > one exists) Road Network (in road whole/half hexes) divided by five (FRU). At the conclusion of each Player Turn starting on this determined turn, make a dr. On a dr of ≤ 3 the Mission ends immediately.

EX: If the Road Network is 43 hexes in length from FBE to where it exits the EBE, the minimum turn length is 9 (43 divided by 5 = 8.6; 8.6 [FRU] is 9). Starting at the end of the FRIENDLY Player Turn of Game Turn 9 the Mission can end on a dr of ≤ 3.

VP SCHEDULE (12.6; 9.41, 17.1321):

- The ENEMY gains VP for Casualty VP earned.
- At Mission end the ENEMY gains 1 VP for each ENEMY unbroken-unit/S? within four hexes of any Location of the Road Network.
- The FRIENDLY side gains 1/2 VP for each Road Network hex that is FRIENDLY Controlled, "connected" to the FBE via a contiguous string of other FRIENDLY-Controlled Road Network hexes, and not within Normal Range and LOS of any armed, unbroken ENEMY unit. Such a unit's Normal Range can be extended by the Normal Range of a fully-manned and functioning Weapon. For the purposes of this VP Schedule, the maximum Normal Range of any Ordnance Weapon is considered to be 16 hexes; furthermore, a S? is considered to be an unbroken unit and to have the range of an ENEMY First Line infantry squad (the type with the greatest range if > one first line type is available).

MISSION SPECIAL RULES:

1. There is a -1 drm to the colored die of each DR on Table A11.
2. An ENEMY RE can occur even if no ENEMY unit has been Activated.

Mission 6

The Fortress

BRIEFING: Over the past several weeks struggle for control of the city has been fierce and bloody. Now, after several days of particularly vicious fighting, an important enemy-held building lies within our reach. Your company has been brought out of reserve in order to make good its capture; one concentrated push should put it in your hands. Since heavy resistance is expected, you should use as much stealth as possible when approaching the objective. To assist in the final assault you have been reinforced by a platoon of specially trained combat engineers. Your men are to break through to, capture, and hold the objective; all other concerns are secondary.

PREVAILING ATTITUDE (3.2): Hold {A2b}

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		RE Numbers	
DR	SAN #	DR	SAN #	dr	AC#	dr	RE#s
≤ 3	7	≤ 3	4	≤ 2	2	≤ 2	5/6
4-5	6	4-6	3	≥ 3	3	3-4	4/5
6-8	5	≥ 7	2			5	3/4
≥ 9	4					6	2/3

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8b & A9 "City" column

INITIAL MAPBOARDS: Two mapboards are determined. Use Table A8b to determine the western-most map. Use the "City" column of Table A9 to determine the eastern-most mapboard. No additional mapboards may be activated during play. Once both mapboards have been determined and aligned, make a dr. On a dr ≤ 3 only the northern half of the mapboard configuration is in play (excluding hexrow Q); on a dr ≥ 4 only the southern half of the mapboard configuration is in play (excluding hexrow Q).

**Initial
Mapboard
Configuration:**

VPO LOCATIONS (14.):

Determine one VPO on the eastern-most mapboard (only) using the chart below (choose the VPO that is present on the half of the mapboard in play). This building is the only VPO of the Mission and is the "Fortress" building.

Mapboard	Fortress
1	J4 or BB4
20	H3 or AA4
21	G7 or P7*
22	H4 or W8
23*	F3 or Y7

* All bridges are automatically intact (ignore 13.5).

* Ignore rowhouse wall depictions in building 21P7.

S? PLACEMENT/ENTRY (4.):

Place S? on both mapboards as per 4.1a and 4.1c (see also 4.12 {A9e} for S? placement on each mapboard with ≥ 19 rubble-Locations/buildings).

SEQUENCE:

S? are set up first. FRIENDLY units are then set up offboard and may enter anywhere along the FBE on/after Turn 1.

The FRIENDLY side moves first.

MISSION END (see also 12.5):

The minimum number of turns is equal to the sum of all S? initially set up onboard divided by 5 (FRU). At the conclusion of each Player Turn starting on this determined turn, make a dr. On a dr of ≤ 3 the Mission ends immediately.

EX: If 49 S? are set up before play begins the minimum turn length is 10 (49 divided by 5 = 9.8; 9.8 [FRU] is 10). Starting at the end of the FRIENDLY Player Turn of Game Turn 10 the Mission can end on a dr of ≤ 3.

VP SCHEDULE (12.6; 9.41, 17.1321):

The FRIENDLY side wins *only* if all Locations of the "Fortress" (see VPO Locations, above) are FRIENDLY-Controlled at Mission end.

MISSION SPECIAL RULES:

1. There is a +2 DRM to each DR on Table A1, and -1 drm to the colored die of each DR on Table A11 and x9.

2. **DEVASTATED CITY:** Before setup make a dr: if the result is ≥ 4 the city is considered Devastated [EXC: If playing a CG and each mapboard of the *previous* Mission was "Built-up" (4.12), the mapboard is automatically Devastated]. If Devastated, the player performs a Bombardment (C1.8) for rubble/fire (C1.822-.823, respectively) determination *only*; i.e., no units will be affected as there will be none onboard [EXC: All Locations of the "Fortress" building are exempted from rubble/fire created by this method]. ENEMY S? may not be setup in an upper-level Location which cannot be reached from ground level due to stairwell rubble.

3. All Locations of the "Fortress" are Fortified (see VPO Locations). Each ENEMY Infantry unit in a "Fortress" Location is Fanatic.

4. The FRIENDLY side is reinforced by three Combat Engineer squads and one leader {x3; a Cumulative -2 DRM applies; reroll, as necessary until a leader is determined}, three DC and one FT. Each such Combat Engineer squad has a Smoke Exponent of 3 (regardless of nationality).

Mission 7

Block Party

BRIEFING: The enemy's resolve has stiffened considerably since their fanatical soldiers now have brick and fortified concrete walls around them. Nevertheless, your parent division has been ordered to annihilate all enemy resistance in its sector of the city, and your company must do its part. Your unit, reinforced with a specially-equipped assault detachment, is to capture and hold all enemy-held buildings and fortification to their immediate front. Plans call for your men to advance the friendly lines at least 400 to 500m eastward.

PREVAILING ATTITUDE (3.2): Hold [A2b]

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		ENEMY RE Numbers		FRIENDLY RE Numbers		Boobytrap Level	
DR	SAN#	DR	SAN#	dr	AC#	dr	RE#s	dr	RE#s	dr	Level
≤ 3	7	≤ 4	4	≤ 2	3	1	5/6	≤ 2	5/6	≤ 2	A
4-5	6	5-10	3	≥ 3	4	2-3	4/5	3-4	4/5	3	B
6-7	5	≥ 11	2			4-5	3/4	≥ 5	3/4	4	C
8-9	4					6	2/3			≥ 5	-
≥ 10	3										

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: No roll is necessary on Table A8; instead, automatically make a DR using the "City" column of Table A9 to determine the mapboard.

INITIAL MAPBOARDS: One mapboard is determined. [EXC to 13.23: the board number is placed to the east on a dr ≤ 3; otherwise it is toward the west.] No additional mapboards may be activated during play.

Initial Mapboard Configuration:

N

VPO LOCATIONS (14.):

There are no VPO in this Mission; see also MSR 2.

S? PLACEMENT/ENTRY (4.):

Use Table A9e to place S?.

SEQUENCE:

S? are set up first on the mapboard, FRIENDLY units are then set up offboard and may enter anywhere along the FBE on/after Turn 1.

The FRIENDLY side moves first.

MISSION END (see also 12.5):

At the end of Game Turn 8, and at the end of each Game Turn thereafter, perform a dr. If the result is ≤ 2 the Mission ends immediately.

VP SCHEDULE (12.6; 9.41, 17.1321):

- The ENEMY gains VP for Casualty VP earned.
- The ENEMY automatically gains a number of "pre-game" VP equal to the number of squads received due to MSR 3 (if any).
- The ENEMY automatically gains 3 "pre-game" VP if the FRIENDLY player opts to receive reinforcements due to MSR 4.
- The FRIENDLY side gains 3 VP for each "City Block" devoid of all unbroken opposing non-SMC unit(s) at Mission end. A "City Block" is any group of non-road hexes (for purposes of this definition ignore graveyard roads) containing ≥ 3 building Locations and that are completely encircled by (a combination of) road/water-Obstacle/board-edge hexes.

EX. On mapboard 1, building F5 (12 building Locations) occupies a City Block, surrounded by the roads from D5 to J4 to I6 to F7. The buildings surrounded by road F7-J6-J6-J8-J9 are not a City Block, however, as that area does not contain ≥ 3 building Locations. For the same reason, the area enclosed by the roads and board edges from A6-C6-D5-F7-I9-I10-A10 is not a City Block, as only 3 building Locations are enclosed therein.

On board 23, the Canal (water Obstacle) helps to define the following City Blocks: E6-H4-P7-P8-L8-E8 (containing 9 building Locations), or the area A7-B3-F1-H4-E6-E8-I10-A10 (containing 30 building Locations).

MISSION SPECIAL RULES:

1. There is a +1 DRM to each DR on Table A1, and a -1 dr to the colored die of each DR on Table A11 and x9.
2. EXC to 9.25: Consider the nearest FRIENDLY-Controlled building Location to be a VPO for ENEMY Move Command purposes.
3. Before FRIENDLY setup make a dr on the following table to determine FRIENDLY optional reinforcements; after such reinforcements are determined the player may opt to keep them as a group (allowing the ENEMY a pregame VP gain; see VP Schedule) or play the Mission without them.

dr	Assault unit reinforcements
≤ 3	Assault Engineer platoon ¹ (3)
≥ 4	Assault Engineer section ² (2)

¹ The Assault Engineer platoon consists of three FRIENDLY elite squads (use the type with the highest inherent FP factor); one leader (x3; a Cumulative -2 DRM applies; reroll, as necessary, until a leader is determined); three DC and two FT. Each such Combat Engineer squad has a smoke exponent factor of 3 (regardless of nationality).

² The Assault Engineer section consists of two FRIENDLY elite squads (use the type with the highest inherent FP factor); one leader (x3; a Cumulative -2 DRM applies; reroll, as necessary, until a leader is determined); two DC and one FT. Each such Combat Engineer squad has a smoke exponent factor of 3 (regardless of nationality).

4. The FRIENDLY side may opt to supplement his starting OB (allowing the ENEMY a pregame VP gain; see VP Schedule) with either one OBA module or a SPG section [EXC: if the FRIENDLY nationality does not have an SPG Generation chart {x6a} only OBA may be selected].

If the OBA module is chosen, determine the OBA's type by a DR on the FRIENDLY nationality's Chapter H "OBA Availability Chart"; also determine ammunition availability {x8}. The player may also supplement his OB with a FRIENDLY 8-0 leader and a radio.

If the SPG section is chosen instead, make a DR on the FRIENDLY SPG Generation Table {x6a} to determine the SPG type, and a dr [A6b] to determine the number received (all are the same type). Once determined, the OBA/Gun(s) may not be refused.

5. **DEVASTATED CITY:** Before setup make a dr: if the result is ≥ 5 the city is considered Devastated [EXC: If playing a CG and each mapboard of the previous Mission was "Built-up" (4.12), the city is automatically Devastated]. If Devastated, the player performs a Bombardment (C1.8) for rubble/fire (C1.822-823, respectively) determination only; i.e., no units will be affected as there will be none onboard. ENEMY S? may not be setup in an upper-level Location which cannot be reached from ground level due to stairwell rubble.

6. Each ENEMY fully-tracked AFV Activated from Table A1 in a building/rubble Location is Dug In (D9.5-.53); a BMG of a Dug in AFV is automatically Disabled.

Mission 8

Patrol

BRIEFING: Your company is on patrol, advancing down the road in column. As your lead unit rounds a curve it signals for an abrupt halt—an enemy patrol is approaching along the same road! A quick exchange of fire occurs as units on both sides scurry for the nearest cover. The action begins...

PREVAILING ATTITUDE (3.2): Advance {A2a} (see MSR3)

MISSION TABLES (12.32):

ENEMY/FRIENDLY SAN		ENEMY AC#		RE Numbers	
DR	SAN #	dr	AC#	dr	RE#s
≤ 4	4	≤ 3	3	≤ 2	4/5
5-8	3	≥ 4	4	3-5	3/4
≥ 9	2			6	2/3

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8*

* The specific [A8] table used for all boards is determined by Random dr. Use the same table to determine all mapboards generated for the Mission.

INITIAL MAPBOARDS: Two mapboards are determined [A8] before play begins. No additional mapboards may be activated during play. Boards must be placed such that a single Road Network (13.231) exists from the FBE to the EBE.

**Initial
Mapboard
Configuration:**

VPO LOCATIONS (14.):

There are no VPO in this Mission; see also 9.25.

S? PLACEMENT/ENTRY (4.):

The ENEMY begins the Mission with an offboard pool of S? equal to $\frac{2}{3}$ (FRU) of the total US# (A1.6) of all FRIENDLY units in the player's at-start OB.

S? ENTRY: S? (and FRIENDLY units) enter in pre-game "impulses" column as per MSR 1 and 2.

SEQUENCE:

See MSR 2.

MISSION END (see also 12.5):

At the end of Game Turn 8, and at the end of each Game Turn thereafter, make a dr. If the result is ≤ 1 the Mission ends immediately. There is a -1 dr for each complete Game Turn completed after Game Turn 8.

VP SCHEDULE (12.6; 9.41, 17.1321):

- Both sides gain VP for Casualty VP earned.
- The ENEMY earns Exit VP for ENEMY units exited off the FBE. See also 9.41.

MISSION SPECIAL RULES:

1. COLUMN SETUP: All at-start FRIENDLY and ENEMY units must set up and enter in column (E11.5) on a road hex (of their respective entry edge) of the Road Network. Determine the Road Network entry hex by a Random dr (if > 1 exists on that board edge). S? set up offboard in one column (with the two lead S?s of the column ADJACENT to the EBE Road Network entry hex), two S? per Location of the column; any odd S? sets up at column end (i.e., if 19 S? are in the column, the column will be 10 hexes long, with a single S? in the last hex of the column). A vehicle may later be generated from a (former) column S?. FRIENDLY units set up offboard in one column normally (E11.5), with the lead stack of the FRIENDLY column ADJACENT to the FBE Road Network entry hex.

2. COLUMN PREGAME MOVEMENT: Before the Mission begins the lead stack of each column is moved in alternate "impulses" toward the opposite board edge (from edge entered) along the Road Network with the ENEMY having the first "impulse", then FRIENDLY, then ENEMY, etc. The remainder of each column is then moved in sequence behind its lead stack along the Road Network. At an intersection a column must take the road that will insure it of "bumping into" the opposing column (otherwise by Random dr). At the end of any impulse in which LOS has been established between opposing-column units all such in-LOS stacks are revealed. Each such FRIENDLY stack loses concealment [EXC to E11.54]; each such S? (only) is automatically successfully Activated (no AC dr {x1} is made), and each column is immediately Disbanded. These are the positions of units at Mission start (see also MSR 3). Sniper counters are now placed and a Random dr (Δ) is made to determine the side moving first. The "Defender" column is not pinned (as per E11.536).

3. OFFBOARD UNITS: Each ENEMY/FRIENDLY stack still offboard when play commences enters on/adjacent to the board-edge Road Network hex (it would have entered) as reinforcement(s) on/after turn 1.

Mission 9

Enemy Offensive

BRIEFING: The past several weeks have been quiet—almost too quiet. Fortunately, your unit has had ample time and materiel to augment its defensive positions, currently arrayed on a frontage of approximately one km. Increased enemy activity in the divisional area and reconnaissance reports seem to indicate an imminent enemy attack; its strength and timing, however, cannot be predicted. Several key objectives are within your defensive area, each of which must be vigorously defended. Your command must be prepared to hold its sector against each enemy probe or major attack.

PREVAILING ATTITUDE (3.2): Advance {A2a}

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		RE Numbers	
DR	SAN #	DR	SAN #	dr	AC#	dr	RE#s
≤ 3	4	≤ 3	6	≤ 2	2	≤ 2	5/6
4-7	3	4-5	5	≥ 3	3	3-4	4/5
≥ 8	2	6-9	4			≥ 5	3/4
		≥ 10	3				

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8e

INITIAL MAPBOARDS: Three mapboards are determined (A8e) before play begins [EXC: On a dr of ≤ 2 the westernmost board (only) uses Table A8b]. A -1 DRM applies to each mapboard determination DR [A9]. No additional mapboards may be activated during play.

**Initial
Mapboard
Configuration:**

VPO LOCATIONS (14.):

Before setup make a separate dr {A6e} for the two western-most mapboards to determine the number of FRIENDLY-Controlled VPO {A10a} to be marked on each. The value of each VPO is determined only at Mission end {A10b}.

S? PLACEMENT/ENTRY (4.):

The ENEMY begins the Mission with an offboard pool of S? equal to the total US# (A1.6) of all FRIENDLY units in the player's at start OB.

S? ENTRY: At the start of each ENEMY RPh in which there is ≥ one unentered S? remaining in the ENEMY's offboard S? pool make a DR [EXC: a DR+3 enter on turn 1]. This sum is the number of S? from the offboard pool which enter during the ENEMY MPh along the EBE according to rule 4.21.

SEQUENCE:

FRIENDLY units and fortifications are set up on the two western-most mapboards. Any number of FRIENDLY units may be held offboard as desired. See also MSR 2, 3 and 4.

The ENEMY side moves first.

MISSION END (see also 12.5):

At the end of Game Turn 7, and at the end of each Game Turn thereafter, make a dr. If the result is ≤ 1 the Mission ends immediately. There is a -1 drm for each complete Game Turn completed after Game Turn 7.

VP SCHEDULE (12.6; 9.41, 17.1321):

- The FRIENDLY side gains 3 VP for each Game Turn completed *after* Game Turn 7.
- Each side gains VP {A10b} for Control of VPO.
- The ENEMY gains VP for Casualty VP earned, as well as Exit VP for ENEMY units exited off the FBE (9.41).

MISSION SPECIAL RULES:

1. There is a +1 drm to the colored die of each DR on Table A11 and x9.
2. Before setup make a dr on the following table to determine the number of DYO Fortification points (H1.6) received by the FRIENDLY side. All fortifications listed on the H1.6 table are available for purchase, as well as the use of A-T Mine factors as a Daisy Chain (B28.531; maximum five A-T factors).

dr	DYO Fortif. Pts.
1	120
2	110
3	100
4	90
5	80
6	70

3. The FRIENDLY side may opt to supplement his starting OB with a Gun section. Make a DR on the FRIENDLY Gun Generation Table {x5; "Outside" column} *or* AT Gun Generation Table {x5a} (at player's option) to determine the Gun type, and a dr {A6f; applying drm, below, if applicable} to determine the number received (all are the same type). Each Gun comes with one Infantry crew. Once determined the Gun(s) may not be refused.

Table A6f drm:

- +1 if ≥ 110 DYO Fortification points were received
- 1 if ≤ 80 DYO Fortification points were received

4. At the player's option, each/any FRIENDLY Gun received for initial setup (as per MSR 3) may have a transport vehicle determined for it. Make a DR on the FRIENDLY Transport Generation Table {x7}. Reroll, as necessary, until a vehicle is determined that is capable of towing the Gun type. Each transport vehicle must be of the same type.
5. Once all FRIENDLY setup is complete, determine the number {A6c} of Artillery Strike(s) (8.7) the ENEMY receives commencing on the ENEMY Player Turn of Game Turn 1.
6. No FRIENDLY unit may move/advance [EXC: rout] until ≥ one ENEMY unit is Activated/Known.

Mission 10

Hold The Line

BRIEFING: Your company must hold its perimeter against an expected enemy attack until scheduled reinforcements arrive on the scene. Your out-numbered men may be hard-pressed to withstand the onslaught and, to make matters worse, HQ can not tell you how long you must wait until the promised "fire brigade" arrives. If the defensive line in your sector is breached, it could very well cause the collapse of the division's entire defensive line. The enemy assault *must* be repulsed!

PREVAILING ATTITUDE (3.2): Advance {A2a}

MISSION TABLES (12.32):

ENEMY SAN	FRIENDLY SAN	ENEMY AC#	RE Numbers
DR SAN #	DR SAN #	dr AC#	dr RE#s
≤ 4 4	≤ 3 6	1 2	≤ 2 5/6
5-7 3	4-5 5	2-4 3	3-4 4/5
≥ 8 2	6-8 4	≥ 5 4	≥ 5 3/4
	≥ 9 3		

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8e

INITIAL MAPBOARD: Two mapboards are determined [A8e] before play begins [EXC: the DR {A8e} for the western-most board has a -2 DRM]. A -1 DRM applies to each mapboard determination DR [A9]. No additional mapboards may be activated during play.

**Initial
Mapboard
Configuration:**

VPO LOCATIONS (14.):

There are no VPO in this Mission; see also 9.25.

S? PLACEMENT/ENTRY (4.):

The ENEMY begins the Mission with an offboard pool of S? equal to 1 1/2 (FRD) times the total US# (A1.6) of all FRIENDLY units in the player's *at-start* OB [EXC: each unit granted due to MSR 3/4 is *not* considered in the total].

S? ENTRY: At the start of each ENEMY RPh in which there is ≥ one unentered S? remaining in the ENEMY's offboard S? pool make a DR+4. This sum is the number of S? from the offboard pool which enter during the ENEMY MPH along the EBE according to rule 4.21.

SEQUENCE:

FRIENDLY units and fortifications are set up first on the western-most mapboard [EXC: ≤ 3 MMC (and all Weapons/SMC set up in the same Location) may set up HUP on *either* mapboard]. See also MSR 2, 3 and 4. The ENEMY side moves first.

MISSION END (see also 12.5):

At the start of FRIENDLY Player Turn 6, and at the start of each FRIENDLY Player Turn thereafter, make a Reinforcement dr. On a Final Reinforcement dr of ≤ 1 the FRIENDLY reinforcements (see MSR 7) arrive in the upcoming MPH. There is a -1 drm for each complete Game Turn completed after Game Turn 5. The game will last for four more complete Game Turns thereafter. [EXC: See also "Special Automatic Victories", below.]

EX: If the player rolls a Final Reinforcement dr of ≤ 1 at the conclusion of Game Turn 10, the game will end at the end of Game Turn fourteen.

VP SCHEDULE (12.6; 9.41, 17.1321):

SPECIAL AUTOMATIC VICTORIES: The ENEMY side wins immediately if it amasses ≥ 25 VP (in Exit and Casualty VP; A26.2-3). The FRIENDLY side wins at Game end if no ENEMY unit has exited off the FBE. If neither of these conditions are met, use the following VP schedule and the standard (12.6) victory conditions:

- The FRIENDLY side gains 3 VP for each Game Turn completed after Game Turn 6.

- The ENEMY gains VP for Casualty VP earned, as well as Exit VP for ENEMY units exited off the FBE (9.41).

MISSION SPECIAL RULES:

1. There is a +1 drm to the colored die of each DR on Table A11 and x9.
2. Before setup make a dr on the following table to determine the number of DYO Fortification points (H1.6) received by the FRIENDLY side. All fortifications listed on the H1.6 table are available for purchase, as well as the use of A-T Mine factors as a Daisy Chain (B28.531; maximum six A-T factors).

dr	DYO Fortif. Pts.
1	70
2	60
3	50
4	40
5	30
6	20

3. The FRIENDLY side may opt to supplement his starting OB with either an OBA module *or* a Gun section. Once determined, the OBA/Gun(s) may not be refused. [Note: Each unit(s) granted due to this MSR is not counted in the US# total of FRIENDLY units to determine entering S?.]

If the OBA module is chosen, determine the OBA's type by a DR on the FRIENDLY nationality's Chapter H "OBA Availability Chart"; also determine ammunition availability [x8]. The player may also supplement his OB with a FRIENDLY 8-0 leader and a radio (or Field Phone).

If the Gun section is chosen, make a DR on the FRIENDLY Gun Generation Table {x5; "Outside" column} or on the FRIENDLY AT Generation Table {x5a} (player's option) to determine the Gun type, and a dr (A6f; applying drm, below, if applicable) to determine the number received (all are the same type). Each Gun comes with one Infantry crew.

Table A6f drm:

- +1 if ≥ 60 DYO Fortification points were received
- 1 if ≤ 30 DYO Fortification points were received

4. At the player's option, each/any FRIENDLY Gun received for initial setup (as per MSR 3) may have a transport vehicle determined for it. Make a DR on the FRIENDLY Transport Generation Table {x7}. Reroll, as necessary, until a vehicle is determined that is capable of towing the Gun type. Each transport vehicle must be of the same type.
5. Once all FRIENDLY setup is complete, determine the number {A6h} of Artillery Strike(s) (8.7) the ENEMY receives commencing on the ENEMY Player Turn of Game Turn 1.
6. EXC to 9.25: Consider the nearest (in hexes) FBE hex to be the nearest FRIENDLY-occupied VPO for ENEMY Move Command purposes (only).
7. In addition to any FRIENDLY RE reinforcements (if any), the FRIENDLY reinforcements which enter the game (see Mission End) enter on the FBE during the FRIENDLY MPH/APH they first become available, and consist of the following units (do not determine until their turn of entry):

- Make five dr to determine the *number* of FRIENDLY squads, then make one DR {x2} to determine squad type;
- A number of leaders and SW, determined as per H1.8-.83;

EX: Assume the FRIENDLY side is German in August 1942. To determine the number of FRIENDLY reinforcement squads received, the player makes dr of 4, 2, 6, 5 and 3. Summing these five dr, the player receives 20 squads. He then makes a Final DR of 6 {G2}, defining the reinforcement squad type as 4-6-7, rendering an Equivalent (H1.74) number of 20 as well. The leaders and SW received are then determined as per H1.81-.83.

Mission 11

Tank Attack!

BRIEFING: Throughout the long night your troops have slept fitfully, hearing the ominous sound of rumbling engines and squealing tracks in the direction of the enemy lines. Knowing that this is a portent of things to come, you visit your soldiers' entrenchments to encourage their steadfastness as they check and clean their weapons. Suddenly, out of the dismal gloom, enemy artillery shells begin whistling down, rudely cracking the morning open. The enemy offensive cannot be far off.

PREVAILING ATTITUDE (3.2): Advance [A2a]

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		ENEMY RE Numbers		FRIENDLY RE Numbers	
DR	SAN #	DR	SAN #	dr	AC#	dr	RE#s	dr	RE#s
≤ 3	4	2	6	≤ 3	3	≤ 3	5/6	1	5/6
4-5	3	3-4	5	≥ 4	4	4-5	4/5	2-3	4/5
≥ 6	2	5-7	4			6	3/4	≥ 4	3/4
		≥ 8	3						

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8c/d/e*

INITIAL MAPBOARDS: Three mapboards are determined [A8c/d/e]* before play begins. A -1 DRM applies to each mapboard determination DR [A9]. No additional mapboards may be activated during play.

* The player may freely select which (of the listed A8 Tables) to use to determine each mapboard.

**Initial
Mapboard
Configuration:**

VPO LOCATIONS (14.):

There are no VPO in this Mission; see also 9.25.

S? PLACEMENT/ENTRY (4.):

The ENEMY begins the Mission with an offboard pool of S? equal to 1/2 (FRU) of the total US# (A1.6) of all FRIENDLY units in the player's at-start OB (but not including possible RE reinforcements).

S? ENTRY: At the start of each ENEMY RPh in which there is ≥ one unentered S? remaining in the ENEMY's offboard S? pool make a DR. This DR gives the number of S? chosen from the offboard pool to enter during the ENEMY MPh along the EBE according to rule 4.21. See also MSR 7.

SEQUENCE:

FRIENDLY units are set up first on the two western-most mapboards. Any number of FRIENDLY units may be held offboard as desired. See also MSR 2, 3 and 4.

The ENEMY side moves first.

MISSION END (see also 12.5):

At the end of Game Turn 10, and at the end of each Game Turn thereafter, make a dr. If the result is ≤ 1 the Mission ends immediately. There is a -1 drm

for each Game Turn completed after Game Turn 10.

VP SCHEDULE (12.6; 9.41, 17.1321):

- The FRIENDLY side gains one VP for each Game Turn completed after Game Turn 10.
- The FRIENDLY side gains Casualty VP for each ENEMY AFV destroyed, and one VP for each ENEMY AFV Immobilized/Abandoned/Shocked (but not Bogged) at Mission end.
- The ENEMY gains VP for Casualty VP earned, as well as Exit VP for ENEMY units exited off the FBE (see 9.41).

MISSION SPECIAL RULES:

1. There is a +1 drm to the colored die of each DR on Table A11 and x9.
2. Before setup make a dr on the following table to determine the number of DYO Fortification points (H1.6) received by the FRIENDLY side. All fortifications listed on the H1.6 table are available for purchase, as well as the use of A-T Mine factors as a Daisy Chain (B28.531; maximum 8 A-T factors).

dr	DYO Fortif. Pts.
≤ 2	70
3-4	50
≥ 5	30

3. The FRIENDLY side may opt to supplement his starting OB with an AT section. Make a DR on the FRIENDLY AT Gun Generation Table {x5a} to determine the Gun type, and a dr [A6c; applying drm, below, if applicable] to determine the number received (all are the same type). Each Gun comes with one Infantry crew. Once determined the Gun(s) may not be refused.

Table A6c drm:

- 1 if 70 DYO Fortification points were received
- 1 if 30 DYO Fortification points were received

4. At the player's option, each/any FRIENDLY Gun received for initial setup (as per MSR 3) may have a transport vehicle. Make a DR on the FRIENDLY Transport Generation Table {x7}; reroll, as necessary, until a vehicle is determined that is capable of towing the Gun type. Each transport vehicle must be the same type.

5. Once all FRIENDLY setup is complete, determine the number [A6d] of Artillery Strike(s) (8.7) the ENEMY receives commencing on the ENEMY Player Turn of Game Turn 1.

6. No FRIENDLY unit may move [EXC: rout] until ≥ one ENEMY unit is Activated/Known.

7. Each Final even DR on Table A1 is considered a result of "AFV" {x6}; the printed result is ignored. When an ENEMY vehicle is instructed to move toward a VPO, it instead moves toward the FBE (exiting if possible); 9.25 applies normally to ENEMY Infantry.

Mission 12 (P)

Beseiged

BRIEFING: For several weeks your company has been garrisoning this isolated village in the middle of nowhere, a small part of an elastic "Hedgehog" defense necessary due to the overall strategic situation. Fortunately, things have been relatively quiet, and your men have been granted some much-needed rest when not actively engaged in guard duties or preparing fortifications. During the past few days however, there has been a marked increase in enemy activity in the area. Short range reconnaissance patrols have spotted enemy troops toward almost every point of the compass. Now, the ominous booming of heavy artillery in the distance is a good indication that the foe is about to strike. The problem is, from which direction will they be coming?

PREVAILING ATTITUDE (3.2): Advance (A2a)

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		ENEMY RE Numbers		FRIENDLY RE Numbers	
DR	SAN #	DR	SAN #	dr	AC#	dr	RE#s	dr	RE#s
≤4	4	≤3	5	≤5	3	≤2	5/6	≤3	4/5
5-8	3	4-8	4	6	4	3-4	4/5	≥4	3/4
≥9	2	≥9	3			≥5	3/4		

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A9 Village/Farmland

INITIAL MAPBOARDS: Three mapboards are determined before play begins. The center mapboard of the three uses the "Village" column {A9} with a -1 DRM. Use the "Farmland" column {A9} (also with a -1 DRM) to determine the other two mapboards. After the alignment of all mapboards has been determined, the player may freely change the north-south alignment of any one mapboard. No additional mapboards may be activated during play.

Initial Mapboard Configuration:

VPO LOCATIONS (14.):

Before setup make a dr {A6a} to determine the number of FRIENDLY-Controlled VPO {A10a} on the center mapboard (only); reroll any VPO not wholly within the FRIENDLY setup area. The (doubled; see VP Schedule) value of each VPO is determined only at Mission end {A10b}.

S? PLACEMENT/ENTRY (4.):

The ENEMY begins the Mission with an offboard pool of S? equal to the total US# (A1.6) of FRIENDLY units in the player's at start OB [EXC: units received due to MSR 3/4].

S? ENTRY: At the start of each ENEMY RPh in which there is ≥ one unentered S? remaining in the ENEMY's offboard S? pool make a DR+4. This sum is the number of S? from the offboard pool which enter during the ENEMY MPh along a random board edge as per MSR 6.

SEQUENCE:

FRIENDLY units and fortifications are set up first on the center mapboard as well as in any hexes of the two other mapboards that are within four hexes of a whole/half hex of the central mapboard [EXC: FRIENDLY units/fortifications may not set up in hexrows A-D and DD-GG on all mapboards]. The ENEMY side moves first (see MSR 6).

MISSION END (see also 12.5):

At the end of Game Turn 8, and at the end of each Game Turn thereafter, make a dr. If the result is ≤ 1 the Mission ends immediately. There is a -1 dr for each complete Game Turn completed after Game Turn 8.

VP SCHEDULE (12.6; 9.41, 17.1321):

- The FRIENDLY side gains 3 VP for each Game Turn completed after Game Turn 8.
- Each side gains *double* the normal VP {A10b} for Control of VPO (i.e., each dr {A10b} result is doubled).
- The ENEMY gains VP for Casualty VP earned.

MISSION SPECIAL RULES:

- There is a +1 dr to the colored die of each DR on Table A11 and x9.
- Before setup make a dr on the following table to determine the number of DYO Fortification points (H1.6) received by the FRIENDLY side. All fortifications listed on the H1.6 table are available for purchase, as well as the use of A-T Mine factors as a Daisy Chain (B28.531; maximum five A-T factors).

dr	DYO Fortif. Pts.
1	130
2	120
3	110
4	100
5	90
6	80

- The FRIENDLY side may opt to supplement his starting OB with either an OBA module or a Gun section. Once determined, the OBA/Gun(s) may not be refused. [Note: Each unit(s) granted due to this MSR is not counted in the US# total of FRIENDLY units to determine entering S?.]

If the OBA module is chosen, determine the OBA's type by a DR on the FRIENDLY nationality's Chapter H "OBA Availability Chart"; also determine ammunition availability {x8}. The player may also supplement his OB with a FRIENDLY 8-0 leader and a radio (or Field Phone).

If the Gun section is chosen, make a DR on the FRIENDLY Gun Generation Table {x5; "Outside" column} or on the FRIENDLY AT Generation Table {x5a} (player's option) to determine the Gun type, and a dr {A6c; applying dr, below, if applicable} to determine the number received (all are the same type). Each Gun comes with one Infantry crew.

Table A6f dr:

- +1 if ≥ 120 DYO Fortification points were received
- 1 if ≤ 90 DYO Fortification points were received

- At the player's option, each/any FRIENDLY Gun received for initial setup (as per MSR 3) may have a transport vehicle determined for it. Make a DR on the FRIENDLY Transport Generation Table {x7}. Reroll, as necessary, until a vehicle is determined that is capable of towing the Gun type. Each transport vehicle must be of the same type.
- Once all FRIENDLY setup is complete, determine the number {A6e} of Artillery Strike(s) (8.7) the ENEMY receives commencing on the ENEMY Player Turn of Game Turn 1 [EXC to 8.71: each received FFE is initially placed on a FRIENDLY-Controlled VPO hex; as necessary, determine such VPO placement hex (and/or specific hex of a multi-hex VPO) by Random dr].
- All non-RE S? entering during the same turn do so along the same randomly-determined edge (north/east/south/west). However, once S? have entered on three of the four edges the one edge that S? have not yet entered on becomes the FBE. Alternately, the FBE may be determined sooner only if FRIENDLY units must enter "along the FBE" due to a RE, in which case the FBE is determined by Random dr among all edges S? have not yet entered along. Once the FBE is determined by one of the above means, it is considered the West edge for game purposes.
- Each Advance Attitude S?/Activated-unit moves toward the nearest FRIENDLY-Controlled VPO.
- Each ENEMY RE citing a "flank" attack (e.g., ENEMY RE 36) must be rerolled *unless* the FBE has already been determined (see MSR 6).

Mission 13 (P)

The Bridge

BRIEFING: For several days the enemy has been vigorously attacking up and down the lines. Until now, resolute and fanatical resistance has held the foe in check, usually repulsing their assaults with heavy losses. News has just arrived, however, that a breakthrough has occurred, and the enemy has sent a substantial force pouring through the ever-widening rift. Your unit (positioned about 1 km to the rear in the second line of defense) has been guarding a strategic river bridge. Now however, you must do your part to help limit the extent of the enemy breakthrough. It is imperative that you demolish the bridge, rendering it unusable to the enemy—but only *after* all friendly units have been safely evacuated to the western side of the river. Be advised that enemy units have been spotted approaching your sector; contact is expected momentarily!

PREVAILING ATTITUDE (3.2): Advance {A2a}

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		ENEMY RE Numbers		FRIENDLY RE Numbers	
DR	SAN #	DR	SAN #	dr	AC#	dr	RE#s	dr	RE#s
≤ 4	4	≤ 3	5	1	2	≤ 3	5/6	≤ 2	5/6
5-9	3	4-7	4	2-4	3	4-5	4/5	3-4	4/5
≥ 10	2	≥ 8	3	≥ 5	4	6	3/4	≥ 5	3/4

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: See Initial Mapboards, below.

INITIAL MAPBOARDS: Two mapboards are determined before play begins. The western-most mapboard (only) must be a river mapboard; make a Random dr to determine river map (i.e., 7, 8 or 40), then determine the bridge's hexrow location (MSR 2). Next, use Table A8e to determine the eastern-most mapboard (a -1 DRM applies to the subsequent {A9} DR). A Road Network must exist from FBE to EBE, and the bridge must be part of the Road Network. No additional mapboards may be activated during play.

Initial Mapboard Configuration:

VPO LOCATIONS (14.):

There are no VPO in this Mission; the western-most bridge Location is considered a VPO for purposes of rule 9.25.

S? PLACEMENT/ENTRY (4.):

The ENEMY begins the Mission with an offboard pool of S? equal to the total US# (A1.6) of all FRIENDLY units in the player's at start OB.

S? ENTRY: At the start of each ENEMY RPh in which there is ≥ one unentered S? remaining in the ENEMY's offboard S? pool make a DR+1. This sum is the number of S? from the offboard pool which enter during the ENEMY MPPh along the EBE according to rule 4.21 [EXC: The *only* Letter Chits that are placed in the cup for this Mission (regardless of why the Letter Chits are to be used) are the ones with a letter of a hexrow within six hexrows of the bridge's hexrow; e.g., if the bridge is in hexrow Q, the only chits placed in the cup will be the Letter Chits from K through W, all others are kept out of play for the entire Mission].

SEQUENCE:

FRIENDLY units and fortifications are set up first. At least 50% (in US#) of the FRIENDLY units in the player's at start OB must set up on the *east* side of the river. Each FRIENDLY unit set up on the eastern-most mapboard must do so within five hexes of a whole-hex of the western-most mapboard.

The FRIENDLY side moves first.

MISSION END (see also 12.5):

The Mission ends in one of the following ways:

- The bridge is successfully blown; or
- The ENEMY Controls all bridge Locations and/or all FRIENDLY DC are expended/eliminated/captured.

VP SCHEDULE (12.6; 9.41, 17.1321):

- If all bridge demolition attempts (A23.7) are unsuccessful the ENEMY wins.
- If the bridge demolition attempt is successful (i.e., ≥ 1 multi-hex bridge Location has been reduced to rubble as per A23.7-71), the FRIENDLY player wins providing the ENEMY has not amassed ≥ 25 Casualty/Exit VP. Each FRIENDLY unit/Gun remaining on the east side of the river when the bridge is successfully blown is considered Captured for VP purposes.

MISSION SPECIAL RULES:

1. There is a +1 drm to the colored die of each DR on Table A11, and an additional Cumulative -1 DRM on Table A1. Additionally, each "AFV" result [A1] is rolled for generation on Table x6b on a subsequent dr of ≥ 3.
2. Only one multi-hex river bridge is allowed; the type is automatically two-lane stone. Use the table below to determine the hexrow the bridge is in, depending on the river mapboard in play.

dr	board 7	board 8	board 40
≤ 3	Q	Q	Q
4-5	AA	Y	I
6	I	Q	Q

3. The FRIENDLY side has 50 DYO Fortification points. All fortifications listed on the H1.6 table are available for purchase, as well as the use of A-T Mine factors as a Daisy Chain (B28.531).

4. A FRIENDLY RE *automatically* occurs during the first FRIENDLY Player Turn (the normal FRIENDLY RE chance for FRIENDLY Player Turn one is NA). However, the Wind Change DR is still made. Reroll {x9} until a RE occurs that results in ≥ 1 FRIENDLY unit entering. Each FRIENDLY unit entering due to the turn 1 RE is exempt from PANIC on that turn, and must enter on the *east* edge. Each such FRIENDLY vehicle is considered to have already expended 1/2 of its MP allotment offboard.

5. Any FRIENDLY RE reinforcements entering *due to RE* during turns 2/3 must do so along the north and/or south edge (player's choice) *east* of the river; all units of the same RE group must enter on the same edge. Such FRIENDLY RE reinforcement can not be delayed; they must enter on the turn received. After turn 3 all FRIENDLY RE reinforcements enter normally (as per 15.5). Any Gun RE group *must* be in tow (or portaged, as applicable; e.g., dm 81mm MTR).

6. ENEMY RE units can enter only along edges of the *non-river* mapboard.

7. The FRIENDLY bridge demolition team enters anywhere along the FBE following a Reinforcement dr ≤ the current turn number. The team consists of one elite squad (use the type with the highest inherent FP factor), one 9-1 leader and two DC.

8. A Good Order ENEMY Infantry unit starting its turn in a Set DC hex automatically attempts Set DC Clearance (A23.72).

Mission 14

Human Wave

NOTE: This Mission should only be played with the Russians/Japanese as the ENEMY.

BRIEFING: The situation at the front has stabilized for a few weeks, enabling your men to construct front-line fortifications, as well as getting a bit of well-deserved R&R. Veterans now, your men have witnessed a lot, but perhaps nothing as unnerving as the masses of slavish hordes advancing irresistibly across the seemingly endless Russian landscape. Frequently whipped into a vodka-induced frenzy and shouting "Urrah! Urrah!", the human wave continues forward, usually at the pistol point of a desperate Commissar. It is just such a sight that is about to now unfold.

PREVAILING ATTITUDE (3.2): Advance [A2a]

MISSION TABLES (12.32):

ENEMY SAN		FRIENDLY SAN		ENEMY AC#		RE Numbers	
DR	SAN #	DR	SAN #	dr	AC#	dr	RE#s
2	5	2	6	≤ 2	2	≤ 2	5/6
3	4	3-4	5	≥ 3	3	3-4	4/5
4-7	3	5-8	4			≥ 5	3/4
≥ 8	2	≥ 9	3				

MAPBOARD SELECTION & ACTIVATION (13.):

MAPBOARD SELECTION: A8c

INITIAL MAPBOARDS: Three mapboards are determined [A8c] before play begins [EXC: On a dr of ≤ 4 the western-most board (only) uses Table A8b]. A -1 DRM applies to each mapboard determination DR [A9]. No additional mapboards may be activated during play.

**Initial
Mapboard
Configuration:**

VPO LOCATIONS (14.):

Before setup make a dr [A6b] for the western-most mapboard (only) to determine the number of FRIENDLY-Controlled VPO [A10a] to be marked on it. The value of each VPO is determined only at Mission end [A10b].

S? PLACEMENT/ENTRY (4.):

On Turn 1 one Russian Human Wave enters (4.31) along the EBE. At the start of each ENEMY RPh thereafter (until five non-RE Human Waves have entered) the player makes a Wave Entry dr; on a Final Wave Entry dr of ≤ 6 another Human Wave enters during the MPh of that Player Turn along the EBE. There is a +1 drm for each non-RE Human Wave already entered during the Mission.

SEQUENCE:

FRIENDLY units and fortifications are set up on the two western-most mapboards. Any number of FRIENDLY units may be held offboard as desired. See also MSRs 2, 3 and 4.
The ENEMY side moves first.

MISSION END (see also 12.5):

At the end of Game Turn 10, and at the end of each Game Turn thereafter, perform a dr. If the result is ≤ 2 the Mission ends immediately.

VP SCHEDULE (12.6; 9.41, 17.1321):

- The FRIENDLY side gains 1 1/2 VP for each non-RE Human Wave entered.
- Each side gains VP [A10b] for Control of VPO.
- The ENEMY gains VP for Casualty VP earned, as well as Exit VP for ENEMY units exited off the FBE (4.323) [EXC: each Human Wave S? exited counts as four Exit VP].

MISSION SPECIAL RULES:

- There is a +1 drm to the colored die of each DR on Table A11 and x9.
- Before setup make a dr on the following table to determine the number of DYO Fortification points (H1.6) received by the FRIENDLY side. All fortifications listed on the H1.6 table are available for purchase, as well as the use of A-T Mine factors as a Daisy Chain (B28.531; maximum 5 A-T factors).

dr	DYO Fortif. Pts.
1	110
2	100
3	90
4	80
5	70
6	60

- Make a DR on the FRIENDLY Gun Generation Table [x5; "Outside" column] to determine a Gun type. After determining the Gun type the player can decide whether or not he wishes to add this to his OB; if accepted, make a dr [A6f; applying drm, below, if applicable] to determine the number received (all are the same type). Each Gun comes with one Infantry crew.

Table A6f drm:

- +1 if ≥ 100 DYO Fortification points were received
- 1 if ≤ 70 DYO Fortification points were received

- At the player's option, each/any FRIENDLY Gun received for initial setup (as per MSR 3) may have a transport vehicle determined for it. If desired, make a DR on the FRIENDLY Transport Generation Table [x7]; reroll, as necessary, until a vehicle is determined that is capable of towing the Gun type. Each transport vehicle must be of the same type.
- The FRIENDLY side receives one OBA module available at game start. Determine type by DR on the FRIENDLY nationality's Chapter H "OBA Availability Chart"; also determine ammunition availability [x8]. The player may supplement his OB with a FRIENDLY 8-0 leader and a radio (or Field Phone).
- Once all FRIENDLY setup is complete make a dr; if ≤ 3 the Russian receives a number [A6d] of Artillery Strike(s) (8.7) commencing on the ENEMY Player Turn of Game Turn 1.

T. BLOOD REEF: TARAWA

ORDER OF PRESENTATION:

1. PATHFINDERS
2. BRT OCEAN & REEF
3. BRT SAND
4. BRT PALM TREES
5. PRINTED RUBBLE
6. BUNKERS & PILLBOXES
7. BRT TOWERS
8. GUN EMPLACEMENTS
9. PORT OF BETIO
10. BETIO SEAWALL
11. EXCAVATION DITCH
12. GULLIES
13. AIRFIELD
14. OFF-MAP TERRAIN
15. BLOOD REEF: TARAWA CAMPAIGN GAMES

1. PATHFINDERS

1.1 Pathfinders provided invaluable guidance to the U.S. Marine tanks and non-amphibious vehicles crossing the reef to the beach at Betio¹. A Pathfinder is represented by a SMC with a Strength Factor of 0-0-9. If it fails a MC, the Pathfinder is considered wounded and the counter flipped to the wounded side where it displays a Strength Factor of 0-0-8 and must undergo a Wound Severity dr (A17.11). If a wounded Pathfinder fails a MC it is eliminated; a Pathfinder never breaks, is immune to Heat of Battle (A15.), Unit Substitution (A19.) and enforced Pin results [EXC: Wounds (A15.22)]. A Pathfinder's current printed Morale Level is never lowered, but could be increased to 10 (9 if wounded) by various causes (A.18).

1.2 Normally, U.S. Marine forces will be allocated one Pathfinder for each non-amphibious vehicle that enters or sets up Wading. During (CG) scenario setup, each Pathfinder is assigned to escort one vehicle (and only that vehicle). A Pathfinder may only move using Armored Assault (D9.31) with its escorted vehicle (even if the vehicle is unarmored, although no TEM would apply). Pathfinders may not use Double Time movement.

1.3 A Pathfinder is immediately Eliminated if it is not in the same Location as its escorted vehicle, if it occupies the same hex as an enemy unit, or its escorted vehicle enters a Beach or Hinterland hex or becomes Immobilized/Eliminated.

1.4 A Mired vehicle accompanied by a Pathfinder receives a -2 drm to the colored dr of its Ocean Bog Removal DR (2.31).

2.0 BRT OCEAN & REEF

2.1 Any hex with its hex-center-dot covered in ocean blue is a *BRT* Ocean hex [EXC: hexes W11 and V15]. All Ocean hexes are Submerged-reef (G13.431) [EXC: hexes Y11 and Z10 are Exposed Reef (G13.431)].

2.2 BRT OCEAN-HINTERLAND HINDRANCE: All LOS/LOF to or from an Ocean Location is subject to a +1 LV Hindrance for each Hinterland hex depiction which is crossed to or from the target hex. This hindrance is not applicable with any other in-hex hindrance nor does it affect any Fire Lane.

EX: See the accompanying illustration at right. An attack by the 4-4-8 vs. the 6-6-8 will receive a +2 Hindrance DRM (+1 each for Palm-Debris hexes R36 and R37), and an attack vs. the 7-6-8 would also receive a +2 Hindrance DRM (+1 for Hinterland hex Q37 and +1 for the Palm-Debris in hex R37). An alternate-grain 2FP Fire Lane attack through Q37 to S39 would receive only the +1 Palm-Debris Hindrance, would be resolved on the 1FP column vs the 6-6-8, and would not affect the 7-6-8 (2.4).

2.3 WADING VEHICLES: A Hull Hit versus an AFV Wading in Ocean receives a +1 DRM applied to the To Kill DR.

2.31 Swamping (G13.4222) in Ocean is NA. Any non-amphibious vehicle that

enters a Ocean hex must make a Ocean Bog DR that is modified by the following DRM (no other DRM apply):

- +1 if not fully-tracked
- +2 if moving into Wire
- +3 if without escorting Pathfinder (1.0)
- +1 if escorting Pathfinder is wounded

Any vehicle that Bogs in a Ocean hex is automatically Mired. The Mire drm to the colored dr of an Ocean Bog Removal DR is +2, but a CE AFV receives a -1 drm and a vehicle escorted by a Pathfinder receives a -2 drm to the colored dr of its Ocean Bog Removal DR.

2.4 RESIDUAL FIREPOWER & FIRE LANES: All Residual FP in an Ocean hex is reduced by one additional column. Fire Lanes end in the first Ocean hex entered and affect such an Ocean location on the next FP column to the left. See the 2.2 example.

2.5 BRT TETRAHEDRONS: The following rules for the use of tetrahedrons apply in addition to G14.51. Whenever any vehicle enters or changes VCA in a tetrahedron-Ocean hex, the tetrahedron's owner makes a dr (one dr per VCA hexspine changed). On a Final dr of 1, the vehicle is subject to an A-T Mine attack (B28.52). Additional A-T mine factors may be purchased from the FPP Chart, and are secretly recorded as being added to the inherent A-T capability of a tetrahedron. Each additionally-purchased A-T mine factor adds a -1 drm to the above dr for that tetrahedron.

3.0 BRT SAND

3.1 Any predominately golden-yellow hex is a Beach hex. All Beach hexes are Hard Sand. All Hinterland hexes are considered Soft Sand (G13.3) [EXC: building, rubble, runway/taxiway, pier, bridge, or—for movement purposes—if using a road]. A Sand Bog DR (G13.32) is not required for each Hinterland Sand Location entered, but is instead made only once per MPh upon entering a Soft Sand Location as if it was Mud (D8.23). All Bog Removal attempts in a land hex receive a -1 drm to the colored dr. Movement penalties for Japanese Infantry units entering a Soft Sand Location (F7.3) are modified [EXC: when Manhandling a Gun] by adding 1/2 MF (+COT) instead of 1 MF. Sand MF/MP penalties, including F7.3, are NA for units entering a pillbox, a building obstacle, a rubble, runway/taxiway, pier, or bridge Location, or using a road.

T

3.2

3.2 Emplaced Guns receive a +2 TEM. Fortification restrictions (F7.42) are NA [EXC: a trench/foxhole has a +2 TEM vs OBA/Bombardment], nor are ordnance or OBA attacks halved (F7.4) vs unarmored units in a building, pillbox, Command Bunker (6.1), or bombproof (6.5) [EXC: a pillbox, Command Bunker, or bombproof (and any unit therein) does receive the F7.4 -2 DRM to its Bombardment MC].

4.0 BRT PALM TREES

4.1 Palm trees are represented on the BRT map by 2-4 leafy symbols in a hex (EX: hex R10). The rules for palm trees (G4.1) are modified as follows. A palm tree hex is treated as out of season (B14.2) vs aerial LOS/LOF/Sighting-TC. During a Tarawa Naval Bombardment, an affected palm tree hex, including palm-debris-palm (4.23), must take a NMC with a Morale Level of 8 [EXC: Building-Palm, which takes a normal building NMC (4.3)]. Failure of the Naval Bombardment MC (as well as any event during play that would ordinarily result in placement of a shellhole counter; B2.1 & C1.823) causes debris; place a Palm Debris counter in the hex. Palm trees (including palm-debris) are not burnable terrain.

4.2 **PALM DEBRIS:** Palm debris (EX: S35) is Inherent Terrain (B.6) and Concealment Terrain (A12.12). It has a +1 TEM and is a half-level LOS Hindrance. Palm-Debris provides a +1 DRM vs a Sighting TC (E7.32).

4.21 **MF/MP:** Infantry must expend one MF +COT (including Sand) to enter a palm debris Location. Only a fully-tracked AFV may enter palm debris and does so by expending 1/4 (FRU) of its MP allotment and taking a Bog Check with an additional +1 DRM. Dash (A4.63), road bonus (B3.4), and the 1/2-MP road rate are NA in a road hex covered by palm debris, except via a TB.

4.22 **FORTIFICATIONS:** Placement of a Palm Debris counter removes all Entrenchment counters in that hex (although not necessarily their contents) after resolving all attacks against their occupants; otherwise, a Fortification may exist in a palm debris Location unless other terrain/Fortification(s) therein prohibit it. Palm debris may be Cleared as if the Location were Fallen rubble (B24.71).

4.23 **PALM-DEBRIS-PALM:** Some hexes contain palm debris with both the palm and debris depictions (EX: hex J12). A palm-debris-palm hex is a full-level LOS Hindrance. Placement of a Palm Debris counter in such a hex changes it to a normal palm debris hex.

4.3 **BUILDING-PALM:** A hex containing both building and palm tree depictions is a Building-Palm hex (EX: hex Q10).

4.31 In Building-Palm hexes, the terrain effects of both terrain types are cumulative as per B.1. That is, the entry COT (prior to any further modification) for Infantry is 3 MF and that for vehicles is 1 MP plus normal building COT.

4.32 Units may bypass the building obstacle (unless otherwise prohibited; A4.3, D2.3-.31) by moving through the palm tree portion of the Building-Palm hex and in such case would be treated as if moving through a Palm location (4.1).

4.33 A LOS through a Building-Palm hex (i.e., a LOS that is not blocked by the building) is subject to the normal palm tree LOS rules.

4.34 The TEM of a Building-Palm hex is +2 or +3 according to the type of building (wooden or stone).

4.35 The Kindling Number of a Building-Palm hex is that of the building.

5.0 PRINTED RUBBLE

5.1 The BRT map depicts printed rubble Locations (EX: hex K13) all of which are treated exactly as if a corresponding rubble counter were in that Location. Ignore small portions of the artwork extending across a hexside into an adjacent non-rubble Location.

5.2 **CLEARANCE:** Printed rubble is not considered Fallen and so cannot be cleared (B24.71).

6.0 BUNKERS & PILLBOXES¹

6.1 **COMMAND BUNKER:** A Command Bunker is a special type of Single-Story Stone Building and is represented on the BRT map as a stone building enclosed by two-toned brown contour lines (with the darker contour lines on the inside) (EX: hex Q38). A Command Bunker is treated as a Fortified Building and the contour lines are part of the building for LOS purposes. All Japanese Personnel units in a Command Bunker hex are considered Fanatic (A10.8) [EXC: such Fanatic status expires immediately at the end of a CG scenario]. A unit entering from outside the Command Bunker hex becomes Fanatic immediately prior to all Defensive First Fire against it. A Japanese unit already Fanatic receives no further benefit. All fire from a Command Bunker is resolved as Area Fire [EXC: from the Rooftop Location (see 6.12) or by a non-Captured Japanese MG]. No Gun or vehicle may enter/set-up-in any Location of a Command Bunker. A Command Bunker is not burnable terrain and has a Morale Level of "12" for Bombardment purposes (C1.8).

6.12 **COMMAND BUNKER ROOFTOP:** A Command Bunker contains a Rooftop Location (B23.8) at Level 1 with a +2 TEM vs Direct Fire. A Command Bunker Rooftop Location is Concealment Terrain for setup purposes only. Once the first RPh has been completed, B23.82 comes into effect. A Command Bunker Rooftop Location is not considered a building Location for rout or Victory Condition purposes. Infantry units may directly enter a Rooftop location from an adjacent hex [EXC: across hexside L44-M45 as indicated by the lack of dark contour facing that hexside] at a cost of 4 MF for Marines and 3 MF for Japanese.

6.2 **ISLAND COMMAND BUNKER:** Hex M45 contains the Island Command Bunker (ICB) which is a Command Bunker with a +5 TEM. FT attacks against this building must add the TEM to the attack unless the FT fires from within the same hex. The ICB may not be destroyed/rubbled in any way (including Bombardment).

6.21 **UNDERGROUND:** An underground location exists beneath the ICB as if it were a lower level of a building [EXC: this location is NA for building control purposes]. The normal stacking capacity of an ICB underground location is two squad-equivalents. The ICB underground location is accessible (via an inherent stairwell) only from the ground level of the ICB and LOS to/from the ICB underground location is limited to the ground level of the ICB. The ICB underground location has a +4 TEM. Only Infantry/SW may set-up-in/enter the ICB underground location, and their presence therein is indicated by placing them beneath the ICB underground counter. As per 6.32, any trench adjacent to an ICB is considered to connect to the ground level only (i.e. not the ICB underground location); however, a Passage (6.4) can connect to the ICB underground location.

6.3 **BRT PILLBOXES:** Both HIP and "free" tunnels (G1.632) are NA for pillboxes on Betio.

T

6.31 1+4+6 PILLBOX: Use Cave counters to represent 1+4+6 pillboxes; treat these as pillboxes in all respects.

6.32 BUNKERS: The Japanese player automatically receives one Trench counter or Passage (6.4) for every two OB-given/purchased pillboxes (FRU). These trench counters must be used to create Bunkers (B30.8) and are restricted to setting up in the same setup area as that of the pillbox(es) they come with.

6.33 All trenches are considered to "connect" (as per B30.8) to (but not through) all ADJACENT building Locations. Infantry entering such a building Location need not pay an extra MF to leave the trench in that Location, but must still pay applicable building COT. Infantry leaving such a building Location need not pay an extra MF to enter a "connecting" trench. Infantry may not enter such a trench while using Bypass Movement; nor may they use Bypass Movement while in such a trench; nor may they exit such a trench to directly use Bypass Movement. A unit entering/leaving a building Location via a "connecting" trench is not subject to Snap Shots as it does so. A vehicle must pay the appropriate MP-costs/penalty to cross such a trench while using VBM; hence those vehicle types not allowed to cross a trench may not do so while using VBM. Infantry may enter a Fortified Building Location as if that Location were not fortified provided they enter it from a trench that is "connected" to that building Location.

6.4 PASSAGE: A Passage is a Fortification counter treated as a one-hex Tunnel (B8.6) and is obtained in lieu of a Trench counter. Its entrance/exit must be in a building, Pillbox, Bombproof, or Command Bunker Location. A Passage counter is eliminated when either of its entrance/exit Locations is eliminated or rubbled or per B8.61.

6.5 BOMBPROOF:² A bombproof is a Fortification counter that cannot set up in/adjacent to a Beach hex. Except as otherwise stated, a bombproof is treated as a pillbox with normal (A5.) Location stacking limits that does not have a CA.

6.51 TEM/ATTACKS: A bombproof has a +4 TEM and a Morale level of 10 vs Bombardment (C1.822). All fire from a bombproof is halved as Area Fire [EXC: non-Captured Japanese MG.]

7.0. BRT TOWERS

7.1 Towers represent tall, narrow building-like structures that contain an upper level Location with no ground level Tower Location (although the hex contains a Location at ground level), and are represented on the BRT map by an obviously square, single-hex brown structure containing a large white center dot (EX: F7, P9 and L49).³ A Tower (but not the ground level Location of its hex) is treated as a wooden building unless otherwise stated.

7.2 A BRT Tower is a 2 1/2 Level LOS hindrance. Each Tower contains only a single Tower location at level 2. All Towers are subject to a -2 drm on any Rubble Creation dr (B24.11), and any result that would cause placement of rubble instead causes it to Collapse, eliminating all units in the Tower Location (see 7.41) Place a Collapsed counter (G5.5) on such a tower, after which G5.51 applies. Every unit occupying the ground level Location of a Tower when it Collapses is subject to the appropriate G5.5 PTC.

7.21 STACKING: The stacking capacity of a Tower hex's ground level Location is unaffected by the presence of the Tower. A Tower Location has a normal stacking limit (A5.1) of one HS-equivalent and 5PP. Towers have no Rooftop Locations and may never be Fortified.

7.3 TEM: A unit at the ground-level Location of a Tower hex is considered to be occupying the other terrain in that hex and so uses the TEM of that other terrain. A Tower Location has a TEM of 0, although units therein are eligible for the +1 Height Advantage TEM. Units entering a Tower hex/Location are not subject to FFMO, even if fired on from the same or higher elevation.

7.4 MOVEMENT & TEM: The ground-level Location of a BRT Tower is Soft Sand (3.). A Gun may neither set up in nor enter, nor may a dm Gun be assembled in, a Tower hex/Location.

7.41 Vehicles must use VBM to enter a Tower hex. Fully-Trackd, BU, CT, AFV may also enter the Tower obstacle as per B23.41 [EXC: a Tower has no cellar and adds an extra -1 drm to the colored dr of the AFV's Bog Check as though the tower was a single-story building, but see 7.2 if the AFV rolls a final colored dr ≤ 0.

7.42 Infantry may move to/from a Tower Location via the Tower's stairwell at a cost of 1 MF per level changed. A unit may never end it's MPH in an intermediate stairwell Location (i.e., it must end its MPH either in the Tower Location or in the Tower Hex's ground-level Location).

7.43 Infantry moving to/from a Tower Location via the Tower's stairwell may be attacked at ground level (if descending) and/or the Tower Location (if ascending) in the normal manner. They may also be attacked at the first-level "quasi-Location" of that hex by a unit that has a LOS to that quasi-Location. Such a quasi-Location is not considered Open Ground, but such an attack vs it receives no TEM. The target is assumed to expend one MF per level changed; if pinned or broken while at that quasi-Location it reverts to the level it was attempting to leave (and may be attacked by any Residual FP at that level as it re-enters it). The Residual FP left by an attack vs such a quasi-Location remains at that level (place the Residual FP counter on the appropriate Level counter) to attack each unit subsequently entering that level in that hex during the same MPH.

7.5 CONCEALMENT: The other terrain in a Tower hex determines whether or not the ground-level Location of that hex is Concealment Terrain. A Tower Location is treated like a building Rooftop (O.5; B23.82) for HIP/concealment purposes (only).

7.6 ROUT: A Tower hex/Location is not considered a building for rout purposes.

7.7 The ground-level Location of a Tower hex is not considered a building Location for Victory purposes, but the Tower Location is.

7.8 Towers have a Morale Level of 7 for Bombardment (C1.8) purposes. A Japanese unit in a Tower may act as a Spotter (C9.3) for any mortar, 120L AA, 140L ART, or 8-in. Gun that is within three hexes of it as if such weapon was an adjacent mortar [EXC: the minimum range for any non-mortar, non-Type 92 Inf Gun (including the 8-in. Guns) is 7 hexes for Spotted Fire]. Otherwise, normal minimum ranges apply. Spotted fire is treated as Indirect Fire.

8.0 GUN EMPLACEMENTS

8.1 The two 8-in. Gun Emplacements installed by the Japanese on the western end of Betio are represented on the BRT map by the gray, two-hex, building-like structure in hexes D5 and E6 enclosed by two-toned brown contour lines.⁴ The Gun Emplacement structure (including the contour lines) is a half-level LOS obstacle. No Fortification, Gun, or vehicle counter may set-up-in/enter a Gun Emplacement hex. Infantry in a Gun Emplacement hex receive a +1 TEM. Each Gun Emplacement hex contains one 8-in. Gun Turret (8.2).

8.2 8-IN GUN TURRETS: The turrets that housed the Vickers 8-in. Coastal Defense Guns on Betio are represented by special Armored Cupola counters. Each 8-in. Gun Turret is treated as an Open Topped Armored Cupola (D9.5, SSR BRT 12) with a large (-1) Target Size, front and side AF of 2, a rear AF of 0, a ST turret, an inherent vehicular crew, and a MA consisting of a 200L Gun with a minimum range of 12 hexes and a maximum range of 500 hexes (see Japanese Vehi-

8.2

cle Note 19). The manning crew cannot BU (even if Stunned) and receives a +3 CE DRM. An 8-in Gun Turret counter is treated as an immobile, Open-Topped AFV for CC purposes [EXC: PAATC NA] and is considered equal to two squad-equivalents for stacking purposes. Due to the elevated status of the Gun turret in hex E6, attacks by/ vs the Gun Turret in hex E6 treat the Gun Emplacement in hex D5 as if it were non-existent (i.e., ignore the D5 Gun Emplacement altogether). Any non-CC attack that eliminates the Armored Cupola also eliminates all Personnel in the hex.

9.0 PORT OF BETIO

9.1 The small port of Betio is represented on the BRT maps by the Ocean hex abutting the S33 Hinterland hex. The port is protected on two hexsides (T31-T32 and U32-T32) by a stone jetty. This jetty is a one-level LOS obstacle and is impassable to all ground units.

9.2 BETIO PIERS: Two printed wooden piers exist on the BRT map (EX: hex X33) at Level 0. All rules applicable to a wooden pier represented by counters (G13.7) apply except as stated otherwise. A pier Location is treated as a non-open ground location. There is no Location beneath the pier in hexes T33, U33, and V33. No fortifications may set up in a pier Location. Each Location beneath a pier has a maximum stacking capacity of one squad-equivalent and 3PP and is not affected by Residual FP/Fire-Lane on a pier Location. The Japanese may set up beneath a pier Location if it is within the stated Japanese setup area. A unit may move across a sand hexside to/from a pier as per G13.73.

10.0 BETIO SEAWALL

10.1 The brown hexside depiction between some Hinterland and Beach hexes (EX: hexside C13-D12) is a low seawall (G13.6). If opposing units begin a scenario in adjacent hexes which share a common seawall hexside, the unit(s) on the Beach begin the scenario with Wall Advantage.

11.0 EXCAVATION DITCH

11.1 An Excavation Ditch hex is represented on the BRT map by a light-color interior bordered by two-toned brown contour lines (with the darker contour lines on

the outside) (EX: hex H10). Excavation Ditches are treated as shellholes (B2.) except that a vehicle entering or changing VCA in an Excavation Ditch is subject to a Bog Check with a +3 DRM.

12. GULLIES

12.1 There are five gullies on the BRT map. Vehicles may not enter the narrower two running from A62 to D60 and from D11 to T7. Vehicles may gain Crest status in the three wider gullies running from C55 to D54, D52 to G54, and I10 to M20 as if they were Wadis per F5.42-5.426. Vehicles exiting such a gully via a non-depression hexside are subject to a Bog check IN the gully with a +3 DRM.

12.2 TRENCHES: Trenches are considered to "connect" (as per B30.8) to all ADJACENT gully Locations. Infantry entering such a gully Location need not pay an extra MF to leave the trench in that Location. Infantry leaving such a gully Location need not pay an extra MF to enter a "connecting" trench if the Infantry and Trench counter belong to the same side's OB and/or the unit's side Controls the trench Location.

13.0 AIRFIELD ⁵

13.1 The Airfield on Betio has two types of runways (B7). All dark gray runway hexes (EX: hex J29) are paved; all light gray runway hexes (EX: hex K29) are taxiways. Predominantly open ground hexes (B.1) with a significant amount of runway terrain (EX: L39, M40, H51) are nevertheless considered Airfield hexes, although road movement in such hexes is treated normally. Units may entrench in a taxiway hex with a +2 DRM. Direct Fire attacks that incur Wall TEM do not receive the -1 DRM (B7.3). Units on/adjacent to an Airfield hex need not take a Movement DR (E1.531).

14. OFF-MAP TERRAIN

14.1 The road that exits off-map at A63 is considered for the purposes of A2.51 to extend beyond that map edge in hexes of coordinate 63. All off-map hexes bordering the hexes on/between A59-E64 and extending from them along the NW-SE axis are considered to be open ground, Sand (3.) Hinterland hexes. All other off-map terrain is Ocean. On the other hand, all on-map terrain that is not in play in a given scenario remains in effect for "offboard" movement and entry purposes during that scenario.

15.0 BLOOD REEF TARAWA CAMPAIGN GAMES

15.1 INTRODUCTION: *Blood Reef: Tarawa Campaign Games* offer two or more players a series of interrelated scenarios covering the hard fought assault of a portion of Betio Island in the Tarawa Atoll. Using this system, a variable number of scenarios are played simulating the critical moments on specific invasion beaches.

15.11 BETWEEN SCENARIOS: Between Campaign Game (CG) scenarios, players make use of a special CG phase called the Refit Phase (RePh), wherein each side takes stock of what has happened and prepares for further combat in the next CG scenario.

15.12 TEAM PLAY: The three CG herein (15.51-.53) are easily adapted—indeed, recommended—for team play, with each player commanding either certain unit

T

types (EX: one player commands all the armor and Guns, another the non-Gun-crew Infantry, of one side), or a mapsheet sector (EX: one player commands the forces on/west-of hexes numbered 31). If desired, an overall commander may determine which forces his subordinate players will receive, assigning each to the one who requires it most.

15.13 CG ROSTERS & PURCHASE RECORDS: The enclosed printed copies of the *BRT* "Beach Defense Record," "Landing Schedule Record," and "Miscellaneous Status Record" should be photocopied and used by CG players to record important CG information. (Permission to photocopy these and the reduced-size map is granted.)

15.2 DEFINITIONS & ABBREVIATIONS: The following is a glossary that explains abbreviations and important terms used frequently in the *BRT* Campaign Game system.

Assault Wave: One or two Formations from the same BLT that enter in the same Beach Entry Area on the same Game Turn.

Beach Defense Record: A chart to record Japanese purchases, reduced strength units, leaders, etc.

Beach Definitions:

Green Beach Water (entry): M1-Z7

Green Beach Land (Japanese set up area): U10-E4

Red Beach One Water (entry): Z12-Z21

Red Beach One Land (Japanese set up area): V10-N21

Red Beach Two Water (entry): Z22-Z33

Red Beach Two Land (Japanese set up area): O22-T33

Red Beach Three Water (entry): Z34-Z50

*Red Beach Three Land (Japanese set up area):*⁶ U34-D63

Black Beach One Land (Japanese set up area): D4-E32

Black Beach Two Land (Japanese set up area): E33-A58

Beach Setup Area: All Hinterland hexes ≤ 3 hexes from any beach hex of a named beach, and those named beach hexes, and, for placement of tetrahedrons, Ocean hexes extending out from the beach.

BLT (Battalion Landing Team): All the integral and attached Formations of a Marine battalion.

CAPP (Covered Arc Purchase Points): Used by the Japanese for purchasing pillboxes in RePh step 15.6142. The CAPP allotment for a beach may be followed by an exponent (termed the CAPP Exponent) that represents the number of squad-equivalent stacking capacities the Japanese player may add to one or more pillboxes in the Setup Area for that beach (15.6142).

CG: Campaign Game. The three CG are listed in 15.51-.53.

CG Date: Each CG Date consists of the calendar date plus an AM, PM, or Night reference (e.g., "22 AM"). One CG scenario may be played per CG Date—hence up to three CG scenarios may be played per calendar day: one in the morning (AM), one in the afternoon/early-evening (PM), and one at night (NT).

CG End: Completion of RePh step 15.6032 after the November 22 PM CG Date, or upon attainment of the CG Victory Conditions by either side.

Eliminated: Units/Equipment "Eliminated" in a CG are removed from that side's OB.

Enterable: A hex/Location that the unit in question could enter (disregarding its occupation by a Fortification/enemy-unit) during a hypothetical MPh/APH. If defined in relation to a Setup/Entry Area (or to a "path" of hexes drawn to/from/between such), the hex/Location must be Enterable along that "path." A terrain Blaze is not Enterable.

Entry Area: Each colored map-edge hex (red or green) as designated by the corresponding beach name.

Equipment: Any SW/Gun/Vehicle that can be part of a side's OB. Any counter that can be Portaged/driven/Manhandled about on the map.

FLL (Front Line Location): Each Location that belongs to a Perimeter marked in RePh step 15.607. Each Marine FLL is part of a "loop" of other FLL. Any hex that is part of the Marine Perimeter is a Marine FLL. Any non-Ocean hex adjacent to, but not within, the Marine Perimeter is a Japanese FLL.

Formation: A sub-part of a BLT.

FPP (Fortification Purchase Points): Used to purchase Fortifications in RePh step 15.6143.

GPP (Gun Purchase Points): Used by the Japanese player to purchase Guns and SW in RePh step 15.6141.

Initial Scenario: The first scenario of a CG. A CG's Initial Scenario gives each side's setup/entry restrictions, Initial-Scenario Victory Conditions, starting OB and reinforcements, as well as the SSR applicable to that Initial Scenario or CG.

ISSR: Initial Scenario Special Rule(s).

Isolated: After Setup Areas are determined (15.6071), all Marine units outside of, and Japanese units inside of, a Marine Setup Area are Isolated (15.6072).

Landing Schedule Record: A chart used by the Marine player to record Assault Wave assignments and leaders.

Leader Determination (LD) DR: The quality of most leaders is determined by a DR on the CG 19 Leader Determination table. Make a DR on this table whenever a generic "leader" is assigned in the OB.

Map Section: One of the two *BRT* mapsheets.

OB (Order of Battle): All units, Equipment, Fortifications, and Reinforcements of a side that are eligible to participate in the next CG scenario.

Retained: All units and Equipment in a side's OB that are available for setup/entry in the next CG scenario; i.e., all Initial-Scenario OB-given/purchased units/Equipment (or all units/Equipment remaining available from the previous scenario of the CG), and all reinforcements entered since the previous (if any) scenario of the CG. In *BRT*, such a unit/Equipment is required to be set up in the Setup Area it was Retained in (RePh 15.6081); e.g., a unit ending a CG scenario in friendly Setup Area "X" must begin the next CG scenario in that same Setup Area. LVTs may be Retained off-map for entry.

Roster: A listing of the units available to a side for a CG.

Setup Area: For the Marines, each Strategic Location Controlled, plus each Location within a Perimeter "loop" of Strategic Locations that is not Controlled by the Japanese; each such non-Strategic Location hex must also be Enterable by Infantry from $\geq$ one Strategic Location of that Setup Area. For the Japanese, all Hinterland Locations not part of any Marine Setup Area. Friendly Setup Areas that touch/overlap are treated as a single Setup Area. For an initial Scenario, see also 15.51, .52, .53.

Strategic Location: A Strategic Location is any ground level Location of a hex with $\geq +2$ non-Crest TEM, a Beach hex, a Hinterland map-edge hex, or a pier Location. In addition, at the end of a CG scenario all hexes containing a Marine hero or MMC are Strategic Locations for the Marine player. At the start of a CG all Strategic Locations are Controlled by the Japanese [EXC: in CGI, the Marines initially Control all Strategic Locations they occupy at scenario start]. Each terrain Strategic Location captured by the Marine player may be marked with a Marine Location marker (15.606).

15.3 THE CAMPAIGN GAME SCENARIOS: The parameters of the Initial Scenario for each CG are given in 15.51, .52, .53. Additional scenarios for that CG occur as per the *BRT* CG Scenario Chart and CG10. The length of each CG scenario is listed on the *BRT* CG Scenario Chart (15.6205). The CG continues until the specific CG Victory Conditions are fulfilled by one side or the completion of the last CG Date of that CG, whichever comes first. The "start lines" (or FLL, to use the game term) in a CG scenario are determined by Locations Controlled by both sides at the end of the last-completed CG scenario.

15.31 CG BALANCE PROVISIONS: Should each player wish to play the same side (A26.5) the following Balance is used:

Japanese: Japanese infantry units are considered Fanatic when in a Fortified Building, bombproof, or pillbox.

Marine: Marine infantry units are also considered Fanatic (G14.32; SSR BRT 4) when adjacent to a beach hex.

15.4 CAMPAIGN GAME SPECIAL RULES: The following *BRT* CG SSR below apply in all CG scenarios.

CG1 BRT SSR: All BRT SSR are in effect except as amended below.

CG2 MARINE UNIT ORGANIZATION:

CG2.1 BATTALION LANDING TEAM (BLT): A Marine infantry battalion and its attached units combine to form a Battalion Landing Team (BLT)(SSR CG2.2)⁷. A BLT must be assigned to a particular Entry Area during setup (or, for a reinforcement BLT, during the RePh immediately preceding the CG scenario during which

CG2.1

the first Formation of that BLT will enter the map). All units of a BLT must enter within its assigned Entry Area (see 15.2 Beach Definitions). Only one BLT may be assigned per Entry Area per CG Date [EXC: a Reinforcement BLT].

CG2.2 FORMATIONS: Each sub-unit of a BLT is called a Formation and assigned a number (EX: F1, F2, etc.). These Formations are assigned to Assault

T

Waves (CG2.3) and are then recorded on the appropriate Landing Schedule Table. The standard Marine infantry battalion contains the following Formations: Headquarters (HQ) Company, three Rifle Companies, and a Heavy Weapons (HW) Company. The Formations of each Marine BLT available during the Tarawa campaign are set forth in the Formation Table in CG2.4. Units from one Formation may not transfer to any other Formation [EXC: Engineer Platoon, Scout Sniper Platoon, Anti-Tank Section (Division), Artillery Battery, Anti-Tank Section (Regiment), Light Tank Platoon, Medium Tank Platoon, and Seabee Platoon (see CG2.3)]

CG2.3 ASSAULT WAVES:⁸ After viewing the Japanese setup, but prior to the start of play, the Marine player must assign at least one but no more than two of the available Formations in his OB to each of the Assault Waves for the current CG Date. The Marine player may freely add (i.e., without counting as a second "Formation") to his formations as follows:

- A MG Platoon (including ≤ 1 Leader) from the HW Company may be added to any Rifle Company of the same BLT (any MG Platoon that is not added to a Rifle Formation remains a part of its original Formation).
- Units of the HQ Company may also be added to any other Formation of the same BLT [EXC: such units may be added in the First Assault Wave only if sufficient transport is available].
- The Scout Sniper Platoon may be attached to any other Formation of any BLT and may enter with that Formation or may enter by itself on any pier Location that is not adjacent to a Japanese unit.

Record each such combination on the Formation Creation Record. The entry turn for each Assault Wave is listed on the Landing Schedule Record. All Marine Personnel in Assault Wave 1 [EXC: Scout Sniper Platoon] must enter as LVT Passengers. Each LVT must be at least half (rather than 2/3) full; thereafter, such units must enter either as Waders or as Passengers on (Retained) LVT. Guns and SW entering in an Assault Wave must be dm if possible. All units in an Assault Wave must enter on an Ocean hex [EXC: the Scout Sniper Platoon, and Jeeps towing M3A1 37LL AT, may enter on a pier Location not adjacent to a Japanese unit]. Assault Waves may only enter on Marine Player Turns 1, 3, and 5 of any CG scenario. All units in a Formation, and all Formations in an Assault Wave, must enter on their designated turn of entry or they are eliminated with full CVP awarded to the Japanese player.

CG2.4 MARINE REINFORCEMENT TYPE: A BLT not designated as a "Reinforcement Type" is an At-Start BLT. The Marine OB will designate some BLTs as one or more of the following Reinforcement Types: "Follow-On Battalion," "Regimental Reserve," or "Divisional Reserve." None of these Reinforcement Types are available for entry until all units of the Marine player's At-Start BLT have completely entered the map [EXC: A Follow-On Battalion may be eligible for entry when all of the At-Start BLT have entered each of their formations numbered from F1-F5. However, if the Follow-On Battalion enters before any of the other Formations of those At-Start Battalions, then all Formations of the Follow-On Battalion must enter before any of the remaining At-Start BLT Formations may enter. No Regimental Reserves may enter until all Formations of all At-Start Battalions and Follow-On Battalion have fully entered.] No Divisional Reserves may enter until all Formations of all of the Regimental Reserve have fully entered. Once the above conditions have been met, a Reinforcement Type may be Committed to the Landing Schedule Table during the RePh immediately previous to the CG scenario that it is to enter.

CG3 TARAWA NAVAL GUNFIRE:

CG3.1 TARAWA NAVAL OBA: Chapter G Naval OBA rules are modified for all BRT scenarios as follows.⁹

CG3.11 SHORE FIRE CONTROL PARTY: All rules for SFCP (G14.61) apply except as herein modified. Use a German, Russian, or British 2-2-8 Infantry Crew counter to represent the U.S. SFCP. Prior to the start of any CG scenario, each SFCP must be assigned to a Naval Battery (which it may share with another SFCP) for the duration of the CG scenario (CG3.22). Each SFCP is allowed to make one Radio Contact attempt for its assigned module per Player turn, but Battery Access may be attempted only once per Player turn per module (i.e., Radio Contact is established per SFCP, Battery access per module). Once Battery Access has been attempted, any remaining SFCP assigned to that Naval Battery may attempt to gain/maintain Radio Contact. A SFCP (or its radio) eliminated during a CG scenario is automatically Retained (and repaired) for the next CG scenario,

FORMATION TABLE NOTES

- * Units may be attached to any other Formation in its BLT [CG2.3].
- ** Each MG Platoon (along with ≤ 1 leader) of this Formation may be attached to a Rifle Company Formation in its BLT.
- *** May be attached to any other Formation in any BLT.
- [a] 4x Leader, 2x SFCP
- [b] 9x 6-6-8, 6x 2-4-8, 4x Leader, 3x dmMMG, 3x dm60mm MTR
- [c] 3x Leader, 3x MG Platoon [3x 2-4-8, 2-2-8 crew, 3x dmMMG, dmHMG(.50-cal.)], 4x 2-2-8 crew, 4x dm81mm MTR
- [d] 8x 7-6-8, 3x Leader, 8x DC, 3x FT
- [e] 3x Pathfinders (1.), 3x M3 GMC
- [f] 3x 2-2-8 crew, 3x M1A1 75* ART
- [g] 3x 2-2-8 crew, 3x M3A1 37LL AT (includes three Jeeps [unarmed] if it enters at the Z33 pier Location)
- [h] 6x Pathfinders (1.), 6x M3A1, 2x A.L.
- [i] 7x Pathfinders (1.), 7x M4A2, 3x A.L.
- [j] 3x Pathfinders (1.), 3x armored Bulldozer
- [k] 10-3, 3x 7-6-8, 3x DC, FT
- [l] First LD DR receives a -2 DRM.
- [m] First LD DR receives a -3 DRM.

T

but must enter with the first Assault Wave on the next CG scenario. See CG3.4 for Japanese Counterbattery Fire and its effect on Battery Access of NOBA. Regardless of whether Radio Contact is gained/retained, each NOBA module may fire using the principles of Direct Fire (CG3.21). Immediately after a successful radio contact DR, the Marine player must announce which type of attack he will use (i.e. Direct Fire or NOBA).

CG3.12 SHIPBOARD OBSERVER: At the start of each CG scenario, each NOBA module must record a Shipboard Observer (G14.68). A Shipboard Observer is only used to determine the Blast Area (G14.65) of any NOBA mission or to determine LOS to the target for Direct Fire when there is no Radio Contact.

CG3.13 LOF: As per CG3.12 a NOBA module of 120+mm must trace a LOF from any Ocean Map edge-hex in play along the north, south or west edge; a NOBA module of 200+mm must trace a LOF from any south or west Ocean map edge-hex in play. NOBA LOF may be traced from an edge hex that is ≤ 12 hexes from a Hinterland hex.

CG3.2 NAVAL BATTERIES: In CG I and II, the Marine player receives one module of 120+mm NOBA (HE, WP, and IR), and in CGIII he receives two modules of 120+mm NOBA for each CG scenario after the initial CG scenario. During any one CG Date for CGII, and two CG Dates in CGIII, the Marine player may exchange one 120+mm module for a 200+mm module (HE and IR only). The CG Date on which the 200+mm NOBA module will replace the 120+mm module must be secretly recorded prior to the start of the Initial CG scenario (but after viewing the initial Japanese setup).

CG3.21 DIRECT FIRE: The Marine player may declare that a Naval Battery (120+mm only) will fire a Direct Fire mission. The mechanics of Direct Fire for a Naval Battery are identical to those for any on-board Gun, except as modified herein. If a SFCP has made Radio Contact and has Battery Access it may use Direct Fire instead of an AR/SR/FFE placement. A Shipboard Observer uses Direct Fire in the same way except that no Radio Contact has been established. In both cases Battery Access must be gained in each Player Turn. The LOS is traced from the SFCP's location or from the Off-board Observer's recorded hex (depending on which method is being employed). Any Direct Fire which uses a SFCP receives a ROF of 2 (Intensive Fire is NA). A white Dispersed Smoke counter is placed in any non-water target hex after the resolution of any IFT result. A Naval Battery may not use Direct Fire if it has an FFE2 counter already on board [EXC: if a SFCP has radio contact], or if there is Air Support on-map.

CG3.22 TARGET SELECTION: A Naval Battery using Direct Fire may use Multiple ROF only to fire at that phase's original target hex or an adjacent hex.

CG3.23 TO HIT: In order to fire using Direct Fire, all AR/SR/FFE counters for that module are first removed. Direct Fire by a Naval Battery may use any Target Type. The Basic TH# of a Naval Battery for the various Target Types is 6 for Infantry, 7 for Vehicular, and 8 for Area, regardless of range. No Basic (C4) or Firer-based (C5) To Hit DRM apply, although all Target based (C6) To Hit DRM apply normally (acquisition is lost when Battery Access is lost). When using a SFCP for Direct Fire, only hindrances from the SFCP to the target apply. Otherwise, hindrances from the Shipboard Observer are applicable. Direct Fire may use WP (for 120mm only) and HE. To use WP, however, the Marine player must make another Battery Access draw. A subsequent black chit allows the use of WP, while a red chit allows only the use of HE for that mission.

CG3.3 NAVAL FIRE & AIR SUPPORT ARRIVAL: All Naval SR/FFE/Acquisitions must be immediately removed from the map following a successful Air Support dr, with all Battery Access lost. Battery Access may not be attempted while any FB remain on board.

CG3.4 JAPANESE COUNTERBATTERY FIRE: The Japanese player receives Counterbattery Fire whenever one or more of the following Guns starts a scenario on board, fully manned, and functioning: 120L AA, 140L ART, or 200L (8-in. Gun Turret). Depending on the caliber of the Gun, Counterbattery fire may remove one Black card from, and/or add one Red card to, the Marine NOBA Draw Pile (G14.63).

Marine Draw Pile		
Weapon	Black	Red
120L	-1	
140L		+1
200L (8-in. Gun Turret)	-1	+1

Counterbattery Fire results are cumulative for each eligible Gun on Board. In CGIII, since more than one Marine NOBA module exists, the Marine player must match the Counterbattery Fire of each eligible Japanese Gun to his Naval Batteries accordingly (see example below). A Gun used for Counterbattery Fire may fire without affecting Counterbattery Fire results. The effects of Counterbattery Fire last throughout the scenario until the Gun is Captured or Eliminated.

EX. The Marine player has one module of 120+mm and one 200+mm NOBA available. The Japanese player has two 120L Guns and one 8" Gun remaining. The Marine player chooses to apply all Counterbattery fire effects to the 120+mm module (which would give it a Battery Access draw pile of 2 black and 3 red cards) and leave the 200+mm module with its full draw pile of 5 black and 2 red chits.

CG4 TARAWA NAVAL BOMBARDMENTS: The ISSR of a CG may provide the Marine player with one or more Naval Bombardments. The Naval Bombardment rules (G14.7-.72; see also F7.4) apply as modified herein. In addition to stating the number of Bombardments, the ISSR will state the hex radius for each Bombardment. After viewing the Japanese setup, the Marine player may place one AR counter on any land hex in play for each Tarawa Naval Bombardment module in his OB. After the placement of all such AR counters, make an accuracy dr prior to placing an FFE:2 to designate the center of the bombardment's blast radius. The bombardment is accurate on an Original dr ≤ 2 . If not accurate, make a C1.31 Error DR, with halving being the only modification to the Extent of Error dr. Naval Bombardment effects apply to all hexes within the Blast Area [EXC: G14.73 second attacks are NA]. After resolving all Tarawa Naval Bombardment MC, place a Smoke counter in each land hex affected by the Bombardment (which counters are then flipped to their Dispersed side at the start of the immediately following Marine PFP).

CG4a BREACHING SEAWALLS: A seawall has a Morale of 10 and is breached (G13.624) if it fails its NMC. Each hex in the Blast Area and formed by ≥ 1 seawall hexside takes one seawall NMC. If more than one hexside could be affected, use Random Selection to determine which hexside(s) are breached.

CG5 MARINE CLOAKING: The Marine player has the option of keeping in a Cloaking box each of his SMC/SW [EXC: Pathfinders] which enter from offboard into an Ocean location by secretly recording one accompanying MMC (this cloaking is in addition to that granted by G14.23).¹⁰ Cloaking is lost for these pieces upon entering a land Location, or if unpossessed, or if in a different Location than its original MMC, or if a SW is fired/assembled or leadership used in any way. A Cloaked Leader is not required to take a MC unless it will use its leadership DRM to assist any other unit in the same Location; if a leader chooses not to take its own MC, it suffers Casualty Reduction if its accompanying MMC fails the MC. All Infantry MMC may enter the map from an Ocean hex under a "?". This form of concealment is not lost in a water hex due to movement but is lost normally otherwise. Attacks against cloaked/concealed Marine units in the Ocean are not affected by Area Fire for being concealed.

CG6 AIR SUPPORT: The Marines receive Random Air Support (E7.2) on a dr ≤ 2 on each turn of a daytime CG scenario [EXC: Initial Scenario of CGI] provided no Air Support is presently on board. Air Support takes the form of '44 FB with bombs. All AR/SR/FFE on board are immediately removed from the map following a successful Air Support dr.¹¹ Once Air Support arrives, NOBA may not be used by the Marines until all aircraft are eliminated, Recalled, or voluntarily exited. FB may voluntarily exit at the end of any friendly DFPh as if Recalled. The Marine player may not refuse Air Support and must make an Air Support dr during every eligible RPh.9 A +2 DRM (cumulative with all other DRM) applies to each Sighting TC.

CG7 JAPANESE RESERVES AND REINFORCEMENTS:

CG7.1 RESERVE POOL:¹² Japanese counters may be designated by CG setup restrictions or ISSR as part of, or subsequently assigned by the Japanese player to, the Reserve Pool. All such counters are held off-map until they either enter the game as reinforcements or are added to the Japanese player's Retained counters during the RePh. If a rule designates a specific number or percentage of counters from the Reserve Pool to enter/setup, each MMC/SMC/SW/vehicle is considered a separate counter [EXC: Armor Leader] and all SW must enter with an Infantry unit. During the setup sequence for each AM and PM CG Date after 20AM, the Japanese player may set up on board $\leq 20\%$ (FRU) of the remaining Reserve Pool counters [EXC: during the last CG scenario of each CG the Japanese player may setup all of his remaining Reserve Pool counters on board]; during a Night CG scenario (see CG10), the Japanese player must set up on board $\geq 30\%$ (FRU) of the remaining MMC in the Reserve Pool. A Reserve Pool counter must set up ≥ 3 hexes from every Marine FLL; if unable to do so, it is returned to the Reserve

CG7.1

Pool and may enter later in the scenario as the result of a successful Reinforcement DR (CG7.2). No Night CG scenario is allowed if the Japanese player cannot set up all of his Reserve Pool reinforcements ≥ 3 hexes from any Marine FLL. In addition to receiving reinforcements from the Reserve Pool as per CG7.2, after the Initial CG Scenario the Japanese player may make a Replenishment DR on the Reserve Pool Replenishment Chart to add more units to his Reserve Pool. The Replenishment DR is made on Turns 1 and 5 of each CG scenario during the Rally Phase of the Japanese Player Turn.

Reserve Pool Replenishment Chart

DR	Reserve Pool Units
2	3x 448, 2x Leader
3	2x 448, 2x Leader
4	3x 447, 2x Leader
5	3x 447, 1x Leader
6	3x 347
7	3x 347, 1x Leader
8	3x 347
9	2x 447, 1x Leader
10	3x 448, 1x Leader
11	2x 448, 1x Leader
12	2x 448, 1x Leader

CG7.2 REINFORCEMENTS: The Japanese player may make a Reinforcement dr during the RPh of each Japanese Player Turn after Turn 1 to determine if reinforcements are available to enter from the Reserve Pool. Japanese reinforcements may enter from any friendly controlled land hex on the east map edge (south/east map edge for CGIII) following a dr $\leq$ the current turn number. In CG I the Japanese player may enter a number of counters $\leq$ a subsequent dr. In CG II & III, the Japanese player may enter a number of counters $\leq$ a subsequent DR. Reinforcements not entered are returned to the Reserve Pool at the end of the Player Turn.

CG8 SNIPERS: Each side may use two Sniper counters during each CG scenario. Each Sniper counter must still be set up initially as per the first two sentences of A14.2, but with ≥ 15 hexes between them (or as far apart as possible if they cannot set up ≥ 15

hexes apart); when a Sniper attack can occur, make a dr to randomly determine which one actually makes an attack (assign numbers so that each has an equal chance). The SAN is never altered by the presence of > 1 friendly Sniper in play simultaneously. Any result (e.g., Pin) affecting a Sniper counter affects all friendly Snipers simultaneously. See RePh 15.6122. If a player wishes to reposition his Sniper counter by choosing not to activate his Sniper on a successful SAN dr, he may reposition either or both Sniper counters as per A14.2. Neither player's SAN may drop below 2 during the course of any CG scenario.

CG9 BANZAI: The Japanese player may not declare a multi-Location Banzai Charge (G1.5) [EXC: CG10].

CG10 NIGHT BANZAI ATTACK:¹³ During RePh step 15.616 after any PM scenario before November 22, the Japanese player secretly records whether he will attempt a Night Banzai Attack. The Marine player then sets up for the next CG scenario and then the Japanese player reveals if he is attempting a Night Banzai Attack (15.6203). If so, and if he makes a Final dr ≤ 1 , a Night CG scenario occurs. Otherwise, the Japanese player sets up normally for the next AM scenario.

If a Night CG scenario occurs, CG7 is suspended for the duration of that scenario. The initial NVR for any Night CG Date is 3; the Japanese are the Scenario Attacker (but may not use Cloaking) and the Marines are the Scenario Defender [EXC: E1.2 is NA. Instead, the Marine player may now freely conceal all of his units]. The Japanese player must then designate $\geq 30\%$ of his Reserve Pool MMC, plus $\leq 25\%$ of his retained on-map MMC, and ≥ 1 Leader as elements of the Night Banzai Charge. Any available SMC/SW, either on-map or in Reserve, may join. All such units must set up ≥ 3 hexes from any Marine FLL, and in one or more "chains" of contiguous hexes that contain ≥ 1 MMC per hex and with each such stack adjacent to ≥ 1 other such stack; each chain must contain at least one leader. Once set up, all units of the Night Banzai Charge are marked with a Banzai counter and may not undertake any action until the MPh of the Japanese Player Turn of Turn 1; Retained units not participating in the Night Banzai Charge are not so restricted. At the start of the MPh of the Japanese Player Turn of Turn 1, all

units of the Night Banzai Charge must immediately conduct a single (i.e., all "chains" moving simultaneously) Banzai Charge (G1.5). The Japanese player selects only one Marine unit as the "target" (A25.23) for the entire initial Banzai Charge but that unit can be anywhere on the map regardless of range or LOS. In each succeeding Japanese MPh (and APh) each unit of the Night Banzai Charge that has neither become a broken HS nor been in an enemy-occupied hex must Banzai Charge again in the same manner, regardless of normal MF, LOS, and leader requirements; however, each such unit/stack/chain may now make its own Banzai Charge. Units "charge" during the APh by moving in the required direction (A25.231). Until it has become a broken HS or has entered an enemy-occupied hex, each unit of the Night Banzai Charge [EXC: any T-H Hero created from a unit participating in the Night Banzai Charge] is considered to be part of a Human Wave (A25.23) in all phases, during which time Range Counters (A25.2321) are not removed and it is subject to FFNAM (and FFMO if appropriate); may conduct no RPh/PFP activity; may not participate in a multi-Location FG; uses Area Fire for Defensive First/Final Fire (cumulative with any other applications); and may not Interdict. Units conducting a Banzai Charge do not incur the additional MF cost for entering Concealment Terrain at night (E1.51). Instead, make a DR each time a MMC enters a Concealment Terrain Location in the MPh, with an Original 12 DR considered failure of an Attack Break (G1.12) MC.

CG11 CONCEALMENT & HIP: Each Japanese/Korean Infantry unit (and its possessed equipment) setting up in Concealment Terrain may set up concealed, regardless of enemy LOS. Each Japanese vehicle may begin concealed if it is set up in Concealment Terrain ≥ 6 hexes from the nearest Marine Set-Up Area Location. Such "?" need not be purchased; i.e., each is placed freely, and before the Marine player views the setup. See SSRs BRT1 for Fortifications and CG13 and BRT5 for Guns. Otherwise, A12.2 and A12.34 apply in the normal manner. In addition to the normal HIP capabilities of G1.631, the Japanese player may use FPP to purchase HIP squad-equivalents for an additional 5% (10% during a Night CG scenario)(FRU) of the squad-equivalents (including Korean labor units) available for on-map set up but may not use HIP in a FLL.

CG12 KOREAN LABOR UNITS: The Korean labor units stationed on Betio are represented by Chinese 3-3-6 counters. Neither G1. nor G18. apply. Korean labor units treat Japanese SW as captured (A21.11-12), but Japanese Leaders do not have their leadership reduced for directing these Allied Troops which are, however, treated as part of the Japanese OB for purposes of determining the number of MMC squad-equivalents that may use HIP (G1.631 and SSR CG11). Korean labor units are always Conscripts and become Fanatic on a Heat of Battle Final DR ≤ 8 and Disrupt on a Final DR ≥ 9 , and have an ELR of 3.

CG13 GUNS (See also SSR BRT5): Each AA Gun, Gun in a pillbox, or Gun ≥ 76 mm must set up in the same Location from CG scenario to CG scenario. Every other non-vehicular Gun that ended the last CG scenario on-map must be set up within three hexes of the Location in which it ended that scenario [EXC: 81mm MTR; if at the start of setup (RePh step 15.6202) it is hooked up to a Mobile vehicle], even if it will be set up (un)hooked. Any Gun that is eligible to setup in a different location than where it ended the preceding CG scenario may set up HIP if otherwise eligible to do so. Each Gun in a Setup Area that contains Personnel may be set up (un)hooked/(un)limbered/(non-)dm unless otherwise prohibited. The U.S. M1A1 75 ART Gun may be dm as if it were an 81mm MTR, except it may be assembled/dismantled only in the PFP.¹⁴ An M3A1 37LL AT Gun may be manhandled into an Ocean hex with a +2 DRM and is not eliminated if unpossessed but is eliminated on an Original Manhandling DR of 12 while entering or exiting an Ocean Location.¹⁵ An M3A1 37LL AT Gun may enter loaded on a LVT as if on a LVT4 (U.S. Vehicle Note 51), but unloads by being pushed into the LVT's own location by Passengers of the LVT (with a +2 DRM to the Manhandling DR), and (during CGII & III) may enter (towed by an unarmed jeep at the Marine player's option) at Z33 on the pier if pier Locations Z33-U33 are Controlled by the Marine player.

CG14 SELF RALLY: Each side may attempt to Self Rally ≤ 2 (not just one) non-Disrupted broken MMC, provided (as per A18.11) both attempts are carried out before other friendly MMC Rally attempts.

CG15 PILLBOX CONTROL: Provided there are no armed enemy ground units within the pillbox, pillboxes are Controlled by the side Controlling the non-pillbox Location.

CG16 OVER THE WALL TC: During the initial Scenario of CGII and CGIII, each Good Order Marine Infantry MMC must pass a 4TC to cross a seawall (10.)

T

from a Beach hex to a Hinterland hex, failure of which causes the unit to be pinned in its current Beach hex. During the MPh of these CG, a Marine MMC may move from one Beach hex to another only if using Assault Movement [EXC: if moving with a leader].¹⁶

The following DRM apply to the 4TC:

- 1 if stacked with a Hero
- 2 if crossing breached seawall hexside
- +x Leadership modifier of best Good Order Leader in the same hex and currently capable of moving.

CG17 ELR: All Marines have ELR of 5. All Japanese 4-4-8s/2-3-8s have ELR of 5. All other Japanese non-crew Infantry have ELR of 4. Korean Labor units have ELR of 3.

CG18 BASIC CG SCENARIO PREPARATION SEQUENCE: The following sequence is followed in preparation for any CG Scenario. This sequence is performed after steps 15.601–6139. Refer to the specifics of RePh steps 15.614–6205. See 15.6205 for setup/move order.

CG18.1 PRE-SETUP SEQUENCE

CG18.11. LEADER DETERMINATION: Both players roll for all undetermined Leaders on the Leader Determination table (SSR CG19). Record the resulting Leaders on the Beach Defense Record (Japanese) or Landing Schedule Record (Marine).

CG18.12 PURCHASE GUNS AND FORTIFICATIONS: Purchase Guns and Fortifications (including pillboxes) for each Beach/Setup area (15.614).

CG18.13 ASSAULT WAVE ASSIGNMENT: The Marine player assigns Formations to Assault Waves (SSR CG2.3).

CG18.2 UNIT SETUP

CG18.21 NIGHT BANZAI DETERMINATION: If applicable, the Japanese player decides if a Night Banzai Attack will be attempted per SSR CG10.

CG18.22 FIRST PLAYER SETUP: The side setting up first (Japanese in all Initial CG Scenarios and PM scenarios; Marines in all Night and AM scenarios [EXC: Initial CG Scenario]) places his Isolated and non-Isolated units per 15.620–205.

CG18.23 NIGHT BANZAI ATTEMPT RESOLUTION: If applicable, the Japanese player resolves any attempt to conduct a Night Banzai Attack (SSR CG10).

CG18.24 SECOND PLAYER SETUP: The side setting up second (Marines in all Initial CG Scenarios and PM scenarios; Japanese in all Night and AM scenarios [EXC: Initial CG Scenario]) places his Isolated and non-Isolated units per 15.620–205.

CG18.3 BOMBARDMENT RESOLUTION: The Marine player declares and resolves any bombardments. Play then begins.

CG19 LEADER DETERMINATION: For each LD DR required, make a DR on the following table. All applicable DRM are listed in the applicable CG ISSR.

LEADER DETERMINATION TABLE

DR	Japanese		Marine	
	Inf	Armor	Inf	Armor
≤ 2	10-2	9-2	10-3	10-2
3	10-1	9-1	10-2	9-2
4	10-0	8-1	9-2	9-1
5	10-0	—	9-1	8-1
6	9-1	—	9-1	—
7	9-1	—	8-1	—
8	9-0	—	8-0	—
9	9-0	—	8-0	—
10	8-0	—	7-0	—
11	8-0	—	7-0	—
12	8+1	†	6+1	—

† All Japanese AFV have Inexperienced Crews (D3.45).

15.5 INITIAL SCENARIO: First select one of the CG listed below (CG I is the shortest with 4-5 CG dates). Included there is the information needed to play that CG's Initial Scenario. For the Initial Scenario, players begin with RePh step

15.51

15.614 ("Purchase Fortifications and Guns") and complete RePh steps 15.620–6204 after first determining leaders on the SSR CG 19 Leader Determination table.

In the Initial Scenario of each BRT CG the Japanese sets up first and the Marines move first. Furthermore, the Marine player is assumed to be the Scenario Attacker and the Japanese player is the Scenario Defender in all AM and PM CG scenarios. During any Night CG scenario (CG10) the Japanese player is the Scenario Attacker and the Marine player is the Scenario Defender.

15.51 BRT Campaign Game I: A HELL OF A WAY TO DIE

CG Dates: 21 AM - 22 PM

TARAWA, BETIO ATOLL, 21 November 1943: Monday morning brought the beginning of the second day of battle for the coral atoll of Betio. Five battalions of Marines had tried to dislodge a stubborn Japanese force from the tiny island without success. The Japanese Special Naval Landing Force, or rikusentai, still held 90% of the atoll. The situation looked grim for Colonel David Shoup, the Marine landing force commander on shore. Two battalions had been torn to shreds crossing 2,000 yards of coral reef as they tried in vain to reach the shore. Communications were spotty at best, and no real control of the forces could be achieved. Similarly hampered by poor communications and coordination, the rikusentai had been unable to organize an effective counter-attack. The rikusentai had missed a prime opportunity to push the invaders back into the sea in the now receding darkness. Had they done so, the situation for Colonel Shoup would have been even worse. There were Marines still ashore, however, and there was only one thing to do—attack. Colonel Shoup gave the order. As the assault started, 1st Battalion, 8th Marine Regiment began wading over the terrible reef of death. The still-strong defenders wasted no time in ripping apart the Marines wading toward them. After spending 18 hours in landing craft, the 1/8 landed into the teeth of the defense due to miscommunication. Marines on the island watched in horror as the proud battalion lost more and more men in the water. Something had to be done. In small groups, men ashore braved the fire to try to stop the slaughter.

PLAYING AREA: Only hexes numbered ≤ 32 are in play.

CG I VICTORY CONDITIONS: The Marines win immediately if there are no unbroken Japanese/Korean squads on the map, provided the Japanese amass ≤ 204 CVP.

INITIAL-SCENARIO VICTORY CONDITIONS: The Marines win at scenario end if there are no Japanese units on/north of hexrow P22-P32, and/or there are no Japanese units on/adjacent to beach hexes N21-V11, and/or there are no Japanese units on/adjacent to beach hexes V10-D4.

INITIAL-SCENARIO SETUP SEQUENCE: The Japanese player sets up first. After the Marine player sets up, the Japanese player makes a dr to determine which side moves first. On a dr of 1-3 the Marines move first; otherwise, the Japanese moves first.

JAPANESE OB

(see SSR CG17 for ELR)

Elements of Betio Island Command set up in Hinterland hexes ≥ 3 hexes from any Beach hex:

75 FPP

3rd Special Base Force set up in Hinterland hexes not in the Marine Setup Area: {SAN: 4}

Armored Bulldozers x3	

AT section enter on/after Turn 1 of the 22AM CG Date at Red Beach One or Red Beach Two or Green Beach.

M3 GMC 75 x3	0-0-9 x 3
--------------	-----------

INITIAL SCENARIO SPECIAL RULES

1. EC are Moist, with no wind at start. See BRT SSR.
2. The Marine player receives one 120+mm NOBA Module. Only 1st Battalion, 6th Marines need to enter in Assault Waves (CG2.3).
3. The Japanese player may apply a -2 drm to the LD DR for his first two leaders.
4. The Marines receive Random Air support (E7.2, *not* per SSR CG6) in the form of '44 FB with bombs.
5. Place a Burnt-out Wreck counter in the hexes V12, W11, R17, Q19, O20, S24, and T28.
6. Seawall hexside U10-T10 begins the game breached (SSR CG4a).

AFTERMATH: On Red Beach Two small groups of men started, one at a time, to pick off machine-gun emplacements and heavy guns. Lieutenant Deane Hawkins led charge after charge. His tactic was to creep up to a pillbox, fire his weapon into it, and then throw in grenades. Hawkins set the example of "cool disdain" that gave heart to the Marines. Hawkins could not survive the Japanese maelstrom and after destroying four pillboxes he was mortally wounded. His actions capped a spectacularly heroic 24 hours for his Scout Sniper Platoon. Major Mike Ryan was the main contributor to winning the battle at the "beak." He took over all the forces in his area, which included elements of nearly every battalion ashore. He organized an attack led by two

Shermans and preceded by Naval gunfire directed by Lt. Thomas Green, USN. Due to spotty communications, airstrikes interfered with the artillery barrage. Major Ryan sent runners to stop the Fighter-bombers and then pressed south. After an intense bunker to bunker fight Green Beach was clear. Major Ryan wasted no time getting the word to Colonel Shoup. Because of Ryan's actions, 1st Battalion 6th Marines landed unmolested in the late evening, the first Battalion to land with full combat strength.

15.52 BRT Campaign Game II: A SPECIAL VALOR

CG Dates: 20 AM - 22 PM

TARAWA, BETIO ATOLL, 20 November 1943: The intense problems inherent to an amphibious assault on a hostile shore could not have been shown more vividly than in the area of Red Beaches One and Two. Physically separated from Red Beach Three by the central pier, this area also featured a cove which enabled the Japanese to subject the invading force to a murderous crossfire. The beaches were also well-protected by some serendipitous planning; heavy anti-aircraft guns had been placed on the "chin" of the Bird's Beak to cover likely air approaches to the runway and to provide long range fire towards the other islands in the Tarawa Atoll. Although the Japanese gunners set the fuses on the AA rounds too high, gaining little effect on their planned targets, the high explosive rounds proved perfect for hitting the LCVPs as they dropped their bow ramps at the reef edges. As the Marines jumped into the water, they were immediately faced with the unenviable choice of drowning in a hole or standing in less than a foot of water in the face of intense fire coming from the AA guns, heavy weapons, or from machine guns some brave defenders had set up in a rusting hulk behind them and on positions under the long central pier. The way to the beaches was slow-going.

PLAYING AREA: Only hexes ≤ 35 are in play.

CG II VICTORY CONDITIONS: The Marines win immediately upon Controlling all Fortified Building Locations, pillboxes, Bombproofs, and Command Bunkers provided the Japanese amass ≤ 449 CVP.

INITIAL-SCENARIO VICTORY CONDITIONS: The Marines win at game end by amassing more Victory Points than the Japanese. CVP are awarded normally and each pillbox Eliminated or Captured by the Marines is worth to them a number of VP equal to the pillbox's stacking capacity.

JAPANESE OB

(see SSR CG17 for ELR)

3rd Special Base Force set up as indicated and as per applicable Reserve Pool provisions: {SAN: 4}

Elements of Island Command set up in Hinterland hexes ≥ 3 hexes from any Beach hex or in the Reserve Pool [EXC: FPP set up anywhere on-map]:

4-4-8 x4	3-4-7 x4	3-3-6 x12
Leader x5 (see ISSR 5)		
Type 95 Ha-GO x4	A.L. x2 (see ISSR 5)	
150 FPP		

Elements of 3rd Special Base Force set up in Hinterland hexes ≤ 3 hexes from any hex of a specified beach; eligible fortifications may also set up in Beach/Ocean hexes with a hex coordinate of ≥ 11:

Red Beach One, Red Beach Two, and/or Green Beach:			
4-4-7 x30	Leader x5	LMG x10	MMG x8
Red Beach One:			
27 ⁴ CAPP	52 GPP	50 FPP	
Red Beach Two:			
27 ⁶ CAPP	52 GPP	75 FPP	

111th Construction Battalion set up in Hinterland hexes ≤ 3 hexes from any hex of Green Beach (see ISSR 3); eligible Fortifications may also set up in any Beach hex or Ocean hex with a hex coordinate of ≤ 10:

3-4-7 x22	Leader x4
LMG x4	50mm MTR x6
31 ³ CAPP	46 GPP
	50 FPP

1st and 2nd Companies, 7th Special Naval Landing Force set up in Reserve Pool and/or adjacent to any hex of a specified beach (see ISSR3) [EXC: Bombproofs may

T

15.53

set up two hexes away from any Black Beach hex. Other units assigned to this beach may set up in such a Bombproof]:

Black Beach One and/or Black Beach Two:

4-4-8 x22 Leader x4
LMG x7 MMG x7 50mm MTR x6

Black Beach One: Black Beach Two:
15GPP 12 GPP
31⁵ CAPP 31⁵ CAPP
20 FPP 20 FPP

RESERVE POOL enter on any friendly Controlled east-edge land hex and/or set up on/adjacent-to Black Beach hexes and ≥ 3 hexes from all Marine units.

4-4-8 x12 4-4-7 x8 3-3-6 (Korean Labor) x8
Leader x12 (see ISSR 5)

Type 95 HA-GO x8

MARINE OB [ELR: 5]

Elements of Regimental Landing Team Two, Second Marine Division [ELR: 5] enter at Red Beach One and Red Beach Two, one BLT per Entry Area: {SAN: 5}

2nd Battalion, 2nd Marines

3rd Battalion, 2nd Marines

20x LVT1(m)

20x LVT(A)2

Follow-on Battalion:

1st Battalion, 8th Marines enter at any *one* Red Beach Entry Area.

Regimental Reserve:

1st Battalion, 6th Marines enter at Red Beach One *or* Red Beach Two *or* Green Beach (may enter on Pneumatic Boats [E5.12]).

INITIAL-SCENARIO SPECIAL RULES

1. EC are Moist, with no wind at start. See BRT SSR.
2. The Marine player receives four Naval Bombardments (SSR CG4). Two Bombardments have a two hex radius and two Bombardments have a three hex radius.
3. All pillboxes/Bombproofs/Command-Bunkers in the Setup Areas of the 111th Construction Battalion and the 1st and 2nd Companies, 7th Special Naval Landing Force, must be manned to capacity if possible. Any units of these formations not set up in a pillbox/Bombproof/Command-Bunker [EXC: a Gun and its manning crew] must set up in the Reserve Pool. No unit of the 7th SNLF which sets up onboard/HIP may leave its initial Location until Japanese Turn 3.
4. Each Bombproof begins the game marked with a No Move counter. Units set up within such a Bombproof gain Freedom of Movement only as a result of a $dr \leq$ the game turn (made by the Japanese player during each Japanese RPh for each still-marked Bombproof). Once the No Move counter is removed, all units within that Bombproof may move/rout/advance normally [EXC: ISSR 3]. The following *dr*m apply to the Freedom of Movement *dr*:
-1 if all units in Bombproof are Elite
+x leadership modifier of best Leader in the Bombproof
5. The Japanese player may apply a -3 *dr*m to the LD DR of his first Leader of the Betio Island Command group, -2 to the LD DR for his next two Leaders of the Betio Island Command group, and -1 to the fourth and fifth LD DR for the Betio Island Command group, and -2 to the LD DR for his first Leader of the Reserve Pool, and may make two *dr* on the LD Table for Armor Leaders.
6. The Marine player may designate ten LVT(A)2 as being equipped with wire-removal grappels [U.S. Vehicle Note 59].

AFTERMATH: *The Japanese had allowed a number of LVTs of the 3/2 to land on the beach unmolested by fire. This was the defenders' first encounter with the strange vehicles and the biggest threat seemed from the landing boats out on the reef. The gunners soon realized their mistake when Marines unexpectedly began pouring over the sides of the LVTs. The Japanese turned the firestorm of machine-gun fire and anti-boat rounds to the LVTs. The Marines on the beach were then completely pinned down and again the Japanese could level their fire on those Marines now wading ashore with more than 2,000 yards to cover. A sense of desperation began to creep into the Marine command. The intense crossfire in the cove area scattered the landings of 2/2 and decimated the follow-on forces of 3/2. Major Schoettel, commander of 3/2, sent a disenhearting message to Colonel Shoup, "We have nothing left to land." This was taken to mean that 3/2 was gone. The commander of 2/2 was dead. It seemed that nothing was working. Major Mike Ryan, Commander, Company K, was wading into the impossible curtain of steel when he saw a Marine standing on the "bird's beak" waving men in without care. Ryan moved in that direction and started bringing all the Marines he could. Before long he had managed to organize a small command of survivors from almost every unit. Ryan finally got word to Colonel Shoup that he was in fact alive and, incredibly, making progress.*

15.53 BRT Campaign Game III: **UTMOST SAVAGERY**

CG Dates: 20 AM - 22 PM

TARAWA, BETIO ATOLL, 20 November 1943: *In the darkness of the morning of November 20, 1943, the irresistible force of the United States Marine Corps was about to collide with the immovable object of the Imperial Japanese marines at a very small place called Tarawa. Despite nearly 170 years of maritime tradition, the Corps had never landed in force against a well-fortified defensive position. Betio island was one such fortified location. Surrounded by a fringing reef, Betio island was a natural setting for a fortress. Only three miles long and no more than 800 yards at its widest point, Betio was the most heavily fortified piece of ground in the world. The defenses of the tiny island were designed and built under the direction of Admiral Saichiro, who used his years of training as an engineer to create a breathtaking array of concrete and steel emplacements. Behind a coconut log seawall, emplacements were interwoven with double-apron barbed wire, mines, and tetrahedrons. When the concrete ran out, bunkers were built with coconut logs and sand. Almost 500 positions were constructed, mutually supporting and packed with automatic weapons. Betio bristled with armaments that included 8-in. naval guns, large caliber anti-aircraft guns, anti-tank guns, and machine guns too numerous to count, all manned by over 4,000 well-trained Imperial marines. "One million Americans couldn't take Tarawa in 100 years," said Rear Admiral Meichi Shibasaki, the commander of the garrison, to his troops. Eighteen thousand men of the 2nd Marine Division were about to give it a try.*

PLAYING AREA: Entire BRT map.

CG III VICTORY CONDITIONS: The Marines win immediately upon Controlling all Fortified Building Locations, pillboxes, Bombproofs, and Command Bunkers provided the Japanese amass ≤ 804 CVP.

INITIAL-SCENARIO VICTORY CONDITIONS: The Marines win at game end by amassing more Victory Points than the Japanese. CVP are awarded normally and each pillbox Eliminated or Captured by the Marines is worth to them a number of VP equal to the pillbox's stacking capacity.

JAPANESE OB (see SSR CG17 for ELR)

3rd Special Base Force sets up as indicated and as per applicable Reserve Pool provisions: {SAN: 4}

Elements of Island Command set up in Hinterland hexes ≥ 3 hexes from any Beach hex or in the Reserve Pool [EXC: FPP set up anywhere *on-map*]:

4-4-8 x4 3-4-7 x8 3-3-6 (Korean Labor) x14

Leader x8 (see ISSR 5)

MARINE OB [ELR: 5]

Elements of Regimental Landing Team Two, and Regimental Landing Team 8, 2nd Marine Division enter at Red Beach One, Red Beach Two, and Red Beach Three Entry Areas with one BLT per Entry Area: {SAN: 5}

3rd Battalion, 2nd Marines (BLT 3/2)

2nd Battalion, 2nd Marines (BLT 2/2)

2nd Battalion, 8th Marines (BLT 2/8)

40x LVT1(m) 20x LVT(A)2

Follow-On Battalion: 1st Battalion, 8th Marines enter at any *one* Red Beach Entry Area.

Regimental Reserve: 1st Battalion, 6th Marines enter at any *one* Red Beach or Green Beach Entry Area (may enter on Pneumatic Boats [E5.12])

Divisional Reserve: 2nd Battalion, 6th Marines enter at any *one* Red Beach or Green Beach Entry Area

INITIAL SCENARIO SPECIAL RULES

1. EC are Moist, with no wind at start. See BRT SSR.

2. The Marine player receives four Naval Bombardments (SSR CG4). Two Bombardments have a two hex radius and two Bombardments have a three hex radius.

3. All pillboxes/Bombproofs/Command-Bunkers in the Setup Areas of the 111th Construction Battalion and the 1st and 2nd Companies, 7th Special Naval Landing Force, must be manned to capacity if possible. Any units of these formations not set up in a pillbox/Bombproof/Command-Bunker [EXC: a Gun and its manning crew] must set up in the Reserve Pool. No unit of the 7th SNLF which sets up onboard/HIP can leave its initial Location until the start of Japanese Turn 3.

4. Each Bombproof begins the game marked with a No Move counter. Units set up within such a Bombproof gain Freedom of Movement only as a result of a $dr \leq$ the game turn (made by the Japanese player during each Japanese RPH for each still-marked Bombproof). Once the No Move counter is removed, all units within that Bombproof may move/rout/advance normally [EXC: ISSR 3]. The following *drm* apply to the Freedom of Movement *dr*:

-1 if all units in Bombproof are Elite

+x leadership modifier of best Leader in the Bombproof

5. The Japanese player may apply a -3 *drm* to the LD DR (15.6) of his first leader of the Betio Island Command group, -2 to the LD DR for his next two leaders of the Betio Island Command group, and -1 to the fourth and fifth LD DR for the Betio Island Command group, and -2 to the LD DR for his first leader of the Reserve Pool, and may make two *dr* on the LD Table for Armor Leaders.

6. The Marine player may designate ten LVT(A)2 as being equipped with wire-removal grapnels [U.S. Vehicle Note 59].

AFTERMATH: *The initial assault waves managed to negotiate the fringing reef as planned, but the follow-up forces were stopped cold more than 2,000 yards from the shore. As they waded ashore, they were subjected to intense withering fire from the dug-in Japanese. By nightfall, there were more than 1,500 Marines casualties. The invaders held only a small section of the beach. The fanatical resistance by the defenders caused the destruction of two full battalions. The first break for the Marines came as 1/6 landed unmolested in the evening of D+1. The next morning, focused attacks were organized. Each bunker had to be taken out individually. The Japanese continued to fight with skill and determination, making the reduction of the defenses costly. The main resistance centered in the "Pocket" between Red Beach 1 and Red Beach 2. Though the rikusentai fought to the last man, the battle was finally won when the Japanese mustered for the final Banzai charge on the night of D+2. More than 400 Japanese tried to turn the tide by launching a series of frontal attacks along the airfield. The Marines held, and the Japanese force was finally broken in heavy hand to hand combat. The blood shed on Tarawa was beyond that imaginable. The courage and determination of the rikusentai forced the Marines to pay in blood for every grain of sand. But the courage, skill, and adaptability of the Marines had carried the day. General Holland Smith saw a young Marine, "one arm still in the air supported by the weight of his body. On top of the sea-wall just beyond his upright hand, was a blue and white flag, a beach marker to tell the succeeding waves were to land". With tears in his eyes General Smith said, "How can men like these ever be defeated?"*

15.6. REFIT PHASE: The following steps (15.601-.6143) are performed simultaneously by each side during the RePh, which occurs between CG scenarios—provided neither side has fulfilled its CG Victory Condition. Each step (and sub-step) must be carried out in the numbered/lettered order given; those not applicable to the current situation may be omitted (e.g., if there are no Blazes on the map, skip RePh step 15.610).

15.601 Conclusion of Melee

15.602 Marker Removal

15.603 Rally, Unloading, Victory Determination, and CVP Totals

15.604 Encirclement, Bog, and Shock

15.605 Wading Unit Survival

15.606 Encirclement Marker Removal

15.607 Marine Perimeter Determination

15.608 Retained Units & Hidden Fortifications

15.609 Prisoners

15.610 Extinguishing Flames and Blazes

15.611 Recombining, Battle Hardening, and Field Promotion

15.612 New CG Date & SAN Adjustment

15.613 Equipment Repair and Replenishment

15.614 Purchasing Fortifications and Guns

15.601 CONCLUSION OF MELEE: All opposing units in the same Location are now assumed to be in *Melee*, and must undergo an (unlimited) number of Melee rounds until no more CC attacks can be made. Such units are free to perform any/all normal CCPh activities associated with Melee (i.e., attack, Capture, Withdrawal, etc.). Consider the side

T

that moved first in that scenario to be the ATTACKER. Following the conclusion of the first round of RePh Melee in a Location, each still concealed unit therein is revealed, each pinned unit becomes unpinned, each CX counter is removed, each vehicle currently in Motion therein has its Motion counter removed, and each Stun counter on a vehicle therein is flipped over to its "+1" side and the vehicle may be marked as CE if so desired.

15.602 MARKER REMOVAL: All hidden/Cloaked units and equipment are placed on-map in their present Location [EXC: Hidden Japanese units and equipment need not be revealed provided they set up in their current Location for the next CG scenario; such units/equipment may set up HIP for the next CG scenario at no cost in FPP]. All system markers listed below are removed from the map at this time in the following order (Right of Inspection *does not* apply to revealed stacks):

- a) SR and FFE markers;
- b) IR and SMOKE counters;
- c) Acquired counters;
- d) DM, Disrupted, Banzai, Berserk, Fanatic Wall Advantage and Crest markers, Dummy stacks, Dummy Cloaking counters, and "7";
- e) CX, Motion, CE, BU, and Labor markers;
- f) All hidden/Cloaked units and Equipment [EXC: non-Isolated HIP Japanese] are placed on-map in their setup Location;
- g) Sniper counters;
- h) FB counters.

15.603 RALLY, UNLOADING, VICTORY DETERMINATION & CVP TOTALS

15.6031 RALLY & UNLOADING: All currently broken units of both sides automatically rally, even if Disrupted; no DR need be made. All Passenger/Rider Personnel and Equipment are then unloaded into their vehicle's Location. All mobile LVT are removed and Retained off-map. Any unpossessed SW/Gun in a mobile LVT is Eliminated. All Guns hooked up and in tow remain so (for now—see CG13); if its vehicle is eliminated in the RePh, so is the Gun that is being towed. When step 15.6031 is completed, CG-Scenario End has occurred.

15.6032 CG-SCENARIO VICTORY DETERMINATION: Final hex/building/pill-box Control and Casualty VP are now determined, and the winner of the just-completed CG scenario is determined as per 15.615 or 15.51–53 as applicable. Units/Equipment Eliminated in the RePh after CG-Scenario End never count for CG-Scenario Victory Determination (but do count towards CG Victory Determination). See 15.609 for Prisoner Casualty VP at CG End (15.2), ignoring any Isolated status of Marine guards. On its CG Roster, each side records its Current Casualty VP Total in the "Casualty VP" column.

15.604 ENCIRCLEMENT, BOG & SHOCK

15.6041 ENCIRCLEMENT: Each Encircled unit [EXC: prisoner] must take a separate ITC for Marine, and NTC for Japanese (Leader DRM may apply). If it passes its TC, the unit remains in its present location (Encircled markers are not removed until RePh 15.606). Failing the TC results in the unit's immediate elimination [EXC: the Encircled Vulnerable PRC of an Immobile vehicle are Eliminated, leaving the vehicle abandoned]. Each prisoner that an Eliminated Encircled unit was Guarding must if possible be claimed by another unit in that Location friendly to the Eliminated unit. If the prisoner is not claimed, it is considered Rearmed (A20.551) and may automatically possess any equipment that an Eliminated Encircled unit left Unpossessed in the location.

15.6042 BOG: Each non-abandoned, bogged/mired vehicle must undergo ≥ one (Ocean) Bog Removal attempt (D8.3; 2.31) until it is either unbogged or immobilized (MP expenditure is immaterial).

15.6043 SHOCK: Each Shocked/UK AFV must undergo a number of recuperation attempts (C7.42) until either the marker is removed or the AFV is Eliminated.

15.605 WADING UNIT SURVIVAL: Each Infantry-MMC/mobile-vehicle that is in an Ocean hex must attempt to enter the nearest (in MP/MF) friendly-Controlled Beach hex by making a successful DR on the Wading Unit Survival Chart. Each unit must roll separately but may first drop possession of any SW/Gun.

WADING UNIT SURVIVAL CHART

DR	Inf	Armor
≤ 7	Survives (a)	Survives (a)
8–9	Casualty Red. (a)	Mired (b)
10	Casualty Red. (a)(d)	Immobilized (b)
≥ 11	Eliminated	Eliminated

Notes:

- a place on nearest friendly Beach hex
- b in current Location
- c check for CS/cs normally; roll for PRC again
- d all possessed SW/Guns eliminated

DRM:

- +2 Encircled Infantry
- +1 per multiple of 2 (3 if vehicle) hexes (FRD) from destination
- +x (Armor) Leader DRM (applies to ≤ 1 MMC per Location)
- 1 per 5 AF of best Armor facing (FRD)*
- +1 per PP > IPC (a stacked leader may combine to increase one MMC's IPC; Guns are treated as having 5 PP)
- +1 Unarmored vehicle*
- +1 Wounded Pathfinder*
- +2 no Pathfinder*

* NA to Infantry

15.606 ENCIRCLEMENT MARKER REMOVAL: All Encircled counters are now removed.

15.607 MARINE PERIMETER DETERMINATION:¹⁷ Each side may (at *any time* during/after a CG scenario) place a friendly Location Control marker (supplied in the BRT counter mix) in a *Strategic Location* (see Definitions; 15.2) that it currently Controls (or is awarded Control of, as per A26.16), if that Location's Control might affect victory determination or the alignment of the perimeter. The Control marker must be removed (or flipped over) if the Controlling side loses Control of that Location. Note that non-Strategic Locations may still be Controlled but never receive a Control marker. The Marine player now places Perimeter markers, one at a time, in a series of Marine-Controlled, ground level Strategic Locations that are ≤ 2 hexes apart in an attempt to create one or more "loops"; each "loop" must begin and end at two adjacent Beach hexes. As each subsequent Perimeter marker is placed, it must be pointed towards a Location within two hexes containing another Perimeter marker, along a(n) (Alternate; E12.11) Hex Grain that is devoid of any armed Japanese units, Ocean hexes, or Japanese-Controlled Strategic Locations. The placement of Perimeter markers must continue in this manner until the Marine player has formed one or more closed "loops" of connecting (Alternate) Hex Grains which the Marine player is satisfied encloses the largest Perimeter legally possible. The Marine player is free to remove or readjust his previously-placed Perimeter markers until he is satisfied with his Perimeter, so long as all of the markers are legally positioned. Any hex that is part of the Marine Perimeter is a Marine Front Line Location (FLL). Any non-Ocean hex adjacent to, but not within, the Marine Perimeter is a Japanese FLL.

15.6071 SETUP AREAS: Each Marine Perimeter defines a Marine Setup Area. The area not within the Marine Setup Area is the Japanese Setup Area [EXC: Ocean hexes]. The Japanese will have only one Setup Area unless the Marines have completely split the Japanese defense. Included in the *BRT* module is a reduced-size copy of the *BRT* map. Each side should now record its Setup Area(s) on a new photocopy of the reduced-size map. After all Setup Areas have been marked, each should be designated with a ID.

15.6072 ISOLATED UNITS: All on-map Marine units outside of, and Japanese units inside of, a Marine Setup Area are Isolated. Record the Location of all Isolated units and the equipment in that Location in order to set them up in that Location in the next scenario.

15.608 RETAINED UNITS & HIDDEN FORTIFICATIONS

15.6081 RETAINED UNITS: All Personnel, Equipment, and mobile vehicles (even if setup HD in a trench) are now removed from the map and Retained by the side Controlling that Setup Area or Isolated Location. The units in each Setup Area, the location of all Guns/vehicles in a FLL, and the location of any Immobile units are recorded, as is any vehicle which would be unable to trace a path of contiguous, Enterable, friendly Setup Area Locations to a Hinterland hex without having to cross an un-breached seawall. The Japanese player also records the number and type of reduced-strength units, and the Location of all still-hidden non-Isolated units/equipment.

T

15.6082

15.6082 HIDDEN FORTIFICATIONS: Each still-hidden Fortification, including all Fortified Building Locations and tunnel (or Passage) entrance/exits in Locations currently Controlled by its purchaser's opponent, is placed on-map [EXC: a tunnel or Passage is revealed only if *both* its entrance and exit Locations are currently enemy-Controlled]. Each on-map Fortification is Controlled by the side Controlling its Location or whose Setup Area it is in.

15.609 PRISONERS: Each Japanese prisoner guarded by a non-Isolated Marine unit is eliminated with the Casualty VP normally awarded for prisoners subtracted from the Japanese player's Casualty VP Total. The Japanese player may either retain possession of Marine prisoners (retained prisoners may be freely transferred to another unit in the same Setup Area) or immediately Massacre (A20.4) them; Massacre (A20.4) will be in effect for all subsequent CG Dates and Casualty VP are awarded (but are not doubled). Doubled Casualty VP for prisoners are not awarded to the Japanese player until CG-End. An unguarded, unarmed Japanese MMC is Replaced by a Conscript unit of the same size, whereas an unarmed Marine HS is replaced by a 2-4-8 HS and a full squad by *two* 2-4-8 HS and Retained in the nearest (in the shortest path of contiguous, Enterable Locations) friendly Setup Area (friendly side's choice if ≥ 2 equidistant Areas).

15.610 EXTINGUISHING FLAMES AND BLAZES:

15.6101 BURNING WRECK: Each Burning Wreck has its Blaze marker removed [EXC: if that wreck is in an obstacle or rubble hex, move the Blaze marker to the building/rubble so that it is now a terrain blaze]. Replace the wreck with a Burnt-Out Wreck (SSR BRT 14).

15.6102 VEHICLES/WRECKS: Any vehicle/wreck sharing a Rubble/Collapsed-Tower/building Location with a Flame/Blaze marker becomes a Burnt-Out Wreck.

15.6103 WOODEN-RUBBLE/COLLAPSED-TOWER: Remove both the Rubble/Collapsed and Flame/Blaze markers, or just the Flame/Blaze marker if in Printed Rubble, and place a Shellhole counter in the Location. All other previous terrain in the Location is eliminated; replace any vehicle/wreck with a Burnt-Out Wreck.

15.6104 STONE RUBBLE: Remove the Flame/Blaze marker. The Stone Rubble still exists and the Location may catch fire again in a later scenario. Replace any vehicle/wreck with a Burnt-Out Wreck.

16.6105 BUILDING: Place the correct rubble counter in all ground level locations of each building that has at least one Flame/Blaze in any of its Locations [EXC: towers are replaced by a Collapsed marker], removing each Flame/Blaze marker. Such Rubble may catch fire again in a later scenario.

15.611 (RE)COMBINING, BATTLE HARDENING & PROMOTION

15.6111 (RE)COMBINING: All retained same-class HS with the same Strength Factors within the same Setup Area must now Recombine (A1.32) so that no more than one of each HS type is Retained in that area [EXC: Marine 2-4-8s; Assault Engineer 3-4-8 HS may only combine with other Assault Engineer HS].

15.6112 WOUNDED LEADERS: Each side makes a dr on the following table for each Retained wounded leader:

WOUNDED LEADER TABLE		
Final DR	Result	drm
≤ 1	Retain unwounded	+1 if Japanese
2-3	Retained Wounded	+1 if Isolated
≥ 4	Eliminated	-1 if Heroic

15.6113 HEROES & MMC: On each side, each Retained hero [EXC: leader] is Eliminated; however, each such Elimination enables that side to Battle Harden one non-crew MMC of the owner's choice within the same Setup Area as that hero [EXC: if unable to Battle Harden an MMC in that Area, the hero is Retained].

15.6114 LEADERS: On each side, each Retained heroic leader Battle Hardens and loses his heroic status [EXC: a heroic 10-3 loses his heroic status with no additional effect]. In addition, the side that won the preceding CG scenario may Battle Harden one non-Isolated leader or create one 7-0 (8-0 if Japanese) leader.

15.612 NEW CG DATE & SAN ADJUSTMENT

15.6121 NEW CG DATE: Each passage of this RePh step represents the start of a new CG Date. The Marine player is always considered to be attacking in every AM/PM CG scenario until his CG Victory Conditions have been met. See SSR CG10 for Night CG scenario generation.

15.6122 SAN ADJUSTMENT: The side that lost the preceding CG scenario immediately reduces its current SAN by 1 but to no less than 3.

15.613 EQUIPMENT REPAIR & REPLENISHMENT

15.6131 VEHICLES: Each side performs the applicable step(s) below for each vehicle in a friendly Setup Area.

a) **ABANDONED:** Each abandoned vehicle may remain abandoned, or may be re-manned and operated (as per A21.22 or D5.42/-D6.631) by Personnel (including any vehicle crew) Retained within the same Setup Area.

b) **IMMOBILIZATION REPAIR:** Each non-captured, non-abandoned, immobilized vehicle that is not in an Ocean Location must make a dr on the following table to determine if the immobilization is repaired:

IMMOBILIZATION REPAIR TABLE	
Final DR	Result
≤ 1	Becomes Mobile *
2-3	Remains Immobile

drm:

- x Armor Leader drm
- +1 if only Non-Qualified Use (A21.13) possible
- +1 if Japanese, if in FLL, or if Isolated (+1 each case)

* May now setup in its Setup Area outside its recorded Location

c) **STUNNED:** Each vehicle/crew which is marked with a Stun marker must now make a dr to determine the final result of the Stun:

STUN RECOVERY TABLE	
Final DR	Result
≤ 2	Retain unwounded
3-6	Retained Wounded
≥ 7	Eliminated*

drm:

- +1 if Japanese
- +1 if Isolated
- 1 if Retained off-map
- * Crew Eliminated; vehicle Abandoned in its current (recorded) Location

d) **AFV RECALL:** See SSR BRT12.

15.6132 WEAPON REPAIR: Each side now makes a separate dr on the table below for each malfunctioned, non-captured Retained Weapon in a friendly Setup Area that contains Personnel (or, for a vehicular Weapon, an Inherent crew in that vehicle).

WEAPON REPAIR TABLE

Final DR	Result
≤ 1	Repaired
≥ 2	Eliminated*

drm:

- x Weapon Repair Number
- 2 if vehicular
- 1 if U.S.
- +1 if only Non-Qualified Use (A21.13) possible
- +1 if Isolated

* If vehicular mounted, the weapon is disabled

15.6133 FT/DC: Each FT/DC removed from play during the preceding CG scenario is retained by the Marine player [EXC: if lost due to being unpossessed in an Ocean location, to an original 12 usage DR, or to SW Destruction (A9.73-.74)]. Place each such Retained SW in the Marines player's "Retained" box on the Chapter T Divider. However, the Marine player may retain in this manner for each Setup Area no more friendly FT/DC than he has 7-6-8 squads.

15.6134 CAPTURED EQUIPMENT: Each sides makes a separate dr for each captured, Retained Weapon in each friendly Setup Area that contains Personnel: if ≥ 4 it is Eliminated (disabled if vehicular). Each already-malfunctioned Captured

T

Weapon is Eliminated (disabled if vehicular). See SSR BRT 11 for disabled MA. At its capturer's option, a captured vehicle may remain in play if it has any functioning Weapon (even if its MA is disabled); otherwise, it is turned into a (Burnt-Out) Wreck.

15.6135 ABANDONING, SCROUNGING & REMOVAL: At his option, the Controlling player may Abandon and/or turn into a (Burnt-Out) Wreck $\geq$ one Non-Recalled vehicle in each friendly Setup Area. Likewise, he may attempt to Scrounge $\geq$ one non-LVT vehicle/non-Burnt-Out-wreck in each friendly Setup Area. [EXC to all: Such actions are NA unless $\geq$ one Personnel unit (even an Abandoning crew) is Retained in that Setup Area].

15.6136 SPECIAL AMMO: Each non-captured, non-Isolated U.S. Weapon in a Marine Setup Area has all of its Depleted ammunition types (if any) replenished to normal availability. Each such Japanese Weapon must make a $dr \leq 4$ for each Depleted Ammo type in order for that special ammunition to be restored. Adjust side records accordingly.

15.6137 SW/Gun dm/ELIMINATION: At the Controlling player's option, $\geq$ one SW/Gun in each friendly Setup Area that contains Retained Personnel may be Eliminated/dismantled/assembled.

15.6138 LOW AMMO REMOVAL: Each Low Ammo counter on each non-Isolated unit is now removed.

15.6139 FORTIFICATION & WRECK REMOVAL: Attempts may be made to Eliminate (Burnt-Out) wrecks, Immobile vehicles, and other fortifications in friendly-Controlled Locations. Attempts made vs (Burnt-Out)-wrecks/Immobile-vehicles may not exceed the total number of Dozers and vehicles of ≥ 30 tons Retained in that Setup Area.

Only one removal attempt dr may be made per item per completion of this RePh step (and does not create a Labor marker). If a Location contains $>$ one of the above mentioned items, the side may roll once for each, but must announce which item it is currently rolling for. Each Engineer *squad*, and Korean laborer *squad*, and bulldozer may participate in one clearance attempt for an item in its Setup Area.

FORTIFICATION REMOVAL TABLE

Item	Final dr Req'd
Wreck/Immob.-Vehicle, Tunnel/Passage	≤ 3
Wire, Seawall breach	≤ 2
Rubble, Pillbox, Bombproof, Entrenchment	≤ 1

An original dr of 6 for an item in a Front Line Location results in Casualty Reduction for one MMC in that Setup Area (randomly determine which type of MMC).

drm:

- +2 Item is adjacent to an enemy Front Line Location
- +1 Item is one hex from an enemy Front Line Location
- 1 Per each participating Assault Engineer/Korean-Labor squad
- 2 Per each participating Bulldozer

15.614 PURCHASING FORTIFICATIONS AND GUNS: The Japanese player now secretly allots GPP, CAPP, and FPP for the purchase of, respectively, Guns/machine-guns, pillboxes, and fortifications. Starting after the Initial CG Scenario, the Marine player secretly allots any FPP accrued pursuant to 15.6143. All purchase points of any kind must bespent prior to the start of the next CG Date or they are forfeit. The purchase points expended and the Guns/machine-guns, pillboxes, and fortifications purchased may all be kept secret until the end of the CG, but must be marked on the Beach Defense Record or the Fortification Location Record, as applicable. As each item is selected for purchase, record its ID (and the purchase points expended to purchase it) in the appropriate column of the Beach Defense Record or the Fortification Location Record. The GPP, CAPP, and FPP available per Beach Setup Area are listed in the Japanese OB for each CG. The number listed for each Beach applies to that specific Beach Setup Area only; purchase points designated for one Beach Setup Area may not be transferred to or used in any way in another Beach Setup Area [EXC: FPP designated for the Island Command may be combined with FPP designated for another Beach Setup Area for fortifications setup in Hinterland hexes]. A Beach Setup Area extends out into the Ocean and one or more are designated for each CG as per the Initial Scenario OB.

15.6143

15.6141 GUN PURCHASE POINTS (GPP): GPP are used by the Japanese player to purchase Guns and machine guns from the Gun Purchase Point Table. GPP expenditures are recorded on the Beach Defense Record. All weapons purchased with GPP include a 2-2-8 Infantry crew.

Weapon	GPP Max per		CG Maximum		
	Cost	Beach	CGI	CGII	CGIII
HMG	4	4	8	2	16
.50cal HMG	5	4	8	12	14
Twin 12.7 (12 IFE)	6	4	4	6	8
37* INF	3	6	8	12	14
37L AT	4	4	6	9	12
Type 92 70* INF	3	6	12	14	16
Year 41 75* INF	5	4	6	10	12
Year 38 75* ART	4	4	6	8	12
Type 10 76L AA	5	4	6	8	10
Type 88 75 AA	6	3	4	6	8
Year 10 120L AA	7	2	2	2	4
Year 3 140L ART	8	2	2	2	2
8-in. Gun Turret *	8	2	2	2	2

* May not set up on Green Beach

15.6142 COVERED ARC PURCHASE POINTS (CAPP): CAPP are used by the Japanese player to purchase pillboxes. A pillbox is worth a number of CAPP equal to its CA TEM. CAPP expenditures are recorded on the Beach Defense Record. The Japanese player may use CAPP to purchase any of the following pillbox types: 1+3+5, 1+4+6 (6.31), or 1+5+7. A pillbox purchased with CAPP must set up adjacent to a Beach hex with at least one adjacent Beach hex within its CA in all CG scenarios. In the Initial Scenario of a CG, every pillbox must be filled to capacity before any Japanese unit may set up in a non-pillbox Location. A pillbox purchased with CAPP ordinarily has a stacking capacity of one squad-equivalent. The CAPP allotment for a beach may be followed by an exponent (termed the CAPP Exponent) that represents the number of squad-equivalent stacking capacities the Japanese player may add to one or more pillboxes set up in the Setup Area for that beach.

EX: "26² CAPP" means that the Japanese player may spend up to 26 CAPP and either increase the stacking capacity of two pillboxes by one squad-equivalent, or increase the stacking capacity of one pillbox by two squad-equivalents.

15.6143 FORTIFICATION PURCHASE POINTS (FPP): FPP are used by both players to purchase fortifications for their respective Setup Areas. FPP expenditures are recorded on the Beach Defense Record and/or the Fortification Location Record. During the RePh, the Japanese player receives two FPP for every Korean squad-equivalent (FRU) currently in a Japanese Setup Area. The Marine player receives one FPP for every Assault Engineer *squad* currently in a Marine Setup Area. No Fortification may set up on/north-of hexrow Y.

FORTIFICATION PURCHASE TABLE

Fortification Type	FPP Cost	Notes
Bombproof	10	J,a,f
Fortified Building Location	8	J,h
Trench, Passage	4	J,a
Tetrahedron	8	J,a,n
Tetrahedron/Wire	10	J,a,n

Wire	5	J,a
Foxhole	3/2/1	d,k
HIP	3/2/2/1	J,e,m
"?"	1	g,k,l
SAN Increase	8	c
Tunnel	30	J,a
A-T Mine Factor	4	J,a,b
Pillbox	(Capacity+CA+NCA)x2	J,a

T

15.6143

- [J] Japanese only.
- [a] Not available after Initial CG scenario.
- [b] Maximum of 10 may be purchased per Beach Setup Area; must set up with tetrahedron (see 1.11).
- [c] Maximum of one may be purchased per RePh.
- [d] 3S/2S/1S Foxhole costs.
- [e] Listed cost is per Squad/HS/crew/SMC. SW may set up with HIP unit up to IPC of that unit (a leader may lend its IPC to a MMC).
- [f] May not set up adjacent to a Beach hex.
- [g] Marines may purchase only during RePh prior to an AM or Night CG Date.
- [h] Cost is double after Initial CG scenario.
- [k] May set up in an Isolated Location.
- [l] May set up in a Front Line Location.
- [m] HIP may be purchased for $\leq 5\%$ of the on-map Japanese squad-equivalents in a daytime scenario (or 10% in a night scenario). See SSRs CG10 and CG11 for night scenarios.
- [n] Must set up in an Ocean hex. Limit of 4 of any type of tetrahedron per Beach Setup Area.

15.615 CG-SCENARIO VICTORY CONDITIONS: The Marines win at game end by amassing more Victory Points than the Japanese. CVP are awarded normally and each pillbox Eliminated or Captured by the Marines is worth to them a number of VP equal to the pillbox's stacking capacity.

15.616 BANZAI NIGHT ATTACK DECISION: After any PM CG Date prior to CG End, the Japanese player must now secretly record whether he will attempt a Night Banzai Attack (see SSR CG10).

15.620 UNIT SETUP: The Japanese player sets up first in the Initial CG scenarios and in all PM CG scenarios, and the Marine player moves first in all AM/PM scenarios; see 15.6205. For Night scenarios, see 15.6203.

15.6201 ISOLATED UNIT SETUP: The side that sets up first (15.6205) on a given CG Date now sets up all of its Retained units, Equipment, and new Fortifications which will go into an Isolated Location, after which the other side does likewise. An Isolated Marine unit must set up, Encircled, only in its recorded Location or ADJACENT to that Location in a friendly-Controlled Strategic Location [EXC: Gun/AFV in Fortified-Building-Location/Pillbox and Immobile/Abandoned vehicles may not be moved]. An Isolated Japanese unit may set up either Encircled in any friendly Location of its recorded hex or in the closest Japanese Setup Area.

15.6202 NON-ISOLATED UNIT SETUP: The side that sets up first now sets up the remainder of its Retained units, Equipment and new Fortifications in eligible Locations of the Setup Area each is Retained in:

- Immobile vehicles, AA Guns, and Guns in pillboxes/fortified-building-locations must setup in their recorded location.
- No vehicle which did not have access to a Hinterland hex in its Setup Area via an un-breached seawall (15.6081) may set up in a Hinterland hex.
- See 15.6143 for setup restrictions on certain fortification types (record the hex coordinates of new Fortification setup Locations on the Fortification Location Record.
- All 5/8" counters and .50 HMG (and manning crews) must set up on-map [EXC: Relocated Guns, SSR CG 13].
- No 5/8" counter may set up in a Front Line Location [EXC: unless it ended the last CG scenario in that hex].
- HIP units may not set up in a Front Line Location (see CG11).
- A Japanese unit from the Reserve Pool that sets up on board must set up ≥ 3 hexes from all Marine Front Line Location; if unable to do so, it must enter as reinforcements (CG3.2).
- During a Night Banzai Attack, any Japanese unit that sets up as part of the Banzai charge must set up ≥ 3 hexes from all Marine Front Line Location.
- Any Marine units which would be forced to setup overstacked (as per RePh 15.605) due to Setup Area limitations may set up in an Ocean hex which is adjacent to the Beach hex which it tried to reach during RePh 15.605. This is the only time a unit may set up in Ocean [EXC: immobile vehicles].
- Units/Equipment Retained off-map must enter as reinforcements. See SSRs CG2 & CG7.2 and CG3.11 for SFCP, and BRT11 for LVT.

Once the side setting up first has completed setup, the other side follows the same procedure.

15.6203 BANZAI NIGHT ATTACK DETERMINATION (SSR CG10): Prior to the start of each AM CG scenario after the Initial CG scenario, the Japanese player reveals whether he will attempt a Night Banzai Attack. If so, and if he makes a Final Night Banzai Attack $\text{dr} \leq 1$, a Night CG scenario occurs. The following drmm apply to the Night Banzai Attack dr:

- 1 for each previous Night CG Date in which a CG scenario did not occur or if CGL.
- 1 for each AM/PM CG scenario after the initial CG scenario in which the Japanese player did not enter any units from the Reserve Pool [EXC: NA if a Night Banzai Attack has already occurred].

15.6204 SCENARIO COMMENCEMENT: Players are now ready to begin the CG scenario. Each side announces its current SAN.

15. 6205 SET-UP/MOVE/SCENARIO-LENGTH TABLE

CG SCENARIO SETUP AND GAME LENGTH TABLE

BRT SPECIFIC VEHICLES AND ORDNANCE

JAPANESE VEHICLE NOTES

19. Vickers 8-in. Coastal Defense Gun Turret: Four of these gun turrets were present on Betio Island during the invasion in November 1943. They were placed in tandem on the extremities of the island. The two on the east end of the island were mounted in circular concrete emplacements and could be traversed through 360°. The two on the southwest of the island were mounted in a stair step emplacement made of concrete, sand, and coral. The top gun turret could be traversed through 360°, while the bottom gun turret could traverse through 270°. These guns have been referred to as the "Singapore Guns" because of the belief that they were part of the war spoils from the capture of Singapore. It has been proven, however, that the guns were originally purchased from Vickers by Japan in 1905 as part of a contract for 12 guns. The muzzle velocity was lower than similar guns. None of the ammunition for these guns was manufactured after 1919, and pre-invasion trials showed spotty performance. Each 8-in. Gun Turret is treated as an Open Topped Armored Cupola (D9.5) and for CC purposes as an immobile Open Topped AFV [EXC: PAATC NA]. The manning crew cannot BU (even if Stunned) and receives a +3 CE DRM. The BPV for the 8-in. Gun is 43.

† The rear AF is 0 as shown by the third AF listed on the counter.

† Minimum range is 12 hexes, maximum range is 500 hexes.

ERRATA: The Japanese 200L Basic AP To Kill number is "19."

T

JAPANESE ORDNANCE NOTES

25. Type 10 8cm, Naval High-Angle Gun: This gun was used primarily for coastal defense. Mounted on a pedestal to take advantage of its anti-boat capability, the type of mount used on some islands diminished the gun's effectiveness in AA fire. Although identified as 8cm, a true measurement of the bore shows that it was actually 76.2mm, with a muzzle velocity slightly lower than Russian guns of similar caliber. The anti-aircraft rounds used were capable enough, but the gunners at Tarawa set the fuses too high. A complement of 16 guns made up the third company of a Special Naval Landing Forces unit. The Gun is available from 1921 through 1945. See Japanese Multi-Applicable Ordnance Notes D and E.

RF 1.2 in central Pacific, 1.6 in other areas. The BPV for the Type 10 is 38.

ERRATA: The *Japanese 76L Basic AP To Kill* number is "13."

U.S. VEHICLE NOTES

59. LVT2(m): For the invasion of Tarawa, the Second Marine Division had many LVT1s and LVT2s (approximately 75 of the former and 48 of the latter) that were modified by bolting on 1-inch boiler-plate. The field modified version of the LVT1 is essentially the same as the LVT(A)2 (U.S. Vehicle Note 48). These field-modified vehicles also had one or two .50-cal. machine guns mounted on the front cab. One Browning .30-cal. was also mounted on each side. The gun mounts were on a track that allowed the positioning of the weapon in almost any direction; these skate mounts also prevented any attempts to dismount the machine guns. For the invasion, 15 of these modified LVT had grappels welded onto their stern sides that were designed to remove wire obstructions as the vehicle moved toward the landing beach. See U.S. Multi-Applicable Vehicle Notes D, H, Q, and T.

† If designated as being equipped with a wire-removal grapple, no Bog check is required when entering Wire. Instead, on a dr of ≤ 2, the Wire is removed from play (a Wire/tetrahedron is replaced by a tetrahedron counter).

† Dates and RF are: 11/43 (1.5), 1/44 (1.4), 7/44 (1.3), 1/45 (1.2). The BPV for the LVT2(m) is 48.

FOOTNOTES

1. 6.0 BUNKERS. The various command bunkers, pillboxes, and bombproofs mostly were made of palm trunks with sand covering, or concrete. Two attempts were made to provide more concrete to Betio, but both transports were sunk. Nevertheless, the bunkers were very well made. Some bunkers had spider trenches leading to firing ports and to other covered positions. The films and pictures familiar to many of the sand hill and huge concrete structure show just the largest of several command bunkers locations on the island. Admiral Shibasaki, commander of the Japanese forces on Betio, died as he was moving his headquarters from the most famous of these bunkers in order to provide the Japanese wounded with a protected haven. These rules give the Japanese player the opportunity to match the genius of Rear Admiral Saichiro Tomonari in devising the defense of Betio.

2. 6.5 BOMBPROOFS: These fortifications were built all over the island for ammunition and supply storage but proved very useful for infantry defense.

3. 7.1 TOWERS: The Japanese had built several observation towers to spot for the long range anti-shipping guns on Betio.

4. 8.1 8-INCH GUNS: These are the so-called "Singapore guns." For many years, some historians erroneously thought these guns had been captured by the Japanese from the British during the siege of Singapore. In fact, the guns were Vickers 8-inch guns purchased from the British during the Russo-Japanese war of 1905. During the battle for Betio, the guns never scored a hit on a U.S. Navy vessel. These two on the southwest end of the island were both destroyed by a direct hit on the ammunition storage shelter by a naval gun. Two more were mounted on the east end of the island.

5. 13. AIRFIELD: The main runway on Betio was built of four inches of concrete, while the taxiways were constructed of crushed coral.

Footnote 17

6. 15.2 RED BEACH THREE: Only a portion of Red Beach Three is in play. Adding the remainder would have meant more map sheets without changing play much.

7. 15.4 CG 2.1 BATTALION LANDING TEAMS: The invasion of a hostile shore is one of the most complicated operations undertaken by a military force. In Marine operations, a major part of an invasion plan is the assignment of a particular infantry regiment to a specific invasion beach. The assigned regiment is reinforced with other units, and the resulting combined arms force is called a Regimental Combat Team (RCT). During the landing phase of an operation, the RCT is called a Regimental Landing Team (RLT). The regiment commander assigns each of the regiment's organic battalions to a sub-division of the regiment's assigned landing beach. Each such battalion is then reinforced and becomes a Battalion Landing Team (BLT).

8. 15.4 CG2.3 ASSAULT WAVES: The forces included are correct historically for the initial BLTs in each CG, but the reinforcement designations are not entirely historical. Two battalions, the 1/2 and 3/8, have been left out of the *BRT OB*. Two additional battalions of infantry made the Marines too strong in the CG, and the 1/2—which landed on the heels of the 2/2—had effectively been eliminated while wading into the beach. The intent is to give the Marine player a feel for planning an assault against a heavily-defended hostile shore. In an amphibious assault the decisions made in the planning stages will often win or lose the battle. For example, where will the BLT HQ come in? In this action Colonel Crowe commanding 2/8 came with the initial assault waves, whereas Major Schoettel came with the third wave. Colonel Crowe had control of his forces from the time he hit the shore, but Major Schoettel did not gain control until the night of D+1. And of course in the middle, Colonel Amey was killed on the way in.

9. 15.4 CG3.1 NAVAL GUNFIRE: Naval gun fire on Betio has universally been declared a disaster. The low-lying island caused the majority of the larger caliber shells to skip across the island causing minimal damage. On the positive side, however, was the bravery of the crews of the USS RINGGOLD (DD 500) and the USS DASHIEL (DD 659) on D-Day. These ships went into the lagoon and provided direct fire on the Japanese fortifications. After some semblance of command and control was obtained the 5-inch guns of these two ships wreaked havoc on the defenders (see SSR CG3.21).

10. 15.4 CG5 CLOAKING: Without this rule, the Japanese player could spend the entire first turn eliminating all the leaders and SW.

11. 15.4 CG6 AIR SUPPORT: The primary problem with the air support received on Betio was timing. The naval task force and the landing force mixed up "Beginning Morning Nautical Twilight" and "Civil Twilight." Consequently, the air support arrived on time according to the clocks of the air crews, but over an hour late for the needs of the amphibious forces. This discrepancy caused a cessation of naval gunfire for a critical thirty minutes, enabling the Japanese to readjust their forces. Also important was the doctrine of "Little Sky, Big Bullet" (largely discredited after Tarawa), which dictated that naval gunfire (or any artillery) not fire while aircraft were operating in order to avoid hitting the friendly air support.

12. 15.4 CG7.1 RESERVE POOL: Although there were no "reserves" for the Japanese units, the reserve pool represents the 7th SNLF units which were defending the south shore and which migrated north after the American intentions were realized. The Reserve Pool helps connect the two rather distinct game segments in the CG: the Marine attempt to get ashore, followed by the Japanese struggle to hold out in the face of superior marine firepower.

13. 15.4 CG 10 NIGHT BANZAI ATTACK: The Japanese defense plan for Betio included contingencies for a counterattack that was not executed due to the loss of Admiral Shibasaki on D-Day. This rule gives the Japanese player a potentially decisive, albeit risky, counterattack option.

14. 15.4 CG 13 M1A1: The 75mm artillery pieces were carried over the reef like all of the other gear.

15. 15.4 CG13 M3A1: Most 37mm AT guns came ashore along the pier, although some were rolled along in the reef. The general depth of the water made it no more difficult to manhandle them than a muddy field, but deeper pockets posed a threat to their continued existence.

16. 15.4 CG17 OVER THE WALL TC: The Marines were pinned down behind the seawall for most of the first day. The greater the cover, the less likely was it that large groups would go over. Only in small groups did the Marines start to destroy the fortifications blocking the advance. The loss of leaders and the intimidating defenses created a need for "courage of even greater measure".

17. 15.607 STRATEGIC LOCATIONS: The intent here is to provide a system for

**T****Footnote 17**

setting up for the next CG Date. The concept of front lines is really not applicable on Betio. For example, units of 2/8 reached the far side of the airfield and were completely cut off, with no real ill-effect.

18. BRT SSR 8 MMG USAGE: Commander Sugai IJN, commander of the *rikusentai* on Betio, and Admiral Shibasaki both believed in cross-training troops to fire all available weapons, and they integrated the islands medium machine guns in with the squad defensive positions. Allowing the Japanese 1st line and Elite squads to use MMG without penalty helps simulate this, as well as cutting down on the number of crew counters needed.

19. BRT SSR 11 LVT TC: Operations orders for the assault called for LVTs to provide direct fire support for the Marines ashore. Many LVTs did stay at the beach or venture inland, with one making it to the center of the airfield. It soon became apparent, however, that the follow-on boats could not negotiate the reef. Many intrepid LVT drivers then went back into the lagoon to try to aid the wading Marines and to help with the shuttling of supplies. After Tarawa, Marine doctrine was changed. Close support LVTs were developed to work with Marines ashore.

20. BRT SSR 13 dm SW: Dismantled American support weapons were water-proofed, with parts individually packed. Other Marines often could not recover all the parts after the original crews were incapacitated.
